Sage-grouse subject matter experts determined which of the ecological systems from the LANDFIRE EVT to use in the sagebrush base layer by identifying the ecological systems that have the capability of supporting sagebrush vegetation and that could provide suitable seasonal habitat for the sage-grouse. (See Table 4, Ecological systems in BpS and EVT capable of supporting sagebrush vegetation and capable of providing suitable seasonal habitat for Greater Sage-Grouse.) Two additional vegetation types that are not ecological systems were added to the EVT: *Artemisia tridentata* ssp. *vaseyana* Shrubland Alliance and *Quercus gambelii* Shrubland Alliance. These alliances have species composition directly related to the Rocky Mountain Lower Montane-Foothill Shrubland ecological system and the Rocky Mountain Gambel Oak-Mixed Montane Shrubland ecological system, both of which are ecological systems in LANDFIRE BpS. In LANDFIRE EVT, however, in some map zones, the Rocky Mountain Lower Montane-Foothill Shrubland ecological system and the Rocky Mountain Gambel Oak-Mixed Montane Shrubland ecological system were named *Artemisia tridentata* ssp. *vaseyana* Shrubland Alliance and *Quercus gambelii* Shrubland Alliance, respectively.

**Table 3.** Datasets for establishing and monitoring changes in sagebrush availability.

Dataset	Source	Update Interval	Most Recent Version Year	Use
BioPhysical Setting v1.1	LANDFIRE	Static	2008	Denominator for sagebrush availability
Existing Vegetation Type v1.2	LANDFIRE	Static	2010	Numerator for sagebrush availability
Cropland Data Layer	National Agricultural Statistics Service	Annual	2012	Agricultural updates; removes existing sagebrush from numerator of sagebrush availability
National Land Cover Dataset Percent Imperviousness	Multi-Resolution Land Characteristics Consortium (MRLC)	5-Year	2011 (next available in 2016)	Urban area updates; removes existing sagebrush from numerator of sagebrush availability
Fire Perimeters	GeoMac	Annual	2013	< 1,000-acre fire updates; removes existing sagebrush from numerator of sagebrush availability
Burn Severity	Monitoring Trends in Burn Severity	Annual	2012 (2-year delay in data availability)	> 1,000-acre fire updates; removes existing sagebrush from numerator of sagebrush availability except for unburned sagebrush islands

**Table 4.** Ecological systems in BpS and EVT capable of supporting sagebrush vegetation and capable of providing suitable seasonal habitat for Greater Sage-Grouse.

Ecological System	Sagebrush Vegetation that the Ecological System has the Capability of Producing
Colorado Plateau Mixed Low Sagebrush Shrubland	<i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia bigelovii</i> <i>Artemisia nova</i> <i>Artemisia frigida</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Columbia Plateau Low Sagebrush Steppe	<i>Artemisia arbuscula</i> <i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i>

Columbia Plateau Scabland Shrubland	<i>Artemisia rigida</i>
Columbia Plateau Steppe and Grassland	<i>Artemisia</i> spp.
Great Basin Xeric Mixed Sagebrush Shrubland	<i>Artemisia arbuscula</i> ssp. <i>longicaulis</i> <i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Inter-Mountain Basins Big Sagebrush Shrubland	<i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>xericensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Inter-Mountain Basins Big Sagebrush Steppe	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>xericensis</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tripartita</i> ssp. <i>tripartita</i> <i>Artemisia frigida</i>
Inter-Mountain Basins Curl-Leaf Mountain Mahogany Woodland and Shrubland	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i>
Inter-Mountain Basins Mixed Salt Desert Scrub	<i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia spinescens</i>
Inter-Mountain Basins Montane Sagebrush Steppe	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia nova</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>spiciformis</i>
Inter-Mountain Basins Semi-Desert Shrub-Steppe	<i>Artemisia tridentata</i> <i>Artemisia bigelovii</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Northwestern Great Plains Mixed Grass Prairie	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia frigida</i>
Northwestern Great Plains Shrubland	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Rocky Mountain Gambel Oak-Mixed Montane Shrubland	<i>Artemisia tridentata</i>
Rocky Mountain Lower Montane-Foothill Shrubland	<i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia frigida</i>
Western Great Plains Floodplain Systems	<i>Artemisia cana</i> ssp. <i>cana</i>
Western Great Plains Sand Prairie	<i>Artemisia cana</i> ssp. <i>cana</i>
Wyoming Basins Dwarf Sagebrush Shrubland and Steppe	<i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tripartita</i> ssp. <i>rupicola</i>
<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> Shrubland Alliance (EVT only)	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
<i>Quercus gambelii</i> Shrubland Alliance (EVT only)	<i>Artemisia tridentata</i>

### ***Accuracy and Appropriate Use of LANDFIRE Datasets***

Because of concerns over the thematic accuracy of individual classes mapped by LANDFIRE, all ecological systems listed in Table 4 will be merged into one value that represents the sagebrush base layer. With all ecological systems aggregated, the combined accuracy of the sagebrush base layer (EVT) will be much greater than if all categories were treated separately.

LANDFIRE performed the original accuracy assessment of its EVT product on a map zone basis. There are 20 LANDFIRE map zones that cover the historical range of sage-grouse as defined by Schroeder (2004). (See Attachment B, User and Producer Accuracies for Aggregated Ecological Systems within LANDFIRE Map Zones.) The aggregated sagebrush base layer for monitoring had user accuracies ranging from 57.1% to 85.7% and producer accuracies ranging from 56.7% to 100%.

*LANDFIRE EVT data are not designed to be used at a local level.* In reports of the percent sagebrush statistic for the various reporting units (Measure 1a), the uncertainty of the percent sagebrush will increase as the size of the reporting unit gets smaller. LANDFIRE data should never be used at the 30m pixel level (900m<sup>2</sup> resolution of raster data) for any reporting. The smallest geographic extent for using the data to determine percent sagebrush is at the PAC level; for the smallest PACs, the initial percent sagebrush estimate will have greater uncertainties compared with the much larger PACs.

### ***Agricultural Adjustments for the Sagebrush Base Layer***

The dataset for the geographic extent of agricultural lands will come from the National Agricultural Statistics Service (NASS) Cropland Data Layer (CDL) (<http://www.nass.usda.gov/research/Cropland/Release/index.htm>). CDL data are generated annually, with estimated producer accuracies for “large area row crops ranging from the mid 80% to mid-90%,” depending on the state ([http://www.nass.usda.gov/research/Cropland/sarsfaqs2.htm#Section3\\_18.0](http://www.nass.usda.gov/research/Cropland/sarsfaqs2.htm#Section3_18.0)). Specific information on accuracy may be found on the NASS metadata website (<http://www.nass.usda.gov/research/Cropland/metadata/meta.htm>). CDL provided the only dataset that matches the three criteria (nationally consistent, known level of accuracy, and periodically updated) for use in this monitoring framework and represents the best available agricultural lands mapping product.

The CDL data contain both agricultural classes and nonagricultural classes. For this effort, and in the baseline environmental report (Manier et al. 2013), nonagricultural classes were removed from the original dataset. The excluded classes are:

Barren (65 & 131), Deciduous Forest (141), Developed/High Intensity (124), Developed/Low Intensity (122), Developed/Med Intensity (123), Developed/Open Space (121), Evergreen Forest (142), Grassland Herbaceous (171), Herbaceous Wetlands (195), Mixed Forest (143), Open

Water (83 & 111), Other Hay/Non Alfalfa (37), Pasture/Hay (181), Pasture/Grass (62), Perennial Ice/Snow (112), Shrubland (64 & 152), Woody Wetlands (190).

The rule set for adjusting the sagebrush base layer for agricultural lands (and for updating the base layer for agricultural lands in the future) is that once an area is classified as agriculture in any year of the CDL, those pixels will remain out of the sagebrush base layer even if a new version of the CDL classifies that pixel as one of the nonagricultural classes listed above. The assumption is that even though individual pixels may be classified as a nonagricultural class in any given year, the pixel has not necessarily been restored to a natural sagebrush community that would be included in Table 4. A further assumption is that once an area has moved into agricultural use, it is unlikely that the area would be restored to sagebrush. Should that occur, however, the method and criteria for adding pixels back into the sagebrush base layer would follow those found in the sagebrush restoration monitoring section of this monitoring framework (see Section I.B.1.b., Monitoring Sagebrush Availability).

### ***Urban Adjustments for the Sagebrush Base Layer***

The National Land Cover Database (NLCD) (Fry et al. 2011) includes a percent imperviousness dataset that was selected as the best available dataset to be used for urban adjustments and monitoring. These data are generated on a 5-year cycle and are specifically designed to support monitoring efforts. Other datasets were evaluated and lacked the spatial specificity that was captured in the NLCD product. Any new impervious pixel in NLCD will be removed from the sagebrush base layer through the monitoring process. Although the impervious surface layer includes a number of impervious pixels outside of urban areas, this is acceptable for the adjustment and monitoring for two reasons. First, an evaluation of national urban area datasets did not reveal a layer that could be confidently used in conjunction with the NLCD product to screen impervious pixels outside of urban zones. This is because unincorporated urban areas were not being included, thus leaving large chunks of urban pixels unaccounted for in this rule set. Second, experimentation with setting a threshold on the percent imperviousness layer that would isolate rural features proved to be unsuccessful. No combination of values could be identified that would result in the consistent ability to limit impervious pixels outside urban areas. Therefore, to ensure consistency in the monitoring estimates, all impervious pixels will be used.

### ***Fire Adjustments for the Sagebrush Base Layer***

Two datasets were selected for performing fire adjustments and updates: GeoMac fire perimeters and Monitoring Trends in Burn Severity (MTBS). An existing data standard in the BLM requires that all fires of more than 10 acres are to be reported to GeoMac; therefore, there will be many small fires of less than 10 acres that will not be accounted for in the adjustment and monitoring attributable to fire. Using fire perimeters from GeoMac, all sagebrush pixels falling

within the perimeter of fires less than 1,000 acres will be used to adjust and monitor the sagebrush base layer.

For fires greater than 1,000 acres, MTBS was selected as a means to account for unburned sagebrush islands during the update process of the sagebrush base layer. The MTBS program (<http://www.mtbs.gov>) is an ongoing, multiyear project to map fire severity and fire perimeters consistently across the United States. One of the burn severity classes within MTBS is an unburned to low-severity class. This burn severity class will be used to represent unburned islands of sagebrush within the fire perimeter for the sagebrush base layer. Areas within the other severity classes within the fire perimeter will be removed from the base sagebrush layer during the update process. Not all wildfires, however, have the same impacts on the recovery of sagebrush habitat, depending largely on soil moisture and temperature regimes. For example, cooler, moister sagebrush habitat has a higher potential for recovery or, if needed, restoration than does the warmer, dryer sagebrush habitat. These cooler, moister areas will likely be detected as sagebrush in future updates to LANDFIRE.

### ***Conifer Encroachment Adjustment for the Sagebrush Base Layer***

Conifer encroachment into sagebrush vegetation reduces the spatial extent of sage-grouse habitat (Davies et al. 2011, Baruch-Mordo et al. 2013). Conifer species that show propensity for encroaching into sagebrush vegetation resulting in sage-grouse habitat loss include various juniper species, such as Utah juniper (*Juniperus osteosperma*), western juniper (*Juniperus occidentalis*), Rocky Mountain juniper (*Juniperus scopulorum*), pinyon species, including singleleaf pinyon (*Pinus monophylla*) and pinyon pine (*Pinus edulis*), ponderosa pine (*Pinus ponderosa*), lodgepole pine (*Pinus contorta*), and Douglas fir (*Pseudotsuga menziesii*) (Gruell et al. 1986, Grove et al. 2005, Davies et al. 2011).

A rule set for conifer encroachment was developed to adjust the sagebrush base layer. To capture the geographic extent of sagebrush that is likely to experience conifer encroachment, ecological systems within LANDFIRE EVT version 1.2 (NatureServe 2011) were identified if they had the capability of supporting both the conifer species (listed above) and sagebrush vegetation. Those ecological systems were deemed to be the plant communities with conifers most likely to encroach into sagebrush vegetation. (See Table 5, Ecological systems with conifers most likely to encroach into sagebrush vegetation.) Sagebrush vegetation was defined as including sagebrush species or subspecies that provide habitat for the Greater Sage-Grouse and that are included in the HAF. (See Attachment C, Sagebrush Species and Subspecies Included in the Selection Criteria for Building the EVT and BpS Layers.) An adjacency analysis was conducted to identify all sagebrush pixels that were directly adjacent to these conifer ecological systems, and these pixels were removed from the sagebrush base layer.

**Table 5.** Ecological systems with conifers most likely to encroach into sagebrush vegetation.

EVT Ecological Systems	Coniferous Species and Sagebrush Vegetation that the Ecological System has the Capability of Producing
Colorado Plateau Pinyon-Juniper Woodland	<i>Pinus edulis</i> <i>Juniperus osteosperma</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia bigelovii</i> <i>Artemisia pygmaea</i>
Columbia Plateau Western Juniper Woodland and Savanna	<i>Juniperus occidentalis</i> <i>Pinus ponderosa</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia rigida</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
East Cascades Oak-Ponderosa Pine Forest and Woodland	<i>Pinus ponderosa</i> <i>Pseudotsuga menziesii</i> <i>Artemisia tridentata</i> <i>Artemisia nova</i>
Great Basin Pinyon-Juniper Woodland	<i>Pinus monophylla</i> <i>Juniperus osteosperma</i> <i>Artemisia arbuscula</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Northern Rocky Mountain Ponderosa Pine Woodland and Savanna	<i>Pinus ponderosa</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Rocky Mountain Foothill Limber Pine-Juniper Woodland	<i>Juniperus osteosperma</i> <i>Juniperus scopulorum</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i>
Rocky Mountain Poor-Site Lodgepole Pine Forest	<i>Pinus contorta</i> <i>Pseudotsuga menziesii</i> <i>Pinus ponderosa</i> <i>Artemisia tridentata</i>
Southern Rocky Mountain Pinyon-Juniper Woodland	<i>Pinus edulis</i> <i>Juniperus monosperma</i> <i>Artemisia bigelovii</i> <i>Artemisia tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Southern Rocky Mountain Ponderosa Pine Woodland	<i>Pinus ponderosa</i> <i>Pseudotsuga menziesii</i>

	<i>Pinus edulis</i> <i>Pinus contorta</i> <i>Juniperus</i> spp. <i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
--	---

### ***Invasive Annual Grasses Adjustments for the Sagebrush Base Layer***

There are no invasive species datasets from 2010 to the present (beyond the LANDFIRE data) that meet the three criteria (nationally consistent, known level of accuracy, and periodically updated) for use in the determination of the sagebrush base layer. For a description of how invasive species land cover will be incorporated in the sagebrush base layer in the future, see Section I.B.1.b., Monitoring Sagebrush Availability.

### ***Sagebrush Restoration Adjustments for the Sagebrush Base Layer***

There are no datasets from 2010 to the present that could provide additions to the sagebrush base layer from restoration treatments that meet the three criteria (nationally consistent, known level of accuracy, and periodically updated); therefore, no adjustments were made to the sagebrush base layer calculated from the LANDFIRE EVT (version 1.2) attributable to restoration activities since 2010. Successful restoration treatments before 2010 are assumed to have been captured in the LANDFIRE refresh.

## **b. Monitoring Sagebrush Availability**

### ***Monitoring Sagebrush Availability***

Sagebrush availability will be updated annually by incorporating changes to the sagebrush base layer attributable to agriculture, urbanization, and wildfire. The monitoring schedule for the existing sagebrush base layer updates is as follows:

***2010 Existing Sagebrush Base Layer*** = [Sagebrush EVT] minus [2006 Imperviousness Layer] minus [2009 and 2010 CDL] minus [2009/10 GeoMac Fires that are less than 1,000 acres] minus [2009/10 MTBS Fires that are greater than 1,000 acres, excluding unburned sagebrush islands within the perimeter] minus [Conifer Encroachment Layer]

***2012 Existing Sagebrush Update*** = [2010 Existing Sagebrush Base Layer] minus [2011 Imperviousness Layer] minus [2011 and 2012 CDL] minus [2011/12 GeoMac Fires < 1,000 acres] minus [2011/12 MTBS Fires that are greater than 1,000 acres, excluding unburned sagebrush islands within the perimeter]

***Monitoring Existing Sagebrush post 2012*** = [Previous Existing Sagebrush Update Layer] minus [Imperviousness Layer (if new data are available)] minus [Next 2 years of CDL] minus [Next 2 years of GeoMac Fires < 1,000 acres] minus [Next 2 years of MTBS Fires that are greater than

1,000 acres, excluding unburned sagebrush islands within the perimeter] plus  
[restoration/monitoring data provided by the field]

### ***Monitoring Sagebrush Restoration***

Restoration after fire, after agricultural conversion, after seedings of introduced grasses, or after treatments of pinyon pine and/or juniper are examples of updates to the sagebrush base layer that can add sagebrush vegetation back into sagebrush availability in the landscape. When restoration has been determined to be successful through rangewide, consistent, interagency fine- and site-scale monitoring, the polygonal data will be used to add sagebrush pixels back into the broad- and mid-scale sagebrush base layer.

### ***Measure 1b: Context for Monitoring the Amount of Sagebrush in a Geographic Area of Interest***

Measure 1b describes the amount of sagebrush on the landscape of interest compared with the amount of sagebrush the landscape of interest could ecologically support. Areas with the potential to support sagebrush were derived from the BpS data layer that describes sagebrush pre-EuroAmerican settlement (v1.2 of LANDFIRE).

The identification and spatial locations of natural plant communities (vegetation) that are believed to have existed on the landscape (BpS) were constructed based on an approximation of the historical (pre-EuroAmerican settlement) disturbance regime and how the historical disturbance regime operated on the current biophysical environment. BpS is composed of map units that are based on NatureServe (2011) terrestrial ecological systems classification.

The ecological systems within BpS used for this monitoring framework are those ecological systems that are capable of supporting sagebrush vegetation and of providing seasonal habitat for sage-grouse (Table 4). Ecological systems selected included sagebrush species or subspecies that are included in the HAF and listed in Attachment C.

The BpS layer does not have an associated accuracy assessment, given the lack of any reference data. Visual inspection of the BpS data, however, reveals inconsistencies in the labeling of pixels among LANDFIRE map zones. The reason for these inconsistencies is that the rule sets used to map a given ecological system will vary among map zones based on different physical, biological, disturbance, and atmospheric regimes of the region. These variances can result in artificial edges in the map. Metrics will be calculated, however, at broad spatial scales using BpS potential vegetation type, not small groupings or individual pixels. Therefore, the magnitude of these observable errors in the BpS layer will be minor compared with the size of the reporting units. Since BpS will be used to identify broad landscape patterns of dominant vegetation, these inconsistencies will have only a minor impact on the percent sagebrush availability calculation. *As with the LANDFIRE EVT, LANDFIRE BpS data are not designed to be used at a local level. LANDFIRE data should never be used at the 30m pixel level for reporting.*

In conclusion, sagebrush availability data will be used to inform effectiveness monitoring and initiate adaptive management actions as necessary. The 2010 estimate of sagebrush availability will serve as the base year, and an updated estimate for 2012 will be reported in 2014 after all datasets become available. The 2012 estimate will capture changes attributable to wildfire, agriculture, and urban development. Subsequent updates will always include new fire and agricultural data and new urban data when available. Restoration data that meet the criteria for adding sagebrush areas back into the sagebrush base layer will be factored in as data allow. Given data availability, there will be a 2-year lag (approximately) between when the estimate is generated and when the data used for the estimate become available (e.g., the 2014 sagebrush availability will be included in the 2016 estimate).

### ***Future Plans***

Geospatial data used to generate the sagebrush base layer will be available through the BLM's EGIS web portal and geospatial gateway or through the authoritative data source. Legacy datasets will be preserved so that trends may be calculated. Additionally, accuracy assessment data for all source datasets will be provided on the portal either spatially, where applicable, or through the metadata. Accuracy assessment information was deemed vital to help users understand the limitation of the sagebrush estimates; it will be summarized spatially by map zone and will be included in the portal.

LANDFIRE plans to begin a remapping effort in 2015. This remapping has the potential to improve the overall quality of data products greatly, primarily through the use of higher-quality remote sensing datasets. Additionally, the BLM and the Multi-Resolution Land Characteristics Consortium (MRLC) are working to improve the accuracy of vegetation map products for broad- and mid-scale analyses through the Grass/Shrub mapping effort. The Grass/Shrub mapping effort applies the Wyoming multiscale sagebrush habitat methodology (Homer et al. 2009) to depict spatially the fractional percent cover estimates for five components rangewide and West-wide. These five components are percent cover of sagebrush vegetation, percent bare ground, percent herbaceous vegetation (grass and forbs combined), annual vegetation, and percent shrubs. A benefit of the design of these fractional cover maps is that they facilitate monitoring "within" class variation (e.g., examination of declining trend in sagebrush cover for individual pixels). This "within" class variation can serve as one indicator of sagebrush quality that cannot be derived from LANDFIRE's EVT information. The Grass/Shrub mapping effort is not a substitute for fine-scale monitoring but will leverage fine-scale data to support the validation of the mapping products. An evaluation will be conducted to determine if either dataset is of great enough quality to warrant replacing the existing sagebrush layers. At the earliest, this evaluation will occur in 2018 or 2019, depending on data availability.

## **B.2. Habitat Degradation Monitoring (Measure 2)**

The measure of habitat degradation will be calculated by combining the footprints of threats identified in Table 2. The footprint is defined as the direct area of influence of “active” energy and infrastructure; it is used as a surrogate for human activity. Although these analyses will try to summarize results at the aforementioned meaningful geographic areas of interest, some may be too small to report the metrics appropriately and may be combined (smaller populations, PACs within a population, etc.). Data sources for each threat are found in Table 6, Geospatial data sources for habitat degradation. Specific assumptions (inclusion criteria for data, width/area assumptions for point and line features, etc.) and methodology for each threat, and the combined measure, are detailed below. All datasets will be updated annually to monitor broad- and mid-scale year-to-year changes and to calculate trends in habitat degradation to inform adaptive management. A 5-year summary report will be provided to the USFWS.

### **a. Habitat Degradation Datasets and Assumptions**

#### ***Energy (oil and gas wells and development facilities)***

This dataset will compile information from three oil and gas databases: the proprietary IHS Enerdeq database, the BLM Automated Fluid Minerals Support System (AFMSS) database, and the proprietary Platts (a McGraw-Hill Financial Company) GIS Custom Data (hereafter, Platts) database of power plants. Point data from wells active within the last 10 years from IHS and producing wells from AFMSS will be considered as a 5-acre (2.0ha) direct area of influence centered on the well point, as recommended by the BLM WO-300 (Minerals and Realty Management). Plugged and abandoned wells will be removed if the date of well abandonment was before the first day of the reporting year (i.e., for the 2015 reporting year, a well must have been plugged and abandoned by 12/31/2014 to be removed). Platts oil and gas power plants data (subset to operational power plants) will also be included as a 5-acre (2.0ha) direct area of influence.

***Additional Measure: Reclaimed Energy-related Degradation.*** This dataset will include those wells that have been plugged and abandoned. This measure thereby attempts to measure energy-related degradation that has been reclaimed but not necessarily fully restored to sage-grouse habitat. This measure will establish a baseline by using wells that have been plugged and abandoned within the last 10 years from the IHS and AFMSS datasets. Time lags for lek attendance in response to infrastructure have been documented to be delayed 2–10 years from energy development activities (Harju et al. 2010). Reclamation actions may require 2 or more years from the Final Abandonment Notice. Sagebrush seedling establishment may take 6 or more years from the point of seeding, depending on such variables as annual precipitation, annual temperature, and soil type and depth (Pyke 2011). This 10-year period is conservative and assumes some level of habitat improvement 10 years after plugging. Research by Hemstrom et al. (2002), however,

proposes an even longer period—more than 100 years—for recovery of sagebrush habitats, even with active restoration approaches. Direct area of influence will be considered 3 acres (1.2ha) (J. Perry, personal communication, February 12, 2014). This additional layer/measure could be used at the broad and mid scale to identify areas where sagebrush habitat and/or potential sagebrush habitat is likely still degraded. This layer/measure could also be used where further investigation at the fine or site scale would be warranted to: 1) quantify the level of reclamation already conducted, and 2) evaluate the amount of restoration still required for sagebrush habitat recovery. At a particular level (e.g., population, PACs), these areas and the reclamation efforts/success could be used to inform reclamation standards associated with future developments. Once these areas have transitioned from reclamation standards to meeting *restoration* standards, they can be added back into the sagebrush availability layer using the same methodology as described for adding restoration treatment areas lost to wildfire and agriculture conversion (see Monitoring Sagebrush Restoration in Section I.B.1.b., Monitoring Sagebrush Availability). This dataset will be updated annually from the IHS dataset.

### ***Energy (coal mines)***

Currently, there is no comprehensive dataset available that identifies the footprint of active coal mining across all jurisdictions. Therefore, point and polygon datasets will be used each year to identify coal mining locations. Data sources will be identified and evaluated annually and will include at a minimum: BLM coal lease polygons, U.S. Energy Information Administration mine occurrence points, U.S. Office of Surface Mining Reclamation and Enforcement coal mining permit polygons (as available), and U.S. Geological Survey (USGS) Mineral Resources Data System mine occurrence points. These data will inform where active coal mining may be occurring. Additionally, coal power plant data from Platts power plants database (subset to operational power plants) will be included. Aerial imagery will then be used to digitize manually the active coal mining and coal power plants surface disturbance in or near these known occurrence areas. While the date of aerial imagery varies by scale, the most current data available from Esri and/or Google will be used to locate (generally at 1:50,000 and below) and digitize (generally at 1:10,000 and below) active coal mine and power plant direct area of influence. Coal mine location data source and imagery date will be documented for each digitized coal polygon at the time of creation. Subsurface facility locations (polygon or point location as available) will also be collected if available, included in density calculations, and added to the active surface activity layer as appropriate (if an actual direct area of influence can be located).

### ***Energy (wind energy facilities)***

This dataset will be a subset of the Federal Aviation Administration (FAA) Digital Obstacles point file. Points where “Type\_” = “WINDMILL” will be included. Direct area of influence of these point features will be measured by converting to a polygon dataset as a direct area of

influence of 3 acres (1.2ha) centered on each tower point. See the BLM’s “Wind Energy Development Programmatic Environmental Impact Statement” (BLM 2005). Additionally, Platts power plants database will be used for transformer stations associated with wind energy sites (subset to operational power plants), also with a 3-acre (1.2ha) direct area of influence.

***Energy (solar energy facilities)***

This dataset will include solar plants as compiled with the Platts power plants database (subset to operational power plants). This database includes an attribute that indicates the operational capacity of each solar power plant. Total capacity at the power plant was based on ratings of the in-service unit(s), in megawatts. Direct area of influence polygons will be centered over each point feature representing 7.3ac (3.0ha) per megawatt of the stated operational capacity, per the report of the National Renewable Energy Laboratory (NREL), “Land-Use Requirements for Solar Power Plants in the United States” (Ong et al. 2013).

***Energy (geothermal energy facilities)***

This dataset will include geothermal wells in existence or under construction as compiled with the IHS wells database and power plants as compiled with the Platts database (subset to operational power plants). Direct area of influence of these point features will be measured by converting to a polygon dataset of 3 acres (1.2ha) centered on each well or power plant point.

***Mining (active developments; locatable, leasable, saleable)***

This dataset will include active locatable mining locations as compiled with the proprietary InfoMine database. Aerial imagery will then be used to digitize manually the active mining surface disturbance in or near these known occurrence areas. While the date of aerial imagery varies by scale, the most current data available from Esri and/or Google will be used to locate (generally at 1:50,000 and below) and digitize (generally at 1:10,000 and below) active mine direct area of influence. Mine location data source and imagery date will be documented for each digitized polygon at the time of creation. Currently, there are no known compressive databases available for leasable or saleable mining sites beyond coal mines. Other data sources will be evaluated and used as they are identified or as they become available. Point data may be converted to polygons to represent direct area of influence unless actual surface disturbance is available.

***Infrastructure (roads)***

This dataset will be compiled from the proprietary Esri StreetMap Premium for ArcGIS. Dataset features that will be used are: Interstate Highways, Major Roads, and Surface Streets to capture most paved and “crowned and ditched” roads while not including “two-track” and 4-wheel-drive routes. These minor roads, while not included in the broad- and mid-scale monitoring, may support a volume of traffic that can have deleterious effects on sage-grouse leks. It may be

appropriate to consider the frequency and type of use of roads in a NEPA analysis for a proposed project. This fine- and site-scale analysis will require more site-specific data than is identified in this monitoring framework. The direct area of influence for roads will be represented by 240.2ft, 84.0ft, and 40.7ft (73.2m, 25.6m, and 12.4m) total widths centered on the line feature for Interstate Highways, Major Roads, and Surface Streets, respectively (Knick et al. 2011). The most current dataset will be used for each monitoring update. *Note: This is a related but different dataset than what was used in BER (Manier et al. 2013). Individual BLM/USFS planning units may use different road layers for fine- and site-scale monitoring.*

### ***Infrastructure (railroads)***

This dataset will be a compilation from the Federal Railroad Administration Rail Lines of the USA dataset. Non-abandoned rail lines will be used; abandoned rail lines will not be used. The direct are of influence for railroads will be represented by a 30.8ft (9.4m) total width (Knick et al. 2011) centered on the non-abandoned railroad line feature.

### ***Infrastructure (power lines)***

This line dataset will be derived from the proprietary Platts transmission lines database. Linear features in the dataset attributed as “buried” will be removed from the disturbance calculation. Only “In Service” lines will be used; “Proposed” lines will not be used. Direct area of influence will be determined by the kV designation: 1–199 kV (100ft/30.5m), 200–399 kV (150ft/45.7m), 400–699 kV (200ft/61.0m), and 700-or greater kV (250ft/76.2m) based on average right-of-way and structure widths, according to BLM WO-300 (Minerals and Realty Management).

### ***Infrastructure (communication towers)***

This point dataset will be compiled from the Federal Communications Commission (FCC) communication towers point file; all duplicate points will be removed. It will be converted to a polygon dataset by using a direct area of influence of 2.5 acres (1.0ha) centered on each communication tower point (Knick et al. 2011).

### ***Infrastructure (other vertical structures)***

This point dataset will be compiled from the FAA’s Digital Obstacles point file. Points where “Type\_” = “WINDMILL” will be removed. Duplicate points from the FCC communication towers point file will be removed. Remaining features will be converted to a polygon dataset using a direct area of influence of 2.5 acres (1.0ha) centered on each vertical structure point (Knick et al. 2011).

### ***Other Developed Rights-of-Way***

Currently, no additional data sources for other rights-of-way have been identified; roads, power lines, railroads, pipelines, and other known linear features are represented in the categories

described above. The newly purchased IHS data do contain pipeline information; however, this database does not currently distinguish between above-ground and underground pipelines. If additional features representing human activities are identified, they will be added to monitoring reports using similar assumptions to those used with the threats described above.

#### **b. Habitat Degradation Threat Combination and Calculation**

The threats targeted for measuring human activity (Table 2) will be converted to direct area of influence polygons as described for each threat above. These threat polygon layers will be combined and features dissolved to create one overall polygon layer representing footprints of active human activity in the range of sage-grouse. Individual datasets, however, will be preserved to indicate which types of threats may be contributing to overall habitat degradation.

This measure has been divided into three submeasures to describe habitat degradation on the landscape. Percentages will be calculated as follows:

Measure 2a. Footprint by geographic area of interest: Divide area of the active/direct footprint by the total area of the geographic area of interest (% disturbance in geographic area of interest).

Measure 2b. Active/direct footprint by historical sagebrush potential: Divide area of the active footprint that coincides with areas with historical sagebrush potential (BpS calculation from habitat availability) within a given geographic area of interest by the total area with sagebrush potential within the geographic area of interest (% disturbance on potential historical sagebrush in geographic area of interest).

Measure 2c. Active/direct footprint by current sagebrush: Divide area of the active footprint that coincides with areas of existing sagebrush (EVT calculation from habitat availability) within a given geographic area of interest by the total area that is current sagebrush within the geographic area of interest (% disturbance on current sagebrush in geographic area of interest).

### **B.3. Energy and Mining Density (Measure 3)**

The measure of density of energy and mining will be calculated by combining the locations of energy and mining threats identified in Table 2. This measure will provide an estimate of the intensity of human activity or the intensity of habitat degradation. The number of energy facilities and mining locations will be summed and divided by the area of meaningful geographic areas of interest to calculate density of these activities. Data sources for each threat are found in Table 6. Specific assumptions (inclusion criteria for data, width/area assumptions for point and line features, etc.) and methodology for each threat, and the combined measure, are detailed

below. All datasets will be updated annually to monitor broad- and mid-scale year-to-year changes and 5-year (or longer) trends in habitat degradation.

**Table 6.** Geospatial data sources for habitat degradation (Measure 2).

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>
<b>Energy (oil &amp; gas)</b>	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300
	Power Plants	Platts (power plants)	5.0ac (2.0ha)	BLM WO-300
<b>Energy (coal)</b>	Mines	BLM; USFS; Office of Surface Mining Reclamation and Enforcement; USGS Mineral Resources Data System	Polygon area (digitized)	Esri/Google Imagery
	Power Plants	Platts (power plants)	Polygon area (digitized)	Esri Imagery
<b>Energy (wind)</b>	Wind Turbines	Federal Aviation Administration	3.0ac (1.2ha)	BLM WO-300
	Power Plants	Platts (power plants)	3.0ac (1.2ha)	BLM WO-300
<b>Energy (solar)</b>	Fields/Power Plants	Platts (power plants)	7.3ac (3.0ha)/MW	NREL
<b>Energy (geothermal)</b>	Wells	IHS	3.0ac (1.2ha)	BLM WO-300
	Power Plants	Platts (power plants)	Polygon area (digitized)	Esri Imagery
<b>Mining</b>	Locatable Developments	InfoMine	Polygon area (digitized)	Esri Imagery
<b>Infrastructure (roads)</b>	Surface Streets (Minor Roads)	Esri StreetMap Premium	40.7ft (12.4m)	USGS
	Major Roads	Esri StreetMap Premium	84.0ft (25.6m)	USGS
	Interstate Highways	Esri StreetMap Premium	240.2ft (73.2m)	USGS
<b>Infrastructure (railroads)</b>	Active Lines	Federal Railroad Administration	30.8ft (9.4m)	USGS
<b>Infrastructure (power lines)</b>	1-199kV Lines	Platts (transmission lines)	100ft (30.5m)	BLM WO-300
	200-399 kV Lines	Platts (transmission lines)	150ft (45.7m)	BLM WO-300
	400-699kV Lines	Platts (transmission lines)	200ft (61.0m)	BLM WO-300
	700+kV Lines	Platts (transmission lines)	250ft (76.2m)	BLM WO-300
<b>Infrastructure (communication)</b>	Towers	Federal Communications Commission	2.5ac (1.0ha)	BLM WO-300

### **a. Energy and Mining Density Datasets and Assumptions**

#### ***Energy (oil and gas wells and development facilities)***

(See Section I.B.2., Habitat Degradation Monitoring.)

#### ***Energy (coal mines)***

(See Section I.B.2., Habitat Degradation Monitoring.)

#### ***Energy (wind energy facilities)***

(See Section I.B.2., Habitat Degradation Monitoring.)

#### ***Energy (solar energy facilities)***

(See Section I.B.2., Habitat Degradation Monitoring.)

#### ***Energy (geothermal energy facilities)***

(See Section I.B.2., Habitat Degradation Monitoring.)

#### ***Mining (active developments; locatable, leasable, saleable)***

(See Section I.B.2., Habitat Degradation Monitoring.)

### **b. Energy and Mining Density Threat Combination and Calculation**

Datasets for energy and mining will be collected in two primary forms: point locations (e.g., wells) and polygon areas (e.g., surface coal mining). The following rule set will be used to calculate density for meaningful geographic areas of interest including standard grids and per polygon:

- 1) Point locations will be preserved; no additional points will be removed beyond the methodology described above. Energy facilities in close proximity (an oil well close to a wind tower) will be retained.
- 2) Polygons will not be merged, or features further dissolved. Thus, overlapping facilities will be retained, such that each individual threat will be a separate polygon data input for the density calculation.
- 3) The analysis unit (polygon or 640-acre section in a grid) will be the basis for counting the number of mining or energy facilities per unit area. Within the analysis unit, all point features will be summed, and any individual polygons will be counted as one (e.g., a coal mine will be counted as one facility within population). Where polygon features overlap multiple units (polygons or pixels), the facility will be counted as one in each unit where the polygon occurs (e.g., a polygon crossing multiple 640-acre

- sections would be counted as one in each 640-acre section for a density per 640-acre-section calculation).
- 4) In methodologies with different-sized units (e.g., MZs, populations, etc.) raw facility counts will be converted to densities by dividing the raw facility counts by the total area of the unit. Typically this will be measured as facilities per 640 acres.
  - 5) For uniform grids, raw facility counts will be reported. Typically this number will also be converted to facilities per 640 acres.
  - 6) Reporting may include summaries beyond the simple ones above. Zonal statistics may be used to smooth smaller grids to help display and convey information about areas within meaningful geographic areas of interest that have high levels of energy and/or mining activity.
  - 7) Additional statistics for each defined unit may also include adjusting the area to include only the area with the historical potential for sagebrush (BpS) or areas currently sagebrush (EVT).

Individual datasets and threat combination datasets for habitat degradation will be available through the BLM's EGIS web portal and geospatial gateway. Legacy datasets will be preserved so that trends may be calculated.

### **C. Population (Demographics) Monitoring**

State wildlife management agencies are responsible for monitoring sage-grouse populations within their respective states. WAFWA will coordinate this collection of annual population data by state agencies. These data will be made available to the BLM according to the terms of the forthcoming Greater Sage-Grouse Population Monitoring Memorandum of Understanding (MOU) (2014) between WAFWA and the BLM. The MOU outlines a process, timeline, and responsibilities for regular data sharing of sage-grouse population and/or habitat information for the purposes of implementing sage-grouse LUPs/amendments and subsequent effectiveness monitoring. Population areas were refined from the "Greater Sage-grouse (*Centrocercus urophasianus*) Conservation Objectives: Final Report" (COT 2013) by individual state wildlife agencies to create a consistent naming nomenclature for future data analyses. These population data will be used for analysis at the applicable scale to supplement habitat effectiveness monitoring of management actions and to inform the adaptive management responses.

### **D. Effectiveness Monitoring**

Effectiveness monitoring will provide the data needed to evaluate BLM and USFS actions toward reaching the objective of the national planning strategy (BLM IM 2012-044)—to conserve sage-grouse populations and their habitat—and the objectives for the land use planning

area. Effectiveness monitoring methods described here will encompass multiple larger scales, from areas as large as the WAFWA MZ to the scale of this LUP. Effectiveness data used for these larger-scale evaluations will include all lands in the area of interest, regardless of surface ownership/management, and will help inform where finer-scale evaluations are needed, such as population areas smaller than an LUP or PACs within an LUP (described in Section II, Fine and Site Scales). Data will also include the trend of disturbance within these areas of interest to inform the need to initiate adaptive management responses as described in the land use plan.

Effectiveness monitoring reported for these larger areas provides the context to conduct effectiveness monitoring at finer scales. This approach also helps focus scarce resources to areas experiencing habitat loss, degradation, or population declines, without excluding the possibility of concurrent, finer-scale evaluations as needed where habitat or population anomalies have been identified through some other means.

To determine the effectiveness of the sage-grouse national planning strategy, the BLM and the USFS will evaluate the answers to the following questions and prepare a broad- and mid-scale effectiveness report:

- 1) Sagebrush Availability and Condition:
  - a. What is the amount of sagebrush availability and the change in the amount and condition of sagebrush?
  - b. What is the existing amount of sagebrush on the landscape and the change in the amount relative to the pre-EuroAmerican historical distribution of sagebrush (BpS)?
  - c. What is the trend and condition of the indicators describing sagebrush characteristics important to sage-grouse?
- 2) Habitat Degradation and Intensity of Activities:
  - a. What is the amount of habitat degradation and the change in that amount?
  - b. What is the intensity of activities and the change in the intensity?
  - c. What is the amount of reclaimed energy-related degradation and the change in the amount?
- 3) What is the population estimation of sage-grouse and the change in the population estimation?
- 4) How are the BLM and the USFS contributing to changes in the amount of sagebrush?
- 5) How are the BLM and the USFS contributing to disturbance?

The compilation of broad- and mid-scale data (and population trends as available) into an effectiveness monitoring report will occur on a 5-year reporting schedule (see Attachment A), which may be accelerated to respond to critical emerging issues (in consultation with the USFWS and state wildlife agencies). In addition, effectiveness monitoring results will be used to identify emerging issues and research needs and inform the BLM and the USFS adaptive

management strategy (see the adaptive management section of this Environmental Impact Statement).

To determine the effectiveness of the sage-grouse objectives of the land use plan, the BLM and the USFS will evaluate the answers to the following questions and prepare a plan effectiveness report:

- 1) Is this plan meeting the sage-grouse habitat objectives?
- 2) Are sage-grouse areas within the LUP meeting, or making progress toward meeting, land health standards, including the Special Status Species/wildlife habitat standard?
- 3) Is the plan meeting the disturbance objective(s) within sage-grouse areas?
- 4) Are the sage-grouse populations within this plan boundary and within the sage-grouse areas increasing, stable, or declining?

The effectiveness monitoring report for this LUP will occur on a 5-year reporting schedule (see Attachment A) or more often if habitat or population anomalies indicate the need for an evaluation to facilitate adaptive management or respond to critical emerging issues. Data will be made available through the BLM's EGIS web portal and the geospatial gateway.

### ***Methods***

At the broad and mid scales (PACs and above) the BLM and the USFS will summarize the vegetation, disturbance, and (when available) population data. Although the analysis will try to summarize results for PACs within each sage-grouse population, some populations may be too small to report the metrics appropriately and may need to be combined to provide an estimate with an acceptable level of accuracy. Otherwise, they will be flagged for more intensive monitoring by the appropriate landowner or agency. The BLM and the USFS will then analyze monitoring data to detect the trend in the amount of sagebrush; the condition of the vegetation in the sage-grouse areas (MacKinnon et al. 2011); the trend in the amount of disturbance; the change in disturbed areas owing to successful restoration; and the amount of new disturbance the BLM and/or the USFS has permitted. These data could be supplemented with population data (when available) to inform an understanding of the correlation between habitat and PACs within a population. This overall effectiveness evaluation must consider the lag effect response of populations to habitat changes (Garton et al. 2011).

*Calculating Question 1, National Planning Strategy Effectiveness:* The amount of sagebrush available in the large area of interest will use the information from Measure 1a (I.B.1., Sagebrush Availability) and calculate the change from the 2012 baseline to the end date of the reporting period. To calculate the change in the amount of sagebrush on the landscape to compare with the historical areas with potential to support sagebrush, the information from Measure 1b (I.B.1., Sagebrush Availability) will be used. To calculate the trend in the condition of sagebrush at the mid scale, three sources of data will be used: the BLM's Grass/Shrub mapping effort (Future Plans in Section I.B.1., Sagebrush Availability); the results from the calculation of the landscape

indicators, such as patch size (described below); and the BLM's Landscape Monitoring Framework (LMF) and sage-grouse intensification effort (also described below). The LMF and sage-grouse intensification effort data are collected in a statistical sampling framework that allows calculation of indicator values at multiple scales.

Beyond the importance of sagebrush availability to sage-grouse, the mix of sagebrush patches on the landscape at the broad and mid scale provides the life requisite of space for sage-grouse dispersal needs (see the HAF). The configuration of sagebrush habitat patches and the land cover or land use between the habitat patches at the broad and mid scales also defines suitability. There are three significant habitat indicators that influence habitat use, dispersal, and movement across populations: the size and number of habitat patches, the connectivity of habitat patches (linkage areas), and habitat fragmentation (scope of unsuitable and non-habitats between habitat patches). The most appropriate commercial software to measure patch dynamics, connectivity, and fragmentation at the broad and mid scales will be used, along with the same data layers derived for sagebrush availability.

The BLM initiated the LMF in 2011 in cooperation with the Natural Resources Conservation Service (NRCS). The objective of the LMF effort is to provide unbiased estimates of vegetation and soil condition and trend using a statistically balanced sample design across BLM lands. Recognizing that sage-grouse populations are more resilient where the sagebrush plant community has certain characteristics unique to a particular life stage of sage-grouse (Knick and Connelly 2011, Stiver et al. *in press*), a group of sage-grouse habitat and sagebrush plant community subject matter experts identified those vegetation indicators collected at LMF sampling points that inform sage-grouse habitat needs. The experts represented the Agricultural Research Service, BLM, NRCS, USFWS, WAFWA, state wildlife agencies, and academia. The common indicators identified include: species composition, foliar cover, height of the tallest sagebrush and herbaceous plant, intercanopy gap, percent of invasive species, sagebrush shape, and bare ground. To increase the precision of estimates of sagebrush conditions within the range of sage-grouse, additional plot locations in occupied sage-grouse habitat (Sage-Grouse Intensification) were added in 2013. The common indicators are also collected on sampling locations in the NRCS National Resources Inventory Rangeland Resource Assessment (<http://www.nrcs.usda.gov/wps/portal/nrcs/detail/national/technical/nra/nri/?&cid=stelprdb1041620>).

The sage-grouse intensification baseline data will be collected over a 5-year period, and an annual sage-grouse intensification report will be prepared describing the status of the indicators. Beginning in year 6, the annual status report will be accompanied with a trend report, which will be available on an annual basis thereafter, contingent on continuation of the current monitoring budget. This information, in combination with the Grass/Shrub mapping information, the mid-scale habitat suitability indicator measures, and the sagebrush availability information will be used to answer Question 1 of the National Planning Strategy Effectiveness Report.

*Calculating Question 2, National Planning Strategy Effectiveness:* Evaluations of the amount of habitat degradation and the intensity of the activities in the area of interest will use the information from Measure 2 (Section I.B.2., Habitat Degradation Monitoring) and Measure 3 (Section I.B.3., Energy and Mining Density). The field office will collect data on the amount of reclaimed energy-related degradation on plugged and abandoned and oil/gas well sites. The data are expected to demonstrate that the reclaimed sites have yet to meet the habitat restoration objectives for sage-grouse habitat. This information, in combination with the amount of habitat degradation, will be used to answer Question 2 of the National Planning Strategy Effectiveness Report.

*Calculating Question 3, National Planning Strategy Effectiveness:* The change in sage-grouse estimated populations will be calculated from data provided by the state wildlife agencies, when available. This population data (Section I.C., Population [Demographics] Monitoring) will be used to answer Question 3 of the National Planning Strategy Effectiveness Report.

*Calculating Question 4, National Planning Strategy Effectiveness:* The estimated contribution by the BLM or the USFS to the change in the amount of sagebrush in the area of interest will use the information from Measure 1a (Section I.B.1., Sagebrush Availability). This measure is derived from the national datasets that remove sagebrush (Table 3). To determine the relative contribution of BLM and USFS management, the current Surface Management Agency geospatial data layer will be used to differentiate the amount of change for each management agency for this measure in the geographic areas of interest. This information will be used to answer Question 4 of the National Planning Strategy Effectiveness Report.

*Calculating Question 5, National Planning Strategy Effectiveness:* The estimated contribution by the BLM or the USFS to the change in the amount of disturbance in the area of interest will use the information from Measure 2a (Section I.B.2., Monitoring Habitat Degradation) and Measure 3 (Section I.B.3., Energy and Mining Density). These measures are all derived from the national disturbance datasets that degrade habitat (Table 6). To determine the relative contribution of BLM and USFS management, the current Surface Management Agency geospatial data layer will be used to differentiate the amount of change for each management agency for these two measures in the geographic areas of interest. This information will be used to answer Question 5 of the National Planning Strategy Effectiveness Report.

Answers to the five questions for determining the effectiveness of the national planning strategy will identify areas that appear to be meeting the objectives of the strategy and will facilitate identification of population areas for more detailed analysis. Conceptually, if the broad-scale monitoring identifies increasing sagebrush availability and improving vegetation conditions, decreasing disturbance, and a stable or increasing population for the area of interest, there is evidence that the objectives of the national planning strategy to maintain populations and their habitats have been met. Conversely, where information indicates that sagebrush is decreasing and vegetation conditions are degrading, disturbance in sage-grouse areas is increasing, and/or

populations are declining relative to the baseline, there is evidence that the objectives of the national planning strategy are not being achieved. Such a determination would likely result in a more detailed analysis and could be the basis for implementing more restrictive adaptive management measures.

With respect to the land use plan area, the BLM and the USFS will summarize the vegetation, disturbance, and population data to determine if the LUP is meeting the plan objectives. Effectiveness information used for these evaluations includes BLM/USFS surface management areas and will help inform where finer-scale evaluations are needed, such as seasonal habitats, corridors, or linkage areas. Data will also include the trend of disturbance within the sage-grouse areas, which will inform the need to initiate adaptive management responses as described in the land use plan.

*Calculating Question 1, Land Use Plan Effectiveness:* The condition of vegetation and the allotments meeting land health standards (as articulated in “BLM Handbook 4180-1, Rangeland Health Standards”) in sage-grouse areas will be used to determine the LUP’s effectiveness in meeting the vegetation objectives for sage-grouse habitat set forth in the plan. The field office/ranger district will be responsible for collecting this data. In order for this data to be consistent and comparable, common indicators, consistent methods, and an unbiased sampling framework will be implemented following the principles in the BLM’s AIM strategy (Taylor et al. 2014; Toevs et al. 2011; MacKinnon et al. 2011), in the BLM’s Technical Reference “Interpreting Indicators of Rangeland Health” (Pellant et al. 2005), and in the HAF (Stiver et al. *in press*) or other approved WAFWA MZ-consistent guidance to measure and monitor sage-grouse habitats. This information will be used to answer Question 1 of the Land Use Plan Effectiveness Report.

*Calculating Question 2, Land Use Plan Effectiveness:* Sage-grouse areas within the LUP that are achieving land health stands (or, if trend data are available, that are making progress toward achieving them)—particularly the Special Status Species/wildlife habitat land health standard—will be used to determine the LUP’s effectiveness in achieving the habitat objectives set forth in the plan. Field offices will follow directions in “BLM Handbook 4180-1, Rangeland Health Standards,” to ascertain if sage-grouse areas are achieving or making progress toward achieving land health standards. One of the recommended criteria for evaluating this land health standard is the HAF indicators.

*Calculating Question 3, Land Use Plan Effectiveness:* The amount of habitat disturbance in sage-grouse areas identified in this LUP will be used to determine the LUP’s effectiveness in meeting the plan’s disturbance objectives. National datasets can be used to calculate the amount of disturbance, but field office data will likely increase the accuracy of this estimate. This information will be used to answer Question 3 of the Land Use Plan Effectiveness Report.

*Calculating Question 4, Land Use Plan Effectiveness:* The change in estimated sage-grouse populations will be calculated from data provided by the state wildlife agencies, when available, and will be used to determine LUP effectiveness. This population data (Section I.C., Population [Demographics] Monitoring) will be used to answer Question 4 of the Land Use Plan Effectiveness Report.

Results of the effectiveness monitoring process for the LUP will be used to inform the need for finer-scale investigations, initiate adaptive management actions as described in the land use plan, initiate causation determination, and/or determine if changes to management decisions are warranted. The measures used at the broad and mid scales will provide a suite of characteristics for evaluating the effectiveness of the adaptive management strategy.

## **II. FINE AND SITE SCALES**

Fine-scale (third-order) habitat selected by sage-grouse is described as the physical and geographic area within home ranges during breeding, summer, and winter periods. At this level, habitat suitability monitoring should address factors that affect sage-grouse use of, and movements between, seasonal use areas. The habitat monitoring at the fine and site scale (fourth order) should focus on indicators to describe seasonal home ranges for sage-grouse associated with a lek or lek group within a population or subpopulation area. Fine- and site-scale monitoring will inform LUP effectiveness monitoring (see Section I.D., Effectiveness Monitoring) and the hard and soft triggers identified in the LUP's adaptive management section.

Site-scale habitat selected by sage-grouse is described as the more detailed vegetation characteristics of seasonal habitats. Habitat suitability characteristics include canopy cover and height of sagebrush and the associated understory vegetation. They also include vegetation associated with riparian areas, wet meadows, and other mesic habitats adjacent to sagebrush that may support sage-grouse habitat needs during different stages in their annual cycle.

As described in the Conclusion (Section III), details and application of monitoring at the fine and site scales will be described in the implementation-level monitoring plan for the land use plan. The need for fine- and site-scale-specific habitat monitoring will vary by area, depending on proposed projects, existing conditions, habitat variability, threats, and land health. Examples of fine- and site-scale monitoring include: habitat vegetation monitoring to assess current habitat conditions; monitoring and evaluation of the success of projects targeting sage-grouse habitat enhancement and/or restoration; and habitat disturbance monitoring to provide localized disturbance measures to inform proposed project review and potential mitigation for project impacts. Monitoring plans should incorporate the principles outlined in the BLM's AIM strategy (Toevs et al. 2011) and in "AIM-Monitoring: A Component of the Assessment, Inventory, and Monitoring Strategy" (Taylor et al. 2014). Approved monitoring methods are:

- “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011);
- The BLM’s Technical Reference “Interpreting Indicators of Rangeland Health” (Pellant et al. 2005); and,
- “Sage-Grouse Habitat Assessment Framework: Multiscale Assessment Tool” (Stiver et al. *in press*).

Other state-specific disturbance tracking models include: the BLM’s Wyoming Density and Disturbance Calculation Tool (<http://ddct.wygisc.org/>) and the BLM’s White River Data Management System in development with the USGS. Population monitoring data (in cooperation with state wildlife agencies) should be included during evaluation of the effectiveness of actions taken at the fine and site scales.

Fine- and site-scale sage-grouse habitat suitability indicators for seasonal habitats are identified in the HAF. The HAF has incorporated the Connelly et al. (2000) sage-grouse guidelines as well as many of the core indicators in the AIM strategy (Toevs et al. 2011). There may be a need to develop adjustments to height and cover or other site suitability values described in the HAF; any such adjustments should be ecologically defensible. To foster consistency, however, adjustments to site suitability values at the local scale should be avoided unless there is strong, scientific justification for making those adjustments. That justification should be provided. WAFWA MZ adjustments must be supported by regional plant productivity and habitat data for the floristic province. If adjustments are made to the site-scale indicators, they must be made using data from the appropriate seasonal habitat designation (breeding/nesting, brood-rearing, winter) collected from sage-grouse studies found in the relevant area and peer-reviewed by the appropriate wildlife management agency(ies) and researchers.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in sage-grouse designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat (see Section I.D., Effectiveness Monitoring).

### III. CONCLUSION

This Greater Sage-Grouse Monitoring Framework was developed for all of the Final Environmental Impact Statements involved in the sage-grouse planning effort. As such, it describes the monitoring activities at the broad and mid scales and provides a guide for the BLM and the USFS to collaborate with partners/other agencies to develop the land use plan- specific monitoring plan.

### IV. THE GREATER SAGE-GROUSE DISTURBANCE AND MONITORING SUBTEAM MEMBERSHIP

Gordon Toevs (BLM -WO)	Robin Sell (BLM-CO)
Duane Dippon (BLM-WO)	Paul Makela (BLM-ID)
Frank Quamen (BLM-NOC)	Renee Chi (BLM-UT)
David Wood (BLM-NOC)	Sandra Brewer (BLM-NV)
Vicki Herren (BLM-NOC)	Glenn Frederick (BLM-OR)
Matt Bobo (BLM-NOC)	Robert Skorkowsky (USFS)
Michael “Sherm” Karl (BLM-NOC)	Dalinda Damm (USFS)
Emily Kachergis (BLM-NOC)	Rob Mickelsen (USFS)
Doug Havlina (BLM-NIFC)	Tim Love (USFS)
Mike Pellant (BLM-GBRI)	Pam Bode (USFS)
John Carlson (BLM-MT)	Lief Wiechman (USFWS)

**Attachment A. An Overview of Monitoring Commitments**

	Broad and Mid Scales					Fine and Site Scales
	Implementation	Sagebrush Availability	Habitat Degradation	Population	Effectiveness	
<b>How will the data be used?</b>	Track and document implementation of land use plan decisions and inform adaptive management	Track changes in land cover (sagebrush) and inform adaptive management	Track changes in disturbance (threats) to sage-grouse habitat and inform adaptive management	Track trends in sage-grouse populations (and/or leks; as determined by state wildlife agencies) and inform adaptive management	Characterize the relationship among disturbance, implementation actions, and sagebrush metrics and inform adaptive management	Measure seasonal habitat, connectivity at the fine scale, and habitat conditions at the site scale, calculate disturbance, and inform adaptive management
<b>Who is collecting the data?</b>	BLM FO and USFS Forest	NOC and NIFC	National datasets (NOC), BLM FOs, and USFS Forests as applicable	State wildlife agencies through WAFWA	Comes from other broad- and mid-scale monitoring types, analyzed by the NOC	BLM FO and SO, USFS Forests and RO (with partners)
<b>How often are the data collected, reported, and made available to USFWS?</b>	Collected and reported annually; summary report every 5 years	Updated and changes reported annually; summary report every 5 years	Collected and changes reported annually; summary report every 5 years	State data reported annually per WAFWA MOU; summary report every 5 years	Collected and reported every 5 years (coincident with LUP evaluations)	Collection and trend analysis ongoing, reported every 5 years or as needed to inform adaptive management
<b>What is the spatial scale?</b>	Summarized by LUP with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by MZ and LUP with flexibility for reporting by other units (e.g., PAC)	Variable (e.g., projects and seasonal habitats)
<b>What are the potential personnel and budget impacts?</b>	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment	At a minimum, current skills and capacity must be maintained; data management costs are TBD	At a minimum, current skills and capacity must be maintained; data layer purchase cost are TBD	No additional personnel or budget impacts for the BLM or the USFS	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment

<b>Who has primary and secondary responsibilities for reporting?</b>	1) BLM FO & SO; USFS Forest & RO 2) BLM & USFS Planning	1) NOC 2) WO	1) NOC 2) BLM SO, USFS RO, & appropriate programs	1) WAFWA & state wildlife agencies 2) BLM SO, USFS RO, NOC	1) Broad and mid scale at the NOC, LUP at BLM SO, USFS RO	1) BLM FO & USFS Forests 2) BLM SO & USFS RO
<b>What new processes/tools are needed?</b>	National implementation datasets and analysis tools	Updates to national land cover data	Data standards and rollup methods for these data	Standards in population monitoring (WAFWA)	Reporting methodologies	Data standards data storage; and reporting

FO (field office); NIFC (National Interagency Fire Center); NOC (National Operations Center); RO (regional office); SO (state office); TBD (to be determined); WO (Washington Office)

**Attachment B.** User and Producer Accuracies for Aggregated Ecological Systems within LANDFIRE Map Zones

<b>LANDFIRE Map Zone Name</b>	<b>User Accuracy</b>	<b>Producer Accuracy</b>	<b>% of Map Zone within Historical Schroeder</b>
Wyoming Basin	76.9%	90.9%	98.5%
Snake River Plain	68.8%	85.2%	98.4%
Missouri River Plateau	57.7%	100.0%	91.3%
Grand Coulee Basin of the Columbia Plateau	80.0%	80.0%	89.3%
Wyoming Highlands	75.3%	85.9%	88.1%
Western Great Basin	69.3%	75.4%	72.9%
Blue Mountain Region of the Columbia Plateau	85.7%	88.7%	72.7%
Eastern Great Basin	62.7%	80.0%	62.8%
Northwestern Great Plains	76.5%	92.9%	46.3%
Northern Rocky Mountains	72.5%	89.2%	42.5%
Utah High Plateaus	81.8%	78.3%	41.5%
Colorado Plateau	65.3%	76.2%	28.8%
Middle Rocky Mountains	78.6%	73.3%	26.4%
Cascade Mountain Range	57.1%	88.9%	17.3%
Sierra Nevada Mountain Range	0.0%	0.0%	12.3%
Northwestern Rocky Mountains	66.7%	60.0%	7.3%
Southern Rocky Mountains	58.6%	56.7%	7.0%
Northern Cascades	75.0%	75.0%	2.6%
Mogollon Rim	66.7%	100.0%	1.7%
Death Valley Basin	0.0%	0.0%	1.2%

There are two anomalous map zones with 0% user and producer accuracies, attributable to no available reference data for the ecological systems of interest.

**User accuracy** is a map-based accuracy that is computed by looking at the reference data for a class and determining the percentage of correct predictions for these samples. For example, if I select any sagebrush pixel on the classified map, what is the probability that I'll be standing in a sagebrush stand when I visit that pixel location in the field? **Commission Error** equates to including a pixel in a class when it should have been excluded (i.e., commission error =  $1 - \text{user's accuracy}$ ).

**Producer accuracy** is a reference-based accuracy that is computed by looking at the predictions produced for a class and determining the percentage of correct predictions. In other words, if I know that a particular area is sagebrush (I've been out on the ground to check), what is the probability that the digital map will correctly identify that pixel as sagebrush? **Omission Error** equates to excluding a pixel that should have been included in the class (i.e., omission error =  $1 - \text{producer's accuracy}$ ).

**Attachment C.** Sagebrush Species and Subspecies Included in the Selection Criteria for Building the EVT and BpS Layers

## Appendix F – Idaho Key Habitat Map Update Process and Provisions for Addressing GRSG documented in New Areas Outside Priority, Important and General Habitat Management Areas

### Modifications to Priority, Important and General Habitat Management Areas:

The BLM and FS have worked closely with the State of Idaho and USFWS in using the best available science to delineate GRSG occupancy in Idaho to the extent possible, as reflected in the boundaries of the Priority, Important and General Habitat Management Areas (PHMA, IHMA, GHMA) identified in this Plan. These management areas will be reviewed and updated approximately every 5 years. Prior to a specific 5-year update, however, it is possible that due to progress toward conservation and habitat restoration, vegetation succession or new information arising from scientific studies or targeted surveys, additional areas of occupied GRSG habitat may be identified, occurring outside the three management areas. Such new areas of occupancy must be based on sound science (e.g., telemetry, formal habitat assessments documenting GRSG usage etc.) and represent an occupied seasonal habitat. They must not be based solely on random or occasional observations of GRSG. In these areas GRSG habitat on BLM and/or FS lands will be managed in accordance with Required Design Features, seasonal restrictions and/or BMPs deemed appropriate by BLM or FS for that area. During the 5-year map update, formal designation of these new areas as PHMA, IHMA or GHMA will be considered by BLM/FS in coordination with the State of Idaho and USFWS along with other recommendations for modification to existing PHMA, IHMA or GHMA areas.

### Modifications to the Key Habitat Map:

The Idaho GRSG Key habitat map displays several broad vegetation classes relevant to GRSG conservation and habitat restoration, that underlie and help inform the Priority, Important and General Habitat Management Areas. These vegetation classes include Key habitat, perennial grasslands, annual grasslands and conifer encroachment areas, and have been utilized in GRSG conservation in Idaho since 2000.

As directed in IM ID-2013-010, Idaho BLM annually updates the Key Habitat map. The purpose of this Instruction Memorandum (IM) is to request updates to the Idaho Sage-grouse Habitat Planning Map. The update is needed to reflect habitat changes resulting from wildfire, succession, and vegetation treatments that occurred or were observed since the last update. This update is also intended to capture additional edits recommended by the field offices, sage-grouse Local Working Groups (LWG), or agency partners in sage-grouse conservation.

**Factors to Consider During Edits:** The following factors are applicable to land of any ownership status for which the Bureau of Land Management (BLM) data are available, or for which data or other information are provided by non-BLM partners. If such new data are unavailable, or not provided by partners, retain the existing spatial data in the dataset:

1. Wildfires that have occurred in the most recent calendar year fire season on land administered by the BLM and on land not administered by the BLM.
2. Vegetation management projects that have been completed within key habitat or potential restoration areas of sage-grouse planning areas. This includes activities

such as burned area rehabilitation seeding projects, sagebrush thinning/reduction, conifer thinning/reduction, restoration of annual grasslands, new fuel breaks, etc. However, only consider those treatment areas completed and where a change in habitat classification has occurred (e.g., from annual grassland to perennial grassland; perennial grassland to key habitat, etc.). Areas planned for treatment or in the process of treatment (e.g., cheatgrass chemical treatment is completed, but seeding is pending) should not be included until an observed change in habitat category is achieved.

3. Changes in habitat status resulting from vegetation succession, such as perennial grasslands that have transitioned to key habitat due to increased sagebrush cover.
4. Habitat mapping errors or omissions that have been identified in the existing Idaho Sage-grouse Habitat Planning Map and other edits recommended by sage-grouse conservation partners, as appropriate. For this item, it is crucial that BLM field office biologists or an alternate staff specialist coordinate closely with their agency partners, especially the UFSFS and the Idaho Department of Fish and Game (IDFG), to actively solicit and resolve additional suggested edits that we may not be aware of. Those edits must also be incorporated into the respective BLM office's update submission. This is vital to ensure that the update is completed efficiently and as collaboratively as possible.
5. Since the Idaho Sage-grouse Habitat Planning Map is intended for use by all conservation partners in Idaho, it is important that we maintain a seamless coverage across land ownerships. In that regard, when editing, do not clip out BLM (or non-BLM land) on the basis of land ownership. Rather, make edits based on vegetation boundaries only, using the best available information and professional judgment. If you have uncertainties about accuracies for certain areas, document that in the metadata as appropriate.
6. Based on discussions during map updates in recent years, we will again use a 10.0 acre minimum polygon size for wildfires since data are readily available to that scale. For vegetation treatments, we will also use a minimum area of 10 acres. For sagebrush or other vegetation patches (e.g., key habitat, perennial grassland, annual grassland, conifer encroachment), delineate habitat to the extent you have data, recognizing that some offices may have more recent, finer resolution data than others.
7. Areas that have recently burned, for which the field has little or no information as to habitat status, should be classified as "recent burn." Efforts to document the general habitat status in these areas should be made the following field season if possible, in preparation for the next map update. The field may also attribute 2013 fires as perennial grassland or annual grassland, as appropriate.

8. Sage-grouse habitat polygon descriptions relevant to this IM include key habitat, perennial grassland, annual grassland, and conifer encroachment potential restoration areas.
  - o Key habitat includes areas of generally intact sagebrush that provide sage-grouse habitat during some portion of the year.
  - o Perennial grassland can be reclassified as key habitat once average sagebrush canopy cover is at least 10 percent.
  - o Annual grassland areas may be reclassified as perennial grassland once a restoration, fuels treatment or related project, such as an Emergency Stabilization and Rehabilitation (ES&R) seeding, is considered successful (i.e., seeded perennial species have successfully established).
  - o Conifer encroachment areas may be reclassified as key habitat following treatment of conifers if sagebrush cover is at least 10 percent and there is a perennial understory. They can also be reclassified as perennial grasslands if native perennial herbaceous species are dominant or if an associated restoration seeding is successful.
9. Field offices must ensure that original project-level data utilized in this update, including Global Positioning System data files, spatial, tabular and metadata associated with specific vegetation treatments, restoration projects, ES&R projects, etc., are archived at the field level and readily accessible in the event of future data calls.

## Appendix G – Anthropogenic Disturbance and Adaptive Management

### Part I – Baseline Map and Description of Development

The **biologically significant units (BSUs)** are geographical/spatial areas within Greater Sage-grouse habitat that contains relevant and important habitats which is used as the basis for comparative calculations to support evaluation of changes to habitat. The BSUs include all land ownerships for evaluation, although application of the anthropogenic disturbance cap is specific only to BLM and Forest Service lands. The BSUs are used in the evaluation of anthropogenic disturbance and in the adaptive management habitat trigger.

For the Idaho and Southwestern Montana Greater Sage-Grouse Plan Amendment EIS the biologically significant units are defined as:

*Idaho: All of the modeled nesting<sup>1</sup> and delineated winter habitat, which is based on 2011 data, occurring within Priority and/or Important Habitat Management Areas within individual Conservation Areas<sup>2</sup>*

*Montana: All of the Priority Habitat Management Area*

These BSUs form the geographic basis for the calculation of anthropogenic disturbance and in the soft and hard adaptive management habitat triggers.

While the BSUs define the geographic extent and scale of the Subregion's landscape that will be considered in evaluating anthropogenic disturbance and the adaptive management habitat triggers, how disturbance and habitat triggers are calculated differ since anthropogenic disturbance and habitat loss affect Greater Sage-grouse differently (Knick et al. 2013).

The BSU is the total area (acreage) of nesting and wintering habitat within Priority or Important Habitat Management Areas, separately, by each Conservation Area. For Idaho this results in 8 BSUs, 2 each within the Idaho Conservation Areas – 1 in Priority Habitat Management Areas and 1 in Important Habitat Management Areas. There is 1 BSU in southwest Montana and 1 BSU for the Utah portion of the Sawtooth National Forest (Raft River BSU). There are a total of 10 BSUs within the Idaho and Southwestern Montana Subregion as shown in Map-G-1.

In developing these BSUs it was determined at the subregional level that data from these units must be compatible with aggregation to the PAC and WAFWA Management Zone levels, in order to meet FWS needs. In addition, BSUs must be edge matched/aligned with neighboring states. All sub-regions acknowledge there may be locally important biologically significant units smaller than PACs which may or may not be rolled up to PAC level. The Subregions also acknowledge that assessing disturbance at larger scales such as certain PACs, or via rollup of data, provides a baseline metric for future comparison, but dilution may likely mask disturbance concerns occurring at more local scales.

<sup>1</sup> Modeled nesting habitat is defined as those areas of Priority or Important Habitat Management Areas within 6.2 miles of 2011 active leks.

<sup>2</sup> The Utah portion of the Sawtooth National Forest is calculated separately for the Southern Conservation area.

The application of these calculations requires certain assumptions and associated baseline values which set an appropriate benchmark for future comparison.

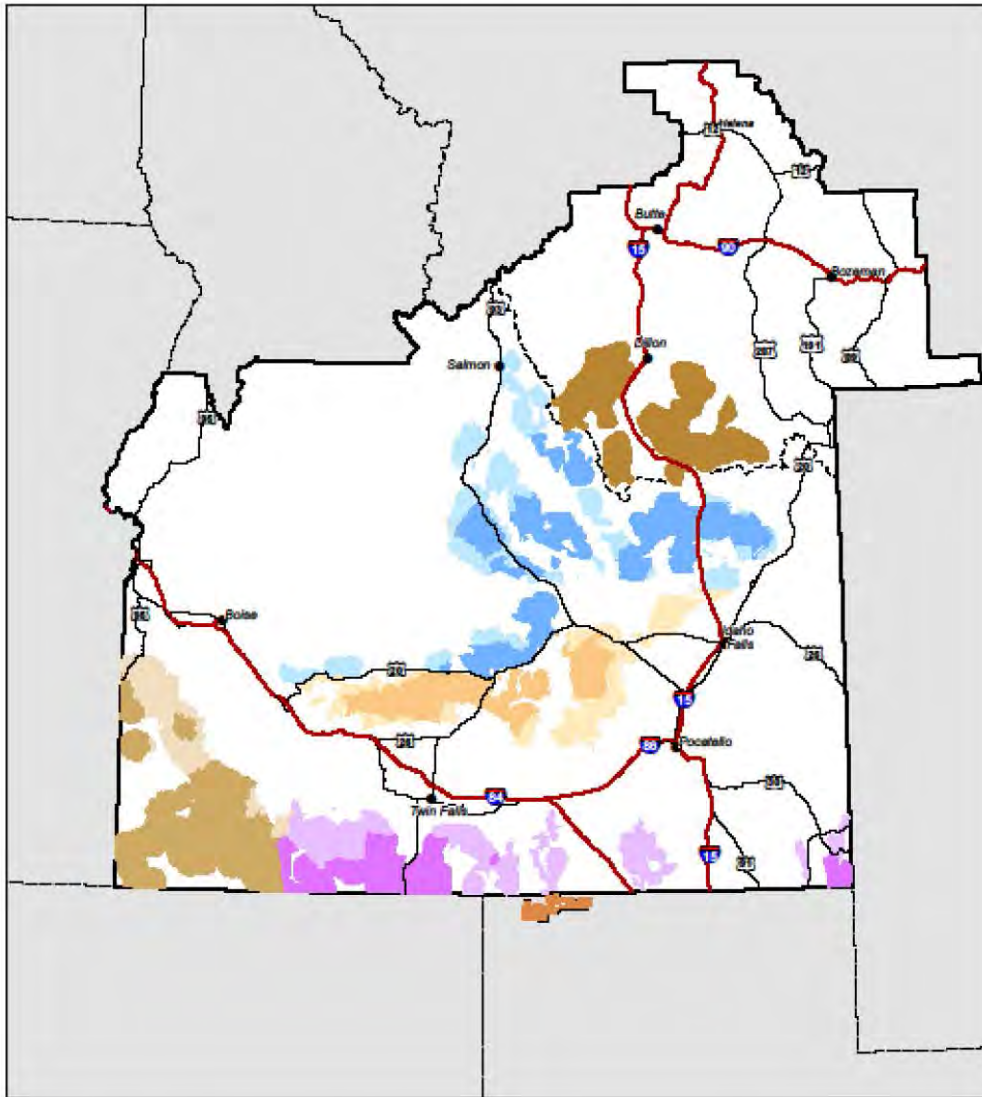

For the adaptive management evaluation in Idaho the baseline year for comparison of both the population and habitat values is set at 2011. Sage-grouse have been monitored by counting males on leks since the 1950's (IDFG files). Average male lek attendance (statewide average) reached a low point in 1996 (IDFG in file). A more consistent and intensified survey of leks began with the annual monitoring of all 78 lek routes across southern Idaho in 1996. Average male lek attendance has fluctuated since 1996 (Figure G-1) in response to favorable or unfavorable conditions (e.g. weather, habitat improvements or loss, and West Nile virus). Peaks were in 2000, 2006, and 2011 with low points in 2002 and 2009. The increase in male lek attendance after previous declines indicates that sage-grouse populations can rebound over a relatively short time frame (e.g. 5 years) given desirable conditions. The baseline was set at the 2011 average number of males because this level is approximately the medium (8 higher and 7 lower years) of the counts between 1996-2011. At the statewide scale, the 2011 baseline allows 10% and 20% population triggers to be above the second lowest point in 2009. Application of the trigger at a smaller (Conservation Area) scale is a more conservative approach that will indicate potential trends sooner than if applied at the state-wide scale.

Figure G-1. Idaho Trend in Male Sage-grouse Lek Attendance.

Map-G-1

**Biologically Significant Unit**

- |  |   |

| Idaho Southern Conservation Area - Core              | Analysis Boundary                               |
| Idaho Southern Conservation Area - Important         |   |

## Part II – Anthropogenic Disturbance Calculation

The specific formula for the percent of anthropogenic disturbance is defined by:

### *Disturbance Percentage*

$$= \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100$$

The BSU in the denominator represents the total area (acreage) of the applicable area of analysis. Each BSU is tracked and evaluated separately within each of the 10 BSUs, and reaching the 3% disturbance cap in any one BSU has specific management implications both within and beyond that specific BSU as described in the Proposed Plan.

All sub-regions within the Great Basin Region will use the same types of disturbances for fine/site scale monitoring as were used for broad and mid-scale analysis and would use local data and/or more current satellite imagery if available.

Anthropogenic Disturbance included in the numerator is shown in Table G-1.

Table G-1. Anthropogenic Disturbances and Areas of Impact

Datasets as Described in the Monitoring Framework <sup>3</sup>	Source	Spatial Extent
Oil and Gas Wells and Development Facilities	HIS; BLM (AFMSS)	5.0 ac
Coal Mines	BLM; USFS; Office of Surface Mining Reclamation and Enforcement; USGS Mineral Resource Data System	Polygon Area
Wind Towers	Federal Aviation Administration	3.0 ac
Solar Fields	Platts (power plants)	7.3 ac
Geothermal Development Facilities	IHS	3.0 ac or Polygon Area
Mining (Active Locatable, Leasable and Saleable Developments)	InfoMine	5.0 ac or Polygon Area
Roads <sup>4</sup>	ESRI StreetMap Premium	40.7 ft. (surface streets) 84.0 ft. (major roads) 240.2 ft. (Interstate Hwys.)
Railroads <sup>5</sup>	Federal Railroad Administration	30.8 ft.
Powerlines <sup>6</sup>	Platts	100 ft. (1-199kV)

<sup>3</sup> Taken from Table 6 – GRSG Monitoring Framework.

<sup>4</sup> Values described for line features – roads; railroads; powerlines – represent associated widths centered on the line feature.

<sup>6</sup> See previous note.

Datasets as Described in the Monitoring Framework <sup>3</sup>	Source	Spatial Extent
		150 ft. (200-399kV) 200 ft. (400-699kV) 250 ft. (700+kV)
Communication Towers	Federal Communications Commission	2.5 ac
Other Vertical Structures	Federal Aviation Administration	2.5 ac
Additional Local Datasets (need definitions)		
Underground Pipelines		
Coal Bed Methane Ponds		
Meteorological Towers	BLM; Federal Communications Commission	2.5 ac
Nuclear Energy Facilities	As Available	Polygon Area
Airports	Federal Aviation Administration	Polygon Area
Military Ranges (ground based?)		
Hydropower plants		
Recreation Areas (Developed)	BLM data	Polygon Area

The following data sets would *not* be used to calculate anthropogenic disturbance, but would be used in the habitat baseline to estimate habitat availability or the amount of sagebrush on the landscape within biologically significant units.

1. Habitat treatments
2. Wildfire
3. Invasive plants
4. Conifer encroachment
5. Agriculture
6. Urbanization, Ex-urban and rural development

### ***Travel and Transportation Disturbance in Sage-Grouse Habitat***

The following would count as disturbance (see Part V for definitions):

Linear transportation features identified as roads that have a maintenance intensity of 3 or 5

Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a functional classification and a maintenance intensity of level 3 or 5

### **Non-Disturbance**

The following items would not count as disturbance:

Linear transportation features identified as trails.

Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a maintenance intensity of either level 0 or 1.

Linear transportation features identified as primitive routes.

Linear disturbances.

### *Derivation of the Disturbance Formula -*

There is no definitive and scientifically proven formula to determine impact to GRSG from disturbance described in current research. However, Knick et al. (2013) did describe certain relationships between GRSG and anthropogenic disturbance that have been used, in conjunction with specific assumptions to describe a mathematical relationship between human disturbance footprint, effective GRSG habitat and effects to GRSG.

The variables in the equation are defined as:

- Acres of a Biologically Significant Unit (BSU)
- Acres of Anthropogenic Development within the BSU
- Acres of Effective GRSG Habitat (sagebrush) within the BSU

Knick et al. (2013) defined their unit of comparison (analogous to a biologically significant unit) as an area within 5 km of the lek. Within this area they also found that 79% of this area contained sagebrush (analogous to effective GRSG habitat). Results of the study show that “Ninety-nine percent of active leks were in landscapes with <3% developed”. This shows that when areas within 5 km of a lek containing 79% sagebrush were 3% developed there was a measurable effect on the presence of GRSG – this defines a disturbance threshold of 3% at which point GRSG are affected. Knick et al. developed a habitat similarity relationship between the proportion of leks and percent of sagebrush which shows the highest proportion of leks when sagebrush percentage is between 70-90% (Knick et al. 2013, Figure 5, Connelly et al. 2000, Wisdom ???). Above 90% and below 70% the proportion of leks is reduced. This helps define the optimum range for sagebrush at between 70-90% and also indicates that the disturbance threshold of 3% is also dependent upon and varies with the percent of sagebrush present (effective habitat).

These findings from Knick et al. (2013) help define some mathematical parameters to define a modeled relationship between disturbance, effective habitat and effects to GRSG. Figure G-2 illustrates three different ‘disturbance curves’ that reflect the relationship between disturbance (y-axis) and effective habitat (sagebrush percentage) (x-axis) when the footprint disturbed is equivalent to 3% of the area. The red boxes (A) represent the conceptual relationship between disturbance and effective habitat as described and interpreted from Knick et al. (2013). The blue diamonds (B) represent a simple calculation based only on disturbance footprint, without regard to effective habitat. The green triangles (C) represent the derived formula to model the relationship.

The ‘A’ disturbance curve shows that when the disturbance footprint is 3% of the area and the sagebrush percentage is between 70-90% the disturbance calculation would be 3. When sagebrush percent falls below 70% or rises above 90%, the change in habitat, even without a change in disturbed footprint would begin to affect the presence of GRSG. As the amount of sagebrush declines while disturbance remains the same there would be an increasing effect to GRSG presence. This disturbance curve is conceptual and Knick et al. (2013) does not explicitly define this relationship, although this relationship does reflect numerical the observations described in Knick et al. (2013).

The 'B' disturbance curve is a straight calculation based only on disturbed footprint over a specified area. It does not account for variability of sagebrush percentage, and the only variable is the acres of disturbance. For an area that is 3% disturbed the relationship 'curve' is a flat line at 3, regardless of sagebrush percentage. This 'curve' or calculation would match the conceptual curve when sagebrush percentage is between 70 and 90%. This calculation would not account for changes in effective habitat due to loss through fire or gain through restoration and rehabilitation.

The 'C' disturbance curve models and approximates the conceptual relationship described in Knick et al. (2013). It accounts for changes in effective habitat that would translate into variable effects to GRSG based on loss or gain of habitat. It includes the ability to consider habitat loss such as from fire and to consider habitat gain such as from rehabilitation efforts including conifer removal. The model matched the conceptual relationship in the range of 70% sagebrush and approximates the conceptual relationship in areas with more or less sagebrush cover. The conceptual relationship assumes a more exponential relationship to GRSG effects from loss of habitat, while the derived formula assumes a more linear relationship. There are no available scientific studies that more clearly define the nature of the relationship. The derived formula and the conceptual relationship are substantially similar from 35-90% sagebrush percentage to validate the derived formula's relative approximation of the relationship.

Figure G-2. Disturbance Relationships

#### *Development of the Modeled Formula:*

In order to manage and apply a defined disturbance cap it is necessary to take the findings of the appropriate scientific research and utilize them as appropriately as possible to develop management strategies and evaluation techniques consistent with the management objective. Most scientific research is not completed with the intent to develop specific management objectives or approaches; however, it is through the management approaches that the scientific findings utilized to inform management.

Development of the modeled formula began by describing the simplest relationship of disturbance across a defined area by defining the disturbance percentage as:

$$\% \text{ Disturbance} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}}{\text{Acres within Area of Concern}} \right) * 100$$

This accounts for disturbance, but does not account for changes in effective habitat or sagebrush percentage as described in Knick et al. (2013). To account for effective habitat the formula needs to include a term that adjusts the resulting calculation with regard to effective habitat. This should be reflected as an adjustment to the denominator (acres within area of concern). The denominator would be weighted based on the amount of effective habitat. In mathematical terms this would give a denominator of:

$$(\text{Acres within Area of Concern}) * (\text{Adjustment Based on Effective Habitat})$$

The adjustment term must equal 1.0 when the effective habitat is somewhere between 70-90% as described in Knick et al. (2013). Assuming the adjustment term is related to the relative percentage of sagebrush or effective habitat then the *Adjustment Based on Effective Habitat* could be expressed as:

$$\frac{\text{Acres of Effective Habitat within the Area of Concern}}{\text{Acres within the Area of Concern}}$$

However, this term does not equal 1.0 when effective habitat is less than 100%. In order to meet the requirement of equaling 1.0 a constant must be added. This constant, when added to the percentage calculated in the previous term must equal 1.0 when the *Acres of Effective Habitat within the Area of Concern* is somewhere between 70-90%. In the Idaho and Southwestern Montana Subregional Plan an objective of 70% effective habitat has been defined, which is consistent with Knick et al. (2013). If the objective is 70% then the constant that must be added to this term is 0.3 in order to meet the requirement of equaling 1.0 at 70% effective habitat. This defines the following derived formula that approximates the conceptual relationship described in Knick et al. (2013).

*Disturbance Percentage*

$$= \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance within Area of Concern}}{\text{Acres within the Area of Concern} * \left( \frac{\text{Acres of Effective Habitat within the Area of Concern}}{\text{Acres within the Area of Concern}} + 0.3 \right)} \right) * 100$$

**Scale:**

The particular scale for which this formula is calculated is defined by the Area of Concern. The Knick et al. (2013) used a study area defined by the area within 5 km of an individual lek. The disturbance relationships described previously are applicable at this scale and begin to break down or lose their integrity at greater distances from the lek (18 km). This concern, coupled with limited availability of consistent data across broader areas undermines the reliability and accuracy of the calculation when including areas more distant from the lek.

From a management perspective there is a need to address concerns at the broader scale to help manage those threats before they become a concern at the site specific scale. In Idaho, nesting location data collected by Idaho Department of Fish and Game (IDFG), shows that most nesting habitat occurs

within 6.2 miles (10 km) of the lek. IDFG has also collected telemetry data on GRSG movements and used this data to help define wintering areas. Nesting and wintering areas are the most limited and seasonal habitats in Idaho and additional disturbance in those areas could have impacts to GRSG presence. For these reasons the Area of Concern, referred to as the Biologically Significant Unit have been delineated to include nesting and wintering habitats. This results in areas that include more acres than just those associated within a 5 km area of an individual lek as described by Knick et al. (2013), but that are associated (within 6.2 miles or 10 km) with leks. While the Knick et al. (2013) study did not include winter habitat, because of their relative importance they have also been included as part of the BSU since conceivably disturbances that would cause lek abandonment would also likely cause abandonment or avoidance of other seasonal habitat areas. Using other administratively defined areas not delineated or based on specific GRSG use may undermine the utility and integrity of the disturbance relationship and calculation.

This approach, built upon the findings in Knick et al. (2013), uses those findings to help inform management at a broader scale that would help determine management actions based on disturbance evaluations. Using the BSU as the Area of Concern is a scale larger than described in Knick et al. (2013), but still within the predictive bounds described in that study. The formula can be used to calculate disturbance at the BSU scale to help inform a disturbance cap, and it can also be used at the site or project scale to help inform specific project activities.

### Example 1 – Anthropogenic Disturbance

In the Southern Conservation Area the Priority BSU was delineated to include 784,958 acres and the Important BSU was delineated to include 1,036,455 acres, which represent the acres of the Biologically Significant Unit to be used in the denominator. The acres of Effective Habitat in the Priority BSU are 424,656 and in the Important BSU are 447,497. This sets up two equations – one for Priority Habitat Management Areas and one for Important Habitat Management Areas.

The existing footprint acres of disturbance within the Priority BSU are 17,661 acres and the footprint acres of disturbance within the Important BSU are 12,748 acres.

This gives the following two equations to define the baseline disturbance condition in the BSUs:

$$Priority = \frac{17661}{(784958 * (\frac{424656}{784958}) + 0.3)} * 100$$

$$Or \left( \frac{17661}{784958 * (0.54) + 0.3} \right) * 100$$

$$Or \left( \frac{17661}{784958 * (0.84)} \right) * 100$$

Yielding a percent disturbance in the Priority BSU of 2.68%

$$Important = \frac{12748}{(1036455 * (\frac{447497}{1036455}) + 0.3)} * 100$$

Yielding the percent disturbance in the Important BSU of 1.68%

If by 2015 we project additional development within the Priority BSU to be 2120 acres (a 12% increase) and development within the Important BSU to be 4000 acres (a 30% increase) then the Priority footprint acres becomes 20,161 acres and the Important footprint acres becomes 16,748 acres. The resulting evaluation for this cumulative disturbance is calculated by:

$$Priority = \frac{19781}{(784958 * (\frac{424656}{784958}) + 0.3)} * 100 \quad Important = \frac{16748}{(1036455 * (\frac{447497}{1036455}) + 0.3)} * 100$$

Yielding the percent disturbance as: Priority = 3.00% and Important = 2.21%

In the examples, given the existing disturbance footprint it would require development of an additional 2,120 acres in the Priority BSU and an additional 10,005 acres in the Important BSU before the 3% cap would be engaged.

### Part III - Adaptive Management

#### Adaptive Management Habitat Trigger-

The specific formula for the change in habitat for the habitat trigger is defined by:

Within Idaho and Utah all factors are measured within the modeled nesting and wintering habitat within Priority or Important Habitat Management Areas (calculated separately) by Conservation Area; in Southwest Montana all factors are measured within the Priority Habitat Management Area.

In simple description the adaptive management habitat trigger calculation is the percentage of Effective Habitat (defined as areas of generally intact sagebrush that provide Greater sage-grouse habitat during some portion of the year) within modeled nesting and wintering areas within Priority or Important Habitat Management Areas by Conservation Area within a particular year when compared to the Effective Habitat within modeled nesting and wintering areas within Priority or Important Habitat Management Areas by Conservation Area as of the 2011 baseline. Using Effective Habitat as the metric of comparison removes non-habitat acres from the calculation. The calculation is evaluated within both Priority and Important Habitat Management Areas separately within each of the 10 BSUs.

For purposes of evaluating the adaptive management habitat triggers, Effective Habitat in Idaho is tracked using the Key Habitat Map which is updated annually by BLM in coordination with IDFG, Forest Service, US FWS and Local Working Groups and tracks the areas of generally intact sagebrush providing Greater sage-grouse habitat during some portion of the year. Effective habitat equates to areas described as Key Habitat on the Key Habitat Map. Appendix F contains a description of the Key Habitat Map maintenance and update process including the inclusion of disturbances from fire and temporary disturbances and habitat restoration/rehabilitation. **For Montana and Utah Effective Habitat is based on...**

Factors: EHP(Y) – where Y is the year and EHC is the acres of Effective Habitat for that year within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

EHI(Y) - where Y is the year and EHI is the acres of Effective Habitat for that year within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

ADP(Y) – where Y is the year and AD is the acres of anthropogenic disturbance within Effective Habitat for that year within the 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

ADI(Y) – where Y is the year and AD is the acres of anthropogenic disturbance within Effective Habitat for that year (Y) within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

EHP(2011) – the Effective Habitat within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

EHI(2011) - the Effective Habitat within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

ADP(2011) – the acres of anthropogenic disturbance within Effective Habitat within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

ADI(2011) – the acres of anthropogenic disturbance within Effective Habitat within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

Formulas:

$$\text{Priority Habitat Management Area} = 100 - \left( \frac{EHP(Y) - ADP(Y)}{EHP(2011) - ADP(2011)} \right) * 100$$

$$\text{Important Habitat Management Area} = 100 - \left( \frac{EHI(Y) - ADI(Y)}{EHI(2011) - ADI(2011)} \right) * 100$$

When this calculation equals or exceeds 10 then an adaptive trigger has been engaged as per AM-7 & AM-8.

Tables 2-7 describe the acreages associated with the BSUs by Conservation Area for the Idaho and Southwestern Montana Subregion. The tables contain values for the entire BSU (Priority and Important), including all ownerships, acres of effective habitat within the BSUs and acres of anthropogenic disturbance within the BSUs.

These values will be used to provide several examples applying the anthropogenic disturbance and adaptive management habitat trigger evaluations. These are for illustrative purposes and do not represent an actual evaluation of ground conditions.

### **Example 2 – Adaptive Management – Habitat**

In the Southern Conservation Area the Priority BSU was delineated to include 784,958 acres, of which 424,656 acres were Effective habitat; therefore EHP(2011) is equal to 424,656 acres. Development within the Effective Habitat in 2011 was measured at 10,074 acres; therefore ADP(2011) is equal to 10,074 acres.

If in 2015 we project a cumulative loss of 42,000 Effective habitat acres due to wildfire (10% loss) and an additional 1000 acres of anthropogenic development (10% increase), then

EHP(2015) is equal to 424,656 – 42,000 or 382,656 and ADP(2015) is equal to 10,074+1000 or 11,074. The evaluation for the adaptive management trigger is calculated by:

$$100 - \left( \frac{382656 - 11074}{424656 - 10074} \right) * 100$$

This simplifies to:  $100 - \left( \frac{371582}{414582} \right) * 100$

Or  $100 - (0.896 * 100)$

Or  $100 - 89.6$

Or  $10.4 - \text{equivalent to } 10.4\%$

This evaluation shows a loss of greater than 10 percent and less than 20 percent which would engage the soft habitat trigger as described in AM-8 and not the hard habitat trigger described in AM-7.

### Soft Trigger Considerations and Implementation Actions

The Sage-Grouse Implementation Task Force, in coordination with BLM and Forest Service would utilize monitoring information to assess when triggers have been tripped. When information indicates that the soft habitat or population trigger may have been tripped, a Sage-Grouse Implementation Task Force, in coordination with BLM and Forest Service - aided by the technical expertise of IDF&G - would assess the factor(s) leading to the decline and identify potential management actions. The Sage-Grouse Implementation Task Force may consider and recommend to BLM possible changes in management to the PHMA. As to the IHMA, the Sage-Grouse Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state's ability to meet the overall management objective. It is anticipated IDF&G will collect data annually and will make recommendations to the Implementation Team by August 31st for population triggers and January 15th for habitat triggers.

Only where the monitoring information indicates the cause(s) of the decline is not a primary threat will the Sage-Grouse Implementation Task Force analyze the secondary threats to the species and determine whether further management actions are needed.

### Potential Implementation Level Actions to Consider in the Event Soft Trigger Criteria are Met

- ✓ Increase monitoring and evaluation of sage-grouse populations in Priority Habitat Management Area (area of concern).
- ✓ Implement Priority Habitat Management Area management strategy in corresponding Important Habitat Management Area of the same Conservation Area.
- ✓ Implement Priority Habitat Management Area RDFs in corresponding Important Habitat Management Area of the same Conservation Area.

- ✓ Not allow any new (large) infrastructure development within the Priority Habitat Management Area (no exceptions allowed).
- ✓ Reallocate resources to focus on primary threats in the Priority Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Priority Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Apply Priority Habitat Management Area criteria for all primary threats, and/or all secondary threats to the Important Habitat Management Area.
- ✓ Reallocate resources to focus on primary threats in the Important Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Important Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).

**If Livestock Grazing is determined to be a Causal Factor Consider the Following Measures:**

1. Employ grazing management systems that ensure adequate nesting and early brood rearing habitat within the breeding landscape.
2. When use-pattern mapping or monitoring demonstrates an opportunity to adjust livestock distribution to benefit occupied sage-grouse breeding habitat, include as appropriate herding, salting, and water-source management (e.g., turning troughs/pipelines on/off, extending pipelines/moving troughs) in grazing programs.
3. If available and feasible, utilize exotic perennial grass seedings and/or annual grasslands to avoid breeding season of use of occupied sage-grouse habitat.
4. Modify authorized seasons of use within grazing permits to provide greater flexibility in managing livestock for the benefit of sage-grouse.
5. Where appropriate, maintain residual herbaceous vegetation at the end of the growing/grazing season to contribute to nesting and brood-rearing habitat during the coming nesting season. Table 5.
6. Insure that permittees are informed of management and movement requirements related to avoidance of recent burns, rehabilitation seedings or other restoration sites.
7. Manage grazing of riparian areas, meadows, springs, and seeps in a manner that promotes vegetative structure and composition appropriate to the site. In some cases enclosure fencing may be a viable option. However, recognize the availability and quality of desired herbaceous species may be improved by periodic grazing use of the enclosure.
8. Implement management actions (grazing decisions, allotment management plan/conservation plan development, or other agreements) to modify grazing management to meet seasonal sage-grouse habitat requirements. Employ proper grazing management by providing flexibility in scheduling the intensity, timing, duration and frequency of grazing use over time that best promotes management objectives. During drought periods, prioritize evaluating effects of drought in the CMA relative to grouse needs for food and cover. Ensure that post-drought management allows for vegetation recovery that meets sage-grouse needs in priority sage-grouse habitat areas.
9. When using salt or mineral supplements: a) place them in existing disturbed sites, areas with reduced sagebrush cover—e.g., seedings or cheatgrass sites—to reduce impacts to sage-grouse breeding habitat, b) where feasible use salts or mineral supplements to improve management of livestock for the benefit of sage-grouse habitat.

10. In general, avoid constructing new fences within 2 km of occupied leks. Where feasible, place new, taller structures, such as corrals, loading facilities, water-storage tanks, windmills, etc., at least 2 km from occupied leks to reduce opportunities for perching raptors. Careful consideration, based on local conditions, should also be given to the placement of new fences or structures near other important seasonal habitats (winter-use areas, movement corridors etc.) to reduce potential impacts.
11. New spring developments in sage-grouse habitat should be designed to maintain or enhance the free-flowing characteristics of springs and wet meadows. Analyze developed springs, seeps and associated pipelines to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area within priority sage-grouse habitat. Make modifications where necessary, considering impacts to other water users when such considerations are neutral or beneficial to sage-grouse.
12. Ensure that new and existing livestock troughs and open water storage tanks are fitted with ramps to facilitate the use of and escape from troughs by sage-grouse and other wildlife. Do not use floating boards or similar objects, as these are too unstable and are ineffective. Use BMPs to mitigate potential impacts from West Nile virus.
13. When placing new water developments in sage-grouse breeding habitat, choose sites and designs that will provide the greatest enhancement for sage-grouse and sage-grouse habitat.
14. Avoid new water developments in higher quality native breeding/early brood habitats that have not had significant prior grazing use except in situations in which water developments may aid in better livestock distribution across the allotment and will not adversely impact the species.
15. Identify and when feasible, establish strategically located forage reserves focusing on areas unsuitable for sage-grouse habitat restoration or lower priority habitat restoration areas.
16. Monitor for, and treat invasive species associated with, existing range improvements.
17. Consider initiating vegetative manipulation projects where sagebrush canopy cover exceeds optimal characteristics to promote grass and forb understory growth. These projects should only be undertaken where it can be achieved without negatively impacting the species.

### **Adaptive Grazing Management Response**

BLM will individually analyze those allotments and pastures within the relevant Conservation Area. Given limited agency resources, prioritization will be given to areas that have the potential to provide the greatest benefit to sage-grouse. Allocation of resources should be concentrated on allotments within the CMA that have declining sage-grouse populations. Following those permits within the CMA, resources will be further prioritized to allotments within the IMA with breeding habitats that have decreasing lek counts. Sage-grouse populations that are stable or trending upward will be a lower priority for permit renewal and the adaptive assessment process. The assessment/determination process for sage-grouse pursuant to Standard 8 will consider published characteristics of sage-grouse habitat and the Ecological Site Descriptions, existing vegetation, habitat inventories/assessments (Stiver et al. 2010), and where available, state and transition models that describe vegetation and other physical attributes for sage-grouse. The related characteristics within the categories shown below will also be included. These characteristics indicate the ability of a given area to provide sage-grouse habitat.

Category 1: The grazing allotment (or any pasture/significant area therein) has the existing vegetation and existing ecological condition (seral state) to provide sage-grouse habitat

Category 2: The grazing allotment (or any pasture/significant area therein) has the ecological potential to provide sage-grouse habitat.

Where an allotment or pasture meets one of these Categories above, the GRSG Habitat Management Objectives will be incorporated into relevant resource management plans as the desired conditions with the understanding that these desired conditions may not be achievable:

- (a) due to the existing ecological condition, ecological potential or the existing vegetation; or
- (b) due to causal events unrelated to existing livestock grazing.

Allotments will only be managed for the primary seasonal habitat that it has the potential to support. Based on these habitat characteristics, BLM will conduct fine and site scale-habitat assessments to help inform grazing management. Where necessary, a determination of factors causing any failure to achieve the habitat characteristics GRSG HMOs will be conducted at a resolution sufficient to document the habitat condition. This determination will include consideration of local spatial and inter-annual variability. A determination of issues attributable to livestock grazing management shall not result from one year of data at a specific location within an allotment. If the process and conditions outlined above demonstrate that livestock grazing is limiting achievement of the habitat characteristics GRSG HMOs, renewed permits will include measures to achieve desired habitat conditions. These measures must be tailored to address the specific management issues associated with seasonal habitat limitations identified in the fine-scale assessments.

## Part IV – Anthropogenic Disturbance and Adaptive Management 2011 Baseline Indices

### Table G-2 – Desert Conservation Area Baseline Indices

	BLM & FS Acres	Total Acres	Effective Habitat	Existing Anthropogenic Disturbance	
				Within BSU	Within Effective Habitat

## Part V - Travel and Transportation Management Definitions for Use in Anthropogenic Disturbance Calculation

**Roads** are linear routes managed for use by low clearance vehicles having four or more wheels, and are maintained for regular and continuous use.

**Primitive Roads** are linear routes managed for use by four-wheel drive or high-clearance vehicles. They do not normally meet any design standards.

**Trails** are linear routes managed for human-powered, stock, or OHV forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-clearance vehicles.

**Linear Disturbances** are human-made linear features that are not part of the designated transportation network are identified as "Transportation Linear Disturbances." These may include engineered (planned) as well as unplanned single and two-track linear features that are not part of the BLM's transportation system.

**Primitive Routes** are any transportation linear feature located within a WSA or lands with wilderness characteristics designated for protection by a land use plan and not meeting the wilderness inventory road definition.

**Temporary routes** are short-term overland roads, primitive roads or trails which are authorized or acquired for the development, construction or staging of a project or event that has a finite lifespan. Temporary routes are not intended to be part of the permanent or designated transportation network and must be reclaimed when their intended purpose(s) has been fulfilled. Temporary routes should be constructed to minimum standards necessary to accommodate the intended use; the intent is that the project proponent (or their representative) will reclaim the route once the original project purpose or need has been completed. Temporary routes are considered emergency, single use or permitted activity access. Unless they are specifically intended to accommodate public use, they should not be made available for that use. A temporary route will be authorized or acquired for the specific time period and duration specified in the written authorization (permit, ROW, lease, contract etc.) and will be scheduled and budgeted for reclamation to prevent further vehicle use and soil erosion from occurring by providing adequate drainage and re-vegetation.

**Administrative routes** are those that are limited to authorized users (typically motorized access). These are existing routes that lead to developments that have an administrative purpose, where the agency or permitted user must have access for regular maintenance or operation. These authorized developments could include such items as power lines, cabins, weather stations, communication sites, spring

### *Maintenance Intensities*

#### **Level 0**

##### Maintenance Description:

Existing routes that will no longer be maintained and no longer be declared a route. Routes identified as Level 0 are identified for removal from the Transportation System entirely.

**Maintenance Objectives:**

- No planned annual maintenance.
- Meet identified environmental needs.
- No preventative maintenance or planned annual maintenance activities.

**Level 1****Maintenance Description:**

Routes where minimum (low intensity) maintenance is required to protect adjacent lands and resource values. These roads may be impassable for extended periods of time.

**Maintenance Objectives:**

- Low (Minimal) maintenance intensity.
- Emphasis is given to maintaining drainage and runoff patterns as needed to protect adjacent lands. Grading, brushing, or slide removal is not performed unless route bed drainage is being adversely affected, causing erosion.
- Meet identified resource management objectives.
- Perform maintenance as necessary to protect adjacent lands and resource values.
- No preventative maintenance.
- Planned maintenance activities limited to environmental and resource protection.
- Route surface and other physical features are not maintained for regular traffic.

**Level 3****Maintenance Description:**

Routes requiring moderate maintenance due to low volume use (for example, seasonally or year-round for commercial, recreational, or administrative access). Maintenance Intensities may not provide year-round access but are intended to generally provide resources appropriate to keep the route in use for the majority of the year.

**Maintenance Objectives:**

- Medium (Moderate) maintenance intensity.
- Drainage structures will be maintained as needed. Surface maintenance will be conducted to provide a reasonable level of riding comfort at prudent speeds for the route conditions and intended use. Brushing is conducted as needed to improve sight distance when appropriate for management uses. Landslides adversely affecting drainage receive high priority for removal; otherwise, they will be removed on a scheduled basis.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

**Level 5**

## Maintenance Description:

Route for high (maximum) maintenance due to year-round needs, high volume of traffic, or significant use. Also may include route identified through management objectives as requiring high intensities of maintenance or to be maintained open on a year-round basis.

## Maintenance Objectives:

- High (Maximum) maintenance intensity.
- The entire route will be maintained at least annually. Problems will be repaired as discovered. These routes may be closed or have limited access due to weather conditions but are generally intended for year-round use.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

## Appendix H – Anthropogenic Disturbance

### Disturbance Density Calculation

#### GRSG Local/Site Disturbance Calculation

- **All sub-regions:** Agreed to use the same types of disturbances for fine/site scale monitoring as were used for broad and mid-scale analysis. Would use local data and/or more current satellite imagery if available. Recognize that site specific data, where available, provide a more accurate measure of land cover, disturbance and conifer encroachment than Landfire. In the long-term, ensure fine/site scale monitoring provides results that can be used across the GRSG range and “rolled up” for reporting purposes. In the short term (<5 years), locally derived vegetation data may not be available or easily rolled up, so use of seamless land cover data such as Sagestitch is recommended.

Great Basin sub-regions agreed to use the same type of data sets as used for broad and mid-scale to monitor local/site level conditions. Supplement with local data where available and/or more accurate. The following data layers or local surrogate would be used.

1. Energy (oil and gas wells and development facilities) Based on local info, actual footprint; see NOC language for certain exceptions.
2. Energy (coal mines) Actual footprint
3. Energy (wind towers) Based on local info, actual footprint
4. Energy (solar fields) Based on local info, actual footprint
5. Energy (geothermal) Based on local info, actual footprint
6. Mining (active developments; locatable, leasable, saleable) Based on local info, actual footprint
7. Infrastructure (roads) actual footprint; see road attachment for specific guidance
8. Infrastructure (railroads) abandoned railroads are NOT a disturbance
9. Infrastructure (power lines) Using NOC guidance, apply these widths:
  - <100 kV: use ROW width
  - 100-199kV: 100 ft
  - 200-399kV: 150 ft
  - 400-699kV: 200 ft
  - 700-799kV: 250 ft
10. Infrastructure (communication towers, fire lookouts, met towers) Based on local info, actual footprint
11. Other developed rights-of-ways

The National Monitoring Framework lists the data sets by threat. These are:

<b>FWS Listing Decision Threat</b>	<b>Sagebrush Habitat Availability</b>	<b>Habitat Degradation (Human Activities)</b>	<b>Density of Energy and Mining Facilities</b>
Agriculture	X		
Urbanization	X		
Wildfire	X		
Conifer encroachment	X		
Treatments	X*		
Invasive Species	X*		
Energy (oil and gas wells and development facilities)		X	X
Energy (coal mines)		X	X
Energy (wind towers)		X	X
Energy (solar fields)		X	X
Energy (geothermal)		X	X
Mining (active locatable, leasable, and salable developments)		X	X
Infrastructure (roads)		X	
Infrastructure (railroads)		X	
Infrastructure (power lines)		X	
Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights of ways		X*	

The following data sets would *not* be used to calculate anthropogenic disturbance, but would be used in the habitat baseline to estimate habitat availability or the amount of sagebrush on the landscape within biologically significant units. Use best available data, where Landfire or Sagestitch could be used for biophysical setting (bps), compared to existing vegetation type.

1. Habitat treatments
2. Wildfire
3. Invasive plants
4. Conifer encroachment
5. Agriculture
6. Urbanization, Ex-urban and rural development

#### **Biologically Significant Unit:**

- Idaho proposes use of Priority and Important Habitat Management Areas that generally match PACs, but also anticipates assessing disturbance at other scales including nesting and winter habitat, 5 km lek neighborhood, Conservation Areas and/or at the project-scale, depending on need.
- For all subregions, data from these units would be rolled up to the PAC and WAFWA Management Zone, to meet FWS needs. In addition, units must be edge matched/aligned with neighboring states. All sub-regions acknowledge there may be locally important biologically significant units smaller than PACs which may or may not be rolled up to PAC level. The Subregions also acknowledge that assessing disturbance at larger scales such as certain PACs, or via rollup of data, provides a baseline metric for future comparison, but dilution may likely mask disturbance concerns occurring at more local scales.

#### ***Travel and Transportation Disturbance in Sage-Grouse Habitat***

The following would count as disturbance:

- Linear transportation features identified as roads that have a maintenance intensity of 3 or 5
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a functional classification and a maintenance intensity of level 3 or 5

#### **Non-Disturbance**

The following items would not count as disturbance:

- Linear transportation features identified as trails.
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a maintenance intensity of either level 0 or 1.

Linear transportation features identified as primitive routes.  
Linear disturbances.

DRAFT

### *Travel and Transportation Management Definitions*

**Roads** are linear routes managed for use by low clearance vehicles having four or more wheels, and are maintained for regular and continuous use.

**Primitive Roads** are linear routes managed for use by four-wheel drive or high-clearance vehicles. They do not normally meet any design standards.

**Trails** are linear routes managed for human-powered, stock, or OHV forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-clearance vehicles.

**Linear Disturbances** are human-made linear features that are not part of the designated transportation network are identified as "Transportation Linear Disturbances." These may include engineered (planned) as well as unplanned single and two-track linear features that are not part of the BLM's transportation system.

**Primitive Routes** are any transportation linear feature located within a WSA or lands with wilderness characteristics designated for protection by a land use plan and not meeting the wilderness inventory road definition.

**Temporary routes** are short-term overland roads, primitive roads or trails which are authorized or acquired for the development, construction or staging of a project or event that has a finite lifespan. Temporary routes are not intended to be part of the permanent or designated transportation network and must be reclaimed when their intended purpose(s) has been fulfilled. Temporary routes should be constructed to minimum standards necessary to accommodate the intended use; the intent is that the project proponent (or their representative) will reclaim the route once the original project purpose or need has been completed. Temporary routes are considered emergency, single use or permitted activity access. Unless they are specifically intended to accommodate public use, they should not be made available for that use. A temporary route will be authorized or acquired for the specific time period and duration specified in the written authorization (permit, ROW, lease, contract etc.) and will be scheduled and budgeted for reclamation to prevent further vehicle use and soil erosion from occurring by providing adequate drainage and re-vegetation.

**Administrative routes** are those that are limited to authorized users (typically motorized access). These are existing routes that lead to developments that have an administrative purpose, where the agency or permitted user must have access for regular maintenance or operation. These authorized developments could include such items as power lines, cabins, weather stations, communication sites, spring

### *Maintenance Intensities*

#### **Level 0**

##### Maintenance Description:

Existing routes that will no longer be maintained and no longer be declared a route. Routes identified as Level 0 are identified for removal from the Transportation System entirely.

##### Maintenance Objectives:

- No planned annual maintenance.
- Meet identified environmental needs.
- No preventative maintenance or planned annual maintenance activities.

### **Level 1**

#### Maintenance Description:

Routes where minimum (low intensity) maintenance is required to protect adjacent lands and resource values. These roads may be impassable for extended periods of time.

#### Maintenance Objectives:

- Low (Minimal) maintenance intensity.
- Emphasis is given to maintaining drainage and runoff patterns as needed to protect adjacent lands. Grading, brushing, or slide removal is not performed unless route bed drainage is being adversely affected, causing erosion.
- Meet identified resource management objectives.
- Perform maintenance as necessary to protect adjacent lands and resource values.
- No preventative maintenance.
- Planned maintenance activities limited to environmental and resource protection.
- Route surface and other physical features are not maintained for regular traffic.

### **Level 3**

#### Maintenance Description:

Routes requiring moderate maintenance due to low volume use (for example, seasonally or year-round for commercial, recreational, or administrative access). Maintenance Intensities may not provide year-round access but are intended to generally provide resources appropriate to keep the route in use for the majority of the year.

#### Maintenance Objectives:

- Medium (Moderate) maintenance intensity.
- Drainage structures will be maintained as needed. Surface maintenance will be conducted to provide a reasonable level of riding comfort at prudent speeds for the route conditions and intended use. Brushing is conducted as needed to improve sight distance when appropriate for management uses. Landslides adversely affecting drainage receive high priority for removal; otherwise, they will be removed on a scheduled basis.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

### **Level 5**

#### Maintenance Description:

Route for high (maximum) maintenance due to year-round needs, high volume of traffic, or significant use. Also may include route identified through management objectives as requiring high intensities of maintenance or to be maintained open on a year-round basis.

Maintenance Objectives:

- High (Maximum) maintenance intensity.
- The entire route will be maintained at least annually. Problems will be repaired as discovered. These routes may be closed or have limited access due to weather conditions but are generally intended for year-round use.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

## Appendix J – Mitigation

### Part I – Regional Mitigation Strategy

The BLM/USFS will achieve no net unmitigated loss for authorized land uses within greater sage-grouse priority and general habitat. No net unmitigated loss means that impacts from authorized land uses will be fully offset to benefit the species. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to fully offset those residual impacts in order to achieve the no net unmitigated loss standard. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy to address impacts within that Zone. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

#### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy to address impacts within that Zone. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance

- Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
- Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects.
      - This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
      - For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure may require an upward adjustment of the valuation.
      - The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
    - Compensatory Mitigation Options
      - Options for implementing compensatory mitigation should be identified, such as:
        - Utilizing certified mitigation/conservation bank or credit exchanges.
        - Contributing to an existing mitigation/conservation fund.
        - Authorized-user conducted mitigation projects.
      - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
    - Compensatory Mitigation Siting
      - Sites should be in areas that have the potential to yield the greatest conservation benefit to the greater sage-grouse, regardless of land ownership.
      - Sites should be durable (see glossary).
      - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be

considered, if those sites have the potential to yield the greatest benefit to greater sage-grouse and are durable.

- Compensatory Mitigation Project Types and Costs
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- Compensatory Mitigation Compliance and Monitoring
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.
- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into Land Use Authorization Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for authorized land uses that may impact greater sage-grouse or its habitat.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to achieve the greatest conservation benefit, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

## Glossary Terms

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** Specific, on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur.

**Durability (protective and ecological):** The administrative, legal, and financial assurances that secure and protect the conservation status of a compensatory mitigation site, and the ecological benefits of a compensatory mitigation project, for at least as long as the associated impacts persist. (BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts from an authorized land use that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The conservation benefits from compensatory mitigation accruing as early as possible or before impacts have begun. (BLM Manual Section 1794).

## Part II – Idaho Mitigation Framework

### FRAMEWORK FOR MITIGATION OF IMPACTS FROM INFRASTRUCTURE PROJECTS ON SAGE-GROUSE AND THEIR HABITATS

Sage-Grouse Mitigation Subcommittee of the Idaho Sage-Grouse State Advisory Committee<sup>1</sup>  
December 6, 2010

#### INTRODUCTION

The Conservation Plan for Greater Sage-grouse in Idaho (Idaho Sage-Grouse Advisory Committee 2006; as amended in 2009) calls for the development of a “proposal for a mitigation and crediting program for sagebrush steppe habitats in Idaho and recommendations for policy consideration” (Measure 6.2.4). In early 2010, the Idaho Sage-grouse Advisory Committee (SAC) established the Mitigation Subcommittee to complete this task.<sup>1</sup> The Mitigation Subcommittee met several times from the late spring, through the fall of 2010 and found broad areas of agreement among its diverse participants.

This report presents the Mitigation Subcommittee’s consensus recommendations for the creation of an Idaho-based program to compensate for the impacts of infrastructure projects on sagegrouse and their habitats. This program – called the Mitigation Framework – would serve as a science-based “mitigation module” that project developers and government regulators could use to achieve compensatory mitigation objectives called for in project plans and permits. While compensatory mitigation may help offset certain impacts arising from infrastructure projects, mitigation should not be considered a substitute for first avoiding and then minimizing impacts.

In addition, it is important to recognize that federal and state regulatory or land-management agencies, and county or local governments may also require additional stipulations, conditions of approval or other requirements as well as on-site mitigation, in accordance with applicable law, regulation or policy.

This document proposes a general outline or “skeleton” of policies and procedures for such a program. The Mitigation Framework is designed to be transparent, inclusive, and accountable to defined objectives. The Subcommittee’s purpose is to describe the program in enough detail to foster a dialogue among SAC members, spot important issues and points of agreement, and assess the level of support for developing a functioning mitigation program for Idaho sagegrouse and their habitats.

---

<sup>1</sup> Subcommittee participants: John Robison and Lara Rozzelle, Idaho Conservation League; Brett Dumas, Idaho Power Company; Paul Makela and Tom Rinkes, BLM; Don Kemner, Idaho Department of Fish and Game; Will Whelan and Trish Klahr, The Nature Conservancy; Rich Rayhill, Ridgeline Energy, LLC; Lisa LaBolle and Kirsten Sikes, Idaho Office of Energy Resources; Nate Fisher, Idaho Office of Species Conservation; John Romero, Citizen at Large.

## EXECUTIVE SUMMARY

The state of Idaho is seeing an increasing number of infrastructure projects, such as transmission lines and wind energy facilities, proposed in the state's sagebrush steppe ecosystems. Where federal permits are required, the environmental review process for these projects will analyze how these projects affect sage-grouse and will consider a range of potential mitigation measures to avoid, minimize, or offset any impacts. It is likely that the environmental review process will lead at least some developers and agencies to implement compensatory mitigation.

Compensatory mitigation consists of compensating for residual project impacts that are not avoided or minimized by providing substitute resources or habitats, often at a different location than the project area. For sage-grouse, this would include, among other things, protecting and restoring sagebrush habitats to offset habitat losses and other effects of infrastructure projects.

This framework describes the general outline for a sage-grouse compensatory mitigation program in Idaho. This program would employ an "in-lieu fee" approach to compensatory mitigation through which a project developer would pay funds into an account managed by the mitigation program for performance of mitigation actions that provide measureable benefits for sage-grouse and their habitats within Idaho.

The Mitigation Framework does not alter the legal standards or procedures for review and approval of infrastructure projects. Rather, it offers an option that project developers and/or regulators may choose for implementing mitigation plans and agency permit conditions. It should be emphasized that this program would not relieve project developers and permitting agencies of their obligation to avoid and minimize environmental impacts through appropriate project siting, design and implementation.

Although the initial focus is on sage-grouse, the Mitigation Framework can be readily adapted to provide compensatory mitigation for other sagebrush obligate and associated species. The suitability of the Framework for other species and natural features has not been evaluated.

The objectives of the Mitigation Framework include:

- Provide a credible, efficient, transparent, and flexible mechanism to implement compensatory mitigation;
- Ensure that sage-grouse impacts are offset by actions that benefit the affected species and habitats;
- Provide increased certainty for developers and agencies;
- Involve private and public partners in crafting solutions;
- Provide developers the opportunity to offset the impacts of project development and operation on sage-grouse and sage-grouse habitat, and provide a consistent mechanism to offset impacts to the species that can be evaluated in future reviews of the species' status; and
- Evaluate issues based on best available scientific information, while acknowledging and responding to scientific uncertainty.

The Mitigation Framework would be established through a memorandum of agreement (MOA) among entities that have the capacity and commitment to assist in its implementation. Such parties may include land and wildlife management agencies, counties, tribes, participating private infrastructure development companies, and non-governmental organizations. The MOA would define the specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based compensatory mitigation program.

The Mitigation Framework envisions a program with the following attributes: (1) a Mitigation Team and program administrator to steer the mitigation program and ensure strong oversight; (2) technically sound and transparent guidelines for estimating compensatory mitigation costs; (3) a science-based statewide strategy to guide the selection of mitigation actions that will receive funding; (4) provisions that the costs of operating the program will be borne by infrastructure developers that use the Mitigation Framework to deliver compensatory mitigation; (5) monitoring the implementation and effectiveness of mitigation actions funded by the Mitigation Framework program; (6) a system to track benefits provided by the Mitigation Framework to sage-grouse habitat in Idaho; and (7) periodic evaluation and adaptation of the Mitigation Framework program.

This framework provides only a general outline of a proposed Idaho-based compensatory mitigation program. It is intended to assess the level of support for crafting the agreements and completing the technical tasks needed to bring the Mitigation Framework into being.

## **DISCUSSION**

### **I. The Role of Compensatory Mitigation in Infrastructure Development and Sage-grouse Conservation**

#### **A. Mitigation Basics**

Broadly defined, “mitigation” refers to a wide range of measures that are taken to avoid, minimize, rectify, reduce, or compensate for the adverse impacts of actions affecting the environment. See 40 C.F.R. § 1508.20 (definition of “mitigation” in National Environmental Policy Act (NEPA) rules). In this general sense, mitigation should be an integral part of all phases of project planning and implementation.

The focus of this report is on compensatory mitigation – also known as “biodiversity offsets” or “offsite mitigation.” Compensatory mitigation consists of compensating for residual project impacts that are not avoided or minimized by providing substitute resources or habitats, often at a different location than the project area. For instance, a project developer may fund the restoration of a particular type of habitat in order to replace or “offset” similar habitat that is lost as a result of project construction.

This Framework adopts an “in-lieu fee” approach to compensatory mitigation. Under this approach, a project developer provides funding to a compensatory mitigation program administrator who then distributes the funds to the appropriate government agency, foundation or other organization for performance of mitigation actions. In an in-lieu fee program, the responsibility for actually delivering the compensatory mitigation is transferred from the developer to the program administrator once the developer provides the necessary funds to the in-lieu fee program. It is important to emphasize that compensatory mitigation

does not relieve project developers and permitting agencies of their obligation to avoid and minimize environmental impacts. This Framework endorses the principle known as the “mitigation hierarchy,” which holds that decision makers should consider the elements of environmental mitigation in the following order of priority:

1. Avoid environmental impacts through project siting and design;
2. Minimize the impacts during construction, operation, maintenance, and decommissioning by implementing appropriate conservation measures related to timing and conduct of project activities;
3. Restore areas that have been disturbed or otherwise rectify on-site project-related impacts to the greatest extent practicable; and
4. Compensate for residual impacts (direct and indirect effects that are not mitigated on-site) by providing replacement habitats or other benefits.

This means that compensatory mitigation is addressed only after efforts to avoid, minimize, and mitigate the impacts have been addressed. It also should be noted that significant impacts to habitat areas that support special functions and values for sage-grouse may simply not be replaceable through mitigation and therefore the best course may be to avoid those areas altogether.

## **B. Need for an Idaho Compensatory Mitigation Program**

In recent years, the state of Idaho has seen an increase in the number of major infrastructure projects proposed in the state’s sagebrush steppe ecosystems. Several current proposals involve high voltage transmission lines that would cross over hundreds of miles of sage-grouse habitat. Large scale energy infrastructure projects such as wind farms may also affect large areas of sagegrouse habitat. Where these projects are located at least partially on federally managed public lands they will be required by federal law to go through an extensive environmental review process under NEPA before relevant federal permits are issued. The NEPA process requires the permitting agencies to consider the projects’ environmental effects (both positive and negative), alternatives, and potential mitigation measures. Impacts on sage-grouse will be one of the topics analyzed in the NEPA process.

Even after efforts are taken to avoid and minimize impacts, it is possible that some of these infrastructure projects will degrade some sage-grouse habitat, cause direct sage-grouse mortality, or lead to indirect effects such as avoidance of previously occupied habitat. The extent to which project developers and regulators adopt compensatory mitigation as a means to offset these impacts is not fully known. However, it is likely that at least some developers and regulators will seek to implement compensatory mitigation to benefit sage-grouse and their habitats. Energy companies and other developers face daunting challenges in carrying out compensatory mitigation for sage-grouse habitat. Just identifying specific mitigation actions requires a major effort. Actually implementing sagebrush restoration and enhancement projects is even more difficult and expensive – typically involving years of effort and a significant risk of failure. Delivering this type of technically complex environmental mitigation may be well outside the core business of many infrastructure developers.

## **C. Advantages of the Mitigation Framework**

The Mitigation Framework proposes to respond to these challenges by creating a statewide program to deliver scientifically sound compensatory mitigation for multiple projects. Project developers and regulators would no longer have to design, fund and implement their own mitigation programs. Instead, they would have the option of contributing money to a central fund overseen by agencies with expertise in habitat management and non-governmental partners with similar experience. This approach to compensatory mitigation offers three major advantages. The first advantage stems from the increased efficiency of an Idaho-wide mitigation program compared with fragmented, project-by-project mitigation programs. Mitigation efforts require a significant investment in planning, administration, project oversight, and monitoring. The Mitigation Framework would consolidate these functions, thus avoiding needless duplication. The second advantage is that a state mitigation fund can be used for sage-grouse conservation more strategically and at a greater scale than project-by-project mitigation. As described in more detail below, the Mitigation Framework would fund sage-grouse habitat protection and restoration projects in accordance with a statewide strategy that uses landscape-scale analyses to identify the specific measures and habitats that will provide the greatest benefit for Idaho sagegrouse populations. This Idaho-based mitigation strategy will be integrated with other conservation strategies throughout the range of sage-grouse to ensure that actions taken in Idaho benefit the species as a whole. Third, this method can engage the capacity and competence of natural resources agencies, local governments, private companies, and non-governmental organizations. The Mitigation Framework proposes to enlist these entities in shaping Idaho's strategy, developing criteria for use of the fund, and proposing and implementing habitat protection and restoration projects. The benefits of the Mitigation Framework can be summarized as follows:

*Benefits for Project Developers:*

An efficient and reliable mechanism for meeting compensatory mitigation objectives and permit conditions; and Increased certainty regarding project costs.

*Benefits for Regulatory Agencies:*

Increased certainty that in-lieu fees will result in strategic "on-the-ground" mitigation actions that benefit sage-grouse.

*Benefits for Sage-Grouse:*

Increased certainty that scientifically sound mitigation actions that benefit sage-grouse and offset impacts and habitat losses associated with infrastructure development will be implemented.

#### **D. Ensuring Accountability**

In-lieu fee compensatory mitigation does pose one potentially significant drawback that must be acknowledged and addressed: a poorly designed program may lack accountability for delivering meaningful on-the-ground benefits for sage-grouse. Simply having a project developer contribute to an in-lieu fee mitigation account does not by itself compensate for the sage-grouse impacts caused by the project. Actual mitigation is possible only after well-

conceived habitat protection and restoration projects are planned, funded, implemented, monitored, and successful in achieving stated objectives. The Mitigation Framework seeks to ensure accountability by adopting a series of rigorous and transparent procedures. As described below, the Framework would: (1) ensure that program administration and monitoring functions are adequately funded; (2) provide technically sound guidelines for estimating the costs of delivering compensatory mitigation; (3) establish a sciencebased statewide strategy to guide the program; (4) develop project selection criteria and a request for proposals based on the strategy; (5) require monitoring of the implementation and effectiveness of mitigation actions funded by the program; (6) track benefits the Mitigation

Framework program provides to sage-grouse in Idaho; and (7) require periodic evaluation of the program. Taken together, these procedures provide a high degree of certainty that the Mitigation Framework will be able to turn in-lieu fee payments into tangible, lasting compensatory mitigation for sage-grouse. As described in greater detail in Section E, below, project developers that seek to use the Mitigation Framework will need to show two things. First, they will need to show that their projects' impacts on sage-grouse and their habitats have been evaluated using a scientifically sound process. Second, they will need to show that their contributions to the mitigation fund reflect the Mitigation Framework's compensation guidelines to ensure that funding will be adequate to offset project impacts. Having demonstrated those things, the project developers should then be able to rely on their in-lieu fee contribution to the mitigation account as satisfying their compensatory mitigation objectives or obligations.

## **II. Core Elements of Idaho Sage-Grouse Mitigation Program**

### **A. Program Objectives**

- Provide a credible, efficient, transparent, and flexible mechanism to implement compensatory mitigation;
- Ensure that sage-grouse impacts are offset by mitigation actions that benefit the sage-grouse and their habitats;
- Provide increased certainty for developers and agencies;
- Involve private and public partners in crafting solutions;
- Provide developers the opportunity to offset project impacts on sage-grouse and sage-grouse habitat, and provide a consistent mitigation mechanism that can be evaluated in future reviews of the species' status; and
- Evaluate issues based on best available scientific information while acknowledging and responding to scientific uncertainty.

### **B. Scope**

The Mitigation Framework proposes to mitigate for impacts to Idaho sage-grouse and their habitats in Idaho. The initial focus of the Mitigation Framework is on sage-grouse. However, this program can be readily adapted to provide compensatory mitigation for other sagebrush obligate and associate species, such as pygmy rabbits, if project developers and regulators call for such mitigation.

Whether this Framework is suited for mitigation of impacts to a broader suite of species or natural features has not been evaluated. It should be noted that some subcommittee members expect to advocate in other forums that compensatory mitigation should extend beyond sagegrouse. The Mitigation Framework focuses on infrastructure projects because this type of development is the most likely to give rise to compensatory mitigation under existing environmental policies. As used here, the term “infrastructure” refers to building structures that significantly disturb sage-grouse habitat, including but not limited to projects for electricity transmission, energy generation, pipeline conveyance, transportation, communications, and similar purposes. The Mitigation Framework is not intended to apply to existing projects that are not changing in scope or to the renewal of on-going activities, such as grazing permits. In addition, the Framework is not suited to projects with minor impacts because their contributions to the mitigation program would be too small to justify the effort needed to establish and administer inlieu fee payments.

### **C. Integration with Environmental Review Procedures**

The Mitigation Framework does not alter the legal standards or procedures for review and approval of infrastructure projects. Rather, the Framework offers an option that project developers and/or regulators may choose for implementing mitigation plans and agency permit conditions. The Mitigation Framework is intended to complement the environmental review process conducted pursuant to NEPA and other federal environmental laws as well as county land use planning authorities. Many energy and other infrastructure projects undergo review and approval at the county level. The issues examined and the level of environmental analysis varies widely among individual counties and individual developers. If a county or developer decides to address sage-grouse impacts, it will be able to use the Mitigation Framework as a mechanism for meeting compensatory mitigation objectives that may arise from the county permitting process.

### **D. Mitigation Strategy**

The next step focuses on the Mitigation Team’s task of developing a statewide, science-based strategy that will guide the use of the mitigation fund. The mitigation program strategy would establish priorities for the use of compensatory mitigation funding based on factors/risks identified in the U.S. Fish and Wildlife Service’s 12-Month Findings for Petitions to List Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered (USFWS 2010) and in the Conservation Plan for Greater Sage-grouse in Idaho (2006). The strategy sets mitigation priorities with a landscape view of sage-grouse needs and highlights mitigation opportunities in Idaho based on best available science. In setting priorities, the strategy considers species and community size, landscape condition, and regional context. The strategy is responsive to the threats and risks described in the sage-grouse 12-month findings. The strategy will also generally describe the types of mitigation actions, project specifications, and best practices that are likely to produce measureable benefits for sage-grouse habitat. Finally, the strategy addresses both implementation and effectiveness monitoring requirements for mitigation actions funded through the program. The Mitigation Framework’s strategy will draw heavily from the State of Idaho’s sage-grouse conservation plan but has a narrower focus. It is intended to provide the specific guidance on program priorities, accepted mitigation measures, and geographic areas of emphasis that potential mitigation project sponsors will need to know when they apply for funds. The strategy plays a crucial role in steering mitigation funding to those activities and places that can provide the most effective benefits for Idaho sage-grouse populations consistent

with strategies to increase the viability of the species throughout its range. To this end, the strategy will address one of the major policy questions that arise in the design of compensatory mitigation systems: how closely should the mitigation actions be linked to the type and location of the habitat that was originally affected by the infrastructure project. Stated in the alternative, does removal of the mitigation action from the area of impact improve the effectiveness of or benefit from the action. Some compensatory mitigation systems place a heavy emphasis on this link by favoring “in-kind” and “on-site” compensatory mitigation over “out-of-kind” and “off-site” compensatory mitigation. The subcommittee members generally favor an approach that allows funding to flow to the projects and locations within Idaho that will provide the greatest overall positive impact on sage-grouse populations. The Mitigation Framework calls for a monitoring program that would assess habitat gains provided by mitigation actions and compare them with the mitigation objectives of the participating infrastructure projects. The nature and purpose of this monitoring is described more fully in Mitigation Program Step 4, below.

Once the strategy is complete, the Mitigation Team will develop project ranking criteria and procedures that will guide the selection of the mitigation actions that will receive funding. The goal is to fund projects that provide high quality, lasting benefits based on landscape scale analyses that actually compensate for project impacts.

#### **E. Compensation Guidelines**

The Mitigation Framework Program will develop guidelines that may be used by developers and/or regulators to determine the cost of meeting their compensatory mitigation objectives. These compensatory mitigation objectives determine the extent of compensatory mitigation for each project and are generally incorporated into project plans or permits. The compensation guidelines will provide transparent, technically sound principles for determining how much it costs to deliver habitat mitigation for sage-grouse. In other words, the guidelines will represent best estimates of the true cost of implementing the mitigation actions needed to meet each project’s compensatory mitigation objectives. The guidelines may be used by the project developer and the Mitigation Framework Program Administrator to establish the in-lieu fee that the developer will contribute to the mitigation fund. Specific valuation methods will be developed at a later time and will likely draw from compensatory mitigation systems used elsewhere in the West. Although the details have yet to be worked out, the following outline illustrates the core concepts and principles (shown in bold lettering) that are likely to be employed by the MOA parties in setting the Mitigation Framework’s in-lieu fee structure.

- A common unit of measurement would be established for describing and tracking both the project impacts and the benefits of any compensatory mitigation actions. This unit of measurement can be a physical unit such as “acres impacted” or more specifically “acres of summer brood rearing habitat impacted” or “habitat units” lost.
- While the “common unit of measurement” noted above addresses the area of habitat impacted and mitigated, habitat compensation ratios are used to address the quality of the habitat affected by the infrastructure project. These ratios could specify the number of acres of mitigation required per acre of impacted habitat based on the size, habitat quality/condition and function of the impacted habitat; for more critical or important habitat, more mitigation acres might be required. Thus, habitats with higher quality and importance could have higher compensation ratios.

- Several factors are taken into account in calculating how much it will cost to actually compensate for the acres or habitat units. The recommended approach is to evaluate on the costs of implementing a conceptual portfolio of potential mitigation actions or offset activities that provide benefits for sage-grouse. This portfolio of model projects would include a balanced mix of accepted habitat protection and restoration measures reflecting the types of projects expected to be funded by the mitigation program (in accordance with the strategy discussed above). Examples of projects in this portfolio may include such actions as restoring sagebrush canopy and a native understory on recently burned land, improving riparian areas and wet meadows in early brood-rearing habitat, conservation easements to prevent habitat loss, and land management practices that improve sage-grouse habitat. Project costs include the full range of expenses needed to complete all phases of the mitigation action, including administration and monitoring. The average costs of these model mitigation actions per acre or habitat unit is the foundation of the in-lieu fee calculation.
- In addition, the in-lieu fee should also be adjusted to take into consideration the issue of lag time –the time between when habitat is lost at the impacted site relative to when habitat functions are gained at the compensation site.
- The fee also needs to account for contingencies associated with delivering compensatory mitigation, including an estimate of the risk of failure (i.e., the probability that offsite mitigation will not result in any measureable conservation outcomes) for each mitigation site or project.
- In addition to the fee calculated above, costs for establishing and operating the program, including travel, technical consultation and monitoring of program effectiveness must be included. This overhead fee could range from 5-15% depending on the size and complexity of the proposed mitigation program.

## **F. Program Structure and Oversight**

The Mitigation Framework would be established through a memorandum of agreement (MOA) among the entities that would participate in its implementation. The MOA would define the specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based compensatory mitigation program. The MOA would serve as a joint powers agreement for state and local government parties. The MOA would establish the following administrative structure for the Mitigation Framework:

1. **Core Team:** A core group would oversee the Mitigation Framework program and provide policy-level guidance for the Science Team and Fund Administrator, described below. The Core Team would be composed of three to seven representatives of diverse perspectives among the MOA signatories.
2. **Science Team:** A team of experts drawn from MOA signatories and other targeted organizations will administer the science-based and technical aspects of the program. The Science Team would consist of several individuals with expertise in relevant areas such as habitat protection and restoration, landscape ecology/spatial analysis, wildlife biology, sage-grouse ecology, project development, and mitigation policy.

The Team would focus on developing the policies and statewide strategy that will guide the program, making requests for mitigation project proposals (RFPs), ranking mitigation proposals that will receive funding, tracking monitoring reports and project benefits, and evaluating program success.

3. Program Administrator: A program administrator will be responsible for fund management and administrative tasks. The program administrator will provide administrative support for the Mitigation Team, manage the mitigation account, and administer grants, contracts, and other agreements.

4. Advisory Committee: A broader advisory committee consisting of agencies, companies and organizations with the skills and commitment that will provide useful advice to the Core Team regarding the implementation of the Mitigation Framework. The specific make up of each of these groups will be determined at a later time. Potential participants in the Mitigation Framework include but are not limited to representatives of:

***State of Idaho:***

Department of Fish and Game  
Management  
Office of Energy Resources  
Office of Species Conservation  
Idaho Department of Lands  
Service

***Energy Companies:***

Idaho Power  
Ridgeline Energy  
Conservancy  
  
Idaho Tribes  
Idaho Sage-Grouse Advisory Committee  
interests)  
Sage-Grouse Local Working Groups

***United States:***

Bureau of Land  
  
U.S. Fish and Wildlife Service  
U.S. Forest Service  
Natural Resources Cons.

***Non-Governmental Organizations:***

Idaho Conservation League  
The Nature  
  
Idaho Counties  
Public Land Users (e.g., grazing

**G. Funding the Mitigation Program**

The costs of administering the program will be sustained by the project developers that seek compensatory mitigation. Therefore, a portion of the in-lieu fee that project developers contribute to the mitigation account will be applied for program administration. As noted above, protecting and restoring sagebrush habitats are time consuming and expensive undertakings. Ensuring that these activities are conducted with strong oversight should be viewed as an exceptionally wise investment.

**III. Mitigation Program Steps**

The Mitigation Framework envisions a five-step process for developing, implementing, and monitoring compensatory mitigation.

### **A. Step 1 – Assessment of Project Impacts and Development of Mitigation Objectives**

Assessment of project impacts should be undertaken by the project developers proposing new infrastructure projects and the government agencies that conduct environmental reviews of those projects. Although the Mitigation Framework process is not responsible for this step, it is nevertheless crucial to the integrity of the mitigation program. Specifically, the Framework's success in achieving its goal of offsetting major infrastructure project impacts on sage-grouse depends on an accurate accounting of those impacts. For many projects, this analysis will be done as part of the environmental review procedures required by NEPA. As noted above, NEPA requires federal agencies to address the full range of direct, indirect and cumulative impacts of the proposed project, alternatives to the proposed action, and potential mitigation before they act on permit applications. Once impacts have been assessed and compensatory mitigation objectives set, the project developer is ready to engage the Mitigation Framework, starting with determining the developer's in-lieu fee contribution.

### **B. Step 2 – Determine the In-lieu Fee Contribution**

The goal of Step 2 is to use valuation techniques, such as the guidelines presented above, to convert the complex range of project impacts, including direct, indirect and cumulative impacts, into monetary terms that become the basis for the in-lieu fee payment. The accepted in-lieu fee compensatory mitigation plan could be a condition of the instrument approving the project (FONSI, ROD, right-of-way grant, conditional use permit, etc.) and thus legally requires the project developer comply with the approved mitigation plan.

### **C. Step 3 – Commitment of Mitigation Funds by Project Developer**

Infrastructure project developers can employ the Mitigation Framework by entering into an agreement with the program administrator with regard to a specific infrastructure project. This project agreement sets forth the parties' respective responsibilities, including the project developer's commitment to pay the in-lieu fee. Importantly, the agreement provides that the project developer's funds can only be used for the purposes set forth in the Mitigation Framework. The agreement may also include "conditions" as requested by regulatory agencies or project developers. For instance, the agreement might provide that the in lieu fee will be used to fund mitigation actions in specific geographic areas in order to meet permit requirements. The program administrator, based on consultation with the MOA parties, may decline to enter into an agreement that is inconsistent with the Mitigation Framework principles or includes conditions that are burdensome or unworkable. Once the agreement specifying the payment structure and schedule is signed, the project developer makes the required in-lieu fee deposits to an interest bearing account managed by the program administrator. After the completion of this step, the project developer is no longer engaged in the Mitigation Framework – unless it has decided to participate as a MOA party.

### **D. Step 4 – Issue Request for Proposals (RFP) and Select, Implement, and Monitor Mitigation Actions**

At least at annual intervals, the Mitigation Team will issue an RFP that invite private companies, non-governmental organizations, and agencies to submit proposals for sage-grouse habitat protection, restoration, and/or enhancement actions. The RFP will provide guidance to mitigation project sponsors on program priorities and criteria. These priorities and criteria will be drawn from the mitigation program strategy including identification of geographic areas where mitigation might provide the greatest benefits as well as identification of the threats that present the highest risk to the species or its core habitat. The Mitigation Team should also reach out to federal, state, and local agencies, non-governmental organizations and the general public in order to facilitate discussion, engage stakeholders, raise awareness of the program and generate responses to the RFP. The RFP will solicit project proposals that contain an operation or implementation plan and address at least the following elements:

- Geographic area;
- Threats addressed and how the mitigation action project will offset impacts resulting from those threats;
- An analysis of current sage-grouse conditions in the area;
- Resource goals and objectives the mitigation action project will seek to provide;
- A description of any coordination with federal, state, tribal and local resource management and regulatory authorities or other stakeholder involvement required to complete the mitigation action (e.g., requirement for NEPA compliance or county permit);
- A description of recent or proposed projects and events in the vicinity of the proposed project, if any, such as fire rehabilitation treatments, restoration or enhancement treatments or other activities that complement the effectiveness or intent of the proposed, mitigation action;
- A description of the long term protection, management, stewardship for the project being implemented, and the entity responsible for these activities; and
- A commitment to periodic evaluation and reporting on the progress of the project in meeting stated goals and objectives, including a process for adaptively redirecting the project if necessary.

When selecting projects, the Mitigation Team will estimate the biological benefits of the projects activities, the likely success of those activities, the duration of benefit expected and measure those benefits in relation to the strategy and RFP objectives. Mitigation Team and the program administrator will work together on continuing program administration and oversight including annual reporting of program activities, expenditures, and benefits. An annual program report will describe program activities, budget, and assessment of whether the mitigation strategy and associated projects are benefitting sage-grouse and at what level or scale. The Mitigation Team and/or Program Administrator should implement a monitoring program to measure and validate whether project-specific objectives have been met. Monitoring is required of all compensatory mitigation actions to determine if the project is meeting its performance standards and objectives. As mentioned above, at regular intervals, the total habitat and/or population gains provided by the programs will be compared with the habitat/population losses associated with the participating infrastructure projects. The purpose of this comparison is to evaluate the mitigation program and make

any necessary program adjustments – particularly if the monitoring shows that the mitigation benefits are not compensating for habitat losses. This comparison will not be a basis for imposing new, unexpected requirements on the infrastructure project developers.

## **CONCLUSION**

The framework of policies, principles and procedures outlined above are meant to start a dialogue among parties engaged in sage-grouse conservation and infrastructure development. If these parties agree with the Mitigation Subcommittee that there is great value in establishing an Idaho-based compensatory mitigation program, then this framework will mark the beginning of an inclusive effort to fill in the details and complete the tasks needed to bring such a program into being. We have confidence in our collective ability to create a compensatory mitigation program that will benefit infrastructure developers, agencies, conservation interests, and – not least – Idaho's sage-grouse.

DRAFT

**Part III –****IDAHO AND SOUTHWESTERN MONTANA SUBREGION-NO NET UNMITIGATED LOSS PROCESS****Introduction**

The No Net Unmitigated Loss strategy is a means of assuring that proposed anthropogenic activities, when approved and implemented will not result in long-term degradation of Greater Sage-Grouse habitat or population and will have a net conservation benefit to the species. The attached ‘flow chart’ identifies a screening process for review of proposed anthropogenic activities. The goal of the process is to provide a consistent approach regardless of the administrative location of the project and to ensure that authorization of these projects will not contribute to the decline of the species. Though the initial Steps (1-6) are done prior to initiating the NEPA process, the authorized officer must ensure that appropriate documentation regarding the rationale and conclusion for each is included in the administrative record.

The flow chart provides for a sequential screening of proposals. However, Steps 2-6 can be done concurrently. Steps 7-12 are related to project implementation.

**Step 1**

This screening process is initiated upon formal submittal of a proposal for authorization for use of federal lands (BLM or Forest Service). The actual documentation would include, at a minimum, a description of the location, scale of the project, and timing of the disturbance and would be consistent with existing protocol and procedures for the specific type of use. It is anticipated that the proposals would be submitted by a third party.

**Step 2**

This initial review would evaluate whether the proposal would be allowed as prescribed in the Greater-Sage-Grouse Land Use Plan Amendment. For example, certain activities are prohibited in suitable habitat, such as wind or solar energy development. If the proposal is an activity that is specific prohibited, the submitter would be informed that the proposal is being rejected since it would not be consistent with the Land Use Plan, regardless of the design of the project.

In addition to consistency with program allocations, the Land Use Plan identifies a limit on the amount of disturbance that is allowed within a ‘biological significant unit’ (BSU). If current disturbance within the affected unit exceeds this threshold, the project should be deferred until such time as the amount of disturbance within the area has been reduced, through restoration or other management actions.

**Step 3**

In reviewing a proposal, determine if the project will have a direct or indirect impact on population or habitat (PPH or PGH). This can be done by:

1. Reviewing Greater Sage-Grouse Habitat maps.
2. Reviewing the 'Base Line Environment Report' (USGS) which identifies the area of direct and indirect effects for various anthropogenic activities.
3. Consultation with agency, Fish and Wildlife Service, or State Agency wildlife biologist.
4. Reviewing the standard and guidelines in the plan amendments (such as buffer distances for the proposed activity).
5. Other methods

If the proposal will not have a direct or indirect impact on either the habitat or population, proceed with the appropriate process for review, decision, and implementation of the project.

#### **Step 4**

If the project could have a direct or indirect impact of sage-grouse habitat or population, evaluate whether the proposal can be relocated so as to not have the indirect or direct impact and still achieve the intent of the proposal. This Step does not consider redesign of the project as a means of not having direct or indirect impacts but rather authorization of the project in a physical location that will not impact Greater Sage-grouse. If the project can be relocated so as to not have an impact on sage-grouse and still achieve objectives of the proposal, inform applicant and proceed with the appropriate process for review, decision, and implementation of the relocated project.

#### **Step 5**

If the preliminary review of the proposal concludes that there may be impacts to sage-grouse habitat and/or population, and the project cannot be effectively relocated to eliminate these impacts; evaluate whether the agency has the authority to modified or deny the project. If the agency does NOT have the discretionary authority to modify or deny the proposal, proceed with the authorization process (NEPA) and include appropriate mitigation requirements that minimize impacts to sage-grouse habitat and populations. Mitigations could include a combination of actions such as timing of disturbance, design modifications of the proposal, site disturbance restoration, and compensatory mitigation actions.

#### **Step 6**

If the agency has the discretionary authority to deny the project and after careful screening of the proposal (Steps 1-4) has determined that direct and indirect cannot be eliminated, evaluate the proposal to determine if the adverse impacts can be mitigated. If the impacts cannot be effectively mitigated within the BSU, reject or defer the proposal. The criteria for determining this situation would include but not limited to:

- Natural disturbance within the BSU is significant and additional activities within the area would adversely impact the species.
- The current trend within the BSU is down and additional impacts, whether mitigated or not, could lead to further decline of the species or habitat.

- The proposed mitigation has proven to be ineffective or is unproven in terms of science based approach.
- The additional impacts, after applying effective mitigation, would exceed the disturbance threshold for the BSU.
- The project would impact habitat that has been determined, through monitoring, to be a limiting factor for species sustainability within the BSU.
- Other site specific criteria that determined the project would lead to a downward trend to the current species population or habitat with the BSU.

If the project can be mitigated to provide for a net conservation benefit to the species, proceed with the design of the mitigation plan and authorization (NEPA) of the Project. The authorization process could identify issues that may require additional mitigation or denial/deferring of the project based on site specific impacts to the Greater Sage-grouse.

## Appendix K – Lands No Longer Available for Disposal

The following public land parcels have been previously identified through the land use planning process as available for sale in conformance with the criteria described in the Federal Lands Policy and Management Act. These lands may be considered for exchange as described in the Proposed Plan but are no longer available for sale.

**Appendix L – Travel Management Planning Guidelines:**

- Among other designation criteria from 43 CFR 8342.1(b), “areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention will be given to protect endangered or threatened species and their habitats.
- During subsequent travel management planning, all routes would undergo a route evaluation to determine its purpose and need and the potential resource and/or user conflicts from motorized travel. Where resource and/or user conflicts outweigh the purpose and need for the route, the route would be considered for closure or considered for relocation outside of sensitive GRSG habitat.
- During implementation-level travel planning, threats to GRSG and their habitat would be considered when evaluating route designations and/or closures.
- During subsequent travel management planning, routes that do not have a purpose or need would be considered for closure.
- During subsequent travel management planning, routes that are duplicative, parallel, or redundant would be considered for closure.
- During subsequent travel management planning, seasonal restrictions on OHV use would be considered in important seasonal habitats where OHV use is a threat.
- During subsequent travel management planning, OHV timing limitations would be considered in important seasonal habitats where OHV use is a threat.
- During subsequent travel management planning, consider limiting over snow vehicle (OSV) travel to designated routes, consider seasonal closures in GRSG wintering areas from November 1 through March 31 or define Designation Criteria (i.e. minimization criteria) to regulate over snow vehicle traffic.
- During subsequent travel management planning, routes not required for public access or recreation with a current administrative/agency purpose or need would be evaluated for administrative access only.
- During subsequent travel management planning, consider prioritizing restoration of routes not designated in a Travel Management Plan.
- During subsequent travel management planning, consider using seed mixes or transplant techniques that will maintain or enhance GRSG habitat when rehabilitating linear disturbances.
- During subsequent travel management planning, consider scheduling road maintenance to avoid disturbance during sensitive periods and times to the extent practicable. Consider using time of day limits (After 10:00 AM to 7:00 PM) to reduce impacts on GRSG during breeding and nesting periods.

Over-snow vehicle – a motor vehicle that is designed for use over snow and that runs on a track or tracks and/or a ski or skis, while in use over snow.

DRAFT

**Appendix M – Functioning of Boards**

DRAFT

Many Montana landowners are long familiar with the rhythmic strutting of the greater sage-grouse attracting mates on dancing grounds across rangelands each spring. Sage-grouse are also gaining recognition as a species that responds to activities at local and landscape-scales. This means habitat management for the conservation of sage-grouse requires coordination and investment among interest groups and private landowners across large expanses of public and private lands. Landowners play a pivotal role in implementing broad-scale strategies at local levels to conserve this iconic species.

The U.S. Fish and Wildlife Service (USFWS) has designated the greater sage-grouse as a candidate species for listing under the Endangered Species Act. They will make a final listing determination by fall 2015. Voluntary implementation of conservation practices by private landowners, through the NRCS Sage-grouse Initiative or other programs, can help preclude the need to list under the Endangered Species Act.

# Landowner Assistance Programs

for Conservation of Greater Sage-grouse in Montana

The following information highlights various programs available to landowners that can be leveraged for conserving sage-grouse populations while also promoting sustainable ranching operations. As our friends in Montana's Conservation Districts say, "What's good for cows is good for sage-grouse." There is a win-win out there that we hope this brochure will highlight. All the programs listed here are voluntary. Contact your local Natural Resource Conservation Service (NRCS) Field Office, Montana Fish, Wildlife and Parks (FWP) Regional Office, or Bureau of Land Management (BLM) Field Office for more information on any of these programs.

**Think Collaboratively!** There are numerous opportunities in Montana to coordinate among agencies to help improve sagebrush-grasslands for livestock, sage-grouse, and other wildlife species!

## Range Management

There are several working lands programs available that provide technical and financial assistance to landowners employing range practices beneficial to sage-grouse. Technical assistance is available for any of the topics listed below and many other practices not listed here.

### ► Fence modifications

Marking fences in high risk areas, which is only about 6-14% of the fences in sage-grouse habitat, can reduce sage-grouse collisions with fences by 83%. Fence collision risk increases closer to leks and in relatively open, flat landscapes. NRCS has developed a collision risk tool to map high risk areas. **NRCS, BLM, FWP, Montana Association of Conservation Districts and Intermountain West Joint Venture** provide free markers to landowners to mark fences in high risk areas. These agencies can assist with finding volunteers for deployment of markers.

FWP's **Private Land Technical Assistance Program** and NRCS's **EQIP** can provide recommendations and financial assistance for constructing or modifying existing fences to meet wildlife friendly guidelines. FWP's *A Landowner's Guide to Wildlife Friendly Fences* publication provides technical guidance.

### ► Grazing practices

Sustainable grazing practices may improve soil health and enhance vegetative communities, benefitting livestock operations and sage-grouse. Technical and financial assistance for prescribed grazing systems and associated infrastructure including fences, water tanks, and wildlife escape ramps are provided by NRCS's **Sage-grouse Initiative** and FWP's **Habitat Montana, Private Land Technical Assistance Program** and the **Upland Game Bird Enhancement Program**. Several of Montana's Conservation Districts sell escape ramps for a minimal charge. FWP programs allow for consultation and grazing system design in addition to cost-sharing on boundary and interior fences and can be applied to grazing leases on state or federal lands.

NRCS and BLM are working cooperatively on whole ranch plans if a landowner desires that cross jurisdictional boundaries be used to facilitate landscape-scale planning. Typically one plan among agencies will simplify grazing management for the lessee.

### ► Restoration and enhancement

NRCS's **Sage-grouse Initiative** and FWP's **Upland Game Bird Enhancement Program** can provide financial assistance for a variety of restoration, seeding, and invasive species control activities designed to enhance sagebrush systems for sage-grouse. **County Weed Districts** often have free equipment loan programs and may provide funding as-

sistance for noxious weed control if the property is located in a Cooperative Weed Management Area.

Wetland restoration and enhancement can be beneficial to sage-grouse as brood rearing habitat in localized areas. There are a variety of assistance programs available for wetlands including **NRCS Programs, FWP Migratory Game Bird License Habitat Program, Montana Department of Transportation, North American Wetland Conservation Act** funding, and others.

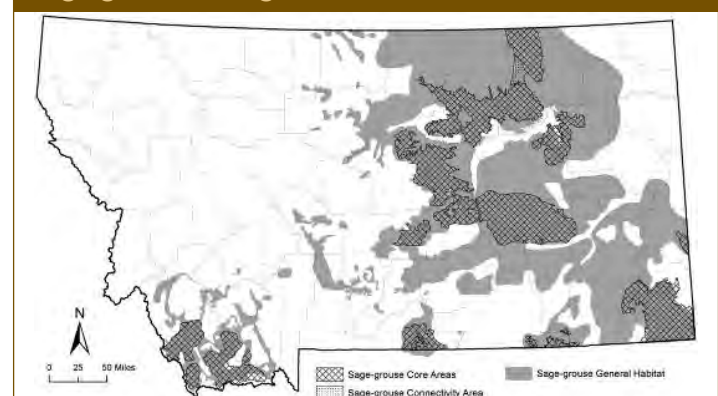

## Conservation Easements

Landowners interested in protecting sage-grouse habitat have a variety of easement options. Often, partnerships can be established to leverage a combination of programs to maximize return to landowners. Local land trusts and conservation organizations can also help identify potential easement funding sources.

NRCS offers the **Agricultural Conservation Easement Program (ACEP)** that provides a permanent easement option on rangelands or wetlands. ACEP requires a 1:1 match of federal to non-federal dollars for agricultural easements but there may be a waiver for portions of the match requirement on some grasslands. Partnerships can often help secure some non-federal match. Wetland easements do not require match. Reserved grazing rights are available with wetland easements but payments are decreased proportionately for the retention of that right.

FWP offers permanent conservation easements through various programs including **Habitat Montana, Upland Game Bird Enhancement Program (UGBEP), and Migratory Bird Habitat Program**. FWP easements typically require grazing management plans. Productive upland game bird habitats that also provide substantial bird hunting opportunities are the focus of conservation easements funded in part with UGBEP dollars. Migratory Bird Habitat Program funds are only eligible for wetlands and associated uplands.

### Sage-grouse Management

FWP has designated priority areas for sage-grouse conservation called Core Areas. General habitat are areas that support sage-grouse but typically in lower densities than Core Areas. Range management practices and easements that benefit sage-grouse are encouraged throughout their range but especially in Core Areas.

# Owyhee County

## Sage-Grouse Local Working Group

### Funding

The OCSGLWG has obtained over **\$X,000,000** in project funding for sage-grouse habitat and research projects since 1998.

The OCSGLWG finds available funding sources and works to match these to willing landowners who can make the largest conservation gains.

Sage-grouse Initiative, EQIP and WHIP funding is available through the Natural Resources Conservation Service.

US Fish and Wildlife Service offers several funding opportunities including: Private Stewardship Program, Cooperative Conservation Initiative, Multistate Conservation Grant Program, and Landowner Incentive Grant.

Several private organizations have funding available including the Nature Conservancy and the Rocky Mountain Elk Foundation.

The Jordan Valley Cooperative Weed Management Area and the Eastern Owyhee Cooperative Weed Management Area have the ability to assist with many invasive species issues.

*A complete copy of the LWG management plan is available through the Owyhee County Natural Resources Committee or the Idaho Department of Fish and Game*

*Anyone interested in helping with this project can contact:*

**Donna Bennett**  
LWG Chair.

**IDMT\_PUB\_12027**  
**2.3**  
**12/4/2015**

Since 1998 the OCSGLWG has utilized local input and knowledge to protect and enhance sage-grouse management and sage-grouse habitat on private and public lands in Owyhee County.

**Locally Led**  
**Locally Focused**

Habitat conversion from wildfire and invasive species are the biggest threats to the continuing existence of sage-grouse.

## SAGE-GROUSE MANAGEMENT PLAN

Initially the Local Working Group (LWG) spent two years gathering input from a wide variety of participants, identifying issues and planning strategies to deal with those issues.

A management plan was written in 2000. It has been endorsed by the Owyhee Cattleman's Association, the Owyhee County Natural Resources Committee, various wildlife services, the Bureau of Land Management, the Idaho Department of Fish and Game, and the Idaho Department of Lands. The plan was updated in 2004 and 2012. It is available on the Idaho Department of Fish and Game website.

The Idaho Department of Fish and Game has been an integral part of the Owyhee County Sage-Grouse Local Working Group since its inception. The IDFG has contributed manpower, technical assistance, and funding.

The Owyhee County Sage Grouse Local Working Group was formed in April 1998 in conjunction with both the Idaho State Plan, which called for Local Working Groups, and the County Land Use Plan, which called for the formation of subcommittees of the County Land Use Planning Committee whenever a species was believed to be threatened or endangered.

Pete DePrati 1955

In August of 1998, the County Land Use Planning Committee, forerunner of the current County Natural Resources Committee, signed a Memorandum of Understanding with the Idaho Department of Fish and Game.

This memorandum established the roles and responsibilities of the two organizations in the development of a local working group and the production of a local conservation plan.

## Project Successes

### Bluebird Mine Fire Restoration

Burned in 2003. This site was effectively treated with seed mix designed to be beneficial to sage-grouse.

### Crab Creek Meadows

#### Restoration

Stream head cutting lowered the water table in this meadow, destroying this important brood rearing area. The installation of dikes immediately restored the meadow!

### Chubby Spain Fire Restoration

6,011 acres burned in 2006. Aerial and broadcast seeding of sagebrush and other natives occurred with high success.

### Juniper Mastication

We proved that mechanical removal of juniper trees can be cost effective and can immediately benefit sage-grouse habitat by restoring sagebrush and meadows.

## Idaho/Southwest Montana Subregion Sage-Grouse RMP/EIS

### Cooperating Agency Call

April 10, 2014 10:00 a.m. MST

#### Attendance

BLM/FS: Brent Ralston

Counties: Doug Balfour – Power County; Jack Depperschmidt – DOE

#### Meeting Minutes

- The ID team is reviewing the public comments and ensuring the comments are responded to. Determining what changes need to be made in the FEIS. Had a week-long meeting last week and groups met by program area to respond to comments.
- Team of biologists and planners will be meeting over the next month and a half to review the greater sage-grouse science, including the science in the draft and additional literature suggested by the public. Group will determine how best to incorporate those into the existing analysis.
- Putting together preliminary proposed plan internally through the end of this month. Hope to share this with cooperators by early to mid-May. Review timeframe will likely be 1-2 weeks.
- BLM and Forest Service are having discussions with the state and USFWS regarding the mapping of greater sage-grouse management areas.
- BLM/FS also having additional discussions with the state task force about the alternatives. Team is choosing management largely from Alternatives D and E and the proposed plan will incorporate adaptive management. Ongoing discussions regarding the disturbance cap. Trying to ensure we're looking and measuring at the same scale for the disturbance cap and adaptive management/monitoring components.
- Trying to streamline the FEIS so that it is easier to review. Proposed plan will not likely be presented in a matrix but will be organized in a shorter, bulleted format. Matrix was useful for comparison of alternatives in the draft, but the focus is on the proposed plan for the FEIS.
- Poisoning ravens project – incorporated into the cumulative effects analysis. BLM does not have a decision to make on this, but the project could affect sage-grouse and ravens. Will look at the APHIS NEPA document and incorporate their effects analysis into our cumulative effects for a more complete picture of effects.

Wyane Butts, Representative  
Custer County Commissioners  
P.O. Box 385  
Challis, ID 83226

Dear Mr. Butts,

As the Idaho Bureau of Land Management (BLM) State Director, I have signed the Memorandum of Understanding (MOU), formalizing your cooperating agency agreement with Idaho BLM as part of the BLM's National Greater Sage-Grouse Planning Strategy.

The MOU describes specific aspects of the agreement. In general, cooperating agencies share skills and resources to help shape BLM land use plans and environmental analyses that better reflect the policies, needs, and conditions of their jurisdictions and the citizens they represent. Cooperating agencies accept obligations to contribute staff time, develop and review analyses for which they have particular expertise, and fund their own participation. The MOU contains specific details regarding that contribution, and primarily identifies collaboration through meetings and potential data sharing.

Given the large geographic scale of the project – covering southern Idaho and southwestern Montana – most coordination as a cooperating agency for this effort will be done in a virtual environment (i.e. via phone, conference calls and electronic mail) and hosted by the BLM.

We have also included the BLM's Cooperating Agency Desk Guide. The guide is a great resource for cooperating agencies and provides Department of the Interior regulations and policies for land use planning.

We look forward to working with you throughout the development of this project. If you have any questions or concerns please contact Brent Ralston at (208) 373-3812 or [bralston@blm.gov](mailto:bralston@blm.gov). There is also information regarding Cooperating Agencies available online at: [http://www.blm.gov/wo/st/en/info/nepa/cooperating\\_agencies.html](http://www.blm.gov/wo/st/en/info/nepa/cooperating_agencies.html).

The BLM will be hosting coordination calls with our formal cooperating agencies. We will continue to update you on any upcoming coordination calls, meetings and milestones in the planning process.

We appreciate your continued interest in this project and look forward to working with you in the future.

Sincerely,

Steven A. Ellis  
Idaho BLM State Director

## Idaho/Southwest Montana Subregion Sage-Grouse RMP/EIS

### Cooperating Agency Call

July 2, 2014 10:00 a.m. MST

#### Attendance

BLM: Brent Ralston

Counties: Bill Frederiksen – Clark County; Doyle Lamb – Custer County; Ladd Carter – Bingham County

#### Action Items

- Review the proposed plan and components and send Brent comments in the comment form provided by July 18<sup>th</sup>.

#### Meeting Minutes

##### *Project Update*

- Working with the Washington Office and National USFWS office regarding direction for the proposed plan. Have been approved to move forward with the proposed plan. Preparing administrative draft proposed plan.
- A review package with the proposed decisions will go out today or tomorrow to the counties. Asking for a 2 week review period for comments, concerns, and questions. Look at the management actions and see if there's anything in conflict with the county land use plans.
- The proposed plan (Alternative G) contains about 40 pages of management decisions broken down by program area. Brent will send two electronic files: 1) proposed decisions (40 pages); 2) supporting documentation/appendices that are directly associated with the proposed decisions and provide more detail and background (150 pages). Brent will also send a comment form with directions. Send comments to Brent by **July 18<sup>th</sup>**.
- A number of federal and state cooperating agencies have been involved in preparing the plan (e.g., Forest Service, ID Office of Species Conservation, IDFG, Montana FWP).
- Expect to compile administrative final EIS by mid-late august and will share the full document around that time.
- The proposed plan will be sent to all county cooperators, including INL and Craters of the Moon, as well as the tribes. Plan has been shared with the state. Will not be distributed widely before September at the earliest.

##### *Proposed Plan Overview*

- Proposed plan was prepared by combining key components of Alternatives D and E. While the text will not be exactly the same, it is similar to both of those alternatives.
- Brent reviewed the proposed plan section by section as summarized below.
- Summary of all decisions up front.

- Discussion of goals and objectives; includes habitat treatments (still working on acreages)
- General direction – following laws, the last couple items relate to RDFs, BMPs, seasonal restrictions, and lek buffer distances for implementation activities (details included as an appendix).
- Coordination with other agencies
- Management Areas – two maps: 1) Conservation Areas – Similar to Alternative E but added one Conservation Area for Montana; 2) Three management zones (similar to Alternative E) – Core (CMZ), Important (IMZ), and General (GMZ). Montana does not have any Important Management Zones.
- Adaptive management – Based on habitat and population measurements. Soft trigger – look at site-specific changes; hard trigger would require a land use plan amendment. Similar to Alternative E, if a hard trigger is tripped, IMZ would be managed as CMZ.
- Baseline map – will continue to use key habitat map to track the change in acres for adaptive management. This map is updated on an annual basis.
- Anthropogenic disturbance – included a 3% disturbance threshold based on USFWS concerns. Evaluated percent disturbance (large infrastructure, does not include fences, two-track roads, or range improvement projects) within CMZ and IMZ by Conservation Area. All areas range between 0.8 percent to 2.2 percent development.
- Exception criteria for CMZ and development criteria for IMZ – they are the same as Alternative E, though some changes have been made for clarity.
- Mitigation – setting up a mitigation board at the state level. Still working out the details. Develop a state-wide mitigation strategy built on the Idaho framework for mitigation.
- Wildfire: a number of actions related to preparedness, suppression, fuels management and ES&R:
  - Working with the RFPAs and pre-season coordination efforts.
  - Complete Wildfire and Invasive Species Assessments to help prioritize areas on a field office basis; identify areas for fuel breaks, etc. GRSG is the highest priority after life and property.
  - Fuels management, including targeted grazing, using existing ROWs.
  - ES&R primarily with native seeds.
- Habitat restoration and vegetation management – similar to some of the ES&R management, it is just done under a different program. Focus on Stage 1 and 2 juniper stands – rapid recovery because understory still there.
- Lands and realty – linked closely with the anthropogenic disturbance threshold and the criteria for when projects would be allowed. Identify ROW exclusion, avoidance, and avoidance. All CMZ and IMZ are ROW avoidance – must meet the criteria. Some exclusions in CMZ: wind, solar, hydropower, nuclear, and commercial service airports. Land tenure adjustments described.
- Fluid mineral development – low and no potential areas within CMZ are closed; moderate and high potential areas in CMZ and IMZ are open with NSO. Geothermal has a different potential map.

- Phosphate – no Known Phosphate Leasing Areas (KPLAs) in CMZ. Outside of KPLAs, CMZ is closed. IMZ in KPLA open; outside KPLAs, must meet the development criteria.
- Grazing – point to rangeland health assessment process.
- Wild horse and burros – no changes
- Travel management – limited to existing routes unless already identified as an open play area. Follow up with travel management planning to designate the routes.
- Monitoring

# IDAHO AND SW MONTANA BLM MANAGEMENT ACTIONS AND FOREST SERVICE PLAN COMPONENTS – A CROSSWALK

BLM Management Actions	Forest Service Plan Components
<p><b>MA-OBJ-1 (Management Area – Objective):</b> Maintain a resilient population of GRSG in Idaho and Southwestern Montana.</p>	<p><b>GRSG-GEN-DC-001-Desired Condition</b> – The landscape for greater sage-grouse encompasses large contiguous areas of native vegetation, approximately 6 to 62 square miles in area, to provide for multiple aspects of species life requirements. Within these landscapes, a variety of sagebrush-community compositions exist without invasive species, which have variations in subspecies composition, co-dominant vegetation, shrub cover, herbaceous cover, and stand structure, to meet seasonal requirements for food, cover, and nesting for greater sage-grouse.</p> <p><b>GRSG-GEN-DC-002-Desired Condition</b> – Anthropogenic disturbance is focused in non-habitat areas outside of priority, important, and general habitat management areas and sagebrush focal areas. Disturbance in general habitat management areas are limited, and there is little to no disturbance in priority and important habitat management areas and sagebrush focal areas except for valid existing rights and existing authorized uses.</p>
<p><b>MA-OBJ-2:</b> Designate GRSG management areas and associated management to maintain a resilient population and to designate strategically located adjacent areas to provide a buffer from unpredictable habitat loss such as wildfire to the resilient population areas.</p>	<p><b>GRSG-GEN-DC-001-Desired Condition</b> – The landscape for greater sage-grouse encompasses large contiguous areas of native vegetation, approximately 6 to 62 square miles in area, to provide for multiple aspects of species life requirements. Within these landscapes, a variety of sagebrush-community compositions exist without invasive species, which have variations in subspecies composition, co-dominant vegetation, shrub cover, herbaceous cover, and stand structure, to meet seasonal requirements for food, cover, and nesting for greater sage-grouse.</p>

BLM Management Actions	Forest Service Plan Components
	<p><b>GRSG-GEN-DC-002-Desired Condition</b> – Anthropogenic disturbance is focused in non-habitat areas outside of priority, important, and general habitat management areas and sagebrush focal areas. Disturbance in general habitat management areas are limited, and there is little to no disturbance in priority and important habitat management areas and sagebrush focal areas except for valid existing rights and existing authorized uses.</p>
<p><b>MA-OBJ-3:</b> Identify and strategically protect larger intact sagebrush areas and areas of lower fragmentation to maintain GRSG population persistence.</p>	<p><b>GRSG-GEN-DC-001-Desired Condition</b> – The landscape for greater sage-grouse encompasses large contiguous areas of native vegetation, approximately 6 to 62 square miles in area, to provide for multiple aspects of species life requirements. Within these landscapes, a variety of sagebrush-community compositions exist without invasive species, which have variations in subspecies composition, co-dominant vegetation, shrub cover, herbaceous cover, and stand structure, to meet seasonal requirements for food, cover, and nesting for greater sage-grouse.</p> <p><b>GRSG-GEN-DC-002-Desired Condition</b> – Anthropogenic disturbance is focused in non-habitat areas outside of priority, important, and general habitat management areas and sagebrush focal areas. Disturbance in general habitat management areas are limited, and there is little to no disturbance in priority and important habitat management areas and sagebrush focal areas except for valid existing rights and existing authorized uses.</p>
<p><b>HM-OBJ-1 (Habitat Management):</b> Maintain or make progress toward at least 70 percent of lands within PHMAs and IHMAs capable of producing sagebrush at 10 to 25 percent canopy cover and conifers absent to uncommon within 1.86 miles of occupied leks.</p>	<p><b>GRSG-GEN-DC-001-Desired Condition</b> – The landscape for greater sage-grouse encompasses large contiguous areas of native vegetation, approximately 6 to 62 square miles in area, to provide for multiple aspects of species life requirements. **BLM Management Actions**

---

---

**Forest Service Plan Components**

---

**HM-OBJ-2:**Incorporate GRSG Seasonal Habitat Objectives (Table 2-3) into the design of projects or activities, as appropriate, based on site conditions and ecological potential, unless achievement of fuels management objectives require additional reduction in sagebrush cover to meet strategic protection of GRSG habitat and conserve habitat quality for the species or at least one of the following conditions can be demonstrated and documented in the NEPA analysis associated with the specific project:

- A specific objective is not applicable to the site-specific conditions of the project or activity;
- An alternative objective is determined to provide equal or better protection for GRSG or its habitat (based on appropriate scientific findings); or
- Analysis concludes that following a specific objective would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.
- These habitat objectives in Table 2-3 summarize the characteristics that research has found represent the seasonal habitat needs for GRSG. The specific seasonal components identified in the table were adjusted based on local science and monitoring data to define the range of characteristics used in this sub-region. Thus, the habitat objectives provide the broad vegetative conditions we strive to obtain across the landscape that indicate the seasonal habitats used by GRSG. These habitat indicators are consistent with the rangeland health indicators used by the BLM.
- The habitat objectives will be part of the GRSG habitat assessment

**GRSG-GEN-DC-002-Desired Condition** – Anthropogenic disturbance is focused in non-habitat areas outside of priority, important, and general habitat management areas and sagebrush focal areas. Disturbance in general habitat management areas are limited, and there is little to no disturbance in priority and important habitat management areas and sagebrush focal areas except for valid existing rights and existing authorized uses.

**GRSG-GEN-DC-003-Desired Condition** – In all greater sage-grouse seasonal habitats, including all seasonal habitats, 70% of lands capable of producing sagebrush have 10 to 30% sagebrush canopy cover and less than 10% conifer canopy cover. In addition, within breeding and nesting habitat, sufficient herbaceous vegetation structure and height provides overhead and lateral concealment for nesting and early brood rearing life stages. Within brood rearing habitat, wet meadows and riparian areas sustain a rich diversity of perennial forb species relative to site potential. Within winter habitat, sufficient sagebrush height and density provides food and cover for greater sage-grouse during this seasonal period. Specific desired conditions for greater sage-grouse based on seasonal habitat requirements are in table 2-6.

**GRSG-GRSGH-ST-028-Standard** – Design habitat restoration projects to move towards desired conditions (Table 2-6) and incorporate the concepts outlined in Appendix D - *Using resistance and resilience concepts to reduce impacts of invasive annual grasses and altered fire regimes on the sagebrush ecosystem and greater sage-grouse: A strategic multi-scale approach.*

**GRSG-GRSGH-GL-029-Guideline** – Sagebrush removal in GRSG breeding and nesting and wintering habitats should be avoided unless necessary to support attainment of desired habitat conditions (Table 2-6).

**GRSG-GRSGH-GL-032-Guideline** - To facilitate safe and effective fire management actions, in PHMA, IHMA, and GHMA and SFAs, fuels treatments in high-risk areas (i.e., areas likely to experience wildfire at

BLM Management Actions	Forest Service Plan Components
<p>to be used during land health evaluations (see Monitoring Framework, Appendix E). These habitat objectives are not obtainable on every acre within the designated GRSG habitat management areas. Therefore, the determination on whether the objectives have been met will be based on the specific site's ecological ability to meet the desired condition identified in the table.</p> <ul style="list-style-type: none"> <li>• All BLM use authorizations will contain terms and conditions regarding the actions needed to meet or progress toward meeting the habitat objectives. If monitoring data show the habitat objectives have not been met nor progress being made towards meeting them, there will be an evaluation and a determination made as to the cause. If it is determined that the authorized use is a cause, the use will be adjusted by the response specified in the instrument that authorized the use.</li> </ul>	<p>an intensity level that might result in movement away from the GRSG desired conditions in Table 2-6) should be designed to reduce the spread and/or intensity of wildfire or the susceptibility of GRSG values to move away from desired conditions (Table 2-6).</p> <p><b>GRSG-GRSGH-GL-034-Guideline</b> – In PHMA, IHMA and SFAs, vegetation treatment projects should only be conducted if they restore, enhance, or maintain desired conditions (Table 2-6).</p>
<p><b>CC-1:</b> Collaborate, coordinate and utilize cooperative planning efforts to implement and monitor activities to achieve desired conditions and to maximize the utilization of available funding opportunities. Coordination efforts could include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups, public lands permit holders and non-governmental organizations.</p>	<p>No similar management direction.</p>
<p><b>CC-2:</b> Develop a cooperative MOU between the BLM, Forest Service and State of Idaho to establish the State of Idaho as a cooperating agency during implementation of the final decision. The MOU would identify responsibilities, role and interaction of the BLM, Forest Service and State of Idaho. Montana BLM will participate as appropriate on Montana's Sage-grouse Oversight Team to facilitate coordination and implementation of BLM's final decision and Montana's Executive Order No. 10-2014.</p>	<p>No similar management direction.</p>
<p><b>CC-3:</b> The BLM and Forest Service would consider any recommendations from the Governor of Idaho as a result of evaluation completed by the Sage-Grouse Implementation Task Force.</p>	<p>No similar management direction.</p>

BLM Management Actions	Forest Service Plan Components
<p><b>CC-4:</b> Idaho: The BLM would coordinate with the State of Idaho and the Idaho Sage-Grouse Implementation Task Force regarding proposed management changes, the implementation of conservation measures, mitigation, and site-specific monitoring, related to adaptive management, anthropogenic disturbance and livestock grazing (Appendix M).</p>	<p>No similar management direction.</p>
<p><b>CC-5:</b> Montana: The BLM would coordinate with the State of Montana and the Montana Sage-grouse Oversight Team regarding proposed management changes, the implementation of conservation measures, mitigation, and site-specific monitoring, related to adaptive management and anthropogenic disturbance (Appendix M).</p>	<p>No similar management direction.</p>
<p><b>CC-6:</b> At the state level, BLM and Forest Service would coordinate with IDFG, MFWP, USFWS, and other conservation partners in collaborative efforts with adjacent states (Oregon, Nevada, Utah, Montana, Wyoming) in GRSG MZs IV and II to evaluate GRSG habitat and population status and trends and make appropriate regional recommendations for GRSG conservation at broader scales.</p>	<p>Included in BLM management action.</p>
<p><b>CC-7:</b> At the state level, BLM and Forest Service would coordinate with the appropriate WAFWA Sage-grouse Technical Committee to develop consistent population and habitat monitoring approaches that facilitate GRSG conservation at the MZ scale.</p>	<p>Include in BLM management action.</p>
<p><b>MA-1 (Management Area):</b> Designate five GRSG Conservation Areas (see Chapter 8, Glossary) within the sub-region to form the geographic basis for achieving population objectives; evaluating the disturbance density and adaptive regulatory triggers; and tailor adaptive management responses. These conservation areas are depicted in Figure 2-1. These areas are referred to as Mountain Valleys, Desert, West Owyhee, Southern and Southwestern Montana Conservation Areas.</p> <p>Conservation Area Description:</p> <ul style="list-style-type: none"> <li>Mountain Valleys Conservation Area – generally located north of the Snake River Plain, including GRSG habitat in the Salmon and Challis areas, and habitat in west-central population area. It</li> </ul>	<p>No similar management direction.</p>

---

**BLM Management Actions****Forest Service Plan Components**

---

extends west from Rexburg, north and west of Highway 33 to Howe, north and west of Highway 33/22 to Arco, north and west of Highway 26/20/93 to Carey, north and west of Highway 20 west to Hill City, north and west of Highway 20 to the Dylan Karaus Road, west to Canyon Creek. Canyon Creek to the confluence with the Snake River form the western boundary.

- Desert Conservation Area – located north of the Snake River and south of the Mountain Valleys Conservation Area. It extends from the confluence of Canyon Creek and the Snake River, eastward to Idaho Falls. The Snake River and Henry’s Fork form the eastern boundary.
- West Owyhee Conservation Area – located south of the Snake River and west of the Bruneau River.
- Southern Conservation Area – located south of the Snake River and east of the Bruneau River, including East Idaho uplands and Bear Lake Plateau, and the Utah portion of the Sawtooth National Forest in Box Elder County.
- Southwestern Montana – located in southwestern Montana - encompassing the Dillon Butte BLM Field Office and Beaverhead-Deerlodge National Forest boundaries (the Butte RMP is not being amended and since there are limited GRSG federal GHMAs, management actions do not apply in the Butte Field Office).
- In general, GRSG habitats in the Desert and West Owyhee CAs are relatively contiguous, while those in the Mountain Valleys and Southern CAs tend to be more fragmented due to more complex topography, and elevational differences and/or effects from wildfires, agriculture, urbanization or other factors.

---

**MA-2:** Within each Conservation Area designate GRSG Habitat Management Areas: Priority, Important and General Habitat Management Areas (Figure 2-2). Priority Habitat Management Areas (PHMAs) focus on conserving the two key meta-populations in the sub-region. PHMA encompasses areas with the highest conservation value to GRSG, based on the presence of larger leks, habitat extent, important movement and connectivity corridors and winter habitat.

---

No similar management direction.

BLM Management Actions	Forest Service Plan Components
<p>PHMAs include adequate area to accommodate continuation of existing land uses and landowner activities. Important Habitat Management Areas (IHMAs) contain additional habitat and populations that provide a management buffer for the PHMA and to connect patches of PHMA. IHMA encompasses areas of generally moderate to high conservation value habitat and/or populations and in some Conservation Areas includes areas beyond those identified by USFWS as necessary to maintain redundant, representative and resilient populations (Priority Areas for Conservation (PACs)). IHMAs are typically adjacent to PHMAs but generally reflect somewhat lower GRSG population status and/or reduced habitat value due to disturbance, habitat fragmentation or other factors. There are no IHMAs designated within the Southwestern Montana Conservation Area. General Habitat Management Areas (GHMAs) encompass habitat that is outside of PHMAs or IHMAs. GHMAs contain approximately 10 percent of the occupied leks that are also of relatively low male attendance compared to leks in PHMA or IHMA. GHMAs are generally characterized by lower quality disturbed or patchy habitat of low lek connectivity.</p>	
<p><b>MA-3:</b> In Idaho, Designate PHMA and IHMA to encompass 90 percent of the breeding males in Idaho. In Montana, designate PHMA to encompass Montana Fish, Wildlife, and Parks 2009 Greater Sage Grouse Core Area designations.</p>	<p>No similar management direction.</p>
<p><b>MA-4:</b> Annually prioritize Conservation Areas at the state scale considering results of the annual adaptive regulatory trigger evaluations relative to implementation of restoration and mitigation activities.</p>	<p>No similar management direction.</p>
<p><b>MA-5:</b> Prioritize activities and mitigation to protect, enhance and restore GRSG habitats (i.e., fire suppression activities, fuels management activities, vegetation treatments, invasive species treatments etc.) first by Conservation Area, if appropriate (Conservation Area under adaptive management or at risk of engaging adaptive management), followed by PHMAs, then IHMAs then GHMAs within the Conservation Areas. Local priority areas within these areas will be further refined as a result of completing the GRSG Wildfire and</p>	<p>Direction will be included in the Implementation Guide.</p>

BLM Management Actions	Forest Service Plan Components
<p>Invasive Species Habitat Assessments as described in Appendix D. This could include projects outside GRSG habitat when those projects would provide a benefit to GRSG habitat.</p>	
<p><b>MA-6:</b> The management area map and Biologically Significant Unit (BSU) baseline map would be re-evaluated in conjunction with plan evaluation processes (i.e. approximately every 5 years). This re-evaluation could indicate the need to adjust PHMA, IHMA or GHMA or the habitat baseline. These adjustments could occur upon completion of the appropriate analysis (plan amendment) to review the allocation decisions based on the map. Results from the Wildfire and Invasive Species Assessments, such as identified focal or emphasis areas would also be used to help inform mapping adjustments during this evaluation.</p>	<p>Direction will be included in either the Implementation Guide or the Record of Decision.</p>
<p><b>MA-7:</b> GRSG habitat within the project area would be assessed during project-level NEPA analysis within the management area designations (PHMA, IHMA, GHMA). Project proposals and their effects would be evaluated based on the habitat and values affected</p>	<p>No similar management direction.</p>
<p><b>MA-8:</b> Idaho BLM will annually update the Key Habitat map as described in Appendix F, in order to reflect habitat changes resulting from wildfire, succession, and vegetation treatments that occurred or were observed since the last update. Key habitat includes areas of generally intact sagebrush that provide sage-grouse habitat during some portion of the year. This map also identifies potential restoration areas (perennial grassland annual grasslands, conifer encroachment and recent burns). This map a broad scale current vegetation map that changes as habitat is lost or restored. The Key Habitat Map is not an allocation decision such as PHMA, IHMA, and GHMA. Updates to the map will also occur if it is determined that mapping errors or omissions have occurred, or that radio-telemetry studies indicate that GRSG are consistently utilizing an area. Updates are also intended to capture recommendations by the field offices, GRSG Local Working Groups, or agency partners in GRSG conservation. Project-level evaluations of GRSG habitat during the NEPA process may also be used to inform the annual update.</p>	<p>No similar management direction.</p>

BLM Management Actions	Forest Service Plan Components
<p><b>MA-9:</b> Areas of habitat outside of delineated management areas identified during the Key habitat update process would be evaluated during site specific NEPA for project level activities and GRSG required design features (Appendix B), seasonal timing restrictions (Appendix C) and buffers (Appendix B) would be included as part of project design. These areas would be further evaluated during plan evaluation and the 5-year update to the management areas, to determine whether they should be included as PHMAs, IHMAs, or GHMAs.</p>	<p>No similar management direction.</p>
<p><b>MA-10:</b> Designate Sagebrush Focal Areas (SFA) as shown on Figure 2-3. SFAs will be managed as PHMA, with the following additional management:</p> <p>Recommended for withdrawal from the General Mining Act of 1872, as amended, subject to valid existing rights.</p> <p>Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.</p> <p>Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions).</p> <p>Areas of non-PHMA mapped within the SFA boundary will not be managed as SFA, except for the Donkey Hills ACEC and three Forest Service parcels in the Lost River Range, Idaho (Borah Peak, Big Flat Top Mountain, and Copper Basin Knob).</p>	<p>Sagebrush focal areas on National Forest System lands are mapped and will be included in the Record of Decision.</p> <p><b>GRSG-M-FMUL-ST-079-Standard</b> – In sagebrush focal areas, there will be no surface occupancy and no waivers, exceptions, or modifications for fluid mineral leasing.</p> <p><b>GRSG-M-FML-GL-086-Guideline</b> – On existing Federal leases in priority and important habitat management areas and sagebrush focal areas, when surface occupancy cannot be restricted due to valid existing rights or development requirements, disturbance and surface occupancy should be limited to areas least harmful to greater sage-grouse based on vegetation, topography, or other habitat features.</p>
<p><b>AM-1 (Adaptive Management):</b> Idaho: Use hard and soft population and habitat triggers to determine an appropriate management response as described in AM-6 to AM-16. Hard and soft triggers responses are applied at the Conservation Area (MA-1) scale (Appendix G).</p>	<p><b>GRSG-AM-ST-010-Standard</b> – If a hard trigger is identified, immediate action is necessary to stop a severe deviation from GRSG conservation objectives. Upon reaching a hard trigger, an appropriate component of a more restrictive alternative analyzed in the environmental impact statement will be implemented. The Forest Service will review available and pertinent data in coordination with greater sage-grouse biologists from multiple agencies (Appendix G).</p> <p><b>GRSG-AM-ST-011-Standard</b> – If a soft trigger is identified, apply more conservative or restrictive implementation measures (e.g.,</p>

BLM Management Actions	Forest Service Plan Components
	extending seasonal restrictions for seasonal surface disturbing activities, modifying seasons of use for livestock grazing, and applying additional restrictions on discretionary activities) for the specific causal factor in the decline of populations and/or habitats, considering and conditions (Appendix G).
<b>AM-2:</b> Utilize monitoring information collected through the Monitoring Framework (Appendix E) to determine when adaptive regulatory triggers have been met.	Direction will be included in the Implementation Guide.
<b>AM-3:</b> Idaho: BLM and Forest Service would maintain GRSG habitat information, through use of the Key Habitat map or latest sagebrush/vegetation map, which would be used to track and identify habitat changes to assess the habitat trigger in the adaptive management approach. Key habitat map updates are made each winter by BLM in coordination with the Forest Service and IDFG, using the process described in Appendix F.	Direction will be included in the Implementation Guide.
<b>AM-4:</b> Idaho: BLM would coordinate with the IDFG regarding population information collected and maintained by the IDFG to track and identify population changes to assess the population trigger in the adaptive management approach.	Standard operating procedure.
<b>AM-5:</b> Idaho: Twice each year the applicable monitoring information would be reviewed to determine if any adaptive management triggers have been met.	Direction will be included in the Implementation Guide.
<b>AM-6:</b> Idaho: Adaptive habitat regulatory triggers would be individually calculated across all ownerships within the BSUs (Appendix G). The BSU is defined as the IDFG modeled nesting and wintering habitat (IDFG 2013, unpublished data) within PHMAs and IHMAs within a Conservation Area. The sagebrush component of the BSU is represented by the Key habitat within the BSU present during the 2011 baseline and as mapped during subsequent annual Key habitat map updates. Key habitat is defined as areas of generally intact sagebrush that provide GRSG habitat during some portion of the year (ISAC 2006).	Direction will be included in the Implementation Guide.

---

**BLM Management Actions****Forest Service Plan Components**

---

**AM-7:** Adaptive Regulatory Criteria for Habitat Hard Triggers are defined as:

- A 20 percent loss of Key Habitat within the BSU of the PHMA of a Conservation Area when compared to the 2011 baseline, inclusive of all land ownerships or
- A 20 percent loss of Key Habitat within the BSU of the IHMA of a Conservation Area when compared to the 2011 baseline.

---

**AM-8:** Adaptive Regulatory Criteria for Habitat Soft Triggers are defined as:

A 10 percent loss of Key Habitat within the BSU of the PHMA of a Conservation Area when compared to the 2011 baseline; or

A 10 percent loss of Key Habitat within the BSU of the IHMA of a Conservation Area when compared to the 2011 baseline.

**GRSG-AM-ST-010-Standard** – If a hard trigger is identified, immediate action is necessary to stop a severe deviation from greater sage-grouse conservation objectives. Upon reaching a hard trigger, an appropriate component of a more restrictive alternative analyzed in the environmental impact statement will be implemented. The Forest Service will review available and pertinent data in coordination with greater sage-grouse biologists from multiple agencies (Appendix Z - Adaptive Management Guidance and Sideboards).

**GRSG-AM-ST-011-Standard** – If a soft trigger is identified, apply more conservative or restrictive implementation measures (e.g., extending seasonal restrictions for seasonal surface disturbing activities, modifying seasons of use for livestock grazing, and applying additional restrictions on discretionary activities) for the specific causal factor in the decline of populations and/or habitats, considering local knowledge and conditions (Appendix Z - Adaptive Management Guidance and Sideboards).

---

**GRSG-AM-ST-010-Standard** – If a hard trigger is identified, immediate action is necessary to stop a severe deviation from greater sage-grouse conservation objectives. ---

---

**BLM Management Actions**

**AM-9:** Adaptive Regulatory Criteria for Population Hard Triggers are defined as:

A 20 percent decline in the current 3-year average of total maximum number of males counted compared to the 2011 maximum male baseline and a finite rate of change ( $\lambda$ ) significantly below 1.0 within PHMA within a Conservation Area over the same 3-year period; or

A 20 percent decline in the current 3-year average of total maximum number of males counted compared to the 2011 maximum male baseline and a finite rate of change ( $\lambda$ ) significantly below 1.0 within IHMA within a Conservation Area over the same 3-year period.

Significance is defined by the 90 percent confidence interval around the current 3-year finite rate of change. If the 90 percent confidence interval is less than, and does not include 1.0, then the finite rate of change is considered significant. The finite rate of change and variance will be calculated following Garton et al. (2011).

**AM-10:** Adaptive Regulatory Criteria for Population Soft Triggers are defined as:

A 10 percent decline in the current 3-year average of total maximum number of males counted compared to the 2011 maximum male baseline and a finite rate of change ( $\lambda$ ) below 1.0 within PHMA within a Conservation Area over the same 3-year period; or

A 10 percent decline in the current 3-year average of total maximum number of males counted compared to the 2011 maximum male baseline and a finite rate of change ( $\lambda$ ) below 1.0 within IHMA within a Conservation Area over the same 3-year period.

**BLM Management Actions****Forest Service Plan Components**

---

found in the State of Wyoming's Core Area Strategy including an all lands approach for calculating anthropogenic disturbances, a clear methodology for measuring the density of operations, and a fully operational Density Disturbance Calculation Tool, the 3% disturbance cap will be converted to a 5% cap for all sources of habitat alteration within a project analysis area.

For Idaho the BSU (Figure 2-3) is defined as the currently mapped nesting and wintering habitat within PHMA and IHMA within a Conservation Area, inclusive of all ownerships for evaluation. For Montana the BSU is defined as the PHMA in Montana. Anthropogenic disturbance excludes habitat disturbance from wildfire and fuels management activities and includes activities described in Table 2-4. For Idaho this disturbance is measured by direct footprint or by ROW width for linear features (powerlines, pipelines and roads). For Montana disturbance is measured similar to the Wyoming Disturbance Density Calculation Tool process described in Appendix G.

Subject to applicable laws and regulations and valid existing rights, if the average density of one energy and mining facility per 640 acres (the density cap) is exceeded on all lands (regardless of land ownership) in the Priority Habitat Management Area within a proposed project analysis area, then no further disturbance from energy or mining facilities will be permitted by BLM: (1) until disturbance in the proposed project analysis area has been reduced to maintain the limit under the cap; or (2) unless the energy or mining facility is co-located into an existing disturbed area.

**AD-2:** New anthropogenic disturbances within PHMA or IHMA within a Conservation Area where the disturbance cap is already exceeded from any source or where the proposed development would result in the cap being exceeded would not be allowed in within that Conservation Area until enough habitat has been restored within that Conservation Area to maintain the area under this cap (subject to valid existing rights).

**GRSG-GEN-ST-004-Standard** – In PHMA, IHMA and SFA, do not issue new discretionary written authorizations unless all existing discrete anthropogenic disturbances cover less than 3 percent of the total GRSG habitat within the BSU and the proposed project area, regardless of ownership, and the new use will not cause exceedance of the 3 percent cap (Appendix G).

---

## BLM Management Actions

**AD-3:** PHMA (Idaho only): Anthropogenic Disturbance Screening Criteria. In order to avoid surface-disturbing activities in PHMA, priority will be given to development (including ROWs, fluid minerals and other mineral resources subject to applicable stipulations) outside of PHMA. When authorizing development in PHMA, priority will be given to development in non-habitat areas first and then in the least suitable habitat for GRSG. In addition to the PHMA and IHMA Anthropogenic Disturbance Development Criteria (AD-4), the following criteria must all be met in the project screening and assessment process:

- a. The population trend for the GRSG within the associated Conservation Area is stable or increasing over a three-year period and the population levels are not currently engaging the adaptive management triggers (this applies strictly to new authorizations; renewals and amendments of existing authorizations would not be subject to this criteria when it can be shown that long-term impacts from those renewals or amendments would be substantially the same as the existing development);
- b. The development with associated mitigation would not result in a net loss of GRSG Key habitat and mitigation would provide a net conservation benefit to the respective PHMA;
- c. The project and associated impacts would not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant Conservation Area (the project would be outside Key habitat in areas not meeting desired habitat conditions or the project would provide a benefit to habitat areas that are functioning in a limited way as habitat);
- d. Cannot be reasonably accomplished outside of the PHMA; or can be either: 1) developed pursuant to a valid existing authorization; or 2) is co-located within the footprint of existing infrastructure (proposed actions would not increase the 2011 authorized footprint and associated impacts more than 50 percent, depending

---

## Forest Service Plan Components

**GRSG-M-FML-GL-086-Guideline** – On existing Federal leases in priority and important habitat management areas and sagebrush focal areas, when surface occupancy cannot be restricted due to valid existing rights or development requirements, disturbance and surface occupancy should be limited to areas least harmful to greater sage-grouse based on vegetation, topography, or other habitat features.

**GRSG-GEN-ST-005-Standard** - In priority and important management areas and sagebrush focal areas, only allow new authorized land uses if the residual impacts to greater sage-grouse or their habitats are fully offset by compensatory mitigation projects that provide a net conservation gain to the species, which will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Any compensatory mitigation will be durable, timely, and in addition to what would have resulted without the compensatory mitigation as addressed in the Mitigation Framework (Appendix X).

**GRSG-LR-SUA-ST-020-Standard** – In priority, important, and general habitat management areas and sagebrush focal areas, co-locate new infrastructure (e.g., high-voltage transmission lines, major pipelines, roads, distribution lines, and cellular towers) with existing infrastructure to limit disturbance to the smallest footprint, or where it best limits impacts to greater sage-grouse or their habitats. If co-location of new infrastructure cannot be accomplished, locate it adjacent to existing infrastructure, roads, or already disturbed areas.

**GRSG-LR-SUA-GL-021-Guideline** – In priority management areas and sagebrush focal areas, outside of existing designated corridors and rights-of-way, new transmission lines and pipelines should be buried to limit disturbance to the smallest footprint unless explicit rationale is provided that the biological impacts to greater sage-grouse and its habitat are being avoided. When new transmission lines and pipelines are not buried, locate them adjacent to existing transmission lines and pipelines

BLM Management Actions	Forest Service Plan Components
<p>on industry practice.</p> <ul style="list-style-type: none"> <li>e. Development could be implemented adhering to the required design features (RDF) described in Appendix B;</li> <li>f. **BLM Management Actions**

area. Colocation for various activities is defined as:

**Communication Sites** – The installation of new equipment/facilities on or within or adjacent to existing authorized equipment/facilities or within a communication site boundary as designated in the Communication Site Plan.

**Electrical Lines** – Installation of new ROWs adjacent to current ROWs boundaries, not necessarily placed on the same power poles.

**Other Rights-of-Way** – The installation of new ROWs within the existing footprint of an approved ROW boundary or adjacent to an approved ROW boundary.

**Designated Corridors** – The installation of new rights-of-way within the existing corridor or adjacent to the existing corridor.

**AD-6:** Incorporate RDFs as described in Appendix B in the development of project or proposal implementation, reauthorizations or new authorizations and suppression activities, as conditions of approval (COAs) into any post-lease activities and as best management practices for locatable minerals activities, to the extent allowable by law, unless at least one of the following conditions can be demonstrated and documented in the NEPA analysis associated with the specific project:

- a. A specific RDF is not applicable to the site-specific conditions of the project or activity;
- b. A proposed design feature or BMP is determined to provide equal or better protection for GRSG or its habitat; or
- c. Analysis concludes that following a specific RDF would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.

---

**Forest Service Plan Components**

where it best limits impacts to greater sage-grouse or their habitats. If co-location of new infrastructure cannot be accomplished, locate it adjacent to existing infrastructure, roads, or already disturbed areas.

---

**GRSG-LR-SUA-ST-013-Standard** – In PHMA, IHMA and SFAs, restrict issuance of new lands special use authorizations for infrastructure, such as high-voltage transmission lines, major pipelines, hydropower, distribution lines, and cellular towers. Exceptions must be limited and based on rationale (e.g., monitoring, modeling, or best available science) that explicitly demonstrates that adverse impacts to GRSG will be avoided by the exception. Existing authorized uses will continue to be recognized.

**GRSG-LR-SUA-ST-014-Standard** – In GHMA, new lands special use authorizations may be issued for infrastructure, such as high-voltage transmission lines, major pipelines, hydropower, distribution lines, and cellular towers, if they can be located within existing designated corridors or ROWs and the authorization includes stipulations to protect GRSG and their habitats. Existing authorized uses will continue to be recognized.

**GRSG-LR-SUA-ST-016-Standard** – In PHMA, IHMA, GHMA and SFAs, require protective stipulations (e.g., noise, tall structure, guy wire removal, perch deterrent installation) when issuing new authorizations or during renewal, amendment, or reissuance of existing

	<p>authorizations that authorize infrastructure (e.g., high-voltage transmission lines, major pipelines, roads, distribution lines, and cellular towers).</p> <p><b>GRSG-LR-SUA-GL-021-Guideline</b> – In PHMA and SFA, outside of existing designated corridors and ROWs, new transmission lines and pipelines should be buried to limit disturbance to the smallest footprint unless explicit rationale is provided that the biological impacts to GRSG and its habitat are being avoided. When new transmission lines and pipelines are not buried, locate them adjacent to existing transmission lines and pipelines.</p>
<p><b>AD-7:</b> Conduct implementation and project activities, including construction and short-term anthropogenic disturbances consistent with seasonal habitat restrictions described in Appendix C.</p>	<p><b>GRSG-LR-SUA-ST-015-Standard</b> – In PHMA, IHMA and SFAs, do not authorize temporary lands special uses (i.e., facilities or activities) that result in loss of habitat or would have long-term (i.e., greater than 5 years) negative impact on GRSG or their habitats.</p> <p><b>GRSG-GEN-GL-006-Standard</b> – During lekking (March 1 to April 30) restrict surface disturbing and disruptive activities, including noise at 10dB above ambient (not to exceed 20-24 dB) measured at the perimeter of an occupied lek, to lekking birds from 6 pm to 9 am within a buffer distance of 3.1 miles.</p> <p><b>GRSG-GEN-GL-007-Guideline</b> – During breeding and nesting (March 1 to June 15), surface disturbing and disruptive activities to nesting birds should be avoided.</p> <p><b>GRSG-RT-ST-070-Standard</b> – Do not conduct or allow road and trail maintenance activities within 2 miles from the perimeter of active leks during lekking (March 1 to April 30) from 6 pm to 9 am.</p>
<p><b>AD-8:</b> RDFs and seasonal habitat restrictions would not be required for emergency or short-term activities necessary to protect and preserve human life or property.</p>	<p>No similar management direction.</p>
<p><b>AD-9:</b> In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater</p>	<p>Plan buffer distances, reflecting lower-interpreted range from Manier, D.J., Bowen, Z.H., Brooks, M.L., Casazza, M.L., Coates, P.S., Deibert, P.A., Hanser, S.E., and Johnson, D.H., 2014, Conservation buffer distance estimates for Greater Sage-Grouse—A review: U.S.</p>

BLM Management Actions	Forest Service Plan Components
Sage-Grouse – A Review (Open File Report 2014-1239) in accordance with Appendix B.	Geological Survey Open-File Report 2014–1239, 14 p., <a href="http://dx.doi.org/10.3133/ofr20141239">http://dx.doi.org/10.3133/ofr20141239</a> , are included as Guidelines.
<b>AD-10:</b> Incorporate appropriate conservation measures for slickspot peppergrass ( <i>Lepidium papilliferum</i> ) as described in the 2014 Conservation Agreement (as updated, amended or reauthorized) into implementation and project design within slickspot peppergrass habitat in the Jarbidge and Four Rivers Field Offices to avoid and minimize impacts to slickspot peppergrass. The 2014 Conservation Agreement is included as Appendix P.	No similar management direction.
<b>MIT-1 (Mitigation):</b> BLM would establish an inter-agency State GRSG Conservation Team at the state level (both Idaho and Montana) to help guide conservation of GRSG through compensatory mitigation, within 90 days of the issuance of the Record of Decision.	No similar management direction.
<b>MIT-3:</b> In all GRSG habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation (Appendix G, Table G-1), the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.	<b>GRSG-GEN-ST-005-Standard</b> - In PHMA, SFA, and IHMA, only allow new authorized land uses if the residual impacts to GRSG or their habitats are fully offset by compensatory mitigation projects that provide a net conservation gain to the species, which will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Any compensatory mitigation will be durable, timely, and in addition to what would have resulted without the compensatory mitigation, as addressed in the Mitigation Framework (Appendix J).
<b>MIT-4:</b> Mitigate anthropogenic development (Appendix G, Table G-1) impacts to GRSG habitat through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix J).	<b>GRSG-GEN-ST-005-Standard</b> - In PHMA, SFA, and IHMA, only allow new authorized land uses if the residual impacts to GRSG or their habitats are fully offset by compensatory mitigation projects that provide a net conservation gain to the species, which will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Any compensatory mitigation will be durable, timely, and in addition to what would have resulted without the compensatory mitigation, as addressed in the Mitigation Framework (Appendix J).

BLM Management Actions	Forest Service Plan Components
<p><b>MIT-5:</b> Consistent with regulations for minerals activities, require a full reclamation bond specific to the site when surface disturbing activities are proposed. Ensure reclamation bonds are sufficient to cover costs to fully rehabilitate lost GRSG habitat. Base the reclamation costs on the assumption that contractors for the BLM will perform the work. Areas are considered fully rehabilitated when they meet the conditions described in Table 2-3.</p>	<p>Standard operating procedure.</p>
<p><b>MON-1 (Monitoring):</b> Once FIAT Assessments are complete, annually complete a review of FIAT Assessment implementation efforts within GRSG habitat with appropriate USFWS and state agency personnel.</p>	<p>Direction will be included in the Implementation Guide.</p>
<p><b>MON-2:</b> Monitor the effectiveness of projects (e.g., fuel breaks, fuels treatments) until objectives have been met or until it is determined that objectives cannot be met, according to the monitoring schedule identified for project implementation.</p>	<p>Standard operating procedure and will be included in the Implementation Guide.</p>
<p><b>MON-3:</b> Monitor invasive vegetation post vegetation management treatment</p>	<p><b>GRSG-GRSGH-GL-031-Guideline</b> – In PHMA, IHMA, GHMA and SFAs, actions and authorizations should include design features to limit the spread and effect of non-native undesirable plant species.</p> <p><b>GRSG-RT-GL-076-Guideline</b> - In PHMA, IHMA, GHMA and SFAs, road and road-way maintenance activities should be designed and implemented to reduce the risk of vehicle or human-caused wildfires and the spread of invasive plants. Such activities include but are not limited to the removal or mowing of vegetation a car-width off the edge of roads; use of weed-free earth-moving equipment, gravel, fill, or other materials; and blading or pulling roadsides and ditches that are infested with noxious weeds only if required for public safety or protection of the roadway.</p>
<p><b>MON-4:</b> Monitor project construction areas for noxious weed and invasive species for at least 3 years, unless control is achieved earlier.</p>	<p><b>GRSG-GRSGH-GL-031-Guideline</b> – In PHMA, IHMA, GHMA and SFAs, actions and authorizations should include design features to limit the spread and effect of non-native undesirable plant species.</p> <p><b>GRSG-RT-GL-076-Guideline</b> - In PHMA, IHMA, GHMA and SFAs, road and road-way maintenance activities should be designed and implemented to reduce the risk of vehicle or human-caused wildfires</p>

BLM Management Actions	Forest Service Plan Components
	and the spread of invasive plants. Such activities include but are not limited to the removal or mowing of vegetation a car-width off the edge of roads; use of weed-free earth-moving equipment, gravel, fill, or other materials; and blading or pulling roadsides and ditches that are infested with noxious weeds only if required for public safety or protection of the roadway.
<b>MON-5:</b> Use lek, nesting and winter habitat maps and key habitat map (updates) to annually assess GRSG population and habitat status in the context of the adaptive management triggers.	No similar habitat.
<b>MON-6:</b> Continue to support updates to the Key Habitat map to track vegetation changes in relation to GRSG habitat on a yearly basis, until such a time this process is replaced. The process used to update the Key Habitat Map is described in Appendix F.	Direction will be included in the Implementation Guide.
<b>MON-7:</b> Monitor GRSG habitat as described in the monitoring framework plan (Appendix E) in coordination with IDFG and MT FWP.	Is included in the Monitoring Appendix.
<b>VEG-OBJ-1 (Vegetation):</b> Reconnect and expand areas of higher native plant community integrity/rangeland health to increase the extent of high quality habitat and, where possible, to accommodate the future effects of climate change.	<b>GRSG-GEN-DC-001-Desired Condition</b> – The landscape for greater sage-grouse encompasses large contiguous areas of native vegetation, approximately 6 to 62 square miles in area, to provide for multiple aspects of species life requirements. Within these landscapes, a variety of sagebrush-community compositions exist without invasive species, which have variations in subspecies composition, co-dominant vegetation, shrub cover, herbaceous cover, and stand structure, to meet seasonal requirements for food, cover, and nesting for greater sage-grouse.
<b>VEG-OBJ-2:</b> Increase the amount and functionality of seasonal habitats by: <ul style="list-style-type: none"> <li>a. Increasing or enhancing canopy cover and average patch size of sagebrush.</li> <li>b. Increasing the amount, condition and connectivity of seasonal habitats.</li> <li>c. Protecting or improving GRSG migration/movement corridors.</li> <li>d. Reducing conifer encroachment within GRSG seasonal habitats.</li> <li>e. Improving understory (grass, forb) and/or riparian condition within</li> </ul>	<b>GRSG-GRSGH-O-027-Objective</b> – Every 10 years for the next 50 years, improve GRSG habitat by removing invading conifers and other undesirable species based upon the number of acres shown in Table 2-7.

BLM Management Actions	Forest Service Plan Components
<p>breeding and late brood-rearing habitats.</p> <p>f. Reducing the extent of annual grasslands within and adjacent to PHMA and IHMA.</p> <p>Decadal treatment objectives by population area are identified in Table 2-5.</p>	
<p><b>VEG-OBJ-3:</b> In all SFAs and PHMAs, the desired condition is to maintain a minimum of 70 percent of lands capable of producing sagebrush with 10 to 30 percent sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).</p>	<p><b>GRSG-GEN-DC-003-Desired Condition</b> – In all GRSG seasonal habitats, including all seasonal habitats, 70 percent of lands capable of producing sagebrush have 10 to 30 percent sagebrush canopy cover and less than 10 percent conifer canopy cover. In addition, within breeding and nesting habitat, sufficient herbaceous vegetation structure and height provides overhead and lateral concealment for nesting and early brood rearing life stages. Within brood rearing habitat, wet meadows and riparian areas sustain a rich diversity of perennial forb species relative to site potential. Within winter habitat, sufficient sagebrush height and density provides food and cover for GRSG during this seasonal period. Specific desired conditions for GRSG based on seasonal habitat requirements are in Table 2-6.</p> <p><b>GRSG-GRSGH-O-027-Objective</b> – Every 10 years for the next 50 years, improve GRSG habitat by removing invading conifers and other undesirable species based upon the number of acres shown in Table 2-7.</p>
<p><b>VEG-I:</b> Implement habitat rehabilitation or restoration projects in areas that have potential to improve GRSG habitat using a full array of treatment activities as appropriate, including chemical, mechanical and seeding treatments.</p>	<p><b>GRSG-GRSGH-ST-028-Standard</b> – Design habitat restoration projects to move towards desired conditions (Table 2-6) and incorporate the concepts outlined in Appendix D - <i>Using resistance and resilience concepts to reduce impacts of invasive annual grasses and altered fire regimes on the sagebrush ecosystem and greater sage-grouse: A strategic multi-scale approach.</i></p> <p><b>GRSG-GRSGH-GL-034-Guideline</b> – In PHMA, IHMA and SFAs, vegetation treatment projects should only be conducted if they restore, enhance, or maintain desired conditions (Table 2-6).</p>

BLM Management Actions	Forest Service Plan Components
<p><b>VEG-2:</b> Implement vegetation rehabilitation or manipulation projects to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat based on FIAT Assessments, HAF assessments, other vegetative assessment data and local, site specific factors that indicate sagebrush canopy cover or herbaceous conditions do not meet habitat management objectives (i.e. is minimal or exceeds optimal characteristics). This may necessitate the use of prescribed fire as a site preparation technique to remove annual grass residual growth prior to the use of herbicides in the restoration of certain lower elevation sites (e.g., Wyoming big sagebrush) but such efforts will be carefully planned and coordinated to minimize impacts to GRSG seasonal habitats.</p>	<p><b>GRSG-GRSGH-ST-028-Standard</b> – Design habitat restoration projects to move towards desired conditions (Table 2-6) and incorporate the concepts outlined in Appendix D - <i>Using resistance and resilience concepts to reduce impacts of invasive annual grasses and altered fire regimes on the sagebrush ecosystem and greater sage-grouse: A strategic multi-scale approach.</i></p> <p><b>GRSG-GRSGH-GL-034-Guideline</b> – In PHMA, IHMA and SFAs, vegetation treatment projects should only be conducted if they restore, enhance, or maintain desired conditions (Table 2-6).</p>
<p><b>VEG-3:</b> Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success (Richards et al. 1998). Non-native seeds may be used as long as they support GRSG habitat objectives (Pyke 2011) to increase probability of success, when adapted seed availability is low or to compete with invasive species especially on harsher sites.</p>	<p><b>GRSG-GRSGH-GL-033-Guideline</b> - In PHMA, IHMA, GHMA and SFAs, native plant species should be used, when possible, to restore, enhance, or maintain desired conditions (Table 2-6).</p>
<p><b>VEG-4:</b> Implement management changes in restoration and rehabilitation areas, as necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat and to ensure long-term persistence of improved GRSG habitat (Eiswerth and Shonkwiler 2006). Management changes could be considered during livestock grazing permit renewals, travel management planning, and renewal or reauthorization of ROWs.</p>	<p><b>GRSG-GRSGH-GL-034-Guideline</b> – In PHMA, IHMA and SFAs, vegetation treatment projects should only be conducted if they restore, enhance, or maintain desired conditions (Table 2-6).</p>
<p><b>VEG-5:</b> Consider establishing seed harvest areas that are managed for seed production (Armstrong 2007) to provide a reliable source of locally adapted seed to use during rehabilitation and restoration activities.</p>	<p>No similar management direction.</p>
<p><b>VEG-6:</b> Allocate use of native seed to GRSG or ESA listed species habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from ESR (BLM) and/or BAER (Forest Service) projects outside of PHMA or IHMA to those inside it.</p>	<p>Direction will be included in the Implementation Guide.</p>

BLM Management Actions	Forest Service Plan Components
<p>Where probability of success or native seed availability is low, nonnative seeds may be used as long as they meet GRSG habitat conservation objectives (Pyke 2011). Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the highest priority for rehabilitation efforts.</p>	
<p><b>VEG-7:</b> During land health assessments, evaluate the relative value of existing nonnative seeding within GRSG habitat as: 1) a component of a grazing system allowing improvement of adjacent native vegetation, 2) development of a forage reserve, 3) incorporation into a fuel break system (Davies et al. 2011) or 4) restoration/diversification for GRSG habitat improvement. Where appropriate and feasible, diversify seedings, or restore to native vegetation when potential benefits to GRSG habitat outweigh the other potential uses of the non-native seeding, with emphasis on PHMA and IHMA. Allow recolonization of seedings by sagebrush and other native vegetation.</p>	<p>Forest Service does not complete land health assessments.</p> <p><b>GRSG-GRSGH-GL-031-Guideline</b> – In priority, important, and general habitat management areas and sagebrush focal areas, actions and authorizations should include design features to limit the spread and effect of undesirable non-native plant species.</p> <p><b>GRSG-GRSGH-GL-033-Guideline</b> - In priority, important, and general habitat management areas and sagebrush focal areas, native plant species should be used, when possible, to restore, enhance, or maintain desired conditions (table 1).</p> <p><b>GRSG-LG-GL-038-Guideline</b> – In priority, important, and general habitat management areas and sagebrush focal areas, consider closure of grazing allotments, pastures, or portions of pastures, or managing the allotment as a forage reserve as opportunities arise under applicable regulations, where removal of livestock grazing would enhance the ability to achieve desired habitat conditions (table 1).</p>
<p><b>VEG-8:</b> Remove conifers encroaching into sagebrush habitats. Prioritize treatments closest to occupied GRSG habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and tools like VDDT and the FIAT report (Chambers et. al., 2014) will help refine the location for specific areas to be treated.</p>	<p><b>GRSG-GRSGH-GL-030-Guideline</b> – When removing conifers that are encroaching into GRSG habitat, avoid persistent woodlands (i.e., old growth relative to the site or more than 100 years old).</p> <p><b>GRSG-GRSGH-ST-028-Standard</b> – Design habitat restoration projects to move towards desired conditions (Table 2-6) and incorporate the concepts outlined in Appendix D - <i>Using resistance and resilience concepts to reduce impacts of invasive annual grasses and altered fire regimes on the sagebrush ecosystem and greater sage-grouse: A strategic multi-scale approach.</i></p>
<p><b>INV-1 (Invasive Species):</b> Incorporate results of the FIAT Assessments into projects and activities addressing invasive species.</p>	<p><b>GRSG-GRSGH-ST-028-Standard</b> – Design habitat restoration projects to move towards desired conditions (Table 2-6) and incorporate the concepts outlined in Appendix D - <i>Using resistance and</i></p>

BLM Management Actions	Forest Service Plan Components
	<i>resilience concepts to reduce impacts of invasive annual grasses and altered fire regimes on the sagebrush ecosystem and greater sage-grouse: A strategic multi-scale approach.</i>
<b>INV-2:</b> Implement noxious weed and invasive species control using integrated vegetation management actions per national guidance and local weed management plans for Cooperative Weed Management Areas in cooperation with State and Federal agencies, affected counties, and adjoining private lands owners.	
<b>INV-3:</b> Conduct integrated weed management actions for noxious and invasive weed populations that are impacting or threatening GRSG habitat quality using a variety of eradication and control techniques including chemical, mechanical and other appropriate means.	Standard operating procedure (FSM 2080).
<b>INV-4:</b> Require project proponent (projects described in Table 2-4 and which are included in the anthropogenic disturbance cap evaluation) to ensure that noxious weeds and invasive species caused as a result of the project are treated to eliminate establishment on the disturbed project construction areas for at least 3 years and monitored and treated during the life of the project.	<b>GRSG-GRSGH-GL-031-Guideline</b> – In PHMA, IHMA, GHMA and SFAs, actions and authorizations should include design features to limit the spread and effect of non-native undesirable plant species.
<b>FUEL-OBJ-1:</b> Design fuel treatments to restore, enhance, or maintain GRSG habitat.	<p><b>GRSG-FM-GL-047-Guideline</b> – In PHMA, IHMA, GHMA and SFA, when reseeding in fuel breaks, fire resistant native plant species should be used if available, or consider using fire resistant non-native species to meet resource objectives, if analysis demonstrates that non-native plants will not damage GRSG habitat in the long term.</p> <p><b>GRSG-FM-GL-048-Guideline</b> – In PHMA, IHMA, GHMA and SFA, fuel treatments should be designed to restore, enhance, or maintain GRSG habitat.</p>
<b>FUEL-OBJ-2:</b> Manage wildfires to minimize loss of sagebrush and protect GRSG habitat.	<b>GRSG-FM-DC-043-Desired Condition</b> – In PHMA, IHMA, GHMA and SFA, the extent and spread of wildfire resulting in loss of sagebrush is minimized, considering firefighter and public safety and other high priority values.
<b>WFP-1 (Wildfire Preparedness):</b> Support development and implementation of Rangeland Fire Protection Associations (RFPAs) in coordination with the State of Idaho.	Will likely be in the Record of Decision.

BLM Management Actions	Forest Service Plan Components
<p><b>WFP-2:</b> Develop a consistent approach to fire restrictions within GRSG habitat through the existing coordinated inter-agency approach to fire restrictions based upon National Fire Danger Rating System thresholds (fuel conditions, drought conditions, and predicted weather patterns).</p>	<p>Standard operating procedure.</p>
<p><b>WFP-3:</b> Annually incorporate into existing fire management plans results and updates from the Wildfire and Invasive Species Habitat Assessments (FIAT Assessments) described in Appendix D, to communicate/explain the resource value of GRSG habitat, including fire prevention messages and actions to reduce human-caused ignitions.</p>	<p>Standard operating procedure.</p>
<p><b>WFP-4:</b> Continue to participate with the Wildland Fire Leadership Council, a cooperative, interagency organization dedicated to achieving consistent implementation of the goals, actions, and policies in the National Fire Plan and the Federal Wildland Fire Management Policy.</p>	<p>Standard operating procedure.</p>
<p><b>WFP-5:</b> Continue annual coordination meetings held between cooperating agencies that have fire suppression responsibilities. Incorporate Rangeland Fire Protection Associations and other stakeholders into this coordination. Discuss priority suppression areas and distribute maps showing priority suppression areas at both the Conservation Area and the local office levels as based on the adaptive management strategy and FIAT Assessments.</p>	<p><b>GRSG-FM-GL-056-Guideline</b> – Localized maps of PHMA, IHMA, GHMA and SFA should be provided to dispatch officers and extended attack incident commanders to use when prioritizing wildfire suppression resources and designing suppression tactics.</p> <p><b>GRSG-FM-GL-055-Guideline</b> - Unit-specific GRSG fire management toolboxes containing maps, lists, contact information for qualified resource advisors, local guidance, and relevant information should be developed and used.</p>
<p><b>WFP-6:</b> Ensure firefighter personnel receive annual orientation regarding GRSG habitat and sagebrush management issues as related to wildfire suppression.</p>	<p><b>GRSG-FM-GL-055-Guideline</b> - Unit-specific GRSG fire management toolboxes containing maps, lists, contact information for qualified resource advisors, local guidance, and relevant information should be developed and used.</p>
<p><b>WFP-7:</b> As part of the FIAT Assessments, identify roads, trails, and recreational use areas with high frequency of human caused fires within or adjacent to the PHMA or IHMA. Consider these areas during annual fire restriction evaluations, and as appropriate, through site specific management.</p>	<p><b>GRSG-FM-GL-053-Guideline</b> - In PHMA, IHMA, GHMA and SFA, roads and natural fuel breaks should be incorporated into fuel break design to improve effectiveness and minimize loss of existing sagebrush habitat.</p>
<p><b>WFP-8:</b> Coordinate with Federal, State and local jurisdictions on fire and litter prevention programs to reduce human caused ignitions.</p>	<p>Standard operating procedure.</p>

BLM Management Actions	Forest Service Plan Components
<p><b>WFP-9:</b> Implement activities identified within the FIAT Assessments</p>	<p><b>GRSG-GRSGH-ST-028-Standard</b> – Design habitat restoration projects to move towards desired conditions (Table 2-6) and incorporate the concepts outlined in Appendix D - <i>Using resistance and resilience concepts to reduce impacts of invasive annual grasses and altered fire regimes on the sagebrush ecosystem and greater sage-grouse: A strategic multi-scale approach.</i></p>
<p><b>WFS-1:</b> Complete Wildland Fire and Invasive Species Assessments (FIAT Assessments) as described within Appendix D and incorporate results into appropriate Fire Management Plans as they are completed. FIAT Assessments are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of focal and emphasis habitats/treatment opportunities for fuels management, fire management, and restoration. These FIAT Assessments identify focal and emphasis habitats and describe strategies for fuels management, suppression and restoration activities. Focal and Emphasis Habitats identified through the FIAT Assessment to further refine priority areas for treatments to reduce the threats posed by wildfire, invasive annual grass and conifer expansion.</p>	<p><b>GRSG-GRSGH-GL-032-Guideline</b> - To facilitate safe and effective fire management actions, in PHMA, IHMA, and GHMA and SFAs, fuels treatments in high-risk areas (i.e., areas likely to experience wildfire at an intensity level that might result in movement away from the GRSG desired conditions in Table 2-6) should be designed to reduce the spread and/or intensity of wildfire or the susceptibility of GRSG values to move away from desired conditions (Table 2-6).</p>
<p><b>WFS-2:</b> As part of the FIAT Assessments incorporate a wildfire response time analysis focusing on response time to identified priority areas within PHMA and IHMA or on those fires that have the potential to impact PHMA and IHMA. Incorporate findings into Unit Initial Attack program that determines initial attack resources.</p>	<p>No similar management direction.</p>
<p><b>WFS-3:</b> As part of the FIAT Assessment incorporate a water capacity analysis for suppression purposes, including potential private water sources. Utilized the analysis to ensure water availability for response to fire in or threatening PHMA and IHMA during initial attack.</p>	<p>Standard operating procedure and no similar management direction.</p>
<p><b>WFS-4:</b> During high fire danger conditions, stage initial attack and secure additional resources closer to priority areas identified in the FIAT Assessments, based on anticipated fires and weather conditions, with particular consideration of the West Owyhee, Southern and Desert Conservation Areas to ensure quicker response times in or near GRSG habitat after considerations and placement of resources to protect human life and property.</p>	<p><b>GRSG-FM-GL-058-Guideline</b> – On critical fire weather days, protection of GRSG habitat should receive high consideration, along with other high values, when positioning resources</p>

BLM Management Actions	Forest Service Plan Components
<p><b>WFS-5:</b> Utilize a full range of fire management strategies and tactics through strategic wildfire suppression planning consistent with appropriate management response and within acceptable risk levels, to achieve resource objectives for GRSG habitat consistent with land use plan direction. Utilizing both direct and indirect attack as appropriate to limit the overall amount of GRSG habitat burned. This could include suppressing fires in intact sagebrush habitats; limiting fire growth in GHMA when suppression resources are available or managing wildfire for resource benefit in areas of conifer (juniper) encroachment.</p>	<p><b>GRSG-FM-GL-051-Guideline</b> – In PHMA, IHMA, GHMA and SFA, use fire management tactics and strategies that seek to minimize loss of existing sagebrush habitat. The safest and most practical means to do so will be determined by fireline leadership and incident commanders.</p> <p><b>GRSG-FM-GL-060-Guideline</b> – In PHMA, IHMA, GHMA and SFA, consider using fire retardant and mechanized equipment only if it is likely to result in minimizing burned acreage</p> <p><b>GRSG-GRSGH-GL-032-Guideline</b> - To facilitate safe and effective fire management actions, in PHMA, IHMA, and GHMA and SFAs, fuels treatments in high-risk areas (i.e., areas likely to experience wildfire at an intensity level that might result in movement away from the GRSG desired conditions in Table 2-6) should be designed to reduce the spread and/or intensity of wildfire or the susceptibility of GRSG values to move away from desired conditions (Table 2-6).</p>
<p><b>WFS-6:</b> Suppression priorities: Firefighter and public safety followed by property are the highest priority for protection during suppression activities. Maintaining GRSG habitat will be the highest natural resources priority immediately after human life and property, commensurate with threatened and endangered species habitat or other critical habitats to be protected.</p>	<p><b>GRSG-FM-DC-043-Desired Condition</b> – In PHMA, IHMA, GHMA and SFA, the extent and spread of wildfire resulting in loss of sagebrush is minimized, considering firefighter and public safety and other high priority values</p>
<p><b>WFS-7:</b> Ensure close coordination with federal and state firefighters including the Rangeland Fire Protection Associations during suppression activities.</p>	<p>Standard operating procedure.</p>
<p><b>FM-I:</b> Design and implement fuels treatments that would reduce the potential start and spread of unwanted wildfires and provide anchor points or control lines for the containment of wildfires during suppression activities with an emphasis on maintaining, protecting, and expanding sagebrush ecosystems and successfully rehabilitated areas and strategically and effectively reduce wildfire threats in the greatest area.</p>	<p><b>GRSG-FM-GL-048-Guideline</b> – In PHMA, IHMA, GHMA and SFA, fuel treatments should be designed to restore, enhance, or maintain GRSG habitat.</p> <p><b>GRSG-FM-GL-053-Guideline</b> - In PHMA, IHMA, GHMA and SFA, roads and natural fuel breaks should be incorporated into fuel break design to improve effectiveness and minimize loss of existing sagebrush habitat.</p>

BLM Management Actions	Forest Service Plan Components
<p><b>FM-2:</b> Enhance (or maintain/retain) sagebrush canopy cover and community structure to match expected potential for the ecological site and consistent with GRSG habitat objectives unless fuels management objectives requires additional reduction in sagebrush cover to meet strategic protection of GRSG habitat. Closely evaluate the benefits of the fuel management treatments against the additional loss of sagebrush cover on the local landscape in the NEPA process.</p>	<p><b>GRSG-FM-GL-048-Guideline</b> – In PHMA, IHMA, GHMA and SFA, fuel treatments should be designed to restore, enhance, or maintain GRSG habitat.</p> <p><b>GRSG-GRSGH-GL-032-Guideline</b> - To facilitate safe and effective fire management actions, in PHMA, IHMA, and GHMA and SFAs, fuels treatments in high-risk areas (i.e., areas likely to experience wildfire at an intensity level that might result in movement away from the GRSG desired conditions in Table 2-6) should be designed to reduce the spread and/or intensity of wildfire or the susceptibility of GRSG values to move away from desired conditions (Table 2-6).</p>
<p><b>FM-3:</b> Apply appropriate seasonal restrictions for implementing vegetation and fuels management treatments according to the type of seasonal habitats present. Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality. Ensure chemical applications are utilized where they would assist in success of fuels treatments. Strategically place treatments on a landscape scale to prevent fire from spreading into PHMA or WVUI.</p>	<p><b>GRSG-FM-GL-046-Guideline</b> – In wintering or breeding and nesting habitat, sagebrush removal or manipulation, including prescribed fire, should be restricted unless the removal strategically reduces the potential impacts from wildfire.</p> <p><b>GRSG-GEN-GL-007-Guideline</b> – During breeding and nesting (March 1 to June 15), surface disturbing and disruptive activities to nesting birds should be avoided.</p>
<p><b>FM-4:</b> Develop a fuels continuity and management strategy to expand, enhance, maintain and protect GRSG habitat informed by the FIAT Assessments completed as described in Appendix D.</p>	<p><b>GRSG-GRSGH-GL-032-Guideline</b> - To facilitate safe and effective fire management actions, in PHMA, IHMA, and GHMA and SFAs, fuels treatments in high-risk areas (i.e., areas likely to experience wildfire at an intensity level that might result in movement away from the GRSG desired conditions in Table 2-6) should be designed to reduce the spread and/or intensity of wildfire or the susceptibility of GRSG values to move away from desired conditions (Table 2-6).</p>
<p><b>FM-5:</b> When developing the fuels management strategy as part of the FIAT Assessment described in Appendix D consider up-to-date fuels profiles; land use plan direction; current and potential habitat fragmentation; sagebrush and GRSG ecological factors; active vegetation management steps to provide critical breaks in fuel continuity where appropriate; incorporate a comparative risk analysis with regard to the risk of increased habitat fragmentation from a</p>	<p><b>GRSG-GRSGH-GL-032-Guideline</b> - To facilitate safe and effective fire management actions, in PHMA, IHMA, and GHMA and SFAs, fuels treatments in high-risk areas (i.e., areas likely to experience wildfire at an intensity level that might result in movement away from the GRSG desired conditions in Table 2-6) should be designed to reduce the spread and/or intensity of wildfire or the susceptibility of GRSG values to move away from desired conditions (Table 2-6).</p>

BLM Management Actions	Forest Service Plan Components
<p>proposed action versus the risk of large scale fragmentation posed by wildfires if the action is not taken.</p>	
<p><b>FM-6:</b> Fuel treatments will be designed through an interdisciplinary process to expand, enhance, maintain, and protect GRSG habitat which considers a full range of cost effective fuel reduction techniques, including: chemical, biological (including grazing and targeted grazing), mechanical and prescribed fire treatments.</p>	<p><b>GRSG-GRSGH-GL-032-Guideline</b> - To facilitate safe and effective fire management actions, in PHMA, IHMA, and GHMA and SFAs, fuels treatments in high-risk areas (i.e., areas likely to experience wildfire at an intensity level that might result in movement away from the GRSG desired conditions in Table 2-6) should be designed to reduce the spread and/or intensity of wildfire or the susceptibility of GRSG values to move away from desired conditions (Table 2-6).</p>
<p><b>FM-7:</b> Existing and proposed linear ROWs could be considered for use and maintenance as vegetated fuel breaks in appropriate areas (this activity may or may not be part of the ROW permit or the responsibility of the permit holder, in cases where this activity is considered part of mitigation for project design then it would be appropriately included as part of the ROW permit and the responsibility of the permit holder for development and maintenance).</p>	<p><b>GRSG-GRSGH-GL-032-Guideline</b> - To facilitate safe and effective fire management actions, in PHMA, IHMA, and GHMA and SFAs, fuels treatments in high-risk areas (i.e., areas likely to experience wildfire at an intensity level that might result in movement away from the GRSG desired conditions in Table 2-6) should be designed to reduce the spread and/or intensity of wildfire or the susceptibility of GRSG values to move away from desired conditions (Table 2-6).</p> <p><b>GRSG-FM-GL-053-Guideline</b> - In PHMA, IHMA, GHMA and SFA, roads and natural fuel breaks should be incorporated into fuel break design to improve effectiveness and minimize loss of existing sagebrush habitat</p>
<p><b>FM-8:</b> Fuel breaks would incorporate existing vegetation treatments (seedings), rocky areas or other appropriate topography or features or be located adjacent to existing linear disturbance areas where appropriate. Fuel breaks should be placed in areas with the greatest likelihood of compartmentalizing a fire and/or to foster suppression options to protect existing intact habitat.</p>	<p><b>GRSG-GRSGH-GL-032-Guideline</b> - To facilitate safe and effective fire management actions, in PHMA, IHMA, and GHMA and SFAs, fuels treatments in high-risk areas (i.e., areas likely to experience wildfire at an intensity level that might result in movement away from the GRSG desired conditions in Table 2-6) should be designed to reduce the spread and/or intensity of wildfire or the susceptibility of GRSG values to move away from desired conditions (Table 2-6).</p> <p><b>GRSG-FM-GL-053-Guideline</b> - In PHMA, IHMA, GHMA and SFA, roads and natural fuel breaks should be incorporated into fuel break design to improve effectiveness and minimize loss of existing sagebrush habitat</p>

BLM Management Actions	Forest Service Plan Components
<p><b>FM-9:</b> Strategically pre-treat areas to reduce fine fuels consistent with areas and results identified within the Wildfire and Invasive Species Assessments.</p>	<p>No similar management direction.</p>
<p><b>FM-10:</b> Protect vegetation restoration and rehabilitation efforts/projects from subsequent fire events.</p>	<p><b>GRSG-GRSGH-GL-032-Guideline</b> - To facilitate safe and effective fire management actions, in PHMA, IHMA, and GHMA and SFAs, fuels treatments in high-risk areas (i.e., areas likely to experience wildfire at an intensity level that might result in movement away from the GRSG desired conditions in Table 2-6) should be designed to reduce the spread and/or intensity of wildfire or the susceptibility of GRSG values to move away from desired conditions (Table 2-6).</p> <p><b>GRSG-FM-GL-048-Guideline</b> – In PHMA, IHMA, GHMA and SFA, fuel treatments should be designed to restore, enhance, or maintain GRSG habitat.</p>
<p><b>FM-11:</b> Targeted grazing as a fuels treatment to adjust the vegetation conditions to reduce the potential start and spread of wildfires may be implemented within existing grazing authorizations if feasible such as through temporary non-renewable authorizations, or through contracts, agreements or other appropriate means separate from existing grazing authorizations and permits.</p>	<p><b>GRSG-GRSGH-GL-032-Guideline</b> - To facilitate safe and effective fire management actions, in PHMA, IHMA, and GHMA and SFAs, fuels treatments in high-risk areas (i.e., areas likely to experience wildfire at an intensity level that might result in movement away from the GRSG desired conditions in Table 2-6) should be designed to reduce the spread and/or intensity of wildfire or the susceptibility of GRSG values to move away from desired conditions (Table 2-6).</p>
<p><b>FM-12:</b> Targeted grazing to achieve fuels management objectives should conform to the following criteria:</p> <ol style="list-style-type: none"> <li>a. Targeted grazing should be implemented strategically on the landscape, and directly involve the minimum footprint and grazing intensity required to meet fuels management objectives.</li> <li>b. Conform to the applicable Standards for Rangeland Health and Guidelines for Livestock Grazing Management (Idaho or Montana) at the assessment scale (pasture/watershed).</li> <li>c. Where feasible and applicable coordinate with the grazing permittee to strategically reduce fuels through livestock management within the Mandatory Terms and Conditions of the applicable grazing authorizations</li> </ol>	<p>No similar management direction.</p>

---

**BLM Management Actions**

**FM-13:** Prioritize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low or non-economical, nonnative seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime. When reseeding, use fire resistant native and nonnative species, as appropriate, to provide for fuel breaks.

**FM-15:** If prescribed fire is used in GRSG habitat, the NEPA analysis for the Burn Plan will address:

why alternative techniques were not selected as a viable options;

how GRSG goals and objectives would be met by its use;

how the COT Report objectives would be addressed and met;

a risk assessment to address how potential threats to GRSG habitat would be minimized.

- a. Allow prescribed fire as a vegetation or fuels treatment in Wyoming big sagebrush sites or other xeric sagebrush species sites, or in areas with a potential for post-fire exotic annual dominance only after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire could be used to meet specific fuels objectives that would protect Greater Sage-Grouse habitat in PHMAs (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities).
- b. Allow prescribed fire in known winter range only after the NEPA

---

**Forest Service Plan Components**

**GRSG-GRSGH-GL-033-Guideline** - In PHMA, IHMA, GHMA and SFAs, native plant species should be used, when possible, to restore, enhance, or maintain desired conditions (Table 2-6).

**GRSG-FM-GL-047-Guideline** – In PHMA, IHMA, GHMA and SFA, when reseeding in fuel breaks, fire resistant native plant species should be used if available, or consider using fire resistant non-native species to meet resource objectives, if analysis demonstrates that non-native plants will not damage GRSG habitat in the long term.

**GRSG-FM-GL-048-Guideline** – In PHMA, IHMA, GHMA and SFA, fuel treatments should be designed to restore, enhance, or maintain GRSG habitat.

**GRSG-FM-ST-044-Standard** – In PHMA, IHMA, GHMA and SFA, do not use prescribed fire, except for pile burning, in 12-inch or less precipitation zones unless necessary to facilitate site preparation for restoration of GRSG habitat consistent with desired conditions in Table 2-6.

**GRSG-FM-ST-045-Standard** – In PHMA, SFA, GHMA, if it is necessary to use prescribed fire to facilitate site preparation for restoration of greater sage-grouse habitat consistent with desired conditions in Table 2-6, the associated NEPA analysis must identify how the project would move towards GRSG desired conditions, why alternative techniques were not selected, and how potential threats to GRSG habitat would be minimized.

**GRSG-FM-GL-046-Guideline** – In wintering or breeding and nesting habitat, sagebrush removal or manipulation, including prescribed fire, should be restricted unless the removal strategically reduces the potential impacts from wildfire

**GRSG-FM-GL-048-Guideline** – In PHMA, IHMA, GHMA and SFA, fuel treatments should be designed to restore, enhance, or maintain GRSG habitat.

---

BLM Management Actions	Forest Service Plan Components
<p>analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat would need to be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality.</p>	
<p><b>ESR-1:</b> Utilize the findings and Restoration/Rehabilitation Strategy developed as part of the FIAT Assessment process described in Appendix D to determine if GRSG rehabilitation actions are needed, based on ecological potential, and direct emergency stabilization and rehabilitation (ESR) (BLM) or Burned Area Emergency Response (BAER) (Forest Service) actions after fire.</p>	<p><b>GRSG-GRSGH-ST-028-Standard</b> – Design habitat restoration projects to move towards desired conditions (Table 2-6) and incorporate the concepts outlined in Appendix D - <i>Using resistance and resilience concepts to reduce impacts of invasive annual grasses and altered fire regimes on the sagebrush ecosystem and greater sage-grouse: A strategic multi-scale approach.</i></p>
<p><b>ESR-3:</b> Provide adequate rest from livestock grazing to allow natural recovery of existing vegetation and successful establishment of seeded species within burned/ESR areas. All new seedings of grasses and forbs should not be grazed until at least the end of the second growing season, and longer as needed to allow plants to mature and develop robust root systems which will stabilize the site, compete effectively against cheatgrass and other invasive annuals, and remain sustainable under long-term grazing management. Adjust other management activities, as appropriate, to meet ESR objectives.</p>	<p><b>GRSG-LG-DC-035-Desired Condition</b> – In PHMA, IHMA and SFAs, livestock grazing is managed to ensure adequate nesting cover and does not conflict with the attainment of other vegetation attributes (Table 2-6).</p>
<p><b>ESR-4:</b> Adjust, as appropriate, livestock management on adjacent unburned areas to mitigate the effect of the burn on local GRSG populations.</p>	<p><b>GRSG-LG-DC-035-Desired Condition</b> – In PHMA, IHMA and SFAs, livestock grazing is managed to ensure adequate nesting cover and does not conflict with the attainment of other vegetation attributes (Table 2-6).</p>
<p><b>ESR-5:</b> Following seedling establishment, modify grazing management practices if needed to achieve long-term vegetation and habitat objectives.</p>	<p><b>GRSG-LG-DC-035-Desired Condition</b> – In PHMA, IHMA and SFAs, livestock grazing is managed to ensure adequate nesting cover and does not conflict with the attainment of other vegetation attributes (Table 2-6).</p>

BLM Management Actions	Forest Service Plan Components
<p><b>RM-1 (Range Management):</b> Maintain existing areas designated as available or unavailable for livestock grazing. Existing active AUMs for livestock grazing within the planning area would not be changed at the broad scale, though the number of AUMs available on an allotment may be adjusted based on site-specific conditions to meet management objectives during term permit renewals, AMP development, or other appropriate implementation planning. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, and season of use in accordance with applicable regulations.</p>	<p>Direction will be included in the Implementation Guide.</p>
<p><b>RM-2:</b> Prioritize BLM land health assessments and processing of BLM grazing permits consistent with management area prioritization (MA-3), unless other higher priority considerations exist (RM-16) or other factors such as threatened, endangered and proposed species habitat that livestock grazing could affect. Where possible, conduct land health assessments at the watershed, or other meaningful landscape-scale.</p>	<p>Forest Service does not complete land health assessments. Direction will be included in the Record of Decision.</p>
<p><b>RM-3:</b> Where opportunities exist, coordinate with other land managers to encourage livestock operations that utilize mixed federal, private and/or state land to be managed at the landscape scale to benefit GRSG and their habitat across land ownerships.</p>	<p>Standard operating procedure.</p>
<p><b>RM-4:</b> PHMA &amp; IHMA: During the land health assessment process, identify the type(s) of seasonal habitat the assessed areas are capable of supporting. Utilize the habitat assessment framework, (Stiver et al. 2014 as amended/replaced) or other BLM or Forest Service approved methodology, in accordance with current policy and guidance to determine whether vegetation structure, condition and composition are meeting GRSG habitat objectives including riparian and lentic areas (HM-OBJ-2; Table 2-3). Use appropriate Ecological Site Descriptions, reference sheets and state and transition models to inform desired habitat conditions and expected responses to management changes for the land unit being assessed.</p>	<p>Forest Service does not complete land health assessments. Direction will be in the Implementation Guide.</p>
<p><b>RM-5:</b> When modifying grazing management, analyze indirect effects to habitat, including changes in fuel loading and wildfire behavior.</p>	<p>Standard operating procedure.</p>
<p><b>RM-6:</b> When livestock management practices are determined to not be compatible with meeting or making progress towards achievable</p>	<p><b>GRSG-LG-GL-038-Guideline</b> – In PHMA, IHMA, GHMA and SFAs, consider closure of grazing allotments, pastures, or portions of</p>

BLM Management Actions	Forest Service Plan Components
<p>habitat objectives following appropriate consultation, cooperating and coordination, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential modifications include, but are not limited to, changes in:</p> <ol style="list-style-type: none"> <li>1) Season or timing of use;</li> <li>2) Numbers of livestock;</li> <li>3) Distribution of livestock use;</li> <li>4) Duration and/or level of use;</li> <li>5) Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011); and</li> <li>6) Grazing schedules (including rest or deferment).</li> </ol>	<p>pastures, or managing the allotment as a forage reserve as opportunities arise under applicable regulations, where removal of livestock grazing would enhance the ability to achieve desired habitat conditions (Table 2-6).</p>
<p><b>RM-7:</b> Where opportunities exist, establish forage reserves to facilitate restoration and rehabilitation efforts in GRSG habitat areas. A forage reserve is an area that is set aside for use as needed by various permittees who might be displaced by wildfire, ESR, restoration efforts, etc. rather than having a term permit issued for grazing like a regular allotment.</p>	<p><b>GRSG-LG-GL-038-Guideline</b> – In PHMA, IHMA, GHMA and SFAs, consider closure of grazing allotments, pastures, or portions of pastures, or managing the allotment as a forage reserve as opportunities arise under applicable regulations, where removal of livestock grazing would enhance the ability to achieve desired habitat conditions (Table 2-6).</p>
<p><b>RM-9:</b> PHMA &amp; IHMA - Where practical, design pasture rotations to utilize non-native perennial grass seedings and/or annual grasslands, during GRSG nesting season annually or periodically.</p>	<p><b>GRSG-LG-DC-035-Desired Condition</b> – In PHMA, IHMA and SFAs, livestock grazing is managed to ensure adequate nesting cover and does not conflict with the attainment of other vegetation attributes (Table 2-6).</p> <p><b>GRSG-LG-GL-038-Guideline</b> – In PHMA, IHMA, GHMA and SFAs, consider closure of grazing allotments, pastures, or portions of pastures, or managing the allotment as a forage reserve as opportunities arise under applicable regulations, where removal of livestock grazing would enhance the ability to achieve desired habitat conditions (Table 2-6).</p>
<p><b>RM-10:</b> Evaluate the locations where salt/supplements are placed, coordinate salt/supplements placement to reduce impacts to GRSG habitat (e.g., existing disturbed areas).</p>	<p><b>GRSG-LG-DC-035-Desired Condition</b> – In PHMA, IHMA and SFAs, livestock grazing is managed to ensure adequate nesting cover and does not conflict with the attainment of other vegetation attributes (Table 2-6).</p>

BLM Management Actions	Forest Service Plan Components
<p><b>RM-11:</b> Incorporate RDFs into Terms and Conditions for crossing permits to limit disturbance of occupied leks when trailing livestock across BLM- and Forest Service -administered lands in the spring. Work with permittees in locating over-nighting, watering and bedding locations to minimize impacts to seasonal habitats.</p>	<p><b>GRSG-LG-GL-039-Guideline</b> – Bedding sheep and placing camps within 1.2 miles from the perimeter of a lek during lekking (March 1 to April 30) should be restricted.</p> <p><b>GRSG-LG-GL-040-Guideline</b> – During the breeding and nesting season (March 1 to June 15), trailing livestock through breeding and nesting habitat should be minimized. Specific routes should be identified, existing trails should be used, and stopovers on active leks should be avoided.</p>
<p><b>RM-12:</b> Design any new structural range improvements, following appropriate cooperation, consultation and coordination, to minimize and/or mitigate effects to GRSG habitat. Any new structural range improvements should be placed along existing disturbance corridors or in unsuitable habitat, to the extent practical, and are subject to RDFs (Appendix B). Structural range improvement in this context, include, but are not limited to: fences, exclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments.</p>	<p><b>GRSG-LG-GL-041-Guideline</b> – Fences should not be constructed or reconstructed within 1.2 miles from the perimeter of occupied leks, unless the collision risk can be mitigated through design features or markings (e.g., mark, laydown fences, or other design features).</p> <p><b>GRSG-LG-GL-042-Guideline</b> – New permanent livestock facilities (e.g., windmills, water tanks, corrals) should not be constructed within 1.2 miles from the perimeter of occupied leks.</p> <p><b>GRSG-LG-ST-036-Standard</b> – In PHMA, IHMA and SFAs, do not approve construction of water developments unless beneficial to GRSG habitat.</p>
<p><b>RM-13:</b> During the land health assessment and grazing permit renewal process, evaluate existing livestock management range improvements with respect to their effect on GRSG habitat. Consider removal of projects that are not needed for effective livestock management, are no longer in working condition, and/or negatively affect GRSG habitat, with the exception of functional projects needed for management of habitat for other threatened, endangered or proposed species or other sensitive resources.</p>	<p>Forest Service does not complete land health assessments. Direction will be included in the Record of Decision.</p>
<p><b>RM-14:</b> Prioritize removal, modification or marking of fences or other structures in areas of high collision risk following appropriate cooperation, consultation and coordination to reduce the incidence of GRSG mortality due to fence strikes (Stevens et al. 2012).</p>	<p><b>GRSG-LG-GL-041-Guideline</b> – Fences should not be constructed or reconstructed within 1.2 miles from the perimeter of occupied leks, unless the collision risk can be mitigated through design features or markings (e.g., mark, laydown fences, or other design features).</p>

BLM Management Actions	Forest Service Plan Components
<p><b>RM-15:</b> In response to weather conditions (i.e. drought) adjust grazing management (i.e., delay turnout, adjust pasture rotations, adjust the amount and/or duration of grazing) as appropriate to provide for adequate food and cover for GRSG.</p>	<p><b>GRSG-LG-DC-035-Desired Condition</b> – In PHMA, IHMA and SFAs, livestock grazing is managed to ensure adequate nesting cover and does not conflict with the attainment of other vegetation attributes (Table 2-6).</p> <p><b>GRSG-LG-GL-038-Guideline</b> – In PHMA, IHMA, GHMA and SFAs, consider closure of grazing allotments, pastures, or portions of pastures, or managing the allotment as a forage reserve as opportunities arise under applicable regulations, where removal of livestock grazing would enhance the ability to achieve desired habitat conditions (Table 2-6).</p>
<p><b>RM-16:</b> The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations</p>	<p>Forest Service will be modifying grazing permits as a result of this decision. A transition period will be identified in the Record of Decision.</p>
<p><b>RM-17:</b> The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds, based on GRSG Habitat Objectives Table, Land Health Standards (43 CFR 4180.2) and ecological site potential, and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis.</p>	<p>Standard operating procedure.</p>
<p><b>RM-18:</b> Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.</p>	<p>Forest Service will be modifying grazing permits as a result of this decision. A transition period will be identified in the Record of Decision.</p>

BLM Management Actions	Forest Service Plan Components
<p><b>RM-19:</b> At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fire breaks.</p>	<p><b>GRSG-LG-GL-038-Guideline</b> – In PHMA, IHMA, GHMA and SFAs, consider closure of grazing allotments, pastures, or portions of pastures, or managing the allotment as a forage reserve as opportunities arise under applicable regulations, where removal of livestock grazing would enhance the ability to achieve desired habitat conditions (Table 2-6).</p>
<p><b>WHB-1:</b> Manage herd management areas (HMAs) in GRSG habitat within established AML ranges to achieve and maintain GRSG habitat objectives (Table 2-3).</p>	<p><b>GRSG-HB-GL-062-Guideline</b> – In PHMA, IHMA, GHMA and SFA, wild horse and burro populations should be managed within established appropriate management levels to restore, enhance, or maintain GRSG desired habitat conditions (Table 2-6).</p>
<p><b>WHB- 2:</b> Complete rangeland health assessments for HMAs containing GRSG habitat using an interdisciplinary team of specialists (e.g. range, wildlife, and riparian). The priorities for conducting assessments are: 1) HMAs Containing SFA; 2) HMAs containing PHMA; 3) HMAs containing IHMA; 4) HMAs containing GHMA; 5) HMAs containing sagebrush habitat outside of PHMA, IHMA, and GHMA mapped habitat; 6) HMAs without GRSG Habitat.</p>	<p><b>GRSG-HB-GL-063-Guideline</b> – In PHMA, IHMA, GHMA and SFA, appropriate management levels should be adjusted if GRSG management standards are not met due to degradation that can be at least partially be attributed to wild horse or burro populations.</p>
<p><b>WHB-3:</b> Prioritize gathers and population growth suppression techniques in HMAs in GRSG habitat, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Place higher priority on Herd Areas not allocated as HMAs and occupied by wild horses and burros in SFAs followed by PHMA.</p>	<p><b>GRSG-HB-GL-063-Guideline</b> – In PHMA, IHMA, GHMA and SFA, appropriate management levels should be adjusted if GRSG management standards are not met due to degradation that can be at least partially be attributed to wild horse or burro populations.</p>
<p><b>WHB-4:</b> In SFAs and PHMA outside of SFA, assess and adjust AMLs through the NEPA process within HMAs when wild horses or burros are identified as a significant causal factor in not meeting land health standards, even if current AML is not being exceeded.</p>	<p><b>GRSG-HB-GL-063-Guideline</b> – In PHMA, IHMA, GHMA and SFA, appropriate management levels should be adjusted if GRSG management standards are not met due to degradation that can be at least partially be attributed to wild horse or burro populations.</p>
<p><b>WHB-5:</b> In SFAs and PHMA outside of SFA, monitor the effects of wild horse and burro use in relation to GRSG seasonal habitat objectives on an annual basis to help determine future management actions.</p>	<p>Forest Service has no WH&amp;B populations in sage grouse habitat.</p>

BLM Management Actions	Forest Service Plan Components
<p><b>WHB-6:</b> Develop or amend herd management area plans (HMAPs) to incorporate GRSG habitat objectives and management considerations for all HMAs within GRSG habitat, with emphasis placed on SFAs and other PHMAs.</p>	<p>Forest Service has no WH&amp;B populations in sage grouse habitat.</p>
<p><b>WHB-7:</b> Consider removals or exclusion of wild horse and burros during or immediately following emergency situations (such as fire, floods, and drought) to facilitate meeting GRSG habitat objectives where HMAs overlap with GRSG habitat.</p>	<p><b>GRSG-HB-GL-063-Guideline</b> – In PHMA, IHMA, GHMA and SFA, appropriate management levels should be adjusted if GRSG management standards are not met due to degradation that can be at least partially be attributed to wild horse or burro populations.</p>
<p><b>WHB-8:</b> When conducting NEPA analysis for wild horse and burro management activities, water developments, or other rangeland improvements for wild horses, address the direct and indirect effects to GRSG populations and habitat. Implement any water developments or rangeland improvements using the criteria identified for domestic livestock.</p>	<p>Forest Service has no WH&amp;B populations in sage grouse habitat.</p>
<p><b>WHB-9:</b> Coordinate with professionals from other federal and state agencies, researchers at universities, and others to utilize and evaluate new management tools (e.g., population growth suppression, inventory techniques, and telemetry) for implementing the wild horse and burro program.</p>	<p>Forest Service has no WH&amp;B populations in sage grouse habitat.</p>
<p><b>LR-I (Lands and Realty):</b> PHMA: Designate and manage PHMA as ROW avoidance areas, consistent with AD-3 and subject to RDFs, buffers and seasonal timing restrictions (Appendices B and C). IHMA: Designate and manage IHMA as ROW avoidance areas, consistent with AD-4 and subject to RDFs, buffers and seasonal timing restrictions. GHMA (Idaho and Montana): Designate and manage GHMA as open with proposals subject to RDFs, buffers and seasonal timing restrictions.</p>	<p><b>GRSG-LR-SUA-ST-013-Standard</b> – In PHMA, IHMA and SFAs, restrict issuance of new lands special use authorizations for infrastructure, such as high-voltage transmission lines, major pipelines, hydropower, distribution lines, and cellular towers. Exceptions must be limited and based on rationale (e.g., monitoring, modeling, or best available science) that explicitly demonstrates that adverse impacts to GRSG will be avoided by the exception. Existing authorized uses will continue to be recognized.</p> <p><b>GRSG-LR-SUA-ST-014-Standard</b> – In GHMA, new lands special use authorizations may be issued for infrastructure, such as high-voltage transmission lines, major pipelines, hydropower, distribution lines, and cellular towers, if they can be located within existing designated corridors or ROWs and the authorization includes stipulations to protect GRSG and their habitats. Existing authorized</p>

---

**BLM Management Actions****Forest Service Plan Components**

---

uses will continue to be recognized.

**GRSG-LR-SUA-ST-016-Standard** – In PHMA, IHMA, GHMA and SFAs, require protective stipulations (e.g., noise, tall structure, guy wire removal, perch deterrent installation) when issuing new authorizations or during renewal, amendment, or reissuance of existing authorizations that authorize infrastructure (e.g., high-voltage transmission lines, major pipelines, roads, distribution lines, and cellular towers).

**GRSG-LR-SUA-ST-017-Standard** – In PHMA, IHMA, GHMA and SFAs, locate upgrades to existing transmission lines within the existing designated corridors or ROWs unless an alternate route would benefit GRSG or their habitats

**GRSG-LR-SUA-ST-020-Standard** – In PHMA, IHMA, GHMA and SFA, co-locate new infrastructure (e.g., high-voltage transmission lines, major pipelines, roads, distribution lines, and cellular towers) with existing infrastructure to limit disturbance to the smallest footprint, or where it best limits impacts to greater sage-grouse or their habitats. If co-location of new infrastructure cannot be accomplished, locate it adjacent to existing infrastructure, roads, or already disturbed areas.

**GRSG-LR-SUA-GL-021-Guideline** – In PHMA and SFA, outside of existing designated corridors and ROWs, new transmission lines and pipelines should be buried to limit disturbance to the smallest footprint unless explicit rationale is provided that the biological impacts to GRSG and its habitat are being avoided. When new transmission lines and pipelines are not buried, locate them adjacent to existing transmission lines and pipelines.

**GRSG-GEN-GL-007-Guideline** – During breeding and nesting (March 1 to June 15), surface disturbing and disruptive activities to nesting birds should be avoided.

---

---

**BLM Management Actions**

**LR-2:** PHMA: Designate and manage PHMA as exclusion areas for utility scale (20 MW) wind and solar testing and development, nuclear and hydropower energy development. IHMA: Designate and manage IHMA as avoidance areas for wind and solar testing and development, nuclear and hydropower development. GHMA (Idaho): Designate and manage GHMA as open for wind and solar testing and development and nuclear and hydropower development subject to RDFs, buffers and seasonal timing restrictions. GHMA (Montana): Designate and manage GHMA as avoidance for wind and solar testing and development and nuclear and hydropower development.

**LR-3:** PHMA: Development of commercial service airports and facilities (as defined by FAA 2014 – publically owned airports that have at least 2,500 passenger boardings each calendar year and receive scheduled passenger service) would not be allowed within PHMA. IHMA and GHMA are Avoidance and Open respectively for these types of ROW applications as described in LR-1.

---

**Forest Service Plan Components**

**GRSG-WS-ST-025-Standard** – In PHMA and SFA do not authorize new solar and wind utility-scale and/or commercial energy development except for on-site power generation associated with existing industrial infrastructure (e.g., mine site).

**GRSG-WS-GL-026-Guideline** – In IHMA, new solar and wind energy utility-scale and/or commercial development should be restricted. If development cannot be restricted due to existing authorized use, adjacent developments, or split estate issues, then ensure that stipulations are incorporated into the authorization to protect GRSG and their habitats.

**GRSG-GEN-ST-004-Standard** –In PHMA, IHMA and SFA, do not issue new discretionary written authorizations unless all existing discrete anthropogenic disturbances cover less than 3 percent of the total GRSG habitat within the BSU and the proposed project area, regardless of ownership, and the new use will not cause exceedance of the 3 percent cap (Appendix G).

**GRSG-GEN-ST-005-Standard** - In PHMA, SFA, and IHMA, only allow new authorized land uses if the residual impacts to GRSG or their habitats are fully offset by compensatory mitigation projects that provide a net conservation gain to the species, which will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Any compensatory mitigation will be durable, timely, and in addition to what would have resulted without the compensatory mitigation, as addressed in the Mitigation Framework (Appendix J).

**GRSG-LR-SUA-ST-013-Standard** – In PHMA, IHMA and SFAs, restrict issuance of new lands special use authorizations for infrastructure, such as high-voltage transmission lines, major pipelines, hydropower, distribution lines, and cellular towers. Exceptions must be limited and based on rationale (e.g., monitoring, modeling, or best available science) that explicitly demonstrates that adverse impacts to GRSG will be avoided by the exception. Existing authorized uses will continue to be recognized

---

---

**BLM Management Actions**

**LR-4:** PHMA: Development of new or expansion of existing landfills would not be allowed within PHMA. IHMA and GHMA are Avoidance and Open respectively for these types of ROW applications as described in LR-1.

**LR-5:** Consistent with LR-2, LR-3 and LR-4, Rights-of-way for development of new or amended ROWs and land use authorizations (including permits and leases) in PHMA would only be considered when consistent with the Anthropogenic Disturbance Screening Criteria (AD-3); Rights-of-way for development of new or amended ROWs and land use authorizations (including permits and leases) in IHMA could be considered consistent with the IHMA Anthropogenic Disturbance Development Criteria (AD-4). GHMA: New ROW and land use authorizations could be considered.

---

**Forest Service Plan Components**

**GRSG-GEN-ST-004-Standard** –In PHMA, IHMA and SFA, do not issue new discretionary written authorizations unless all existing discrete anthropogenic disturbances cover less than 3 percent of the total GRSG habitat within the BSU and the proposed project area, regardless of ownership, and the new use will not cause exceedance of the 3 percent cap (Appendix G).

**GRSG-GEN-ST-005-Standard** - In PHMA, SFA, and IHMA, only allow new authorized land uses if the residual impacts to GRSG or their habitats are fully offset by compensatory mitigation projects that provide a net conservation gain to the species, which will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Any compensatory mitigation will be durable, timely, and in addition to what would have resulted without the compensatory mitigation, as addressed in the Mitigation Framework (Appendix J).

**GRSG-LR-SUA-ST-013-Standard** – In PHMA, IHMA and SFAs, restrict issuance of new lands special use authorizations for infrastructure, such as high-voltage transmission lines, major pipelines, hydropower, distribution lines, and cellular towers. Exceptions must be limited and based on rationale (e.g., monitoring, modeling, or best available science) that explicitly demonstrates that adverse impacts to GRSG will be avoided by the exception. **GRSG-GEN-ST-004-Standard** –In PHMA, IHMA and SFA, do not issue new discretionary written authorizations unless all existing discrete anthropogenic disturbances cover less than 3 percent of the total GRSG habitat within the BSU and the proposed project area, regardless of ownership, and the new use will not cause exceedance of the 3 percent cap (Appendix G).

**GRSG-GEN-ST-005-Standard** - In PHMA, SFA, and IHMA, only allow new authorized land uses if the residual impacts to GRSG or their habitats are fully offset by compensatory mitigation projects that provide a net conservation gain to the species, which will be achieved

BLM Management Actions	Forest Service Plan Components
	<p>by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Any compensatory mitigation will be durable, timely, and in addition to what would have resulted without the compensatory mitigation, as addressed in the Mitigation Framework (Appendix J).</p> <p><b>GRSG-LR-SUA-ST-013-Standard</b> – In PHMA, IHMA and SFAs, restrict issuance of new lands special use authorizations for infrastructure, such as high-voltage transmission lines, major pipelines, hydropower, distribution lines, and cellular towers. Exceptions must be limited and based on rationale (e.g., monitoring, modeling, or best available science) that explicitly demonstrates that adverse impacts to GRSG will be avoided by the exception. Existing authorized uses will continue to be recognized</p>
<p><b>LR-6:</b> In PHMA, if a higher voltage transmission line is required adjacent to an existing line (i.e. the project is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade):</p> <p>the existing transmission line must be removed and area rehabilitated within a specified amount of time after the new line is installed and energized; and the new line must be constructed in the same alignment as the existing line unless an alternate route would benefit GRSG or GRSG habitat.</p>	<p><b>GRSG-LR-SUA-ST-017-Standard</b> – In PHMA, IHMA, GHMA and SFAs, locate upgrades to existing transmission lines within the existing designated corridors or ROWs unless an alternate route would benefit GRSG or their habitats.</p>
<p><b>LR-7:</b> Existing designated corridors, including Section 368 Corridors, will remain Open in all habitat management areas (subject to the ongoing settlement agreement).</p>	<p>Not amended by this decision.</p>
<p><b>LR-8:</b> Process unauthorized use. If the unauthorized use is subsequently authorized, it would be authorized consistent with direction from this plan including RDFs, buffers and seasonal timing restrictions. If the use is not subsequently authorized the site would be reclaimed by removing these unauthorized (trespass) features and rehabilitating the habitat.</p>	<p>Forest Service policy does not provide for authorizing unauthorized uses.</p>
<p><b>LR-9:</b> Land use authorizations that are temporary (less than 3 years) in nature and are not otherwise excluded or restricted would be subject</p>	<p><b>GRSG-LR-SUA-ST-015-Standard</b> – In PHMA, IHMA and SFAs, do not authorize temporary lands special uses (i.e., facilities or activities)</p>

BLM Management Actions	Forest Service Plan Components
to seasonal or timing restrictions and mitigation requirements regarding habitat loss as needed.	that result in loss of habitat or would have long-term (i.e., greater than 5 years) negative impact on GRSG or their habitats.
<b>LR-10:</b> New ROW applications for water facilities (ditches, canals, pipelines), or amendments to existing water facilities which include additional structures to improve fish passage or benefits to fisheries (new diversions, fish screens) would be allowed on a case-by-case basis subject to RDFs to reduce impacts to GRSG habitat and mitigation requirements regarding GRSG habitat loss as needed.	No similar management direction.
<b>LR-11:</b> When a ROW grant expires and is not requested to be renewed, is relinquished, or terminated, the lease holder would be required to reclaim the site by removing overhead lines and other infrastructure and to eliminate avian predator nesting opportunities provided by anthropogenic development on public lands associated with the now void ROW grant (e.g., remove powerline and communication facilities no longer in service).	<b>GRSG-LR-SUA-ST-018-Standard</b> - In PHMA, IHMA, GHMA and SFAs, when a lands special use authorization is revoked or terminated and no future use is contemplated, require the authorization holder to remove overhead lines and other infrastructure in compliance with 36 CFR 251.60(i).
<b>LR-12:</b> As opportunities and priorities indicate work with existing ROW holders to retrofit existing towers and structures consistent with RDFs described in Appendix B.	<b>GRSG-LR-SUA-O-012-Objective</b> - In PHMA, IHMA and SFAs, retrofit existing tall structures (e.g., power poles, cellular towers) with perch deterrents or other anti-perching devices within 2 years of signing the Record of Decision.
<b>LR-13:</b> PHMA (Idaho and Montana) and IHMA (Idaho), and GHMA (Montana only) are designated as avoidance areas for high voltage transmission line and large pipeline ROWs, except for Gateway West and Boardman to Hemingway Transmission Projects. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in AD-3 and AD-4 of this document. The BLM is currently processing an application for Gateway West and Boardman to Hemingway Transmission Projects and the NEPA review for this project is well underway. These projects are further discussed in the cumulative effects analysis. The BLM is analyzing GRSG mitigation measures through the projects' NEPA review process.	<b>GRSG-LR-SUA-ST-013-Standard</b> – In PHMA, IHMA and SFAs, restrict issuance of new lands special use authorizations for infrastructure, such as high-voltage transmission lines, major pipelines, hydropower, distribution lines, and cellular towers. Exceptions must be limited and based on rationale (e.g., monitoring, modeling, or best available science) that explicitly demonstrates that adverse impacts to GRSG will be avoided by the exception. Existing authorized uses will continue to be recognized.
<b>LR-14:</b> Lands classified as PHMA, IHMA, and GHMA for GRSG will be retained in federal management unless: (1) the agency can demonstrate	<b>GRSG-LR-LOA-ST-022-Standard</b> – In PHMA, IHMA, GHMA and SFA, do not approve landownership adjustments unless the action

---

## BLM Management Actions

that disposal of the lands will provide a net conservation gain to the GRSG or (2) the agency can demonstrate that the disposal of the lands will have no direct or indirect adverse impact on conservation of the GRSG. Land tenure adjustments would be subject to the following disposal, exchange, and acquisition criteria, which include retaining lands with GRSG habitat. Retention of areas with GRSG would reduce the likelihood of habitat conversion to agriculture, urbanization, or other uses that would remove sagebrush habitat and potentially impact sensitive plants. Criteria:

- a. Lands within PHMA, IHMA and GHMA would only be available for disposal through exchange (Appendix K).
- b. Acquire habitat within PHMA and IHMA, when possible (i.e. willing landowner), and retain ownership of habitat within all Areas, except if a land exchange would allow for additional or more contiguous federal ownership patterns.
- c. Lands within PHMA, IHMA and GHMA would be retained unless exchange of those lands would increase the extent or provide for connectivity of PHMA or IHMA.
- d. Evaluate potential land exchanges containing historically low-quality GRSG habitat that may be too costly to restore in exchange for lands of higher quality habitat, lands that connect seasonal GRSG habitats or lands providing for threatened and endangered species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of PHMA. Higher priority will be given to exchanges for those in-tact areas of sagebrush that will contribute to the expansion of sagebrush areas within PHMA currently in public ownership. Lower priority would be given to other lands that would promote enhancement in the PHMA and IHMA (i.e., areas with fragmented or less in-tact sagebrush).
- e. Identify lands for acquisition that increase the extent of or provide for connectivity of PHMA.

---

## Forest Service Plan Components

results in a net conservation gain to GRSG or it will not directly or indirectly adversely impact GRSG conservation.

**GRSG-LR-LOA-GL-023-Guideline** – In PHMA, IHMA, GHMA and SFA with minority federal ownership, consider landownership adjustments to achieve a landownership pattern (e.g., consolidation, reducing fragmentation) that supports improved GRSG population trends and habitats.

---

**BLM Management Actions**

**FLM-OBJ-1:** Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA, IHMA, and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA, IHMA, and GHMA, and subject to applicable stipulations for the conservation of GRSG, priority will be given to development in non-habitat areas first and then in the least suitable habitat for GRSG. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 USC 226(p) and 43 CFR 3162.3-1(h).

**FLM-OBJ-2:** Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, minimize and apply compensatory mitigation to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD or Geothermal Drilling Permit (GDP) for the lease to avoid, minimize, and apply compensatory mitigation to impacts to GRSG or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.

---

**Forest Service Plan Components**

**GRSG-M-FMUL-ST-077-Standard** - In PHMA, and IHMA any new oil and gas leases must include an NSO stipulation. There will be no waivers or modifications. An exception could be granted by the authorized officer with unanimous concurrence from a team of agency GRSG experts from the USFWS, Forest Service, and State wildlife agency if:

- There would be no direct, indirect, or cumulative effects to GRSG or their habitats or
- Granting the exception provides an alternative to a similar action occurring on a nearby parcel and
- The exception provides a clear net conservation gain to GRSG.

**GRSG-M-FMUL-ST-078-Standard** – In GHMA, any new leases must include appropriate CSU and TL stipulations to protect GRSG and their habitat.

**GRSG-M-FMUL-ST-079-Standard** – In SFA, there will be NSO and no waivers, exceptions, or modifications for fluid mineral leasing.

**GRSG-M-FML-ST-080-Standard** – In PHMA, IHMA, and SFA, when approving the Surface Use Plan of Operation portion of the Application for Permit to Drill on existing leases that are not yet developed, require that leaseholders avoid and minimize surface disturbing and disruptive activities consistent with the rights granted in the lease.

**GRSG-M-FML-ST-081-Standard** – In PHMA, IHMA, and SFA, when facilities are no longer needed or leases are relinquished, require reclamation plans to include terms and conditions to restore habitat to desired conditions as described in Table 2-6.

**GRSG-M-FML-ST-082-Standard** – In GHMA, authorize new transmission line corridors, transmission line ROWs, transmission line construction, or transmission line-facility construction associated with fluid mineral leases with stipulations necessary to protect GRSG and their habitats, consistent with the terms and conditions of the permit.

---

**BLM Management Actions****Forest Service Plan Components**

---

**GRSG-M-FML-ST-083-Standard** – Locate compressor stations on portions of a lease that are non-habitat and are not used by GRSG, and if there would be no direct, indirect, or cumulative effects on GRSG or their habitat. If this is not possible, work with the operator to use mufflers, sound insulation, or other features to reduce noise, consistent with GRSG-GEN-ST-006-Standard.

**GRSG-M-FML-ST-084-Standard** – In PHMA, GHMA and SFA, when authorizing development of fluid mineral resources, work with the operator to minimize impacts to GRSG and their habitat, such as locating facilities in non-habitat areas first and then in the least suitable habitat.

**GRSG-M-FML-GL-085-Guideline** – In PHMA, IHMA, GHMA and SFA, operators should be encouraged to reduce disturbance to GRSG habitat. At the time of approval of the Surface Use Plan of Operation portion of the Application for Permit to Drill, terms and conditions should be included to reduce disturbance to GRSG habitat, where appropriate and feasible and consistent with the rights granted to the lessee.

**GRSG-M-FML-GL-086-Guideline** – On existing federal leases in PHMA, IHMA, and SFA, when surface occupancy cannot be restricted due to valid existing rights or development requirements, disturbance and surface occupancy should be limited to areas least harmful to GRSG based on vegetation, topography, or other habitat features.

**GRSG-M-FML-GL-087-Guideline** - In PHMA, SFA, and GHMA, where the federal government owns the surface and the mineral estate is in non-federal ownership, coordinate with the mineral estate owner/lessee to apply appropriate stipulations, conditions of approval, conservation measures and RDFs to the appropriate surface management instruments to the maximum extent permissible under existing authorities.

---

**FLM-I (Fluid Minerals):** Idaho and Montana: Areas within SFAs would be open to fluid mineral leasing and development and

---

**GRSG-M-FMUL-ST-077-Standard** - In PHMA, and IHMA any new oil and gas leases must include an NSO stipulation. There will be no

BLM Management Actions	Forest Service Plan Components
<p>geophysical exploration subject to NSO without waiver, exception, or modification. Areas within PHMA and IHMA would be open to mineral leasing and development and geophysical exploration subject to NSO with a limited exception (FLM-3). GHMA would be open to mineral leasing and development and geophysical exploration subject to CSU which includes buffers, seasonal timing restrictions (see Appendix C) and standard stipulations.</p>	<p>waivers or modifications. An exception could be granted by the authorized officer with unanimous concurrence from a team of agency GRSG experts from the USFWS, Forest Service, and State wildlife agency if:</p> <ul style="list-style-type: none"> <li>• There would be no direct, indirect, or cumulative effects to GRSG or their habitats or</li> <li>• Granting the exception provides an alternative to a similar action occurring on a nearby parcel and</li> <li>• The exception provides a clear net conservation gain to GRSG.</li> </ul> <p><b>GRSG-M-FMUL-ST-078-Standard</b> – In GHMA, any new leases must include appropriate CSU and TL stipulations to protect GRSG and their habitat.</p>
<p><b>FLM-2:</b> In Idaho, parcels nominated for lease in PHMA or IHMA would be evaluated prior to lease offering to determine if development is feasible. In GHMA, parcels would not be offered for lease if buffers and restrictions (including RDFs) preclude development in the leasing area.</p>	<p>No similar management direction. Forest Service makes availability decisions not feasibility decisions.</p>
<p><b>FLM-3:</b> PHMA and IHMA: No waivers or modifications to a fluid mineral lease NSO stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease NSO stipulation only where the proposed action:</p> <ol style="list-style-type: none"> <li>i. Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,</li> <li>ii. Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.</li> </ol> <p>Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP amendment. Exceptions based on</p>	<p><b>GRSG-M-FMUL-ST-077-Standard</b> - In PHMA, and IHMA any new oil and gas leases must include an NSO stipulation. There will be no waivers or modifications. An exception could be granted by the authorized officer with unanimous concurrence from a team of agency GRSG experts from the USFWS, Forest Service, and State wildlife agency if:</p> <ul style="list-style-type: none"> <li>• There would be no direct, indirect, or cumulative effects to GRSG or their habitats or</li> <li>• Granting the exception provides an alternative to a similar action occurring on a nearby parcel and</li> <li>• The exception provides a clear net conservation gain to GRSG</li> </ul>

conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts.

Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.

Waivers, Exceptions and Modifications (WEMs) (Source IM-2008-032):

A waiver is a permanent exemption from a lease stipulation, the stipulation would no longer apply anywhere within the lease. Waivers, by regulation, require a 30-day public review if the authorized officer has determined, prior to lease issuance, that a stipulation involves an issue of major concern to the public (43 CFR 3101.4) and are approved and signed by the State Director.

An exception is a one-time exemption for a particular site within the lease; exceptions are determined on a case-by-case basis; the stipulation continues to apply to all other sites within the lease. An exception is a limited type of waiver.

A modification is a change to the provisions of a lease stipulation, either temporarily or for the term of the lease. Depending on the specific modification, the stipulation may or may not apply to all sites within the lease to which the restrictive criteria are applied.

---

---

**BLM Management Actions**

**FLM-4:** Incorporate required design features and best management practices appropriate to the management area as COAs when post leasing activity is proposed into any post-lease authorizations.

**Forest Service Plan Components**

---

**GRSG-M-FMO-ST-088-Standard** – In PHMA, IHMA and SFA, do not authorize employee camps.

**GRSG-M-FMO-ST-089-Standard** – In PHMA, IHMA and SFA, when feasible, do not locate tanks or other structures that may be used as raptor perches. If this is not feasible, use perch deterrents.

**GRSG-M-FMO-GL-090-Guideline** – In PHMA, IHMA and SFA, closed-loop systems should be used for drilling operations with no reserve pits, where feasible.

**GRSG-M-FMO-GL-091-Guideline** – In PHMA, IHMA, GHMA and SFA, during drilling operations, soil compaction should be minimized and soil structure should be maintained using the best available techniques to improve vegetation reestablishment.

**GRSG-M-FMO-GL-092-Guideline** – In PHMA, IHMA, GHMA and SFA, dams, impoundments and ponds for mineral development should be constructed to reduce potential for West Nile virus. Examples of methods to accomplish this include:

- Increase the depth of ponds to accommodate a greater volume of water than is discharged.
  - Build steep shorelines (greater than 2 feet) to reduce shallow water and aquatic vegetation around the perimeter of impoundments to reduce breeding habitat for mosquitoes.
  - Maintain the water level below that of rooted aquatic and upland vegetation. Avoid flooding terrestrial vegetation in flat terrain or low-lying areas.
  - Construct dams or impoundments that restrict down-slope seepage or overflow by digging ponds in flat areas rather than damming natural draws for effluent water storage or lining constructed ponds in areas where seepage is anticipated.
  - Line the channel where discharge water flows into the pond with crushed rock or use a horizontal pipe to discharge inflow directly into existing open water.
-

BLM Management Actions	Forest Service Plan Components
	<ul style="list-style-type: none"> <li>• Line the overflow spillway with crushed rock and construct the spillway with steep sides.</li> <li>• Fence pond sites to restrict access by livestock and other wild ungulates.</li> <li>• Remove or re-inject produced water.</li> <li>• Treat waters with larvicides to reduce mosquito production where water occurs on the surface.</li> </ul> <p><b>GRSG-M-FMO-GL-0093-Guideline</b> – In PHMA, IHMA, GHMA and SFA to keep habitat disturbance at a minimum, a phased development approach should be applied to fluid mineral operations, wherever possible, consistent with the rights granted under the lease. Disturbed areas should be reclaimed as soon as they are no longer needed for mineral operations.</p>
<p><b>FLM-5:</b> In Montana, prior to leasing conduct a Master Leasing Plan process when all four of the following criteria are met:</p> <p>A substantial portion of the area to be analyzed in the MLP is not currently leased.</p> <p>There is a majority Federal mineral interest.</p> <p>The oil and gas industry has expressed a specific interest in leasing, and there is a moderate or high potential for oil and gas confirmed by the discovery of oil and gas in the general area.</p> <p>Additional analysis or information is needed to address likely resource or cumulative impacts if oil and gas development were to occur where there are:</p> <p>multiple-use or natural/cultural resource conflicts;</p> <p>impacts to air quality;</p> <p>impacts on the resources or values of any unit of the National Park System, national wildlife refuge, or National Forest wilderness area, as determined after consultation or coordination with the NPS, the</p>	<p>No similar action</p>

BLM Management Actions	Forest Service Plan Components
<p>USFWS, or the Forest Service; or impacts on other specially designated areas. – analyzing likely development scenarios and varying mitigation levels.</p>	
<p><b>FLM-5:</b> In Idaho, complete a Master Development Plan, consistent with plan development guide on leases where a producing field is proposed to be developed.</p>	<p>Forest Service will work with the BLM to complete Master Development plans.</p>
<p><b>FLM-6:</b> Encourage unitization when deemed necessary for proper development and operation of an area (with strong oversight and monitoring). The unitization must be designed in a manner to minimize adverse impacts on GRSG according to the Federal Lease Form, 3100-11, Sections 4 and 6.</p>	<p>BLM’s responsibility.</p>
<p><b>FLM-7:</b> Issue Written Orders of the Authorized Officer (43 CFR 3161.2) requiring reasonable protective measures consistent with the lease terms where necessary to avoid or minimize effects to GRSG populations or habitat.</p>	<p>No similar management direction.</p>
<p><b>LOC-2:</b> Apply reasonable and appropriate RDFs to locatable minerals consistent with applicable law to prevent unnecessary or undue degradation of GRSG habitat when a Plan of Operations is submitted for BLM or Forest Service approval, in accordance with 43 CFR 3809.411(d)(2) (or 36 CFR 228.5(a)(3) on National Forest System lands).</p>	<p><b>GRSG-M-LM-ST-097-Standard</b> – In PHMA, IHMA and SFA, only approve Plans of Operation if they include mitigation to protect GRSG and their habitats, consistent with the rights of the mining claimant as granted by the General Mining Act of 1872, as amended.</p> <p><b>GRSG-M-LM-GL-098-Guideline</b> – In PHMA, IHMA, GHMA and SFA to keep habitat disturbance at a minimum, a phased development approach should be applied to operations consistent with the rights granted under the General Mining Act of 1872, as amended. Disturbed areas should be reclaimed as soon as they are no longer needed for mineral operations.</p> <p><b>GRSG-M-LM-GL-099-Guideline</b> - In PHMA, IHMA, GHMA and SFA, abandoned mine sites should be closed or mitigated to reduce predation of GRSG by eliminating tall structures that could provide nesting opportunities and perching sites for predators</p>

BLM Management Actions	Forest Service Plan Components
<p><b>LOC-3:</b> Recommend SFAs for withdrawal from the General Mining Act of 1872, as amended, subject to valid existing rights.</p>	<p><b>GRSG-LR-LW-GL-024-Guideline</b> – In priority and important habitat management areas and sagebrush focal areas, use land withdrawals as a tool, where appropriate, to prevent activities that will be detrimental to greater sage-grouse or their habitats.</p>
<p><b>SAL-1 (Salable Minerals):</b> PHMA: All PHMAs will be closed to mineral materials development. However, existing free use permits and the expansion of existing free use permits may be considered only if the following criteria are met:</p> <ul style="list-style-type: none"> <li>the project area disturbance cap is not exceeded within a BSU;</li> <li>the activity is subject to the provisions set forth in the mitigation framework [Appendix J];</li> <li>all applicable required design features are applied; and</li> <li>the activity is permissible under the Idaho exception and development criteria (AD-3 and AD-4)</li> </ul> <p>IHMA: All IHMA will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria (AD-4), and subject to RDFs, buffers and seasonal timing restrictions. Sales from existing community pits within IHMA would be subject to seasonal timing restrictions.</p> <p>GHMA: All GHMA will be open to mineral materials development, subject to RDFs, buffers and seasonal timing restrictions. Sales from existing community pits within GHMA would be subject to seasonal timing restrictions.</p>	<p><b>GRSG-M-MM-ST-0102-Standard</b> – In PHMA and SFA, do not allow new mineral material disposal or development.</p> <p><b>GRSG-M-MM-ST-103-Standard</b> – In PHMA, IHMA and SFA, free-use mineral material collection permits may be issued and expansion of existing active pits may be allowed, except from March 1 to April 30 between 6 pm and 9 am within 2 miles from the perimeter of occupied leks, within the BSU and proposed project area, if doing so does not exceed the disturbance cap.</p> <p><b>GRSG-M-MM-ST-104-Standard</b> - In PHMA, IHMA, GHMA and SFA, any permit for existing mineral material operations must include appropriate requirements for operation and reclamation of the site to restore, enhance, or maintain desired habitat conditions (Table 2-6).</p>
<p><b>SAL-2:</b> Restore salable mineral pits no longer in use to meet GRSG habitat management objectives.</p>	<p><b>GRSG-M-MM-ST-104-Standard</b> - In PHMA, IHMA, GHMA and SFA, any permit for existing mineral material operations must include appropriate requirements for operation and reclamation of the site to restore, enhance, or maintain desired habitat conditions (Table 2-6).</p>

BLM Management Actions	Forest Service Plan Components
<p><b>SAL-3:</b> Require reclamation bonding that would require restoration of GRSG habitat on new site authorizations for mineral material pits in IHMA (this would not apply to free use permits issued to a government entity such as a county road district, but would apply to non-profit entities).</p>	<p><b>GRSG-M-MM-ST-104-Standard</b> - In PHMA, IHMA, GHMA and SFA, any permit for existing mineral material operations must include appropriate requirements for operation and reclamation of the site to restore, enhance, or maintain desired habitat conditions (Table 2-6).</p>
<p><b>SAL-4:</b> Montana: PHMAs are closed to new mineral material sales. However, these areas remain “open” to free use permits and the expansion of existing active pits, only if the following criteria are met: the activity is within the BSU and project area disturbance cap; the activity is subject to the provisions set forth in the mitigation framework [Appendix J]; all applicable required design features are applied; and the activity is permissible under the Montana screening criteria (AD-4) Appendix I.</p>	<p><b>GRSG-M-MM-ST-0102-Standard</b> – In PHMA and SFA, do not allow new mineral material disposal or development.</p> <p><b>GRSG-M-MM-ST-103-Standard</b> – In PHMA, IHMA and SFA, free-use mineral material collection permits may be issued and expansion of existing active pits may be allowed, except from March 1 to April 30 between 6 pm and 9 am within 2 miles from the perimeter of occupied leks, within the BSU and proposed project area, if doing so does not exceed the disturbance cap.</p> <p><b>GRSG-M-MM-ST-104-Standard</b> - In PHMA, IHMA, GHMA and SFA, any permit for existing mineral material operations must include appropriate requirements for operation and reclamation of the site to restore, enhance, or maintain desired habitat conditions (Table 2-6).</p>
<p><b>NEL-1 (Nonenergy Leasables):</b> PHMAs are closed to leasing. IHMA and GHMA: Areas within Known Phosphate Leasing Areas (KPLAs) will remain open to leasing subject to standard stipulations. IHMA areas outside of KPLAs are open to prospecting and subsequent leasing provided the Anthropogenic Disturbance Development Criteria (AD-4) and the anthropogenic disturbance cap (AD-1) can be met. RDFs, buffers and seasonal timing restrictions shall be applied to prospecting permits. GHMA: Lands outside KPLAs are available for prospecting and subsequent leasing and initial mine development subject to RDFs, buffers, timing restrictions (seasonal and daily) and standard stipulations.</p>	<p><b>GRSG-M-NEL-GL-100-Guideline</b> – In PHMA, IHMA, GHMA and SFA, at the time of issuance of prospecting permits, exploration licenses and leases, or readjustment of leases, the Forest Service should provide recommendations to the BLM for the protection of GRSG and their habitats.</p> <p><b>GRSG-M-NEL-GL-101-Guideline</b> - In PHMA, SFA, GHMA, the Forest Service should recommend to the BLM that expansion or readjustment of existing leases avoid, minimize, or mitigate the effects to GRSG and their habitat.</p>
<p><b>NEL-2:</b> Require seasonal and daily timing restrictions in undeveloped nonenergy mineral leases when exploration activities or initial mine development is proposed (e.g. exploration drilling, timber removal, shrub clearing, etc.) as COAs.</p>	<p><b>GRSG-M-NEL-GL-100-Guideline</b> – In PHMA, IHMA, GHMA and SFA, at the time of issuance of prospecting permits, exploration licenses and leases, or readjustment of leases, the Forest Service should provide recommendations to the BLM for the protection of</p>

BLM Management Actions	Forest Service Plan Components
	<p>GRSG and their habitats.</p> <p><b>GRSG-M-NEL-GL-101-Guideline</b> - In PHMA, SFA, GHMA, the Forest Service should recommend to the BLM that expansion or readjustment of existing leases avoid, minimize, or mitigate the effects to GRSG and their habitat.</p>
<p><b>NEL-3:</b> Include RDFs as COAs to mine plans in undeveloped non-energy mineral leases for exploration activities or initial mine development.</p>	<p><b>GRSG-M-NEL-GL-100-Guideline</b> – In PHMA, IHMA, GHMA and SFA, at the time of issuance of prospecting permits, exploration licenses and leases, or readjustment of leases, the Forest Service should provide recommendations to the BLM for the protection of GRSG and their habitats.</p>
<p><b>MSE-1 (Mineral Split Estate):</b> BLM Owns Mineral Estate – non-federal surface owner: Where the federal government owns the mineral estate in PHMAs, IHMAs, and GHMAs, and the surface is in non-federal ownership, apply the same stipulations, COAs, and/or conservation measures and RDFs applied if the mineral estate is developed on BLM-administered lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner.</p>	<p>No similar management direction.</p>
<p><b>MSE-2:</b> BLM owns surface – non-federal mineral estate owner: Where the federal government owns the surface and the mineral estate is in non-federal ownership in PHMA, IHMA, and GHMA, apply appropriate surface use COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee.</p>	<p><b>GRSG-M-FML-GL-087-Guideline</b> - In PHMA, SFA, and GHMA, where the federal government owns the surface and the mineral estate is in non-federal ownership, coordinate with the mineral estate owner/lessee to apply appropriate stipulations, conditions of approval, conservation measures and RDFs to the appropriate surface management instruments to the maximum extent permissible under existing authorities.</p>
<p><b>Coal-1</b> At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR 3461.5. PHMA is essential habitat for maintaining GRSG for purposes of the suitability criteria set forth at 43 CFR 3461.5(o)(1).</p>	<p><b>GRSG-M-CMUL-ST-094-Standard</b> – In PHMA, IHMA and SFA, do not authorize surface disturbances (e.g., appurtenant facilities) for new underground coal mines.</p>

**BLM Management Actions****Forest Service Plan Components**

---

**TM-1 (Travel Management):** Limit off-highway vehicle travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails in areas where travel management planning has not been completed or is in progress. This excludes areas previously designated as open through a land use plan decision or currently under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices.

An off-highway vehicle is any motorized vehicle capable of, or designed for, travel on or immediately over land, water, or other natural terrain, excluding: (1) Any nonamphibious registered motorboat; (2) any military, fire, emergency, or law enforcement vehicle while being used for emergency purposes; (3) any vehicle whose use is expressly authorized by the authorized officer, or otherwise officially approved; (4) Vehicles in official use where official use is use by an employee, agent, or designated representative of the Federal Government or one of its contractors, in the course of his employment, agency, or representation.; and (5) any combat or combat support vehicle when used in times of national defense emergencies (43 CFR 8340.0 5).

**TM-2:** In PHMA, IHMA, and GHMA, temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use).

Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures

**GRSG-RT-DC-0068-Desired Condition** - In PHMA, IHMA, GHMA and SFAs, within the travel management system, GRSG experience minimal disturbance during breeding and nesting (March 1 to June 15) and wintering (November 1 to February 28) periods.

Also 36 CFR 212 subpart B.

---

36 CFR 261 subpart A

BLM Management Actions	Forest Service Plan Components
<p>implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.</p>	
<p><b>TM-3:</b> Develop Travel Management Plans for each Field Office as described in the BLM Travel Management Handbook 8342.1 and according to the travel management planning guidelines (Appendix L).</p>	36 CFR 212
<p><b>TM-4:</b> During subsequent travel management planning design and designate a travel system to minimize adverse effects on GRSG. Locate areas and trails to minimize disturbance of GRSG and/or to have a neutral or positive effect on GRSG habitat and populations. Give special attention to protect endangered or threatened species and their habitats. Allow for route upgrade, closure of existing routes, timing restrictions, seasonal closures, and creation of new routes to help protect habitat and meet user group needs, thereby reducing the potential for pioneering unauthorized routes. The emphasis of the comprehensive travel and transportation planning within PHMA would be placed on having a neutral or positive effect on GRSG habitat. Individual route designations would occur during subsequent travel management planning efforts.</p>	36 CFR 212
<p><b>TM-5:</b> Conduct road construction, upgrades, and maintenance activities to avoid disturbance during the lekking season – see Appendix C.</p>	<p><b>GRSG-RT-ST-069-Standard</b> – In PHMA, IHMA, GHMA and SFAs, do not conduct or allow new road or trail construction (does not apply to realignments for resource protection) except when necessary for administrative access, public safety, or to access valid existing rights. If necessary to construct new roads and trails for one of these purposes, construct them to the minimum standard, length, and number and avoid, minimize, and mitigate impacts.</p> <p><b>GRSG-RT-ST-070-Standard</b> – Do not conduct or allow road and trail maintenance activities within 2 miles from the perimeter of active leks during lekking (March 1 to April 30) from 6 pm to 9 am.</p>

BLM Management Actions	Forest Service Plan Components
	<p><b>GRSG-RT-ST-071-Standard</b> – In PHMA, IHMA and SFAs, prohibit public access on temporary energy development roads, unless consistent with all other terms and conditions included in the forest plan.</p> <p><b>GRSG-RT-GL-072-Guideline</b> – In PHMA, IHMA and SFAs, new roads and road realignments should be designed and administered to reduce collisions with GRSG.</p> <p><b>GRSG-RT-GL-073-Guideline</b> – In PHMA, IHMA, and SFAs, road construction within riparian areas and mesic meadows should be restricted. If not possible to restrict construction within riparian areas and mesic meadows, roads should be designed and constructed at right angles to ephemeral drainages and stream crossings, unless topography prevents doing so.</p> <p><b>GRSG-RT-GL-074-Guideline</b> – In PHMA, IHMA, GHMA and SFAs, when decommissioning roads and unauthorized routes, restoration activity should be designed to move habitat towards desired conditions (Table 2-6).</p> <p><b>GRSG-RT-GL-076-Guideline</b> - In PHMA, IHMA, GHMA and SFAs, road and road-way maintenance activities should be designed and implemented to reduce the risk of vehicle or human-caused wildfires and the spread of invasive plants. Such activities include but are not limited to the removal or mowing of vegetation a car-width off the edge of roads; use of weed-free earth-moving equipment, gravel, fill, or other materials; and blading or pulling roadsides and ditches that are infested with noxious weeds only if required for public safety or protection of the roadway.</p>
<p><b>REC-1:</b> Manage existing recreation uses and sites to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, buffers and seasonal restrictions.</p>	<p><b>GRSG-R-DC-064-Desired Condition</b> – In PHMA, IHMA, GHMA and SFA, existing and new recreation special use authorizations and expansion of special use authorizations avoids effects to GRSG and their habitats.</p>
<p><b>REC-2:</b> In PHMA and IHMA, do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) unless the</p>	<p><b>GRSG-R-GL-067-Guideline</b> – In PHMA, SFA, and IHMA, new recreational facilities or expansion of existing recreational facilities</p>

**BLM Management Actions**

development would have a net conservation gain to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.), or unless the development is required for visitor health and safety or resource protection.

RDFs are means, measures, or practices intended to reduce or avoid adverse environmental impacts. This LUPA/EIS proposes a suite of design features that would establish the minimum specifications for water developments, certain mineral development, and fire and fuels management and would mitigate adverse impacts. These design features would be required to provide a greater level of regulatory certainty than through implementing BMPs.

In general, the design features are accepted practices that are known to be effective when implemented properly at the project level. However, their applicability and overall effectiveness cannot be fully assessed except at the project-specific level when the project location and design are known. Because of site-specific circumstances, some features may not apply to some projects (e.g., when a resource is not present on a given site) or may require slight variations from what is described in the LUPA/EIS (e.g., a larger or smaller protective area). All variations in design features would require appropriate analysis and disclosure as part of future project authorizations. Additional mitigation measures may be identified and required during individual project development and environmental review. The proposed RDFs are presented in Appendix B, Greater Sage-Grouse Habitat Required Design Features and Best Management Practices.

**Forest Service Plan Components**

(e.g., roads, trails, campgrounds), including special use authorizations for facilities and activities, should not be approved unless the development results in a net conservation gain to GRSG and/or their habitats or the development is required for visitor safety.

**GRSG-R-ST-065-Standard** – In PHMA, IHMA and SFA, do not authorize temporary recreation uses (i.e., facilities or activities) that result in loss of habitat or would have long-term (i.e., greater than 5 years) negative impacts on GRSG or their habitats.

**GRSG-R-GL-066-Guideline** – In PHMA, IHMA, GHMA and SFA, terms and conditions that protect and/or restore GRSG habitat within the permit area should be included in new recreation special use authorizations. During renewal, amendment, or reauthorization, terms and conditions in existing permits and operating plans should be modified to protect and/or restore GRSG habitat.

**Table 2-1**  
**Seasonal Habitat Desired Conditions for GRSG on BLM-Administered Lands**

Attribute	Indicator	Desired Condition	Reference
<b>BREEDING HABITAT (LEK AND NESTING/EARLY BROOD REARING)</b>			
<b>Breeding and Nesting (Seasonal Use Period March 1 – June 15)<sup>1</sup></b>			
Lek Security	Proximity of trees	Trees (i.e., in Idaho mainly juniper, conifers, and does not include old-growth juniper, pinyon pine and mountain mahogany; in Montana mainly Douglas-fir) absent or uncommon on shrub/grassland ecological sites within 1.86 miles (3 km) of occupied leks.	Baruch-Mordo et al. 2013 <sup>7</sup> Stiver et al. <i>in press</i> <sup>13</sup>
	Proximity of sagebrush to leks	Adjacent protective sagebrush cover within 328 ft. (100 m) of an occupied lek	Stiver et al. <i>in press</i> <sup>13</sup>
<b>NESTING/EARLY BROOD REARING<sup>1,5,10,12,13,14</sup></b>			
Cover and Food	Seasonal habitat extent (Percent of Seasonal Habitat Meeting Desired Conditions)	>80% of the nesting habitat meets the recommended vegetation characteristics, where appropriate (relative to ecological site potential, etc.).	Connelly et al. 2000 <sup>8</sup>
	Sagebrush cover <sup>2</sup>	15-25%	Connelly et al. 2000 <sup>8</sup> Connelly et al. 2003 <sup>9</sup> Hagen et al. 2007 <sup>11</sup>
	Sagebrush height		Connelly et al. 2000 <sup>8</sup>
	Arid sites <sup>3</sup>	12-31 inches (30-80cm)	
	Mesic sites <sup>4</sup>	16-31 inches (40-80cm)

<sup>9</sup> 10–12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush sub-species for this type site (Stiver et al, 2015).

<sup>10</sup> ≥12 inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site (Stiver et al, 2015).

**Table 2-6  
Seasonal Habitat Desired Conditions for Greater Sage-grouse**

<b>Attribute</b>	<b>Indicators</b>	<b>Desired Condition</b>
------------------	-------------------	--------------------------

- <sup>11</sup> Sagebrush plants with a spreading shape provide more protective cover than sagebrush plants that are more tree- or columnar shaped (Stiver et al. 2015).
- <sup>12</sup> Existing land management plan desired conditions for riparian areas/wet meadows (spring seeps) may be used in place of properly functioning conditions, if appropriate for meeting greater sage-grouse habitat requirements.
- <sup>13</sup> Preferred forbs are listed in Table III-2 (Stiver et al. 2015). Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred in Table III-2.
- <sup>14</sup> The height of sagebrush remaining above the snow depends upon snow depth in a particular year. Intent is to manage for tall, healthy, sagebrush stands.
- <sup>15</sup> Projects will be designed to provide overhead and lateral concealment of nests on a site specific basis.

County Cooperators: My name is Jonathan Beck and I am the new GRSG project lead for the IDswMT Greater Sage-Grouse Proposed Plan Amendment/FEIS filling in behind Brent Ralston. As you are aware, the Bureau of Land Management (BLM) is in the midst of an unprecedented land use planning effort. The BLM is preparing 15 Environmental Impact Statements and amending or revising 68 land use plans for the conservation of the Greater Sage-Grouse. We anticipate completing the planning process this summer. As a cooperating agency, the Bureau of Land Management will be providing you an administrative draft of the IDswMT Greater Sage-Grouse Proposed Plan Amendment/FEIS during the week of April 29 for a two week review.

I am writing to invite you to an informational call on **Tuesday April 28th** to kickoff the cooperator review at **10:00 AM**. I look forward to visiting on the 28th. The call in information is below.

Thanks for you continued interested. Jon

The Call In number is: 866-916-4861

The Passcode is: 4369869#

Bob, sorry it took me so long to respond, I just carved out some time for email. We didn't produce a formal response to cooperating agency review. We reviewed the letters and considered comments, but didn't respond in a formal way. Jon

Subject: RE: ID &amp; SW MT GRSG FEIS Comments

Mr. Beck,

Attached are DoD comments on the BLM Administrative Draft for the Greater Sage-Grouse Proposed Plan Amendment/Final Environmental Impact Statement (FEIS) for the Idaho and Southwest Montana Sub-Region submitted in accordance with the Memorandum of Understanding between DoD and BLM establishing DoD as a Cooperating Agency.

The comments include a request to add language similar to text included in the Nevada and NE California Greater Sage-Grouse Proposed LUPA/Final EIS stating the BLM does not have the authority to regulate aircraft activities that are under the jurisdiction of the Federal Aviation Administration and the Department of Defense, and requests for exemption for projects which have military and national security requirements.

Due to the size of the document and abbreviated document review time line it is possible that additional DoD comments may be received which will be

immediately forwarded for BLM consideration.

Thank you very much for the opportunity to review and comment on the document. If you have any questions, please let me know.

Reference 6500 (ID-931)

To Whom It May Concern:

The administrative draft environmental impact statement, currently open for agency and cooperating entity comment, includes provisions that will potentially result in devastating impacts to livestock operations reliant on early season grazing. These include a requirement that livestock allotments maintain a seven inch (7") stubble height up to and through June 15 of each year.

Those of us who are familiar with rangeland ecosystems know that in our arid environment, seven inches (7") of grass may be an entire year's production for any given low elevation grazing scenario. In these areas, this action may result in the elimination of grazing for entire allotments, thereby creating significant economic impacts to our local ranching families and the local economy.

Given that wildfire has been recognized as the single greatest detriment to sage grouse habitat, it is surprising that the agency would propose an action that could eliminate an important tool in reducing the fuel loads that feed wildfires.

Cheatgrass (Downy Brome), commonly considered an invasive plant species responsible for rapid wildfires, exists predominately on these lower elevation rangelands where early spring grazing occurs. Cheatgrass is a "cool season" grass, meaning that it greens up early and also matures early which is why it is also known as "Junegrass". Reducing and/or eliminating the grazing of cheatgrass will undoubtedly lead to greater risk of wildfires, and further loss of sage grouse habitat.

Hi, Kate and Brandon. Attached is the signed Letter of Concurrence for the greater sage-grouse Land Use Plan Amendment (LUPA) for Idaho and Southwestern Montana for the Twin Falls and Boise District Level 1 Teams' information.

You may notice that proposed species and proposed critical habitat are addressed differently in this Letter of Concurrence than how IFWO has addressed programmatic and project specific actions within our Level 1 Teams. The LUPA Assessment made "non-jeopardy" or "no destruction or adverse modification" determinations for proposed species and proposed critical habitat rather than the "NLAA" or "LAA" effects determinations that our BLM Boise and Twin Falls District Level 1 Teams typically make on projects and plans. When a Federal action agency makes a "non-jeopardy" or "no destruction or adverse modification" determination for proposed species or proposed critical habitat, the Service may concur with the determinations, but conference is not required; therefore, no Conference Report or Conference Opinion is provided.

The bottom line is that BLM may choose to make "non-jeopardy" or "no destruction or adverse modification" determinations for proposed species and proposed critical habitat rather than the "NLAA" or "LAA" effects determinations. However, the Service has encouraged our Level 1 Teams to make "NLAA" or "LAA" effect determinations for proposed species and proposed critical habitat on BLM local projects and plans. These effects determinations allow for relatively seamless conversion of a Conference Report or Conference Opinion to a Letter of Concurrence or Biological Opinion, provided that no significant changes in the action that could warrant a reanalysis of effects has occurred between the original conference and the listing of a species or the designation of critical habitat. Conference allows for more efficient and effective progression of local projects and plans through the section 7 process over the long-term.

Let me know if you have questions. Have a great weekend! Barb

Memorandum

To: State Director, Idaho State Office, U.S. Bureau of Land Management, Boise, Idaho  
Regional Forester, Region 1, U.S. Forest Service, Missoula, Montana  
Regional Forester, Region 4, U.S. Forest Service, Ogden, Utah

From: *Acting* State Supervisor, Idaho Fish and Wildlife Office, U.S. Fish and Wildlife Service, Boise, Idaho *Deir Mackey*

Subject: Idaho/Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement—Multiple Counties in Idaho and Southwestern Montana and Box Elder County, Utah—Concurrence  
In Reply Refer To: 01EIFW00-2015-I-0502

This memorandum transmits the U.S. Fish and Wildlife Service's (Service) concurrence on the effects to species listed under the Endangered Species Act (Act) of 1973, as amended, from actions associated with the U.S. Bureau of Land Management's (Bureau) and U.S. Forest Service's (USFS) (collectively referred to as the action agencies) proposed Idaho/Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement (LUPA) which encompasses multiple counties in Idaho and Southwestern Montana<sup>1</sup> and Box Elder County, Utah. In a letter dated May 8, 2015, and received by the Service on May 12, the action agencies requested concurrence<sup>2</sup> with the determination, documented in the Biological Assessment (Assessment; USBLM and USFS 2015, entire), that implementation of the proposed LUPA may affect, and is not likely to adversely affect the grizzly bear (*Ursus arctos horribilis*) and *Spiranthes diluvialis* (Ute ladies'-tresses), both threatened species under the Endangered Species Act of 1973 (Act), as amended.

In addition, pursuant to the requirements of 7(a)(4) of the Act and CFR 402.10, the action agencies assessed the effects of the proposed actions and made non-jeopardy determinations for the proposed LUPA. The action agencies determined that the LUPA is not likely to jeopardize the continued existence of *Lepidium papilliferum* (slickspot peppergrass), a species currently proposed for listing as Endangered under the Act. The Bureau and USFS also determined that

<sup>1</sup> The LUPA planning area includes Ada, Blaine, Cassia, Camas, Canyon, Elmore, Gem, Gooding, Jerome, Lincoln, Minidoka, Oneida, Owyhee, Power, and Twin Falls counties in Idaho, and Beaverhead, Broadwater, Deer Lodge, Gallatin, Granite, Jefferson, Lewis & Clark, Madison, Park, Powell, and Silver Bow counties in southwestern Montana.

<sup>2</sup> Although the Bureau's memorandum was transmitted under Bureau letterhead and signature, the Bureau specifically stated that this request was also on behalf of the USFS.

the proposed LUPA is not likely to result in the destruction or adverse modification of proposed critical habitat for the slickspot peppergrass and the western yellow-billed cuckoo (*Coccyzus americanus*). Though Director (Service) concurrence is not required by 7(a)(4) or CFR 402.10, the inclusion of these determinations in the Assessment creates a need under CFR 402.12(k) for the Service's concurrence with these determinations. After reviewing the action agencies' Assessment, the Service concurs with these determinations, and pursuant to language at CFR 402.12(k), a conference is not required.

The action agencies also determined that implementation of the LUPA will have no effect on the Canada lynx (*Lynx canadensis*) and its designated critical habitat, the northern Idaho ground squirrel (*Spermophilus brunneus brunneus*), the red knot (*Calidris canutus rufa*), the western yellow-billed cuckoo, the bull trout (*Salvelinus confluentus*) and its designated critical habitat, the Banbury Springs lanx (*Lanx* spp.), the Bliss Rapids snail (*Taylorconcha serpenticola*), the Bruneau hot springsnail (*Pyrgulopsis bruneauensis*), and the Snake River physa (*Physa natricina*). The Service acknowledges these no effect determinations.

## Project Overview

The Bureau and USFS prepared amendments to their respective land use plans (LUPs) in response to the need to inform the Service's March 2010 "warranted, but precluded" listing decision for the greater sage-grouse (*Centrocercus urophasianus*, GRSG). These documents provide direction for the conservation of GRSG, and analyze the environmental effects that could result from implementing the proposed LUPA. There are two selected actions, one for the Bureau and one for the USFS. Overall, the two plans are the same, with some minor differences between the plans primarily due to agency land management planning terminology. Full details of the Bureau and the USFS proposed LUPA are provided in the Assessment (USBLM and USFS 2015, Appendices D and E).

The LUPA addresses GRSG habitat within Idaho, southwestern Montana, and that portion of the Sawtooth National Forest located within Box Elder County, Utah. The LUPA covers Bureau-administered lands in the Bruneau, Burley, Challis, Four Rivers, Jarbidge, Owyhee, Pocatello, Salmon, Shoshone, and Upper Snake Field Offices in Idaho and the Butte<sup>3</sup> and Dillon Field Offices in Montana. The LUPA covers National Forest System lands in the Boise, Caribou-Targhee, Salmon-Challis National Forests, and Curlew National Grassland in Idaho, the Beaverhead-Deerlodge National Forest in Montana, and that portion of the Sawtooth National Forest located in Utah. The Proposed LUPA focuses on addressing public comments and comments from the States of Idaho and Montana, while continuing to meet Bureau and USFS legal and regulatory mandates (USBLM and USFS 2015, pp. 7-8).

The purpose of the LUPA is to identify and incorporate appropriate conservation measures in LUPs to conserve, enhance, or restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat. The Assessment further states that changes in action agency management

---

<sup>3</sup> Butte Field Office-administered lands are not included as part of the analysis in the LUPA/EIS except as required in the GRSG cumulative effects analysis. For additional information, please see Chapter 1 of the Final Environmental Impact Statement for the LUPA.

of GRSG habitats are anticipated to have considerable benefits to present and future GRSG populations, and could reduce the need to list the GRSG as threatened or endangered under the Act (USBLM and USFS 2015, p. 8). The proposed LUPA incorporates the following GRSG goal: Conserve, enhance, and restore the sagebrush ecosystem upon which GRSG populations depend in an effort to maintain and/or increase their abundance and distribution, in cooperation with other conservation partners. GRSG habitat in Idaho is divided into three categories, listed here in order of higher to lower conservation value to GRSG: Priority Habitat Management Areas (PHMA), Important Habitat Management Areas (IHMA), and General Habitat Management Areas (GHMA). Only PHMA and GHMA are identified for GRSG in the southwestern Montana portion of this action (USBLM and USFS 2015, pp. 12-13).

The proposed action, a decision on direction for the conservation of the GRSG, is unlike a typical project in that it does not set in motion specific on the ground, environment-impacting activities. However since the LUPA does represent a final agency action, the Bureau and the USFS have reviewed the general nature of impacts that could potentially occur from the LUPA, including how they potentially affect listed species. At the LUP level, there is only sufficient information to generally evaluate the potential impacts of the LUPA on species protected under the Act and the circumstances or planning and operation constraints that may reduce those potential impacts. The same analytical constraints apply to the Assessment and to this Letter of Concurrence, especially since the LUPA does not specifically act as the decision document for site-specific future projects.

Programmatic plans are considered permissive in that they allow but do not authorize or approve any site-specific projects or actions. They are much like zoning ordinances under which future decisions are made. Decisions at the LUP level establish goals and objectives, identify the types of activities that are allowed or prohibited in specific areas, may specify management standards and minimum habitat condition goals either unit wide or for specific areas, and may establish a monitoring and evaluation program. The Assessment does not analyze site-specific actions, and specifically states that effects determinations should not be assumed to relate to site-specific projects. In the future, during project-level environmental planning and analysis, site-specific actions will continue to be analyzed to identify possible effects on listed species. Site-specific analysis of such actions may identify potential effects on listed species even when the programmatic Assessment determines no effect associated with GRSG management direction for LUP programs. As part of any future project-level environmental analysis, specific conservation measures and strategies to alleviate any potential adverse effects associated with GRSG management direction may be developed as the details of the future site-specific proposed actions become available (USBLM and USFS 2015, pp. 100-101).

The LUPA Assessment, associated section 7 consultation activities, and this Letter of Concurrence do not change the responsibility of the Bureau and the USFS to consult on site-specific projects as they are developed in the future. Even if those future actions are consistent with the LUPA, if those actions may affect any listed species, the Bureau and USFS bear the responsibility to consult with the Service under section 7 of the Act to ensure that their actions are not likely to jeopardize those species or adversely modify designated critical habitat.

This consultation on GRSB management and its LUPA direction is to be considered in the context of already existing LUPs and any consultations on those previous LUPs. This consultation does not substitute or replace any previous consultation on existing LUPs. The action agency's effects determinations and the Service concurrence have been made with this context in mind. The Service recommends that a copy of this memorandum be retained in agency overall LUP files with previously completed LUP consultations for future reference and to document that section 7 compliance for individual LUPs under the Act is complete.

## **Basis for Service Concurrence by Species**

The Bureau and USFS have determined, and the Service concurs, that the LUPA may affect, but is not likely to adversely affect two threatened species (the grizzly bear and the Ute ladies'-tresses). Service concurrence with Bureau and USFS determinations of effect for these listed species is based on the rationales highlighted below. In addition, the Bureau and USFS have determined, and the Service concurs, that the LUPA is not likely to jeopardize the continued existence of one species proposed for listing (the slickspot peppergrass) and will not destroy or adversely modify critical habitat proposed for two species (the slickspot peppergrass and the yellow-billed cuckoo) within some LUP units.

### **Grizzly Bear**

The Bureau and USFS determined that the LUPA decision and associated actions occurring on the Bureau's Bruneau, Burley, Challis, Jarbidge, Owyhee, Pocatello, Salmon, Shoshone, and Four Rivers Field Offices; the USFS's Boise, Salmon-Challis, or Sawtooth National Forests; and the USFS's Curlew National Grassland will have no effect on the grizzly bear because these field offices and national forests/grassland do not contain occupied habitat for grizzly bears. The Service acknowledges these no effect determinations for the grizzly bear.

Service concurrence with the determination that the LUPA may affect, but is not likely to adversely affect the grizzly bear within the Bureau's Upper Snake and Dillon Field Offices and the USFS's Beaverhead-Deerlodge and Caribou-Targhee National Forests, is based on the following rationales.

- Overall, a total of 173,581 acres of occupied grizzly bear habitat overlap with PHMA, 116,465 acres overlap with IHMA, and 81,673 acres of GHMA within the LUPA area (compiled from USBLM and USFS 2015, pp. 47, 50, 63, 69).
- GRSB LUPA decision goals, objectives, desired conditions, standards, and guidelines that could have any bearing on the major threats to grizzly bears—secure habitat, developed sites, food storage, livestock grazing, and four key food sources<sup>4</sup>—are expected to be neutral, result in beneficial effects, or minimal negative impacts. For example:

---

<sup>4</sup> Four seasonal foods have been identified as being important to the grizzly bear population: winter killed ungulates, spawning cutthroat trout, seeds of whitebark pine, and alpine moth aggregation sites. The LUPA action area has no overlap with habitats supporting these four seasonal foods (USBLM and USFS 2015, p. 87).

- Fuels treatments, habitat restoration, and vegetation management treatments in GRSG HMAs will maintain, improve, or restore sagebrush habitat, benefitting all species that use sagebrush habitat, including grizzly bears.
- For recreation and travel management and lands and realty and infrastructure management programs, the GRSG LUPA decision will not authorize new roads. Rather, it will limit new road construction and existing road use, which could benefit grizzly bears by increasing the available amount of secure habitat.
- There is the potential for some negative effects on listed species from direction provided within the LUPA. For example, fuels treatments using targeted grazing or plant species used for seeding proposed within occupied grizzly bear habitat have the potential to negatively impact grizzly bears. In addition, prohibiting construction of new recreation facilities or infrastructure within GRSG PHMA and IHMA could push the construction of developed sites into preferred grizzly habitat. However, site-specific analyses will determine the scope and scale of any likely impacts that may occur associated with project-level activities. Furthermore, significant effects from these site-specific projects will be highly unlikely due to avoidance or other mitigations based on current laws, agency regulations, and other conservation measures in place to protect the grizzly bear. Any possible effects from future proposed actions will be addressed in site-specific analysis at the project level when reasonably certain, explicit actions are identified and proposed. Therefore, potential effects of site-specific projects proposed under LUPA programs that may affect the grizzly bear are expected to be reduced to insignificant or discountable levels.

### **Ute ladies'-tresses**

The Bureau and USFS determined that the Idaho-Southwestern Montana LUPA decision and associated actions occurring on the Bureau's Bruneau, Burley, Challis, Four Rivers, Jarbidge, Owyhee, Salmon, and Shoshone Field Offices; the USFS's Boise and Beaverhead-Deerlodge National Forests; and the USFS's Curlew National Grassland will have no effect on the Ute ladies'-tresses as suitable habitat for the Ute ladies'-tresses is not suspected to occur in these field offices and national forests/grassland. The Service acknowledges these no effect determinations for the Ute ladies'-tresses.

Service concurrence with determination that the LUPA may affect, but is not likely to adversely affect, the Ute ladies'-tresses within the Bureau's Dillon, Pocatello, and Upper Snake Field Offices and within the USFS's Caribou-Targhee, Salmon-Challis, and Sawtooth National Forests, is based on the following rationales.

- There is no overlap between known Ute ladies'-tresses locations and GRSG HMAs. The closest known Ute ladies'-tresses location is over 0.6 mile from the IHMA located in Fremont County, Idaho.
- The areas most likely to support Ute ladies'-tresses populations (riparian areas along major river drainages) have mostly been excluded from GRSG HMAs. However, it is likely that suitable habitat for Ute ladies'-tresses is located within GRSG HMAs due to the inclusion of some wetland habitats.

- Because the proposed LUPA does not propose any specific ground-disturbing actions, no direct negative effects on Ute ladies'-tresses will occur from the LUPA action.
- Where travel management planning has not been completed or is in progress, and listed plant habitats are present, there may be a reduction of impacts from off-road vehicle use (BLM TM-1) in areas where Ute ladies'-tresses overlap with GRSG HMAs (pp. 102, 140). Restrictions for off-road vehicle use may provide a beneficial effect on listed plant species by reducing impacts from off road vehicle activities (plants crushed by tires). Thus, if any areas of occupied or suitable habitat for Ute ladies'-tresses within GRSG HMAs are currently open to off-road vehicle use, restrictions will be placed on vehicles to use only existing routes. This would provide a small and contemporaneous beneficial effect on Ute ladies'-tresses by reducing the likelihood of damage to Ute ladies'-tresses or its habitat from off-road vehicles.
- Proposed retrofitting of existing towers and structures consistent with required design features (RDFs) in the GRSG HMAs (BLM LR-12) to benefit GRSG has the potential to impact listed plants, including the Ute ladies'-tresses, if the plants are present in the right-of-way (ROW) corridors where retrofit activities are needed. Potential crushing of vegetation, including Ute ladies'-tresses, could occur due to parking vehicles off roads near each tower as well as foot traffic near the towers during retrofit activities. However, because towers, structures, and their access roads generally avoid riparian habitats, the Ute ladies'-tresses is not likely to be present on or directly adjacent to ROW roads or near existing towers. Therefore, potential effects of LUPA-related retrofitting of towers and structures on the Ute ladies'-tresses are extremely unlikely to occur, and therefore, are discountable.
- Although there is the potential for some negative effects on listed species from additional proposed actions associated with LUPA direction, significant effects will be highly unlikely due to avoidance or other mitigations based on current laws, agency regulations, and other conservation measures currently in place to protect listed plants. Any possible effects from future proposed actions will be addressed in site-specific analysis at the project level when reasonably certain, explicit actions are identified and proposed. Therefore, potential effects of site-specific projects proposed under LUPA programs that may affect the Ute ladies'-tresses are expected to be reduced to insignificant or discountable levels.

### **Slickspot Peppergrass**

The Bureau and USFS determined that the LUPA decision and associated actions occurring on the Bureau's Bruneau, Burley, Challis, Dillon, Owyhee, Pocatello, Salmon, Shoshone, or Upper Snake Field Offices, the USFS's Boise, Beaverhead-Deerlodge, Caribou-Targhee, Salmon-Challis, or Sawtooth National Forests, or the USFS's Curlew National Grassland will have no effect on the slickspot peppergrass as these field offices and national forests/grassland are not suspected to contain suitable habitats for the slickspot peppergrass. The Service acknowledges these no effect determinations for the slickspot peppergrass.

After reviewing the Bureau and USFS Assessment, the Service concurs with the Bureau and USFS determination that the LUPA is not likely to jeopardize the continued existence of the

slickspot peppergrass within the Bureau's Four Rivers and Jarbidge Field Offices. As described above, pursuant to language at CFR 402.12(k), conference is not required for this Federal action agency non-jeopardy determination.

### **Proposed Critical Habitat for the Slickspot Peppergrass**

The Bureau and USFS determined that the LUPA decision and associated actions occurring on the Bureau's Bruneau, Burley, Challis, Dillon, Owyhee, Pocatello, Salmon, Shoshone, and Upper Snake Field Offices; the USFS's Boise, Beaverhead-Deerlodge, Caribou-Targhee, Salmon-Challis, and Sawtooth National Forests; and the USFS's Curlew National Grassland will have no effect on proposed critical habitat for the slickspot peppergrass as these field offices and national forests/grassland do not contain proposed critical habitat for the species. The Service acknowledges these no effect determinations for slickspot peppergrass proposed critical habitat.

After reviewing the Bureau and USFS Assessment, the Service concurs with the Bureau and USFS determination that the LUPA is not likely to destroy or adversely modify proposed critical habitat for the slickspot peppergrass within the Bureau's Four Rivers and Jarbidge Field Offices. As described above, pursuant to language at CFR 402.12(k), conference is not required for this Federal action agency no destruction or adverse modification determination.

### **Proposed Critical Habitat for the Yellow-billed Cuckoo**

The Bureau and USFS determined that the LUPA decision and associated actions occurring on the Bureau's Bruneau, Burley, Challis, Dillon, Four Rivers, Jarbidge, Owyhee, Pocatello, Salmon, and Upper Snake Field Offices, the USFS's Boise, Caribou-Targhee, Salmon-Challis, Sawtooth, and Beaverhead-Deerlodge National Forests, and the USFS's Curlew National Grassland will have no effect on the proposed critical habitat for the western yellow-billed cuckoo because these field offices and national forests/grassland do not contain western yellow-billed cuckoo proposed critical habitat that overlaps with LUPA actions. The Service acknowledges these no effect determinations for western yellow-billed cuckoo proposed critical habitat.

After reviewing the Bureau and USFS Assessment, the Service concurs with the Bureau and USFS determination that the LUPA is not likely to destroy or adversely modify proposed critical habitat for the yellow-billed cuckoo within the Bureau's Shoshone Field Office. As described above, pursuant to language at CFR 402.12(k), conference is not required for this Federal action agency no destruction or adverse modification determination.

### **Conclusion**

This concludes informal consultation on the proposed LUPA with the Bureau and the USFS under section 7 of the Act. Reinitiation of consultation on this action may be necessary if new information reveals effects of the action that may affect listed species or designated habitat in a manner or to an extent not considered in the assessment, the action is subsequently modified in a manner that causes an effect to listed species that was not considered in the analysis, or a new species is listed or critical habitat is designated that may be affected by the proposed action (CFR 402.16).

Thank you for your continued interest in threatened and endangered species conservation. Please contact Barbara Schmidt of my staff at (208) 378-5259 if you require additional information regarding this memorandum.

May 13, 2015

Dear BLM Project Managers:

Montana Fish, Wildlife and Parks, a Cooperating Agency with the BLM, has received electronic copies of the Administrative Draft Greater Sage-grouse Proposed Resource Management Plan Amendment/Final Environmental Impact Statement (FEIS) or Administrative Draft Proposed Resource Management Plan/Final Environmental Impact Statement (FEIS) for each of the field offices within the range of sage-grouse in Montana. This letter pertains to management decisions related to Greater Sage-grouse. FWP Regional Offices may provide additional comments on other aspects of Resource Management Plan revisions separately.

We have limited our review to the first section of Chapter 2 that details the changes between the Draft and Final EIS because of the limited time provided for review. The BLM's landscape-scale approach that prioritizes conservation action in the most important landscapes (e.g., Core Areas) yet honors valid and existing rights is consistent with Montana's Sage-grouse Habitat Conservation Program – Executive Order 10-2014. The BLM objectives of minimizing new or additional surface disturbance and improving habitat conditions directly align with Montana's program. We are supportive of the BLM's intent to maintain a surface disturbance limit of 3% in the absence of a Montana state program, but to adjust that limit to 5% to be consistent with the state program when the state program becomes fully functional. This consistency among regulatory processes will be easier to communicate with the public and will ultimately provide greater benefits to sage-grouse.

Thank you for the opportunity to review the Administrative Draft. Montana Fish, Wildlife and Parks looks forward to continuing to work with the BLM on implementation of the Resource Management Plans and Greater Sage-grouse conservation efforts.

Sincerely,

A handwritten signature in blue ink that reads "Paul C. Sihler". The signature is written in a cursive, flowing style.

Paul Sihler

Well, you haven't missed any correspondence from me, just in case you've had that thought. We are still in a holding pattern awaiting some final issue resolution at the national level. There are ongoing meetings between FWS and BLM/Forest Service and we should be hearing something soon. Sorry I don't have more to share at this point. Once we have more definitive direction in hand and a better grasp on the upcoming schedule then I'll get a call scheduled for us.

Cc: Jonathan Beck &lt;jmbeck@blm.gov&gt;

Bob,

The last several months had seen significant coordination efforts at the national level with all of the western states and USFWS, which we locally have only been peripherally involved. The results of these efforts are currently being stepped out to the sub-regional efforts and there should be some updates to the schedule and remaining process soon. We don't currently have all of that worked out and there have not been any updates on the web or communicated to our cooperators in the last several months.

Thanks for maintaining your interest and there should be some information to share soon.

Brent,

I have not seen any activity or received any e-mails for quite some time on the BLM RMP/EIS for GRSG. I checked the BLM webpage and it did not look like there was anything new there.

Any updates on status or schedule available?

County Cooperators: My name is Jonathan Beck and I am the new GRSG project lead for the IDswMT Greater Sage-Grouse Proposed Plan Amendment/FEIS filling in behind Brent Ralston

. As you are aware, the Bureau of Land Management (BLM) is in the midst of an unprecedented land use planning effort. The BLM is preparing 15 Environmental Impact Statements and amending or revising 68 land use plans for the conservation of the Greater Sage-Grouse. We anticipate completing the planning process this summer. As a cooperating agency, the Bureau of Land Management will be providing you an administrative draft of the IDswMT Greater Sage-Grouse Proposed Plan Amendment/FEIS during the week of April 29 for a two week review.

I am writing to invite you to an informational call on **Tuesday April 28th** to kickoff the cooperator review at **10:00 AM**.

I look forward to visiting on the 28th. The call in information is below.

Thanks for you continued interested. Jon

The Call In number is:

866-916-4861

The Passcode is: 4369869#

Chris,

Here is the Technical Evaluation for the OSC Agreement.

Brent Ralston  
Sage-Grouse Project Lead  
Idaho and Southwestern Montana Subregion  
Idaho State Office  
208-373-3812

## Technical Evaluation

Memorandum

DATE: April 27, 2012

To: Grants Management Officer: Christina Shaver

From: Program Officer: Brent Ralston

Write a review of the proposal (referring to the attached criteria):

1. Technical Approach – The proposal contains relevant details and specific approaches to address adequately the information criteria. Duties and expertise of Task Force members are adequately described and the timeframe and expectations are clearly articulated.
2. Qualifications, Experience, Past Performance – The identified personnel to be involved in the effort have sufficient expertise and knowledge to successfully complete project goals. The project leadership are well qualified to facilitate the successfully completion of this effort.
3. Purpose, Objectives, and Relevance – The proposal is consistent with and will appropriately supplement the State's involvement with the BLM Planning Strategy to provide a consistent state approach.
4. Budget – The budget is reflective of the needs and requirements necessary to complete the effort.

What is proposed?

Support of the Idaho Governor's Task Force to develop a State approach and viable BLM planning alternative for Greater Sage-Grouse that can be incorporated into the sub regional environmental impact statement.

Specific qualities:

The proposal contains thorough delineation of personnel, travel and supply expenses required.

Found in the budget: Specifically personnel effort and travel expenses.

Salaries – see I. Budget Table A & B; travel expenses - Table D; supplies Table E; other logistics – Tables F & G.

I **do** recommend funding to State of Idaho Office of Species Conservation.

Amount of \$ 75,000

Period of Performance: March 2012 to September 2012.

## **Application review Information Criteria**

### **1. Technical Approach**

- a. The project design contains enough detail to show the development of the project and the relationship between the partners, milestones, and goals. The roles and responsibilities of each partner are clearly articulated. The milestones are clear, and supported by a well thought-out schedule that supports the work to be accomplished for the duration of the project.
- b. The proposed project's importance/relevance and applicability are tied to the program goals. Is there value and importance to the program goals?
- c. The work plan objectives are clear, suitable, and feasible with respect to the following:
  - (1) Techniques, procedures, and methodologies;
  - (2) Data collection, analysis, and means of interpretation;
  - (3) Expected results or outcomes; and
  - (4) Procedures for evaluating project efficacy, including fixed performance indices with probabilities for obtaining them.
- d. The project proposal work plan is designed to produce the proposed outcomes and outputs. The outcomes are clearly stated and tied to intermediate outcomes as stated in the solicitation.

### **2. Qualifications, Experience, Past Performance**

- a. The qualifications and experience of the organization are evident, and appear to be adequate to achieve project goals and objectives.
- b. The qualifications and experience of the Project Director/Principal Investigator to be assigned for direct work on the project are evident, and appear to be adequate to achieve project goals and objectives and will be available for work on this agreement.
- c. The applicants past and current assistance awards show they have completed project goals.

### **3. Purpose, Objectives, and Relevance**

- a. The proposal adequately describes why the project is needed by the recipient.
- b. The objectives are well defined, measurable, and realistic for the project's anticipated timeframe.
- c. The benefits support the mission of the recipient and can be tied to a BLM Performance Measure.

### **4. Budget**

- a. The budget line items are appropriate, reasonable, allowable, well justified and commensurate with the level of effort needed to accomplish the project objectives.
- b. The budget breakdown or narrative provides adequate justification for each budget category used. If equipment is requested by the applicant is it fully justified and necessary for the performance and completion of the project?
- c. The applicant and other counterparts cash and in-kind matching funds or contributions are acceptable.

**Ralston, Brent E**

Move Form to Delete

### Mandatory Documents for Submission

Application for Federal Assistance (SF-424)  
Project Narrative Attachment Form  
Budget Narrative Attachment Form  
Budget Information for Non-Construction Program  
Assurances for Non-Construction Programs (SF-42)

### Optional Documents

Move Form to Submission List

Move Form to Delete

### Optional Documents for Submission

## Instructions

- 1** Enter a name for the application in the Application Filing Name field.

  - This application can be completed in its entirety offline; however, you will need to login to the Grants.gov website during the submission process.
  - You can save your application at any time by clicking the "Save" button at the top of your screen.
  - The "Save & Submit" button will not be functional until all required data fields in the application are completed and you clicked on the "Check Package for Errors" button and confirmed all data required data fields are completed.
- 2** Open and complete all of the documents listed in the "Mandatory Documents" box. Complete the SF-424 form first.

  - It is recommended that the SF-424 form be the first form completed for the application package. Data entered on the SF-424 will populate data fields in other mandatory and optional forms and the user cannot enter data in these fields.
  - The forms listed in the "Mandatory Documents" box and "Optional Documents" may be predefined forms, such as SF-424, forms where a document needs to be attached, such as the Project Narrative or a combination of both. "Mandatory Documents" are required for this application. "Optional Documents" can be used to provide additional support for this application or may be required for specific types of grant activity. Reference the application package instructions for more information regarding "Optional Documents".
  - To open and complete a form, simply click on the form's name to select the item and then click on the => button. This will move the document to the appropriate "Documents for Submission" box and the form will be automatically added to your application package. To view the form, scroll down the screen or select the form name and click on the "Open Form" button to begin completing the required data fields. To remove a form/document from the "Documents for Submission" box, click the document name to select it, and then click the <= button. This will return the form/document to the "Mandatory Documents" or "Optional Documents" box.
  - All documents listed in the "Mandatory Documents" box must be moved to the "Mandatory Documents for Submission" box. When you open a required form, the fields which must be completed are highlighted in yellow with a red border. Optional fields and completed fields are displayed in white. If you enter invalid or incomplete information in a field, you will receive an error message.
- 3** Click the "Save & Submit" button to submit your application to Grants.gov.

  - Once you have properly completed all required documents and attached any required or optional documentation, save the completed application by clicking on the "Save" button.
  - Click on the "Check Package for Errors" button to ensure that you have completed all required data fields. Correct any errors or if none are found, save the application package.
  - The "Save & Submit" button will become active; click on the "Save & Submit" button to begin the application submission process.
  - You will be taken to the applicant login page to enter your Grants.gov username and password. Follow all onscreen instructions for submission.

Governor's Sage Grouse Task Force Coordination – Project Narrative

Funding Opportunity Number: L12AS00002

CFDA # and Title: 15.231 Fish and Wildlife Plant Conservation Resource Management

Funding Agency: DOI Bureau of Land Management

Applicant: State of Idaho, Office of Species Conservation

Acting Administrator: Dustin Miller

Phone Number: 208-332-1555

Date: March 15, 2012

### Purpose

The State of Idaho and its partners have been proactive leaders in greater sage-grouse conservation for many years. Since the late 1990s, an unprecedented collaborative of state and federal resource managers, local government and private stakeholders has been a major factor in maintaining sustainable populations of the bird and improving its habitat. Unfortunately, in March of 2010, after several petitions to and list and multiple rounds of litigation, the U.S. Fish and Wildlife Service (Service) determined that greater sage-grouse warrants listing under the Endangered Species Act (ESA) across its entire range, including the populations in Idaho, but is precluded because of other higher priority listing actions. This action places greater sage-grouse on a "candidate" species list. The Service must reevaluate the status of greater sage-grouse under the ESA by September 30, 2015.

Given this short window, the federal government and many western states within the range of greater sage-grouse are currently working to develop regulatory mechanisms to conserve the species and preclude the need to list. On March 9, 2012 Idaho Governor C.L. "Butch" Otter signed an Executive Order creating a Sage-Grouse Task Force. The Task Force is charged with providing recommendations to the Governor for developing a state-wide regulatory mechanism and plan to preclude the need to list sage-grouse. The development of a state-specific regulatory mechanism will enable the U.S. Bureau of Land Management and the U.S. Forest Service to incorporate the State's plan as an alternative to their analysis pursuant to the National Environmental Policy Act (NEPA). Additionally, the Task Force will develop recommendations for actions on state and private lands to provide adequate protections for the bird and its habitat. The Idaho statewide regulatory mechanism covering actions on private, state and federal land will be given the full force and effect of law through a final Executive Order signed into law by Governor Otter.

It is our hope that in addition to the many years of collaborative conservation work in Idaho, this effort will ultimately result in the Service making a not-warranted decision for greater sage-grouse by September 30, 2015. By avoiding a listing, the State of Idaho and its partners will continue its commitment to conserving greater sage-grouse and its habitat while maintaining predictable land uses and protecting Idaho's custom, culture and way of life.

## Objectives

- A. Provide the Governor of Idaho with recommendations on policies and actions, using the 2006 Sage Grouse Plan and other on-going activities as a backdrop, for developing a state-wide regulatory mechanism to preclude the need to list the species.
- B. The Sage-Grouse Task Forces' recommendations be based upon the following objectives and criteria:
  - a. Conserve the species and its habitat while maintaining predictable levels of land use
  - b. Identifies and designates key/core sage-grouse habitat based upon the biological needs of the species
  - c. Tailors the management recommendations to the import of the habitat and its attuned to the interests of the State
  - d. Address the following primary threats to the species as identified by the Service
    - i. habitat fragmentation due to wildfire
    - ii. invasive species
    - iii. conversion of habitat for agriculture or urbanization
    - iv. energy development/infrastructure
  - e. Address the following secondary threats to the species identified by the Service
    - i. disease/West Nile virus
    - ii. management issues related to livestock grazing
    - iii. collisions with fences and power lines
    - iv. mining, prescribed fire and range treatments
    - v. water development
    - vi. conifer invasion
  - f. Utilize the 2006 Plan and other on-going activities as a backdrop for making management recommendations
  - g. Identifies opportunities for pro-active sage-grouse habitat enhancement projects
  - h. Recognizes, encourages and incentivizes land use practices that are actively maintaining or improving sage-grouse habitat as evidenced by improvements in habitat quality, active lek routes or stable/increasing populations of the species
  - i. Identifies additional opportunities for continued involvement in sage-grouse conservation issues at the local level

## Relevance

The inadequacy of regulatory mechanisms to conserve the greater sage-grouse and its habitat was identified as a significant threat in the FWS finding on the petition to list the greater sage-grouse as a threatened or endangered species. (Federal Register /Vol. 76, No. 237 / Friday, December 9, 2011)

Based on ongoing threats to the Greater sage-grouse and its habitat throughout the West, and the U.S. Fish and Wildlife Service's schedule for making a decision whether to list the species under the Endangered Species Act, the BLM and the U.S. Forest Service have begun to revise

land-use plans (LUPs) for lands that include sage-grouse habitat to incorporate consistent objectives and conservation measures into all relevant plans by September 2014. (Federal Register /Vol. 76, No. 237 / Friday, December 9, 2011)

In view of the identified threats to the greater sage-grouse, and the FWS timeline for making a listing decision on this species, the BLM and FS propose to incorporate consistent objectives and conservation measures for the protection of greater sage-grouse and its habitat into relevant RMPs and LMPs by September 2014 in order to avoid a potential listing under the Endangered Species Act. (Federal Register /Vol. 76, No. 237 / Friday, December 9, 2011)

The Governor's Sage-Grouse Task Force goal is to establish a state-wide regulatory mechanism in a timeframe that will allow its recommendations to be incorporated into the BLM's planning effort.

#### Technical Approach

In order to insure that its recommendations are included into the BLM's planning process, the sage-grouse Task force is operating within a very aggressive timeframe. It is the Governor's expectation that the Task Force will submit their recommendations for his review no later than 31 May 2012. Consequently, the Governor signed the Executive Order establishing the approach that the State of Idaho will take in this effort and how the State intends to use CWCS funds.

1. The creation of the Governor's Sage-Grouse Task Force:
  - A. The members of the Governor's Sage-Grouse Task Force (Task Force) shall be appointed by and serve at the pleasure of the Governor through calendar year 2012.
    - a. The Task Force shall be composed of fifteen (15) members, representing the various geographic areas of the State within the range of the species
    - b. The Office of the Governor will chair this entity
    - c. The Office of Species Conservation and the Idaho Department of Fish and Game will staff this entity
  - B. The Task Force members shall be appointed from the following categories:
    - a. Individuals who:
      - i. Represent agricultural interests; or
      - ii. Represent energy or mineral development interests
    - b. Individuals representing:
      - i. A local working group; or
      - ii. A nationally, regionally or locally recognized environmental organization;  
or
      - iii. Nationally or locally recognized wildlife or sportsmen's groups
    - c. Individuals who:
      - i. Hold State elected office; or
      - ii. Hold county elected office; or
      - iii. Represent the public at large

2. Duties of the Task Force:  
Provide the Governor recommendations on policies and actions, using the 2009 Plan and other on-going activities as a backdrop, for developing a state-wide regulatory mechanism to preclude the need to list the species;
3. The duties of the Task Force are solely advisory
4. The Task Force will provide its recommendations to the Governor no later than May 31, 2012
5. Technical Expertise:
  - A. The Task Force may request consultation, information and technical expertise from Directors or their designees of state agencies regarding the biological needs of the species, activities on state, federal and private lands potentially impacted by the status of the species, and requirements of the ESA and other relevant statutory requirements, including but not limited to the Office of Species Conservation, the Idaho Department of Fish and Game, the Idaho Department of Lands, the Office of Energy Resources, the Idaho State Department of Agriculture and the Idaho Department of Parks and Recreation.
  - B. The Task Force may request comments, information and technical expertise from the American Indian Tribes of Idaho, the universities of the State, federal agencies, including but not limited to the Service, the BLM, the U.S. Forest Service and the Natural Resources Conservation Services, and members of the public.
6. Task Force Composition:
 

Representative Scott Bedke	– Elected Office
Senator Bert Brackett	– Elected Office
Wally Butler	– Idaho Farm Bureau
Bob Cope	– Lemhi County Commissioner
Brett Dumas	– Idaho Power
Gene Gray	– Sage Grouse Local Working Group
Jerry Hoagland	– Owyhee County Commissioner
Chuck Jones	– Simplot
Jack Oyler	– Sportsmen’s Group
Rochelle Oxarango	– Sage-Grouse Local Working Group
John Robison	– Idaho Conservation League
Richard Savage	– Idaho Cattle Association
Randy Vranes	– Monsanto
Will Whelan	– The Nature Conservancy
Bell Meyers	– Attorney

### Qualifications, Experience and Past Performance

The Office of Species Conservation (OSC) was created by the Idaho Legislature in 2000 to coordinate all state policy for threatened and endangered species. OSC's authority to pursue this goal is defined in Idaho Code:

1. Coordinate federal Endangered Species Act (ESA) programs with State agencies (Idaho Code § 67-818).
2. Solicit, provide, and delegate funding for ESA programs (Idaho Code § 67-819).
3. Create de-listing advisory teams (Idaho Code § 36-2402, 2403, 2404).
4. Serve as the State's "one-voice" on ESA policy (Idaho Code § 67-818, 2(a)).
5. Provide a mechanism for Idaho citizens to voice ESA concerns (Idaho code § Section 67-818, 2(g)).
6. Facilitate collaboration between State, federal and private stakeholders (Idaho Code §67-818, 2(b) (c) (d) (g)).

Our office consists of 12 full time staff as follows: Administrator, Program Manager, Legal Counsel, Environmental Liaison, five Project Managers, two project planners and an Administrative Assistant. Our Administrator position is currently open with duties and responsibilities being handled by our Environmental Liaison. We receive accounting support from the State of Idaho Division of Financial Management (DFM), under the Executive Office of the governor. DFM provides fiscal and policy guidance, oversight and management services to OSC.

Since OSC was created, our office has actively been involved with federal, state, local government, and Idaho citizens in coordinating and implementing threatened and endangered species policy. Funding for OSC comes from state and federal sources. OSC has administered nearly \$30 million in federal funds for implementation of species recovery and restoration projects. We currently administer federal programs for salmon recovery, gray wolf recovery, slickspot peppergrass, freshwater aquatic species and sage-grouse.

The Office of Species Conservation proposes to administer the funds required by the Governor's Sage- Grouse Task Force to complete its assigned tasks within the constraints of BLM policy development timelines. It is the intent of the Governor's Office to use these funds to pay for expenditures associated with task force meetings, data requirements and the documents produced by the Governor's Sage-Grouse Task Force as well as for implementation of the actions to be outlined in the Governor's final Executive Order.

8. Schedule:

Eight meetings over 12 days as follows:

March 12 – Boise

March 20 – Boise

April 4 – Boise

April 12-13 – Idaho Falls

April 24-25 – Pocatello

May 3-4 – Boise

May 15 – Twin Falls

May 24-25 – Idaho Falls

Governor's Sage Grouse Task Force Coordination - Budget Narrative  
 Funding Opportunity Number: L12AS00002  
 CFDA # and Title: 15.231 Fish and Wildlife Plant Conservation Resource Management  
 Funding Agency: DOI Bureau of Land Management

Applicant: State of Idaho, Office of Species Conservation  
 Acting Administrator: Dustin Miller  
 Phone Number: 208-332-1555  
 Date: April 3, 2012

The Office of Species Conservation ("OSC") was created by the Idaho Legislature in 2001 and has been the recipient, administrator, and distributor of federal funds beginning in Federal Fiscal Year 2001. This is a comprehensive request involving several budget categories associated with the cost of convening a task force of Idaho constituencies to develop adequate regulatory mechanisms public and private lands in Idaho.

It is the Governor's office intent to use these funds on a reimbursement basis to pay for expenditures associated with task force goals and objectives including the following:

- Salaries
- Per Diem
- Travel Expenses
- Data Requirements
- Documentation
- Misc. meeting costs

The following is an estimated breakdown of the funds requested from BLM the other cost share partners:

<b>Budget Category</b>	<b>Federal</b>	<b>State/Local</b>	<b>Total</b>
Personnel	\$21,600	\$10,000	\$31,600
Fringe	\$8,500	\$5,000	\$13,500
Travel	\$11,600		\$11,600
Equipment	\$800		\$800
Supplies	\$1,600		\$1,600
Contractual	\$3,300		\$3,300
Construction	\$0		\$0
Other	\$2,600		\$2,600
<b>Totals</b>	<b>\$50,000</b>	<b>\$15,000</b>	<b>\$65,000</b>

# I. BUDGET

This is a suggested format for the applicant to use for the detailed budget/costs breakdown. Each cost item should clearly show how the total charge for that item was determined. All major costs should be listed in budget categories similar to those listed below, and all cost items should be explained in the Budget Summary and Justification (Section 4).

**A. SALARIES AND WAGES.** Provide the names and/or titles of key project personnel.

Name/Title of Position	Full Time Monthly Salary	% FTE	No. of Months	Grant Funds	Match / Cost Share (if any)	Third Party Share (if any)	Total
Dustin	\$4560	.50	4	\$9120	\$	\$	\$9120
Ashley	\$2651	.50	4	\$5302	\$	\$	\$5302
Jon	\$4249	.10	3	\$1020	\$	\$	\$1020
TBD	\$4500	.10	3	\$1080	\$	\$	\$1080
	\$			\$	\$	\$	\$
Subtotal				\$16,522	\$	\$	\$16,522

**B. FRINGE BENEFITS.** If more than one rate is used, list each rate and the wage or salary base.

Rate	Salary or Wage Base	Grant Funds	Match / Cost Share (if any)	Third Party Share (if any)	Total
.362	\$ 9120	\$3301	\$	\$	\$3301
.4556	\$ 5302	\$2416	\$	\$	\$2416
.3707	\$ 1020	\$378	\$	\$	\$378
tbd	\$ 1080	\$400	\$	\$	\$400
Subtotal		\$6495	\$	\$	\$6495

**C. CONSULTANT/CONTRACTING FEES.** This should include payments for professional and technical consultants participating in the project.

Name and type of Consultant	# of Days	Daily Rate of Compensation	Grant Funds	Match / Cost Share (if any)	Third Party Share (if any)	Total
		\$	\$	\$	\$	\$
		\$	\$	\$	\$	\$
		\$	\$	\$	\$	\$
		\$	\$	\$	\$	\$
		\$	\$	\$	\$	\$
Subtotal			\$	\$	\$	\$

**D. TRAVEL AND PER DIEM.** For each trip, indicate the number of persons traveling, the total days they will be in travel status, and the total subsistence and transportation costs for that trip. Per diem rates shall not exceed maximum Federal rates. To view current Federal per diem rates, visit <http://www.gsa.gov/Portal/gsa/ep/channelView.do?pageTypeld=8203&channelId=-15943> and follow the links to per diem information.

From/To	No. of People	No. of Travel Days	Per diem (lodging and meals) per person per day	Total per diem (lodging and meals) for this trip	Transportation costs (airfare and mileage) <u>per person</u>	<u>Total transportation costs</u> (airfare and mileage) <u>for this trip</u>	Grant Funds	Match / Cost Share (if any)	Third Party Share (if any)	Total
Boise	15	2	\$100	\$3000	\$114	\$1706	\$4706	\$	\$	\$4706
Boise	15	2	\$100	\$3000	\$114	\$1706	\$4706	\$	\$	\$4706
Boise	15	2	\$100	\$3000	\$114	\$1706	\$4706	\$	\$	\$4706
Idaho Falls	15	2	\$100	\$3000	\$114	\$1706	\$4706	\$	\$	\$4706
Pocatello	15	2	\$100	\$3000	\$114	\$1706	\$4706	\$	\$	\$4706
Boise	15	2	\$100	\$3000	\$114	\$1706	\$4706	\$	\$	\$4706
Twin Falls	15	2	\$100	\$3000	\$114	\$1706	\$4706	\$	\$	\$4706
Idaho Falls	15	2	\$100	\$3000	\$114	\$1706	\$4706	\$	\$	\$4706
Misc.	4	5	\$100	\$2000	\$114	\$455	\$2455	\$	\$	\$2455
Subtotal							\$40105	\$	\$	\$40105

**E. SUPPLIES AND MATERIALS.** Include consumable supplies and materials to be used in the project, listing each item and quantity individually. Include items of expendable equipment, i.e., equipment costing less than \$500 or with an estimated useful life of less than two years. Equipment costing more than that should be listed in the Other Costs category (Category G, below).

Item	# of items	Cost	Grant Funds	Match / Cost Share (if any)	Third Party Share (if any)	Total
Photocopies	5000	\$0.10	\$500	\$	\$	\$500
Office Supplies	1	\$500	\$500	\$	\$	\$500
Maps and Data	1	\$4000	\$4000	\$	\$	\$4000
			\$	\$	\$	\$
			\$	\$	\$	\$
			\$	\$	\$	\$
Subtotal			\$5000	\$	\$	\$5000

**F. SERVICES.** This should include the cost of duplication and printing, long distance telephone calls, equipment rental, postage, and other services not previously listed.

Item	Method of Computation	Grant Funds	Match / Cost Share (if any)	Third Party Share (if any)	Total
IT Tech Support – Web		\$2400	\$	\$	\$2400
IT Tech Support – Video Conferencing		\$2400	\$	\$	\$2400
		\$	\$	\$	\$
		\$	\$	\$	\$
Subtotal		\$4800	\$	\$	\$4800

**G. OTHER COSTS.** List equipment items in excess of \$500, and other items not previously listed. Note that equipment items worth less than \$500 or that have a useful life of less than 2 years must be listed in the Supplies and Materials category.

Item	Cost	Grant Funds	Match / Cost Share (if any)	Third Party Share (if any)	Total
Laptop for Administrator	\$600	\$600	\$	\$	\$600
Software	\$600	\$600	\$	\$	\$600
Meeting Room Rentals	\$878	\$878	\$	\$	\$878
	\$	\$	\$	\$	\$
	\$	\$	\$	\$	\$
Subtotal		\$2078	\$	\$	\$2078

**H. INDIRECT COSTS.** If indirect costs will be charged to the grant, complete the table below with your current approved indirect cost rate and the direct costs it will be applied to. A copy of your most recent indirect cost rate must be

attached if indirect costs will be requested.		
* The Direct Costs from items 1 -- 6 to which the indirect cost rate applies	Current Approved Indirect Cost Rate Percentage (%)	Indirect Cost Rate Amount
\$	%	\$

**Budget Justification.** Provide a brief narrative justification of all cost items, including matching funds, listed in the budget. Be specific and explain why these items are necessary to accomplish the grant objectives. If the project involves travel costs, include a brief summary of each trip (for example, Project Director and two students will fly from Hometown to Someplace and stay three days to examine Someplace Museum's collection). **Note: Travel is limited to this project only. If purchasing or renting computer equipment or other large budget items follow the procedures in 43CFR, Subpart C, Section 12.76 for State, local and Indian tribal governments or Subpart F, Section 12.940 through 12.948 for institutions of higher education, hospitals, other non-profit and all other organizations, as applicable.**

CONFLICT OF INTEREST/NON-DISCLOSURE CERTIFICATE

Idaho Comprehensive Wildlife Conservation Strategy 2012 L12AS00002

I certify that I am not aware of any matter which might reduce my ability to participate in the proposal evaluation proceedings and activities associated with the above funding opportunity in an objective and unbiased manner or which might place me in a position of conflict, real or apparent, between my responsibilities as an evaluator or advisor and other interests.

In making this certification, I have considered all my stocks, bonds, other financial interests, outside business associates, and employment arrangements (past, present, or under consideration) and, to the extent known by me, all the financial interests and employment arrangements of my spouse, my minor children, and other members of my immediate household.

I will notify the Grants Management Officer, if any person, firm, or organization submits a proposal or otherwise becomes involved in the subject project, if to my knowledge, I (including my spouse, minor children, other members of my immediate household) have a financial interest, or with which I have or am actually considering an employment arrangement. Further, based on advice from the servicing ethics counselor, I will agree not to participate further in any way (e.g., by rendering advice, making recommendations, scoring proposals, or otherwise in the particular subject matter or project).

I have also read and understand the Federal Employee Non-Disclosure Statement.

\_\_\_\_\_  
Signature

\_\_\_\_\_  
Date

THIS CERTIFICATION CONTAINS A MATTER WITHIN THE JURISDICTION OF AN AGENCY OF THE UNITED STATES AND THE MAKING OF A FALSE, FICTITIOUS, OR FRAUDULENT CERTIFICATION MAY RENDER THE MAKER SUBJECT TO PROSECUTION UNDER TITLE 18, UNITED STATES CODE, SECTION 1001.

## FEDERAL EMPLOYEE NON-DISCLOSURE STATEMENT

The proper treatment of official information related to the financial assistance process (requirement definition, validation, evaluation, selection proceedings, negotiations, etc.) is of the utmost importance.

An employee may not directly or indirectly use or allow the use of official information obtained through or in connection with his Government employment. Attention is invited to the provisions of 43 CFR Part 12 - Administrative and Audit Requirements and Cost Principals for Assistance Programs.

Title 18 U.S.C. 201 prescribes specific penalties for a Government official accepting, or anyone directly or indirectly promising to a Government official, anything of value with intent to influence an official act or otherwise influence the Government official.

U.S.C. Title 18, Sec. 1905, states: "Whoever, being an officer or employee of the United States or any department or agency thereof, ..., publishes, divulges, discloses, or makes known in any manner or to any extent not authorized by law any information coming to him in the course of his employment or official duties or by reason of any examination or investigation made by, or return, report or record made to or filed with, such department or agency or officer or employee thereof, which information concerns or relates to the trade secrets, processes, operations, style of work, or apparatus, or to the identity, confidential statistical data, amount or source of any income, profits, losses, or expenditures of any person, firm, partnership, corporation, or association; or permits any income return or copy thereof or any book containing any abstract or particulars thereof to be seen or examined by any person except as provided by law, shall be fined not more than \$1,000 or imprisoned not more than one year; or both; and shall be removed from office or employment."

Title 18 U.S.C. 207 restricts the participation of former Government officers and employees with regard to any matter in which participation has been personal and substantial.

Employees shall not reveal any information to anyone who is not also participating in the same activities, and then only to the extent that such information is required in connection with such activities. Such information is classified "FOR OFFICIAL USE ONLY". The dissemination of information in this category to other parties will be at the sole discretion of the Grants Management Officer. Request for Application information, Technical Evaluation Panel members, applicants proposals, proposal evaluation information and documents, and similar materials will be handled and discussed on a need-to-know basis only. Under no circumstances may application information, proposals, evaluation information, or selection criteria or plans be removed from the confines of the technical evaluation meeting area without the specific authorization of the Grants Management Officer. In this regard, the methodology used or planned for use in evaluating and selecting recipients will not be discussed or otherwise disclosed except on a "need-to-know" basis established by the Grants Management Officer on a case-by-case basis.

Any unauthorized disclosures contrary to the foregoing provisions may result in appropriate disciplinary action pursuant to applicable statutory provision.

## Technical Evaluation

Memorandum

DATE

To: Grants Management Officer \_\_\_\_\_

From: Program Officer \_\_\_\_\_

Write a review of the proposal (referring to the attached criteria):

What is proposed?

Specific qualities:

Found in the budget: Specifically personnel effort and travel expenses.

I **(do/do not)** recommend funding to \_\_\_\_\_.

Amount of \$ \_\_\_\_\_

Period of Performance: \_\_\_\_\_ to \_\_\_\_\_.

## **Application review Information Criteria**

### **1. Technical Approach**

a. The project design contains enough detail to show the development of the project and the relationship between the partners, milestones, and goals. The roles and responsibilities of each partner are clearly articulated. The milestones are clear, and supported by a well thought-out schedule that supports the work to be accomplished for the duration of the project.

b. The proposed project's importance/relevance and applicability are tied to the program goals. Is there value and importance to the program goals?

c. The work plan objectives are clear, suitable, and feasible with respect to the following:

- (1) Techniques, procedures, and methodologies;
- (2) Data collection, analysis, and means of interpretation;
- (3) Expected results or outcomes; and
- (4) Procedures for evaluating project efficacy, including fixed performance indices with probabilities for obtaining them.

d. The project proposal work plan is designed to produce the proposed outcomes and outputs. The outcomes are clearly stated and tied to intermediate outcomes as stated in the solicitation.

### **2. Qualifications, Experience, Past Performance**

a. The qualifications and experience of the organization are evident, and appear to be adequate to achieve project goals and objectives.

b. The qualifications and experience of the Project Director/Principal Investigator to be assigned for direct work on the project are evident, and appear to be adequate to achieve project goals and objectives and will be available for work on this agreement.

c. The applicants past and current assistance awards show they have completed project goals.

### **3. Purpose, Objectives, and Relevance**

a. The proposal adequately describes why the project is needed by the recipient.

b. The objectives are well defined, measurable, and realistic for the project's anticipated timeframe.

c. The benefits support the mission of the recipient and can be tied to a BLM Performance Measure.

### **4. Budget**

a. The budget line items are appropriate, reasonable, allowable, well justified and commensurate with the level of effort needed to accomplish the project objectives.

b. The budget breakdown or narrative provides adequate justification for each budget category used. If equipment is requested by the applicant is it fully justified and necessary for the performance and completion of the project?

c. The applicant and other counterparts cash and in-kind matching funds or contributions are acceptable.

Chairman Wayne Butts & Jim Hawkins,

The BLM appreciates your continued interest in the National Greater Sage-Grouse Planning Strategy. For Custer County, Todd Kuck – Challis Field Office Manager, is the primary contact for coordination and routinely attends county and NRAC meetings to share information with the county about BLM activities and gather input from the county. Since the National Greater Sage-grouse Planning Strategy and Idaho and southwestern Montana EIS effort is broader in scope than the Challis Field Office, I am available to attend, with Todd, the county commissioner meeting on May 30<sup>th</sup> and/or the NRAC meeting on June 6<sup>th</sup>.

BLM has been working with Idaho Department of Fish and Game to develop and delineate sage-grouse preliminary priority habitat in Idaho. The updated versions of these maps were released at the end of last week and are available via the BLM website: [http://www.blm.gov/id/st/en/sage-grouse\\_rmp\\_revision.html](http://www.blm.gov/id/st/en/sage-grouse_rmp_revision.html).

Todd will be sharing these maps at the next NRAC meeting and, in June, I can discuss further that information with the group. If you would like to have other data or information provided by the BLM, please let me know so that I may come prepared.

BLM appreciates the invitation and I look forward to meeting with Custer County Officials. If these dates do not work for scheduling please let me know so that we can make other arrangements.

RE: Sage Grouse Conference Call

---

Brent,

I completely spaced the Conference Call this morning. It is too bad, because I was anxiously looking forward to it. In any case I have reviewed your notes, and hopefully will see the documents later this afternoon.

I hope you will not be upset if I have to call you for clarifications, as I was not on the call and could not ask questions.

In the mean time, I am confused by some of your acronyms:

- ES&R
- NSO
- ROW (I presume right of way)
- RDFs
- BMPs
- RFPA

Thanks.

Doug

## Cooperating Agency Call

July 2, 2014 10:00 a.m. MST

### Attendance

BLM: Brent Ralston

Counties: Bill Frederiksen – Clark County; Doyle Lamb – Custer County; Ladd Carter – Bingham County; Gerald Raymond – Jefferson County

### Action Items

- Review the proposed plan and components and send Brent comments in the comment form provided by July 18<sup>th</sup>.

### Meeting Minutes

#### *Project Update*

- Working with the Washington Office and National USFWS office regarding direction for the proposed plan. Have been approved to move forward with the proposed plan. Preparing administrative draft proposed plan.
- A review package with the proposed decisions will go out today or tomorrow to the counties. Asking for a 2 week review period for comments, concerns, and questions. Look at the management actions and see if there's anything in conflict with the county land use plans.
- The proposed plan (Alternative G) contains about 40 pages of management decisions broken down by program area. Brent will send two electronic files: 1) proposed decisions (40 pages); 2) supporting documentation/appendices that are directly associated with the proposed decisions and provide more detail and background (150 pages). Brent will also send a comment form with directions. Send comments to Brent by **July 18<sup>th</sup>**.
- A number of federal and state cooperating agencies have been involved in preparing the plan (e.g., Forest Service, ID Office of Species Conservation, IDFG, Montana FWP).
- Expect to compile administrative final EIS by mid-late august and will share the full document around that time.
- The proposed plan will be sent to all county cooperators, including INL and Craters of the Moon, as well as the tribes. Plan has been shared with the state. Will not be distributed widely before September at the earliest.

#### *Proposed Plan Overview*

- Proposed plan was prepared by combining key components of Alternatives D and E. While the text will not be exactly the same, it is similar to both of those alternatives.
- Brent reviewed the proposed plan section by section as summarized below.

- Summary of all decisions up front.
- Discussion of goals and objectives; includes habitat treatments (still working on acreages)
- General direction – following laws, the last couple items relate to RDFs, BMPs, seasonal restrictions, and lek buffer distances for implementation activities (details included as an appendix).
- Coordination with other agencies
- Management Areas – two maps: 1) Conservation Areas – Similar to Alternative E but added one Conservation Area for Montana; 2) Three management zones (similar to Alternative E) – Core (CMZ), Important (IMZ), and General (GMZ). Montana does not have any Important Management Zones.
- Adaptive management – Based on habitat and population measurements. Soft trigger – look at site-specific changes; hard trigger would require a land use plan amendment. Similar to Alternative E, if a hard trigger is tripped, IMZ would be managed as CMZ.
- Baseline map – will continue to use key habitat map to track the change in acres for adaptive management. This map is updated on an annual basis.
- Anthropogenic disturbance – included a 3% disturbance threshold based on USFWS concerns. Evaluated percent disturbance (large infrastructure, does not include fences, two-track roads, or range improvement projects) within CMZ and IMZ by Conservation Area. All areas range between 0.8 percent to 2.2 percent development.
- Exception criteria for CMZ and development criteria for IMZ – they are the same as Alternative E, though some changes have been made for clarity.
- Mitigation – setting up a mitigation board at the state level. Still working out the details. Develop a state-wide mitigation strategy built on the Idaho framework for mitigation.
- Wildfire: a number of actions related to preparedness, suppression, fuels management and ES&R:
  - Working with the RFPAs and pre-season coordination efforts.
  - Complete Wildfire and Invasive Species Assessments to help prioritize areas on a field office basis; identify areas for fuel breaks, etc. GRS is the highest priority after life and property.
  - Fuels management, including targeted grazing, using existing ROWs.
  - ES&R primarily with native seeds.
- Habitat restoration and vegetation management – similar to some of the ES&R management, it is just done under a different program. Focus on Stage 1 and 2 juniper stands – rapid recovery because understory still there.
- Lands and realty – linked closely with the anthropogenic disturbance threshold and the criteria for when projects would be allowed. Identify ROW exclusion, avoidance, and avoidance. All CMZ and IMZ are ROW avoidance – must meet the criteria. Some exclusions in CMZ: wind, solar, hydropower, nuclear, and commercial service airports. Land tenure adjustments described.
- Fluid mineral development – low and no potential areas within CMZ are closed; moderate and high potential areas in CMZ and IMZ are open with NSO. Geothermal has a different potential map.

- Phosphate – no Known Phosphate Leasing Areas (KPLAs) in CMZ. Outside of KPLAs, CMZ is closed. IMZ in KPLA open; outside KPLAs, must meet the development criteria.
- Grazing – point to rangeland health assessment process.
- Wild horse and burros – no changes
- Travel management – limited to existing routes unless already identified as an open play area. Follow up with travel management planning to designate the routes.
- Monitoring

**Subject:** CA Call

Doug,

I missed you on the call! I'm sure you've got lots of 'irons in the fire' as they say. This call was not critical – the major information we wanted to share is the upcoming review period. We have a draft of the proposed plan and want to provide a review timeframe. The volume of materials is less than what we've shared for review previously ~200 pages with 40 pages the primary focus.

We are preparing that review package to be sent out today or tomorrow so you should get it in the mail in the next several days.

Sorry for all the acronyms. Here is a brief description of the ones you brought to my attention –

ES&R – emergency stabilization and rehabilitation, a program within BLM to address conditions after a fire

NSO – no surface occupancy - fluid mineral leasing stipulation

ROW – you got this one right-of-way

RDF – required design features, previously called best management practices but would be required

BMP – best management practices typically practices and procedures considered at the implementation level to reduce impacts

RFPA – rural fire protection association, this is referring to the State of Idaho supported rural fire protection associations being developed in vvarious areas across the state.

Thanks for your continued interest and involvement in this effort.

Brent Ralston

**Subject:** Re: Adaptive Management Trigger Clarification

Brent:

This clears up the confusion, in my opinion.

Thank you!  
Katie

On Tue, Sep 23, 2014 at 12:25 PM, Brent Ralston <[bralston@blm.gov](mailto:bralston@blm.gov)> wrote:

It has been brought to my attention that the adaptive management triggers for habitat described in the plan may be a bit confusion now that we have developed the concept of biologically significant units and effective habitat (key habitat). What we have in the plan currently is:

**5.1.** Adaptive Regulatory Criteria for Hard Habitat Triggers are defined as:

A 20 percent combined loss of nesting and/or wintering habitat within CMZ within a CA compared to the 2011 biologically significant unit (BSU) baseline (Map 3) (The BSU is defined as the nesting and wintering habitat within Core and Important Management Zones within a Conservation Area, inclusive of all ownerships and is used in the evaluation of the adaptive regulatory triggers and the anthropogenic disturbance cap); or

All the habitat triggers read in a similar fashion. I would suggest we change this wording to resolve any inconsistency with our description of the BSUs to:

*A 20 percent loss of Key Habitat within the biologically significant unit (BSU) of the CMZ of a CA when compared to 2011 acreages (the BSU is defined as the nesting and wintering habitat within a Core and Important Management Zones (separately) within a Conservation Area, inclusive of all ownerships); or...*

So essentially we are replacing "...combined loss of nesting and/or wintering habitat..." with "...loss of Key Habitat within the biologically significant unit (BSU)..."

Since we have defined the BSU as those areas of nesting and wintering habitat within the Core or Important MZs (two BSUs per Conservation Area – 1 for Core, one for Important) the new language eliminates this duplicative description and clearly identifies what we are concerned about losing within those areas – Key Habitat. This also is consistent with the BSU appendix that we have worked on and will be included in the FEIS.

Let me know if you have concerns about this change or other suggested wording.

**To:** James Lyons, Sarah Greenberger  
**Cc:** Edwin Roberson, Timothy Murphy, Jeffery Foss, "Dustin T. Miller", "Moore, Virgil", Michael Carrier  
**Subject:** Disturbance

Jim and Sarah,

Last week's discussion with the State of Idaho seemed very productive and helped focus the specific needs we continue to work forward to resolve. The discussion on the Idaho disturbance approach was also valuable and I appreciate the opportunity to describe our approach. It's a complicated subject and not something that is easy to get to the heart of quickly. Attached you'll find a more thorough description of the approach and its derivation and relation to the appropriate science. – the first ten pages focus on disturbance, the remainder of the document describes Idaho's adaptive management process and calculation.

If you'd like any further information or clarification or have questions we can provide additional information.

We will continue to work on the 'elevator speech' on disturbance which goes something like this – "Idaho applies a 3% anthropogenic disturbance cap to priority and important habitat management areas to limit habitat loss and fragmentation; measured within nesting and brood rearing habitats associated with lek areas and critical wintering areas within priority and important habitat management areas and calculated consistent with existing scientific literature".

Brent Ralston

### Responses to Concerns Raised Regarding Idaho's Disturbance Calculation:

**Concern:** Idaho BLM generated a novel equation for calculating disturbance for the purposes of monitoring for disturbance caps.... It is unclear why Idaho BLM developed its own disturbance calculation apart from the rest of the Great Basin planning areas as we have been asking for consistency to the extent possible.

**Response:** The alternative included in the Draft EIS's describing the National Technical Team Report (Alternative B in the Idaho and Southwestern Montana DEIS) included a management action to apply a 3% disturbance cap. However, there was no description of how this would be applied, calculated or implemented in subsequent management. The Preferred Alternatives (D & E) did not include a disturbance cap since disturbance was not identified as a major concern causing loss of habitat in Idaho or Southwestern Montana and its measurement and applicability was not defined and deemed highly problematic to implement in a meaningful way. When, during the early 2014 Federal Family Meeting USFWS indicated that inclusion of such a disturbance threshold was necessary in order for USFWS to have the assurance and certainty necessary when assessing GRSG listing. At that point, outside of Wyoming's Disturbance Density Calculation Tool there was no developed approach to measure or calculate disturbance to evaluate a disturbance cap against.

Idaho BLM invited Dr. Steve Knick to discuss his study regarding disturbance (the only known scientific research describing a disturbance cap). Also as a result of that FFM the BLM's NOC began working on developing a disturbance calculation process that was not as intensive as the Wyoming DDCT approach, based on BLM guidance that anthropogenic disturbance measurement would not follow that approach in other states due the intensive and workload associated with that approach would not be feasible to implement in other states.

Idaho BLM followed the provided guidance to develop biologically significant units (BSUs). The NOC developed 3 equations to try and relate disturbance and habitat. These equations were specifically applicable to broad scales but not applicable to site specific scales. Idaho BLM took the information and built a simple equation measuring and evaluating absolute disturbance to compare against the cap. That equation was defined as:

$$\frac{\text{Acres of Anthropogenic Disturbance within } h \text{ BSU}}{\text{Acres within } h \text{ BSU}}$$

At the time of the August Federal Family Meeting the Idaho BLM had further refined the previous equation to more accurately reflect the findings in Knick's research. Disturbance was discussed at that meeting and it was evident that there was no other clear guidance from either the WO, the NOC or efforts from other states in this subject. Idaho was the only state to have put effort into the need identified by USFWS and the only effort to have a reasonable, scientifically based approach. Idaho did not intentionally deviate from consistent approaches being developed

apart from the other Great Basin planning areas; and in fact until more recently Idaho is the only Great Basin planning effort to have put an approach together.

**Concern:** Although IFWO did not express significant concerns when the calculation was presented by Idaho BLM, since the disturbance cap in Idaho is not likely to be hit under either method,... That said, IFWO is confident that the conservation outcomes for sage-grouse will be the same regardless of the calculation methodology because the anthropogenic disturbance cap is not likely to be hit under either methodology in Idaho.

**Response:** Loss of habitat from anthropogenic disturbance is not a major issue in Idaho and Southwestern Montana; however, that does not mean that measurement and evaluation of a disturbance cap can be arbitrary, or any less supportable, or inconsistent with the scientific research available if that research can help inform the conditions and evaluation appropriately.

That is why the Idaho disturbance calculation is defined consistent with the scientific research making it reflective of the known effects to GRSG and supportable to base management decisions upon.

**Concern:** ...our recent collective review of this equation in more detail (Pat, Jesse, and Jason) suggests that the genesis of this equation was based on the erroneous assumption that other planning efforts were not "incorporating fire" into their disturbance calculations. They note this in their rationale provided in draft proposal - "[a straight 3% disturbance cap] would not account for changes in effective habitat due to loss through fire or gain through restoration and rehabilitation." This is not true - all other planning areas are accounting for changes to the amount of available habitat (what Idaho BLM calls effective habitat) in the denominator of their disturbance calculations.

**Response:** The Idaho calculation does consider the effect fire has on the habitat and includes loss of habitat from fire as part of the calculation by weighting the denominator based on the actual habitat available to the GRSG. At the time Idaho developed this scientifically based formula there were no other planning effort attempts to describe the disturbance cap so it would be impossible for Idaho to make any assumptions based on those other efforts, erroneous or otherwise, since none existed. The rationale described is in direct reference to the original equation Idaho BLM used:

$$\frac{\text{Acres of Anthropogenic Disturbance within h BSU}}{\text{Acres within h BSU}}$$

Which does not account for changes in habitat due to loss through fire or gain through restoration. Currently, all other planning efforts may have calculations that account for changes in available habitat; however, the existence of these calculations now, roughly six months after Idaho's approach was developed is hardly evidence that the assumptions described in Idaho's approach are erroneous or in some way invalid. As stated previously Idaho's approach was not

developed as a deviation or in comparison to other planning effort attempts at calculating the disturbance cap because such attempts did not yet exist when Idaho's approach was completed.

**Concern:** In addition, the equation inserts two terms in their disturbance calculation that make the equation unnecessarily complex and difficult to interpret. First a term for the entire area of the BSU is included in the denominator, yet anthropogenic disturbance is only being measured in the effective habitat. Second, the inclusion of a "constant" is added as a correction factor. The result of adding these terms is that in some circumstances the amount of disturbance (in acres) actually allowed under a 3% cap would vary significantly depending on the equation applied...

**Response:** The two terms at issue here are precisely what make the equation relevant and scientifically accurate and supportable, they may make the calculation more complex but natural systems are complex and mathematical equations developed to describe those systems may be somewhat complex. That they are difficult to interpret does not invalidate their inclusion and the value in numerical description those terms contribute to describing a complex situation. The actual relationship described in Knick et al., when graphed would resemble:

This graph shows the conceptual relationship curve of anthropogenic disturbance suggested by Knick et al. In that research it was shown that when anthropogenic disturbance reached 3% within an area surrounding leks (5-18km) then lek attendance was impacted through fewer birds attending on leks. In the graph above the curve assumes that the area described has 3% of its acres under some sort of anthropogenic developed. According to Knick et al. when 70-80 percent of an area is effective habitat for GRSG then anthropogenic development totaling 3% of that area will start to reduce lek attendance. That research also shows that if the effective habitat percentage within that area is over 90% or less than 70% lek attendance is affected when less than 3% of the area contains anthropogenic development. This relationship would

mathematically be described using a parabolic (as opposed to a linear) equation, making it a much more accurate reflection of a complex system but also making it even more complex and difficult to interpret. In addition, while Knick et al. suggests this relationship, and defines the effects at a 3% anthropogenic disturbance level in conjunction with 70-80% effective habitat. Knick et al., and we are aware of no other scientific studies, does not describe the trajectory of the curve above 80% or below 60%, so actually developing a more accurate, parabolic formula, is not possible at this time.

The Idaho equation is:

$$Disturbance\ Percentage = \left( \frac{Footprint\ Acres\ from\ Anthropogenic\ Disturbance\ in\ the\ BSU}{Acres\ within\ the\ BSU * \left( \frac{Acres\ of\ Effective\ Habitat\ within\ the\ BSU}{Acres\ within\ the\ BSU} + 0.3 \right)} \right) \times 100$$

This equation is meant to describe a spatially reality, for that reason it is imperative that the terms be linked with that spatially reality. Without this link any equation descriptive of a spatial reality would become meaningless to the reality it is trying to describe. The purpose of a disturbance cap and a supporting disturbance calculation is to measure and evaluate anthropogenic disturbance over a given area. For the purposes of application this area is defined as the biologically significant unit or BSU. For Idaho the BSU was delineated consistent with BLM guidance and reflective of the Knick et al. research. Idaho's BSU are defined as: all of the modeled nesting and delineated winter habitat, which is based on 2011 data, occurring within Priority and/or Important Habitat Management Areas within individual Conservation Areas for all land ownerships. Modeled nesting habitat is defined as a 10 km area around leks. Based on Idaho Department of Fish and Wildlife surveys and monitoring information this area around leks encompasses a vast majority of the nesting habitat (i.e. IDFG data show that over 90% of nesting occurs within 10 km of the lek). This 10 km is within the 5-18 km range for which Knick et al. identified their research was applicable. Knick communicated to the Idaho ID Team that beyond 18 km the disturbance relationship to lek attendance described in his research was not discernable). The equation calculates a disturbance value within that BSU area by totaling the acres of disturbance within that area and dividing by that area appropriately adjusted by effective habitat within that area to reflect a higher impact of disturbance when effective habitat is lower than the low end of the 70-80% optimum range (This optimum range is also supported by Connelly et al. 2000 (80%) and the BLM's National Technical Team Report (70%)). The equation does not accurately depict the disturbance relationship when effective habitat is greater than 80%. This is due to the fact the equation is linear as opposed to parabolic (discussed earlier) and that the areas within Idaho of most concern for continued presence of GRSG and impacts from anthropogenic disturbance do not exceed 80% effective habitat. This instance only occurs in the Mountain Valleys Conservation Area where existing disturbance is well below 2%. Therefore the applicability of the equation to these conditions is limited.

Anthropogenic disturbance is being measured and evaluated within the entire BSU, not just the effect habitat area, which is why it is important to define the denominator across the BSU scale, not just a portion of the BSU which is where the spatial link becomes critical. How the

denominator is described mathematically defines the scale over which the numerator is measured; changing that scale would also require adjustments to the numerator to be mathematically correct and maintain the spatial link critical for using a numeric equation to describe a spatial effect.

The presence of the constant (0.3) is a mathematical necessity that defines the relationship, it is neither irrelevant, nor is it a ‘correction’ factor. Correction implies there is something incorrect or erroneous in the equation. The effective habitat denominator adjustment term:

$$\left( \frac{\text{Acres of Effective Habitat within } h \text{ BSU}}{\text{Acres within } h \text{ BSU}} + 0.3 \right)$$

This entire term, in order to accurately reflect Knick et al. (see previous conceptual curve graph), must equal 1 when effective habitat within the BSU represents 70% of the BSU. Without the constant 0.3 added to the effective habitat proportion this term would not equal 1 when effective habitat is at 70%, it would not be a mathematical correct approximation of the disturbance relationship, it would lose its spatial link since this term needs to account for 100% of the acres in the BSU at the 70% habitat/3% disturbance intercept and would therefore become meaningless with respect to the spatial relationship that is being approximated.

That this equation would ‘vary significantly depending on the equation applied...’ is unequivocally correct since different equations may be describing different conditions. The real question becomes does the Idaho equation ‘vary significantly’ when compared to equations describing similar conditions? Essentially are we comparing like outcomes (i.e. apples and apples) or unlike outcomes (i.e. apples and oranges). See concern and response below.

**Concern:** ...with Idaho's equation allowing more disturbance before hitting the cap in some scenarios.

**Response:** This conclusion would need to be qualified based on the validity of the equation being used for comparison. While that specific equation has not been provided to verify that conclusion an Excel spreadsheet was shared and if the equation is represented by the disturbance relationship described in that table then the comparison equation can be expressed as:

$$\frac{\text{Acres of Disturbance}}{\text{Effective Habitat}}$$

This equation has the benefit of simplicity; however there are several fundamental flaws with this simple calculation which without further refinement to link the spatial reality with the mathematical formula make any current comparisons are invalid. This equation does not appropriately address: 1) spatial representation; 2) scale of the calculation; 3) consistency with known science; or 4) multiple considerations of single disturbances (i.e. double counting, which links back to the spatial representation aspect of the equation).

When using mathematical equations to describe real-world conditions it is imperative that the link between the spatial conditions and the mathematical representation of those conditions be understood and maintained. Otherwise any comparison does not have an appropriate foundation for comparison and is ultimately of limited, if any, use. To help illustrate this equation would more accurately be written (which is the relationship described in the Excel Table):

(Acres of Disturbance within Effective Habitat + Acres of Disturbance outside Effective Habitat)

(Acres of Concern (BSU) – Acres outside Effective Habitat)

While more complicated, this equation is more accurately in depicting the actual formula used in the Excel Table provided by USFWS. This is further described when all the acres within the Area of Concern or BSU are Effective Habitat; Acres outside Effective Habitat would be zero, effectively eliminating that term and similarly Acres of Disturbance outside Effective Habitat would be zero since there are no acres outside Effective Habitat, therefore eliminating that term as well; leaving the original simplified version of this equation. However, when there are no Acres outside Effective Habitat within the Acres of Concern is the ONLY condition where this simplified equation actually represents and links to the real-world spatial conditions which are being described. So it is ONLY at this point (when the BSU contains 100% Effective Habitat) that the Idaho methodology and this simple equation can be appropriately compared. As described earlier the Idaho methodology (equation) does not accurately reflect the spatial conditions (according to Knick et al.) above 80% Effective Habitat (See previous discussion regarding why this is not a significant issue in need of resolution). Below 70% Effective Habitat where the Idaho methodology reflects the scientific relationships comparisons; the simple equation loses its spatial link and comparisons are not valid or appropriate.

So why is the spatial link lost? A key principle in translating spatial conditions to mathematical equations is, in this instance, each acre of either disturbance, within effective or outside effective habitat in the equation represents a real acre of disturbance, a real acre within effective habitat, a real acre outside effective habitat. If there are acres outside Effective Habitat within the Area of Concern the more accurate equation described above shows that those acres are REMOVED through subtraction from the denominator. This changes the scale of the calculation (see below) effectively redefining the spatial extent over which the Acres of Disturbance appropriate to the new scale/denominator can be measured. So this equation redefines the spatial extent for comparison through removing acres from the denominator, while at the same time it includes acres of disturbance in the numerator. The spatial representation is lost when the same acres are both included in the numerator but removed from the denominator.

Scale

Consistency with Known Science

Multiple Considerations of Single Disturbances

**Concern:** However, there is general agreement that applying Idaho's methodology more broadly could be problematic, because in areas where an anthropogenic disturbance cap is likely to be hit, Idaho BLM's methodology could allow for a higher percentage of anthropogenic disturbance before a cap is hit in some scenarios.

**Response:** Using Idaho's methodology in other states will be problematic. Not because 'in areas where an anthropogenic disturbance cap is likely to be hit, Idaho BLM's methodology could allow for a higher percentage of anthropogenic disturbance before a cap is hit in some scenarios' (see previous response regarding comparison of different spatially representative equations); but because the data needed to support Idaho's methodology are not readily available in other states. Idaho has collected, reviewed and updated on an annual basis for 12+ years a GRSG Key Habitat Map. This map tracks effective habitat, effects to that habitat from fire, restoration efforts and use by GRSG. This is the data utilized in the adjustment factor for the denominator and it is critical to the use of the equation, without this data actual meaningful application of the equation would not be possible or relevant. This is a data set that we are not aware exists within other planning areas. For this reason application of the Idaho methodology poses implementation concerns for areas beyond Idaho.

**Concern:** I thought that effective habitat was defined as areas with 70 to 90% sagebrush land cover (based on Knick et al. 2013). So it wouldn't include all sagebrush cover.

**Response:** For Idaho's methodology effective habitat is taken to be the Key Habitat areas described by the Idaho Key Habitat Map. Key habitat includes areas of generally intact sagebrush that provide sage-grouse habitat during some portion of the year. This map also identifies areas that could provide GRSG habitat or currently provide habitat at less than optimum levels. These areas are also spatially depicted and as described as: R1 – perennial grass areas with limited sagebrush presence; R2 – annual grassland areas with limited perennial grasses or sagebrush presence; and R3- juniper encroachment within areas previously dominated by sagebrush.

**Attachments:** 6.25.14\_Ltr to Tribes for the Draft EIS.docx; 6.25.14\_LTR to Cooperating Agency.docx

Hi Kathy,

Brent approved my changes this morning, so these are ready to go. I assume you still have the tribal contacts from the last time, along with the cooperating agencies list, yes? If not, let me know and I'll make sure I get them to you/help you with it.

I'll come over and chat with you about this as well.

Thank you so much Kathy!

Nathan Small, Tribal Chairman  
Shoshone-Bannock Tribes  
PO Box 306  
Fort Hall, ID 83203

Dear Chairman Small:

The Bureau of Land Management (BLM) and U.S. Forest Service (USFS) have received numerous agency, tribal, and public comments on the Draft Environmental Impact Statement (EIS) for the Idaho and Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment (LUPA). We are now ready for you to review the Preliminary Proposed Plan Amendment.

In order to meet the timeline for providing our Final EIS/LUPA to the U.S. Fish and Wildlife Service and to provide you with an opportunity to review both the BLM Preliminary Proposed Plan Amendment and the administrative Final EIS/LUPA, you will be receiving the BLM Preliminary Proposed Plan Amendment section of the Final EIS within the next week for a two week review period. This will include the BLM Preliminary Proposed Plan goals, objectives, and management actions and associated map. The USFS Preliminary Proposed Plan Amendments will be included in the Final EIS/LUPA, but are not included at this time for review as they are still under development.

As part of this review, the BLM will ask for comments on these goals, objectives, and management actions. We will be requesting that your comments be submitted to us within two weeks of the release of the Preliminary Proposed Plan Amendment; the specific date is yet to be determined and will be identified with the release of the review package.

We realize this request for a short review period will impact your staff and their workload and thus we thought it appropriate to provide this letter as an advance notification of the pending review. We request that you provide specific information regarding the consistency of the Preliminary Proposed Plan Amendment with your respective Tribal Plans and Tribal rights and interests; specifically noting any inconsistencies you feel may exist. This will allow us to specifically address your comments and concerns as we develop the Final EIS.

This review precedes release to the public. As such, these are not public documents and are being provided for your review based on your unique status and governmental relationship with

the BLM. We request that you maintain the confidentiality of these documents throughout your review until the BLM and USFS release this information to the public.

If you have any questions, contact Brent Ralston (BLM Idaho) at (208) 373-3812 or Rob Mickelsen (USFS) at (208) 557-5762. Thank you in advance for your review and input throughout this planning process; we look forward to receiving your comments.

Sincerely,

Timothy M. Murphy

Dear Cooperating Agency:

The Bureau of Land Management (BLM) and U.S. Forest Service (USFS) have received numerous agency, tribal, and public comments on the Draft Environmental Impact Statement (EIS) for the Idaho and Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment (LUPA). We are now ready to share the Preliminary Proposed Plan Amendment with our cooperating agencies.

In order to meet the timeline for providing our Final EIS/LUPA to the U.S. Fish and Wildlife Service and to provide you with an opportunity to review both the BLM Preliminary Proposed Plan Amendment and the administrative Final EIS/LUPA, you will be receiving the BLM Preliminary Proposed Plan Amendment section of the Final EIS within the next week for a two week review period. This will include the BLM Preliminary Proposed Plan goals, objectives, and management actions and associated map. The USFS Preliminary Proposed Plan Amendments will be included in the Final EIS/LUPA, but are not included at this time for review as they are still under development.

As part of this two week review, the BLM will ask for comments on these goals, objectives, and management actions. We will be requesting that your comments be submitted to us within two weeks of the release of the Preliminary Proposed Plan Amendment; the specific date is yet to be determined and will be identified with the release of the review package.

We realize this request for a short review period will impact your staff and their workload and thus we thought it appropriate to provide this letter as an advance notification of the pending review. We request that you provide specific information regarding the consistency of the Preliminary Proposed Plan Amendment with your respective federal, Tribal, State or County Plans; specifically noting any inconsistencies you feel may exist. This will allow us to specifically address the consistency in the Final EIS.

Please remember these are not public documents and are being provided for your review based on your Cooperating Agency relationship with the BLM. We request that you maintain the confidentiality of these documents throughout your review until the BLM and USFS release this information to the public.

If you have any questions, contact Brent Ralston (BLM Idaho) at (208) 373-3812 or Rob Mickelsen (USFS) at (208) 557-5764. Thank you in advance for your review and input throughout this planning process; we look forward to receiving your comments.

## Executive Summary

Sage-grouse is a candidate species being reviewed by the U.S. Fish and Wildlife Service (USFWS) to determine listing status under the Endangered Species Act (ESA).

As part of Idaho's commitment to conserving sage-grouse, the Idaho Department of Lands (IDL) developed conservation measures (CMs) for endowment trust land (endowment lands) management programs and for programs that fall under some IDL regulatory and assistance functions. The CMs for IDL programs that involve sage-grouse habitat are included in the Greater Sage-Grouse Conservation Plan outlined in this document, which the State Board of Land Commissioners (Land Board) and Idaho Oil and Gas Conservation Commission approved in April 2015 (Appendix F and G). The Greater Sage-Grouse Conservation Plan (Land Board's Plan) complements and augments the Governor's statewide plan to conserve the most important habitat for sage grouse in Idaho.

IDL collected comments on a draft sage-grouse plan. Input came from natural resource industry user groups, environmental organizations, and relevant state and federal agencies to fine-tune the plan.

Implementation of the Land Board's Plan is contingent upon the federal government's acceptance and incorporation of the Governor's plan in its final decisions on sage-grouse in Idaho.

For proposed activities by third parties on endowment lands, IDL will implement sage-grouse CMs as enforceable stipulations in authorizing documents such as leases, permits, and easements. For activities that take place on privately owned lands in sage-grouse habitat but involve some IDL regulatory and assistance functions, CMs are presented as voluntary best management practices.

Endowment lands are managed under a mandate in the Idaho Constitution (Article IX Section 8) to maximize long-term financial returns to public schools and other State of Idaho institutions. Approximately 1.4 million acres of the total 2.4 million acres of endowment land in Idaho are rangelands, and nearly half of these endowment rangelands are in Core and Important sage-grouse Habitat Zones identified by the Idaho Alternative, and as concurred by the USFWS.

The IDL also carries out a number of regulatory and assistance duties. The IDL regulatory and assistance responsibilities that affect sage-grouse habitat include regulating certain oil and gas development activities; dredge and placer mine permitting; mine reclamation plan approvals; and abandoned mine land reclamation. The IDL also supports enhanced fire preparedness and suppression in sage-grouse habitat.

## 1. Brief History

In 2010, the USFWS determined Greater Sage-Grouse (sage-grouse) warranted protection under the ESA, but it was precluded from listing due to higher priority species. In the USFWS decision, the primary threats listed for Idaho were wildfire, invasive species, and infrastructure development.

The timeline for USFWS analysis was further accelerated when in 2011 a multidistrict litigation in the U.S. District Court of the District of Columbia resulted in a settlement agreement between the litigants and the USFWS. The settlement agreement required the USFWS to implement a six-year work plan to enable the agency to systematically review and address the needs of more than 250 species listed on the 2010 *Candidate Notice of Review* to determine if they should be added to the Federal Lists of Endangered and Threatened Wildlife and Plants. The USFWS agreed to determine the listing status of sage-grouse in 2015. Later in 2012, the U.S. District Court for the District of Idaho ruled that pursuant to the D.C. District Court settlement, the USFWS must reevaluate the status of sage-grouse under the ESA by September 30, 2015. In response to these deadlines, then-Secretary of the Interior Ken Salazar invited the 11 western states impacted by a potential listing of the species, including Idaho, to develop state-specific regulatory mechanisms to address the cited deficiencies in an effort to preclude a listing under the ESA.

As a direct outcome of the proposed ESA listing review, the U.S. Bureau of Land Management (BLM) initiated a draft Land Use Plan Amendment and Environmental Impact Statement (EIS) pertaining to the sage-grouse throughout BLM's management zones within sage-grouse habitat.

In March 2012, Governor C.L. "Butch" Otter issued Executive Order No. 2012-02 establishing the Governor's Sage-Grouse Task Force. The task force's goal was ultimately to develop state-specific regulatory mechanisms for the BLM to incorporate the state's plan as an alternative in the BLM environmental analysis pursuant to the National Environmental Policy Act (NEPA) EIS. The *Idaho Alternative* was submitted to the BLM in September 2012. The *Idaho Alternative* was incorporated as Alternative E in the November 2013 BLM Draft Idaho and Southwest Montana Sub-Regional Sage-grouse Land Use Plan Amendment and EIS, where it was presented as a "co-preferred Alternative" along with the BLM Alternative D.

The Land Board's Plan complements the Governor's *Idaho Alternative* Sage-Grouse Plan for federal land management in Idaho.

The Land Board's Plan utilizes the *State of Idaho Habitat Zone* classifications defined in 2012 by the Governor's task force. Consistent with the *Idaho Alternative*, IDL focuses conservation efforts on the Core and Important Habitat Zones, which include the great majority of the sage-grouse populations in Idaho. There are more than 10,500,000 acres in Core and Important sage-grouse Habitat Zones in Idaho, with the vast majority of these acres under federal management (Table 1.1). IDL has surface or mineral ownership of almost 690,000 acres of Core and Important habitat, with about 619,000 acres of surface ownership in these habitat zones. While the IDL ownership is a relatively small proportion of the 10.5 million acres of habitat (less than 6 percent), almost half of endowment rangelands are found within the Core and Important Habitat Zones.

## 2. Purpose of the Plan

The Plan has a threefold purpose:

- (1) It summarizes CMs for endowment land programs and IDL regulatory and assistance programs that are complementary to the *Idaho Alternative* for sage-grouse conservation actions on federal land.
- (2) It communicates to the USFWS that, along with the *Idaho Alternative*, there are adequate existing regulatory mechanisms to alleviate the primary threats to sage-grouse and sage-grouse habitat in Idaho (such certainty will be necessary to prevent the sage-grouse from being listed under the ESA).
- (3) It preserves the statutory responsibility of IDL to manage endowment lands under a constitutional mandate to maximize long-term financial returns to state institutions, mainly public schools.

For proposed activities by third parties on endowment lands, IDL will implement sage-grouse CMs as enforceable stipulations in authorizing documents such as leases, permits and easements. The authorized activities include: alternative energy development (solar, wind, and geothermal); oil and gas exploration and development; mining; grazing; miscellaneous commercial activities; and the granting of access through rights-of-way, including easements. In addition, IDL as the land manager will implement and support fire prevention and mitigation measures and wildfire suppression efforts to minimize the impact to sage-grouse and their habitat.

For regulatory and assistance activities on private land, CMs will be voluntary BMPs because IDL does not have the statutory authority within its regulatory programs or assistance activities to require adoption by authorized parties. Regulatory and assistance activities include: abandoned mine lands projects; dredge and placer mine permitting; mine reclamation plan approvals; and oil and gas permits (e.g. seismic imaging surveys, well drilling). Where appropriate, IDL will include recommended BMPs within its authorizing documents to encourage compliance.

IDL also will implement actions through its roles and responsibilities that support enhanced fire preparedness and suppression in sage-grouse habitats.

## 3. Coordination

Utilizing available funding, IDL will collaborate, coordinate, and utilize cooperative planning efforts to implement and monitor proposed CMs to protect and potentially improve sage-grouse habitat. Coordination efforts could include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups, lease/permit holders, and nongovernmental organizations.

Current sage-grouse coordination efforts in which IDL is involved include:

- a. *Bruneau-Owyhee Sage-Grouse Habitat Project (Federal Register- NOI, 01/20/2015),*
- b. *Burley Interagency Landscape Sage-Grouse Habitat Restoration Project,*
- c. *Tri-State Interagency Fuel Break Project (Federal Register-NOI, 2015),*
- d. *Paradigm Fuel Break Project (BLM Draft EA, 01/24/2014),*

- e. *Jarbridge Fuel Breaks Project (DOI-BLM-ID-T010-2011-0006-EA),*
- f. *BLM/IDFG/IDL Rangeland Rehabilitation MOU (Final MOU 02/2015), and*
- g. *Owyhee Land exchange (Agreement to Initiate signed December, 2008).*

In addition, IDL's FY 2016 budget includes a one-time appropriation of \$55,000 from the General Fund to cover IDL personnel costs within the Forest and Range Protection program for two heavy equipment mechanic positions to refurbish water tender equipment. This equipment will be utilized by the rangeland fire protection associations (RFPAs) in suppressing rangeland fire in the sage-grouse landscape. The FY 2016 budget also includes a one-time appropriation of \$195,000 in dedicated funds (Earnings Reserve Fund) for operating expenses within the Lands and Waterways program for fire prevention fuel breaks, conifer encroachment treatments, post-fire seeding, fire prevention brush management, wildlife fencing, flagging, and water development wildlife escape ramps.

#### **4. Greater Sage-Grouse Management Areas**

The Land Board's Plan utilizes the *State of Idaho Habitat Zone* classifications as described in the *Idaho Alternative, September 2012*, and as proposed by the Governor's Sage-Grouse Task Force. The *Idaho Alternative* designated a Sage-Grouse Management Area ("SGMA") with three distinct management zones: Core Habitat ("CHZ"), Important Habitat ("IHZ") and General Habitat ("GHZ"). At this time, IDL is not proposing any CMs for endowment lands or regulatory and assistance activities within the GHZ.

IDL concurs with and repeats the following statements from the *Idaho Alternative*:

*The State recognizes that any attempt to map sage-grouse habitat must, by necessity, be at a broad, programmatic scale. The mapping of boundaries presented above is not intended to equate to verified boundary locations or on-the-ground habitat types from which the public can determine with certainty whether any particular location is inside or outside of a particular management zone.*

*Rather, the mapping exercise is intended to give governmental entities, land managers, project proponents and the public a general idea of where certain types of habitat and conservation priorities are spatially located as of the date of the map. The State also recognizes that this mapping exercising depicting current habitat for the species is not static, and any map must be verified through site-specific environmental analysis.*

As described in the *Idaho Alternative*, additional lands beyond the identification thresholds have "been included in the CHZ to consolidate key breeding areas, to include wilderness areas and lands within national monuments, and to foster population connectivity with neighboring states." The IHZ similarly includes "areas of value for migration corridors, connectivity among breeding areas, and long-term persistence of each of the two key meta-populations of sage-grouse in Idaho." By default of the broad scale mapping exercise, both the CHZ and IHZ also include some areas that are neither sage-grouse habitat nor connectivity corridors.

The *Idaho Alternative* lists specific vegetation criteria to be considered for livestock grazing management on federal lands.

*Grazing within the CHZ and IHZ will be managed according to the process outlined in the text below. The first step, and perhaps the most important, is to inform and educate affected permittees regarding sage-grouse habitat needs and conservation measures. These habitat needs or*

*characteristics outlined in Tables 3-5 will be incorporated into relevant resource management plans as the desired conditions with the understanding that these desired conditions may not be achievable: (a) due to the existing ecological condition, ecological potential or the existing vegetation; or (b) due to casual events unrelated to existing livestock grazing.*

The IDL Range Management/Livestock Grazing measures do not include the vegetative criteria recommended for grazing on federal lands. The IDL livestock grazing component is from the previously vetted and approved 2006 Conservation Plan for the Greater Sage-grouse in Idaho (“2006 Idaho Plan”), and as detailed in Section 16 below.

The *Idaho Alternative* uses a *Core, Important, and General* habitat zone classification that is somewhat different from the BLM subregional alternative habitat classification of *Priority, Important, and General Habitat Management Areas* for Idaho. In addition to differences in habitat classifications there exist variations between on-the-ground habitat mapping in the *Idaho Alternative* and the BLM subregional Alternative. However, both Alternatives recognize the value of a three-tiered habitat approach which is essential to the functionality of the adaptive management process outlined in the *Idaho Alternative*. In 2014, the State of Idaho and the Idaho BLM came to final agreement of the sage-grouse habitat map for purposes of completion of the Final EIS for management actions on federal lands. The State and IDL both recognize the value of having a consistent classification across the sage-grouse landscape in Idaho, and IDL fully adopts the habitat map agreed upon by the State of Idaho and the Idaho BLM.

IDL will recognize any habitat management updates resulting from the five-year formal map review.

## **5. Adaptive Management**

### **5.a. Adaptive Management for Federal Lands**

The *Idaho Alternative* (September, 2012) Adaptive Management Triggers have been further refined and presented to the USFWS (Brian Kelly) in a letter from Governor Otter dated March 14, 2013. The trigger discussion has been copied from that letter, in part for reference:

*The adaptive triggers provide a regulatory backstop to prevent further loss and stabilize habitats and populations in the CHZ, and to a lesser extent in the IHZ, where a demonstrated significant loss has either occurred over time or unexpectedly (i.e., Murphy Complex Fire). These adaptive triggers are employed when dramatic shifts in population or habitat occurs based on an average over a three year period compared to 2011 values. Additionally, these adaptive triggers place the primary and secondary threats to the species in proper context to appropriately evaluate the cause(s) of the decline.*

*In addition to the below description, Idaho’s Alternative utilizes two types of triggers to help determine whether changes in management are necessary. The triggers are broken down into a “soft” trigger and a “hard” trigger. The “soft” trigger becomes operative when one of the following occurs:*

- *10% decline in maximum number of males counted and a finite rate of change below 1.0 but not significantly on CHZ over a period of three years; or*
- *10% loss of nesting and wintering habitat in the CHZ of a Conservation Area over a period of three years.*

When the monitoring information indicates that the “soft trigger” may be tripped, an Implementation Team – aided by the technical expertise of IDF&G – will assess the factor(s) leading to the decline and identify potential management actions. See Idaho Alternative at 7. The Implementation Team<sup>1</sup> may consider possible changes in management to the CHZ. As to the IHZ, the Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state’s ability to meet the overall management objective. It is anticipated IDF&G will collect data annually and will make recommendations to the Implementation Team by August 31<sup>st</sup> for population triggers and January 15<sup>th</sup> for habitat triggers. (Per D. Kemner, IDFG, IDFG will collect population data and the BLM will collect habitat data)<sup>2</sup>.

The “hard” trigger becomes operative when one of the following occurs:

- 20% loss in CHZ nesting and/or<sup>2</sup> wintering habitat over a period of three years; or
- 20% decline in maximum number of males counted and a finite rate of change significantly below 1 within a CHZ of a<sup>2</sup> Conservation Area over a period of three years.

If the hard trigger becomes operative according to the monitoring information, management changes are no longer discretionary and will be implemented in the following manner:

First, the IHZ will be managed according to the CHZ provisions primarily impacting the ability to consider infrastructure projects. Like the “soft trigger,” the Implementation Team will analyze the actual cause(s) of the decline. The flow chart (Appendix II of letter is titled Adaptive Trigger Strategy- Determine What Caused a Hard Trigger to Become Operative and What Management Actions are Necessary) illustrates the process used to determine which threat(s) caused the habitat or population loss.

As the illustration denotes, the Service identified wildfire, invasive species, and infrastructure as the primary threats and West Nile Virus, improperly managed grazing, and recreation as secondary threats. This adaptive trigger strategy focuses the analysis on mitigating the primary threats to the

---

<sup>1</sup> Excerpted from the clarification letter sent to Steve Ellis, Idaho State Director, BLM from Dustin Miller, Administrator, Governor’s Office of Species Conservation dated July 1, 2013:

As part of the state’s responsibility under the MOU, Governor Otter would issue an Executive Order (under state law, an EO has the force and effect of law) establishing an Implementation Task Force to meet the state’s role and responsibilities under the MOU. This task force would be similar in composition to Governor Otter’s Sage-Grouse Task Force pursuant to Executive Order 2012-02.

The Implementation Task Force would be tasked with providing Governor Otter advice and counsel on at least the following issues: (1) analyzing the annual sage-grouse monitoring data to determine whether an adaptive response is appropriate and necessary given the population and habitat objectives provided in the Governor’s Alternative; (2) providing input during the National Environmental Policy Act (NEPA) process for on-the-ground infrastructure projects; and (3) prioritizing habitat restoration opportunities. The Implementation Task Force would submit these recommendations to the Governor, and based on his review and concurrence, will transmit these recommendation to the appropriate agency as part of the underlying NEPA analysis. The ultimate decision involving public land management would fall to the appropriate agency.

The Implementation Task Force will make recommendations based on the data and recommendations provided by a science subcommittee led by the Idaho Department of Fish and Game (IDFG). The Implementation Task Force may solicit outside experts if necessary.

<sup>2</sup> Personal communication with Don Kemner, Idaho Fish and Game, April 11, 2015 correcting and clarifying items in letter that were refined for the DEIS.

species in the CHZ. Only where the monitoring information indicates the cause(s) of the decline is not a primary threat will the Implementation Team analyze the secondary threats to the species and determine whether further management actions are needed.

Population and habitat objectives are measured against baselines are illustrated in the tables below. The baseline for habitat within each CA is the 2011 nesting and wintering habitat for the CHZ and IHZ. (See Tables 1 and 2, *Idaho Alternative*, 2012.) The population baseline is the maximum number of males counted on lek routes in 2011 within the CHZ and the average finite rate of change of population for 2009-2011 within the CHZ. It is measured the same way in IHZ. CHZ and IHZ triggers are analyzed separately. The habitat triggers are also analyzed separately from the population triggers.

## **5.b. Adaptive Management for Endowment Lands**

While IDL recognizes that the soft and hard triggers would become operative across the landscape in a conservation area, regardless of land ownership, the appropriate response to address a soft or hard trigger tripping will only take place on federal land according to the *Idaho Alternative*. However, if the Implementation Team determines the causal factors are applicable to IDL managed land, IDL commits to implementing CMs tailored to meet the identified causal factor. These would likely be implemented immediately under an emergency action clause pending IDL Director approval. However, any CM to be implemented long-term that is a major deviation from the Land Board's Plan would need to be approved by the Land Board as an amendment to the Plan.

IDL will also utilize monitoring results to make any recommendations to the Land Board for their consideration as amendments to the Plan.

## **6. Anthropogenic Disturbance**

Impacts caused by anthropogenic disturbances on sage-grouse can vary depending on the type of activity and local habitat conditions. In addition, cumulative impacts of multiple activities can have significant, negative impacts on sage-grouse populations. In the *Administrative Draft Proposed Plan*, the BLM utilizes a 3 percent disturbance limit across all landowners within eight Biologically Significant Unit areas. Because endowment lands make up such a small percentage of Core and Important Habitat Zones, IDL will not place a disturbance limit within any defined areas on endowment lands since these limits would result in a violation of the fiduciary trust responsibilities bestowed on the Land Board and IDL in managing endowment lands in accordance with the Constitutional mandate.

## **7. Mitigation**

At this time, the State of Idaho has not finalized a mitigation plan, nor have there been funding sources identified or allocated to implement such a mitigation plan. Idaho's proposed mitigation plan is described in the "Framework for Mitigation of Impacts from Infrastructure Projects on Sage-Grouse and Their Habitats" (Sage-Grouse Mitigation Subcommittee of the Idaho Sage-Grouse Advisory Committee, December 2010).

IDL will commit to following Idaho’s mitigation plan once fully developed to the extent adequate funding exists.

## Plan Format

The Plan format uses two PARTS. PART I presents the CMs IDL will implement in its authorizing documents (e.g. leases) for third party activities on endowment lands. In addition, PART I identifies activities to be undertaken by IDL as the land manager related to fire prevention, wildfire suppression, and land transactions (e.g. land exchanges).

PART II presents the CMs IDL will recommend as voluntary best management practices for mining operators and oil and gas operators on non-state lands. In addition, PART II identifies activities to be undertaken by IDL under its statutory roles regarding fire prevention, wildfire suppression, and abandoned mine land reclamation.

Each Part then follows the numbered headings used in the BLM *Administrative Draft Proposed Plan* as an organizational outline and reader courtesy.

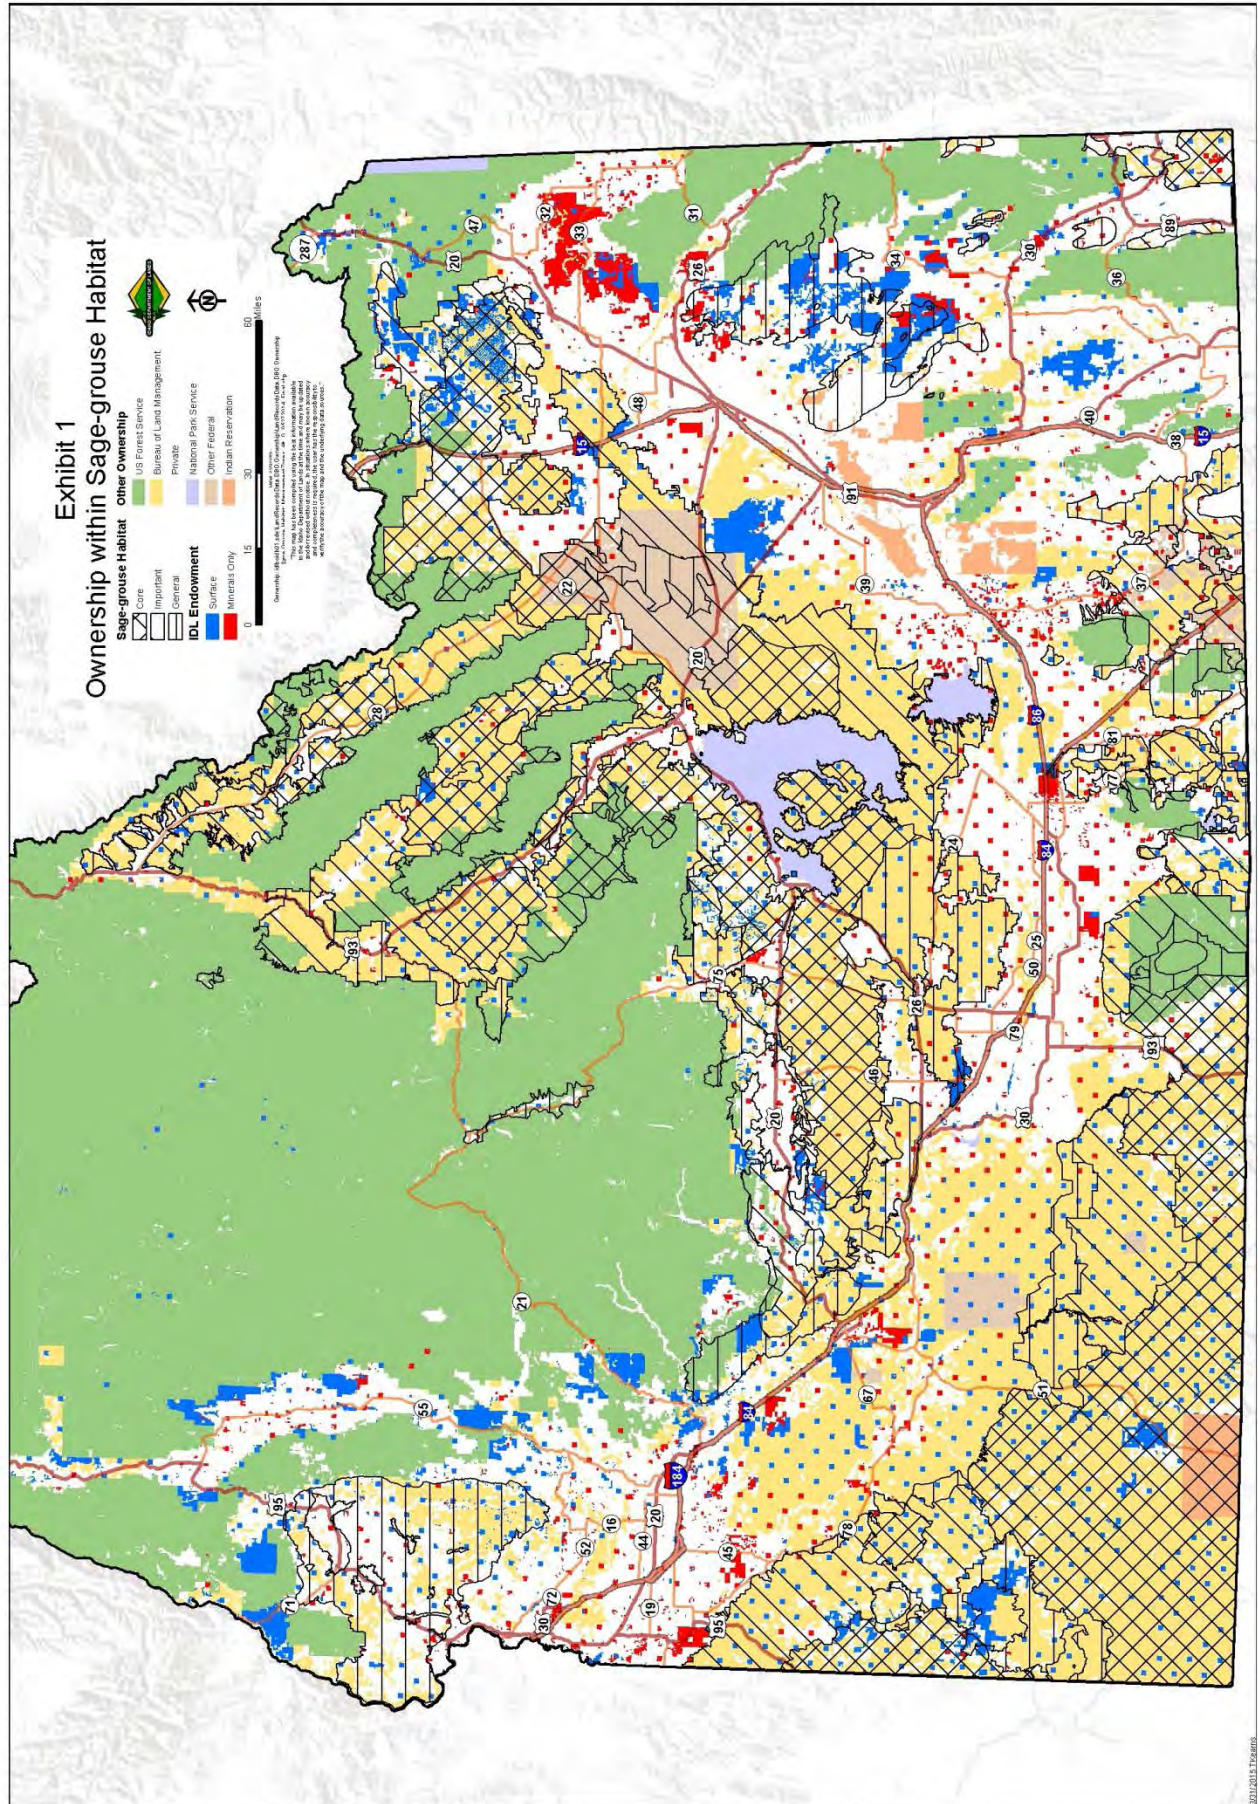

**TABLE 1.1 IDL Ownership within Sage-grouse Habitat by Conservation Area and Habitat Zones**

Conservation Area	Habitat Zone	Total Acres All Owners	Total IDL Ownership		IDL Surface Ownership		IDL Minerals Ownership Only	
		Acres	Acres	%	Acres	%	Acres	%
Idaho Desert	Core	1,017,180	31,702	3.12	29,853	2.93	1,849	0.18
	Important	1,064,653	43,510	4.09	38,710	3.64	4,800	0.45
	Total	2,081,833	75,212	3.61	68,563	3.29	6,649	0.32
Idaho Mountain Valleys	Core	2,110,685	177,006	8.39	164,286	7.78	12,720	0.60
	Important	1,602,894	135,004	8.42	120,881	7.54	14,124	0.88
	Total	3,713,578	312,010	8.40	285,166	7.68	26,844	0.72
Idaho Southern	Core	856,442	47,207	5.51	38,352	4.48	8,855	1.03
	Important	1,225,756	70,727	5.77	51,073	4.17	19,654	1.60
	Total	2,082,198	117,934	5.66	89,425	4.29	28,509	1.37
Idaho West Owyhee	Core	2,034,057	133,498	6.56	130,801	6.43	2,697	0.13
	Important	609,354	50,345	8.26	45,616	7.49	4,729	0.78
	Total	2,643,412	183,843	6.95	176,417	6.67	7,425	0.28
All Conservation Areas	CHZ and IHZ	10,521,022	688,999	6.55	619,571	5.89	69,428	0.66

## **Exhibit 1**

### **Ownership by Sage-Grouse Habitat Zone**

## **PART I. CONSERVATION MEASURES FOR ACTIVITIES ON STATE ENDOWMENT TRUST LANDS**

For proposed activities by third parties on endowment lands in Core and Important Habitat Zones, IDL will implement CMs as enforceable stipulations in authorizing documents such as leases, permits and easements. The authorized activities include: alternative energy development (solar, wind, and geothermal); oil and gas exploration and development; mining; grazing; miscellaneous commercial activities; and the granting of access through rights-of-way, including easements.

Also, IDL as the land manager will implement and support fire prevention and mitigation measures and wildfire suppression efforts to conserve sage-grouse habitat. In addition, IDL will include an analysis of sage-grouse habitat impacts when considering land transactions that are located in Core or Important Habitat Zones.

Because of the diversity of terrain and vegetation types within the sage-grouse region of Idaho, it is difficult to design a “one size fits all” set of CMs. Science and technology also change over time, and new options or alternatives may be proposed as part of a site-specific management plan. Site-specific management plans submitted by applicants or lessees must provide equal or better results than the CMs described below. Site-specific management plans will be reviewed and approved by the appropriate IDL staff. When anticipated results are uncertain, IDL will confer with the Idaho Department of Fish and Game (IDFG) prior to approving any site-specific management plan.

### **8. Fire Prevention on Endowment Land**

IDL is committed to conserving habitat for the sage-grouse in Idaho, which is under threat from the invasion of annual grasses and the loss of habitat from fire. IDL has developed wildfire preparedness and prevention measures that are complementary with the January 5, 2015 U.S. Department of Interior, Secretary of Interior Order Number 3336. The Order from Secretary Jewell sets forth enhanced policies and strategies for preventing and suppressing rangeland fire and for restoring sagebrush landscapes impacted by fire across the West.

In Idaho, there are 619,571 acres of endowment lands located within Core and Important Habitat Zones. These lands contain about 82,000 Animal Unit Months (AUMs) of leased forage. As a primary threat wildland fire has the potential to significantly impact endowment rangelands located in Core and Important Habitat Zones. Between 2009 and 2014, more than 19,000 acres of Core and Important sage-grouse habitat burned on endowment rangelands due to wildland fire. Based on historical averages, approximately 3,200 acres of endowment rangelands are expected to burn each year within Core and Important Habitat Zones with significant impacts to grazing lessees and endowment beneficiaries.

During the 2014 fire season, 2,957 acres of Core Habitat Zone burned on endowment rangelands making 470 AUMs of livestock forage unavailable for one to two years. In 2014, Core habitat restoration costs on 2,088 acres of those endowment lands totaled nearly \$45,000. Left unaddressed, the primary threat of wildland fire within Core and Important Habitat Zones on endowment rangelands is expected to continue at the same rate.

The following CMs will be incorporated as stipulations for any authorizing documents, (except livestock grazing which is addressed separately under item 16), issued within Core and Important sage-grouse habitat:

**8.1.** Authorized parties will be required to develop and be prepared to implement a fire prevention and an emergency response plan that covers all aspects of operations, which will include: coordination with local jurisdictions, such as the cities, counties, landowners, IDL, RFPAs, and federal land management agencies; emergency contact numbers and information, including 911 and local fire dispatch centers; and fire prevention and safety procedures that will include evacuation routes and procedures, the designated safety meeting place, and emergency shutdown procedures.

**8.2.** Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.

**8.3.** Authorized parties will ensure that field personnel are aware of:

- a. fire prevention and emergency response plan,
- b. evacuation routes and procedures,
- c. designated safety meeting places, and
- d. emergency shutdown procedures.

**8.4.** Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

## **9. Wildfire Suppression on Endowment Land**

Appendix C outlines how wildfire protection responsibilities are organized in Idaho, and how Idaho funds its fire program, particularly suppression costs for fires that burn on lands protected by the State of Idaho (IDL and two timber protective associations). Exhibit 2 displays the IDL, federal, and active and proposed rangeland fire protection association boundaries within the sage-grouse landscape.

IDL is committed to conserving habitat for sage-grouse in Idaho, which is under threat from the invasion of annual grasses and the loss of habitat from fire. IDL has developed wildfire suppression guidance that is complementary with the January 5, 2015 U.S. Department of Interior, Secretary of Interior Order Number 3336. The Order from Secretary Jewell sets forth enhanced policies and strategies for suppressing rangeland fire and for restoring sagebrush landscapes impacted by fire across the West.

None of the IDL forest protective districts have suppression responsibilities within any currently identified Core or Important Habitat Zones. Likewise, as of December 2014, none of the IDL forest protective districts have suppression responsibilities within any currently identified General habitat zone.

## Exhibit 2

### Sage-Grouse Habitat Zone and Fire Protection

When IDL fire suppression resources are dispatched as a cooperating agency to another agency's incident within sage-grouse habitat, the resources will utilize that agency's BMPs as applicable for sage-grouse habitat and as instructed in the dispatched resource's briefing. Interagency cooperation suppression activities are assumed to follow the prioritization associated with the BLM/U.S. Forest Service Fire and Invasive Assessment Team (BLM/FS FIAT) plans. For extended attack fires involving endowment rangelands, in or near Core or Important Habitat Zones:

**9.1.** IDL may assign a Resource Advisor (primarily a Resource Specialist-Range) to provide local information regarding sage-grouse habitat during the in-brief and continually throughout the incident. The Resource Advisor will also be engaged with the incident to assess sage-grouse habitat that may be affected by the fire or suppression activities.

## **10. Fuels Management on Endowment Land**

Wildfires in a rangeland ecosystem can grow quickly and affect hundreds of thousands of acres of sage-grouse habitat in a matter of days or within a single burning period. Due to rapid fire spread, the potentially long response times due to remoteness, and limited sites for firefighters to establish safe anchor points to engage wildfires in some of these areas, these fires can be difficult to manage. Additionally, only one of the three legs of the fire triangle (fuel, oxygen, and heat) can be modified, which is fuel, making fuels management key in wildfire control in sage-grouse habitat.

**10.1.** Unless otherwise specified as part of a land use plan, IDL will consider the full array of fuels management treatment types (prescribed fire, mechanical, chemical, and biological) when implementing CMs and BMPs on endowment rangelands.

**10.2.** Where applicable IDL will design fuels treatment objectives on endowment rangelands to protect existing Core and Important Habitat Zones, modify fire behavior, restore native plants, and create landscape patterns to benefit sage-grouse habitat, as resources permit and consistent with the BLM/FS FIAT plans .

**10.3.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to use proper livestock management and targeted grazing as a treatment to reduce vegetative fire fuels, reduce annual grass densities, and to enhance and protect Core and Important Habitat Zones.

**10.4.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically remove standing and encroaching conifer near sage-grouse leks, nesting, wintering and brood-rearing habitat, as resources permit. Examples of IDL cooperative efforts include:

- a. *Bruneau-Owyhee Sage-Grouse Habitat Project (Federal Register- NOI, 01/20/2015)*
- b. *Burley Interagency Landscape Sage-Grouse Habitat Restoration Project*

**10.5.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically implement brush management treatments and rehabilitate annual grasslands to reduce vegetative fire fuels within and to protect Core and Important Habitat Zones, as resources permit.

**10.6.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically establish green and brown strip fuel breaks along existing roads and other disturbances; identify and target higher-risk roads for fuel break construction and maintenance based on fire history maps; and use properly managed and targeted livestock grazing to create fuel break patterns that protect Core and Important Habitat Zones. Fuel breaks to include annual monitoring and maintenance. Examples of IDL cooperative efforts include:

- a. *Tri-State Interagency Fuel Break Project (Federal Register-NOI, 2015)*
- b. *Paradigm Fuel Break Project (BLM Draft EA, 01/24/2014)*
- c. *Jarbidge Fuel Breaks Project (DOI-BLM-ID-T010-2011-0006-EA)*

**10.7.** IDL will authorize private, state and federal contractor fuel break construction across IDL managed land.

**10.8.** IDL will prioritize fuel management treatments within Key Areas (large contiguous blocks of endowment land within Core and Important habitat that USFWS has identified as a priority for conservation efforts). Fuel management treatments within Key Areas will incorporate sage-grouse seasonal habitat guidelines as presented in Tables 3-5 *Idaho Alternative* (developed from Connelly et al. 2000). When habitat parameters are uncertain or in doubt, IDL will confer with IDFG prior to conducting any fuel management treatments within the Key Areas.

## **11. Wildfire Restoration and Rehabilitation on Endowment Land**

Wildfire restoration/rehabilitation is essential for conserving sage-grouse habitat. The increasing frequency and intensity of rangeland fire poses a significant threat to habitat as well as increasing opportunity for the accelerated invasion of non-native annual grasses, in particular cheatgrass and medusahead rye, and the spread of pinyon-juniper across the sagebrush-steppe ecosystem. By quickly taking action to restore/rehabilitate following wildfire, this opportunity is decreased as we increase the likelihood of desired vegetation reestablishing.

**11.1.** IDL will form partnerships, agreements, and cooperate with lessees, working groups, and other federal, state, county and private partners in post-fire restoration treatments of Core and Important Habitat Zones on state endowment trust rangelands damaged by fire. Restoration and rehabilitation efforts will be consistent with the BLM/FS FIAT plans.

- a. *BLM/IDFG/IDL Rangeland Rehabilitation MOU (Final MOU 02/2015)*

**11.2** IDL will prioritize fire restoration/rehabilitation treatments within Key Areas. Fire restoration/rehabilitation treatments within Key Areas will incorporate sage-grouse seasonal habitat guidelines as presented in Tables 3-5 *Idaho Alternative* (developed from

Connelly et al. 2000). When habitat parameters are uncertain or in doubt, IDL will confer with IDFG prior to conducting any fire restoration/rehabilitation treatments within the Key Areas.

## **12. Habitat Restoration and Vegetation Management on Endowment Land**

**12.1.** As resources permit, IDL will give high priority to vegetation restoration, rehabilitation or manipulation projects in Core and Important habitat within the Key Areas first, followed by those areas not within the Key Areas, consistent with the BLM/FS FIAT plans that include:

- a. Cooperative efforts that may improve Core and Important Habitat Zones over multiple ownerships.
- b. Projects that may provide connectivity between suitable habitats or expand existing good quality habitat within Core and Important Habitat Zones on endowment rangelands.
- c. Sites where environmental variables contribute to improved chances for project success.
- d. Projects that address conifer encroachment within Core and Important Habitat Zones. Priority for treatment as Phase 1 (<10 percent conifer cover), Phase 2 (10-30 percent), and Phase 3 (>30 percent).
- e. Where desirable perennial bunchgrasses and/or forbs are deficient in existing sagebrush stands, use appropriate mechanical, aerial, or other techniques to re-establish desired species.
- f. Re-establish sagebrush cover on recently burned native areas within suitable Core and Important Habitat Zones, with consideration to endowment rangeland forage productivity, local needs and conditions.

**12.2.** Assess existing on-site vegetation to ascertain if enough desirable perennial vegetation exists to consider techniques to increase on-site seed production to facilitate an increase in density of desired species.

**12.3.** Use available plant species based on their adaptation to the site when developing seed mixes.

**12.4.** Use post-treatment control to reduce annual grass densities, invasive and noxious weed competition through targeted livestock grazing and herbicide applications.

**12.5.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically remove standing and encroaching conifer near sage-grouse leks, nesting, wintering and brood-rearing habitat, as resources permit.

- a. *Bruneau-Owyhee Sage-Grouse Habitat Project (Federal Register- NOI, 01/20/2015)*
- b. *Burley Interagency Landscape Sage-Grouse Habitat Restoration Project*

**12.6** IDL will prioritize habitat restoration treatments within Key Areas. Habitat restoration treatments within Key Areas will incorporate sage-grouse seasonal habitat

guidelines as presented in Tables 3-5 *Idaho Alternative* (developed from Connelly et al. 2000). When habitat parameters are uncertain or in doubt, IDL will confer with IDFG prior to conducting any habitat restoration treatments within the Key Areas.

### **13. Invasive Plant Species on Endowment Land**

Exotic annual grasses and other invasive plants alter habitat suitability for sage-grouse by reducing or eliminating native forbs and grasses essential for food and cover. Exotic annual grasses, in particular cheatgrass and medusahead rye, also facilitate an increase in mean fire frequency. For endowment lands, the following CMs for invasive plant species will be applied through lease stipulations or other recordable instrument stipulations.

**13.1.** Vehicles and equipment operated by IDL or lessees that will travel off approved /designated transportation routes will be inspected and cleaned of seeds and propagules to prevent the spread of invasive and noxious plant species.

**13.2.** Through a cooperative effort, invasive and noxious plant species will be inventoried and monitored pre-disturbance and throughout the life of the project by the lessee and the lessor or a designated agent.

**13.3.** Reclamation activities will include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) will be certified weed free by the appropriate federal or State of Idaho agency.

**13.4.** Authorized parties will use BMPs and appropriate treatments including chemical, mechanical and biological to treat invasive and state listed noxious plant species. When regulated chemicals are determined to be the best treatment, authorized parties will use Idaho licensed professional applicators to treat noxious plant species with the approved and properly documented herbicide. Weeds will be treated promptly when located on a project site.

### **14. Infrastructure Development / Lands and Realty on Endowment Land**

The *Idaho Alternative* defines “infrastructure”:

*... as discrete, large-scale anthropogenic features, including highways, high voltage transmission lines, commercial wind projects, energy development (e.g., oil and gas development, geothermal wells, airports, mines, cell phone towers, landfills, residential and commercial subdivisions, etc.)*

*Infrastructure related to small-scale ranch, home and farm businesses (e.g., stock ponds, fences, range improvements) do not fall within this definition. These issues are not included within this definition, and are addressed in other sections of the Alternative or through local resource management plans.*

Infrastructure development on endowment lands can vary from minor road or fencing construction to utility-scale renewable energy facilities including wind farms, geothermal power plants, and

solar power plants. These developments regardless of their size can have a measurable and substantial impact on sage-grouse and their habitat. All infrastructure developments require some form of road construction to deliver materials for construction and perform regular maintenance to facilities. These roads are often graded gravel roads and are maintained periodically for easy access to sites. Other smaller roads are developed for access to geothermal well pads, wind turbines, or pipelines. Roads may also be necessary for third-party access to private or federal lands.

Transmission lines must be built in order to harness power from wind turbines, geothermal sites, or solar sites and to provide for grid reliability. Additionally, fences are often erected to protect facilities such as turbines or substations from vandalism. These features all have the potential to directly, or indirectly, affect sage-grouse at multiple scales and over time.

The potential for renewable energy development to occur on endowment lands located in Core and Important Habitat Zones is very low. However, any proposed development will be required to comply with the CMs identified in the following sections. These same CMs will also be included as stipulations in rights-of-way, when IDL authorizes parties to access other lands by using endowment lands.

#### **14.1. Surface Use and Timing**

**14.1.1.** Controlled surface use and timing limitations as described below will be applied within Core and Important Habitat Zones, unless species occupancy and distribution determined by the IDFG recommends otherwise.

**14.1.2.** No surface occupancy is allowed within 1 km (0.62 mi.) of an occupied lek in the designated Core and Important Habitat Zones. Livestock grazing is not considered surface occupancy.

**14.1.3.** During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000-foot elevation may be used as a general distinction.

**14.1.4.** Major construction and maintenance activity shall be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

#### **14.2. Noise**

Limit noise levels from discretionary activities within Core and Important Habitat Zones to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from two hours before sunset to two hours after sunrise during breeding season. Ambient noise levels will be determined by measurements taken at the perimeter of an occupied lek at sunrise.

### **14.3. Fencing**

Findings from Stevens et al. 2012 show that sage-grouse collisions are highly variable spatially, and targeting efforts for fence marking is more strategic and cost-effective. Analysis revealed that terrain ruggedness and distance from the lek were primary factors associated with fence collision risk across the landscape. Use Natural Resource Conservation Service (NRCS) fence collision data and local knowledge to determine low, medium or high risk level around occupied leks. Fence segments within Key Areas will be the first priority.

**14.3.1.** New and existing wire fence segments constructed by authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011).

Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.

**14.3.2.** As necessary and feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important Habitat Zones.

### **14.4. Water Supply Structures**

**14.4.1.** New or modified spring developments (including pipelines) shall be designed by authorized parties to maintain or enhance the free-flowing characteristics of springs and wet meadows, which will help maintain continuity of the pre-developed riparian areas.

**14.4.2.** As an exception to 14.4.4.1., on projects requiring water to be pumped such as solar, hydro or fossil fuel operation, floated tanks will be allowed to conserve water resources and efforts will be made by the lessee to treat these tanks for mosquito species that carry West Nile Virus.

**14.4.3** The construction of new ponds or reservoirs by authorized parties will be minimized, except as needed to meet important resource management or restoration objectives, to reduce the potential impact from West Nile Virus on sage-grouse.

**14.4.4.** Wildlife escape ramps in new and existing water troughs and open-water storage tanks shall be installed and maintained to facilitate the use of and escape by wildlife.

### **14.5. Constructed Improvements**

**14.5.1.** Construction methods will be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.

**14.5.2.** Infrastructure will be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed for access to facilities. Requirements from public utilities will be followed for all installations

**14.5.3.** Surface disturbances will be clustered in order to limit surface occupancy.

**14.5.4.** New utility developments and transportation routes will be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.

**14.5.5.** Use best available science in concurrence with IDFG to address concerns of towers and other elevated structures as perches for predatory or corvid birds.

**14.5.6.** New structures with a height over five feet will not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built, or presently exist, the lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.

**14.5.7.** Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

**14.6. Site Reclamation** (non-fire related rehabilitation/reclamation)

**14.6.1.** Site reclamation will be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.

**14.6.2.** Reclamation activities and plans will consider the ecological site potential. The goal of the reclamation will be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.

**14.6.3.** Sites will be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

## **Transition Lands/Land Tenure**

IDL considers opportunities to sell, purchase, develop, or exchange endowment lands to meet its constitutional mandate to maximize long term returns to the owning beneficiaries by diversifying land holdings, maximizing the rate of return to the trusts, improving public access to endowment lands, and consolidating endowment lands for more efficient management. In order to accomplish these objectives, IDL must be able to maintain the flexibility to move lands into and out of the identified habitat zones. Lands identified for potential ownership changes are termed “transition lands.”

The ultimate decision authority for determining to auction or exchange endowment lands lies with the Land Board. IDL commits to providing the Land Board relevant data and analysis to inform them on potential impacts to sage-grouse habitat of land transitions within Core or Important sage-grouse Habitat Zones through the following CMs.

**14.7.** Any tract proposed for sale or exchange within Core or Important Habitat Zones will include an analysis on the impact to sage-grouse habitat resulting from the transition. This analysis will include, but not limited to:

- Acres in and percentages of Core and Important Habitat Zones.
- Quality/type of habitat (number of leks, breeding, nesting, early brood rearing, summer/late brood rearing, fall, winter).
- Any knowledge of new owner’s implementation/commitment for sage-grouse conservation measures to estimate overall impact to sage-grouse habitat conservation.
- IDFG data and review comments.

## **14.8 BLM Land Exchanges**

IDL adopts a general strategy aimed at reducing endowment ownership of Key Habitat within Core Habitat Zones through completion of land exchanges with the BLM. This strategy would provide the greatest levels of certainty for conservation of core sage-grouse habitat.

Once endowment lands have been proposed to be included in a formal land exchange with the submission and acceptance of an Agreement to Initiate (ATI) with the BLM, the IDL, with Land Board concurrence, would commit to up to a three-year deferral on leasing of those lands for mineral development in order to accomplish the exchange.

Key habitat areas within Core Habitat Zones within the endowment trust estate would be prioritized for exchange. In exchange for those endowment lands, IDL would prioritize BLM lands and/or minerals with the following characteristics for acquisition consistent with its duty to maximize revenue over the long term in accordance with Article IX, Section 8 of the Idaho Constitution: 1) lands and minerals located outside of Core and Important Habitat Zones, 2) lands with oil and gas resource development potential, 3) lands with non-native vegetation (previously seeded crested wheatgrass), and 4) lands that block up existing IDL ownership, not necessarily limited to the current disposal lists in the respective Resource Management Plans.

Given the long timeframes that can be associated with federal land exchanges, IDL proposes that the Department of Interior consider adopting a streamlined exchange process, similar to authorities contained in the 2014 Farm Bill for the U.S. Department of Agriculture. Land exchanges that provide a net benefit to conservation of core sage grouse habitat, should be considered for a categorical exclusion under the National Environmental Policy Act (NEPA).

#### **14.9. Owyhee Land Exchange**

In December, 2008 the BLM and IDL entered into an Agreement to Initiate Land Exchange. IDL's objectives for parcel acquisition selection include: improved range (crested wheatgrass seedings), parcels outside Core or Important sage-grouse habitat or bighorn sheep habitat, parcels that block up current IDL ownership and/or provide legal access to existing ownership, and parcels that may have Higher and Better Use (HBU) potential. Objectives for disposition of IDL lands include: wholly within or adjacent to designated wilderness, scattered parcels with no legal access and no management control, other scattered IDL parcels within large blocks of BLM ownership. Acreage in the current version of the exchange includes approximately 28,000 acres of IDL ownership and 32,000 acres of BLM ownership. Parcels in the exchange are displayed in Appendix D.

**14.10** New acquisitions of endowment lands within the Core and Important Habitat Zones would be discouraged; however, if minor amounts of lands were acquired, they would be managed according to the IDL sage-grouse CMs.

### **15. Mineral Leasing on Endowment Land**

For all mineral leasing activities on endowment lands, CMs for the sage-grouse will be applied through lease stipulations or other recordable instrument stipulations that are enforceable. Mineral leasing can be slightly more complex due to the potential for split estate scenarios, where the surface owner is different than the mineral estate owner. In these cases, IDL would still include CMs as lease stipulations when leasing involves only the mineral estate (where the endowed beneficiary is not the surface owner).

#### **15.1. Fluid Mineral Leasing on Endowment Land**

Fluid minerals are resources of oil, natural gas (gas), and natural gas condensate. The first commercially-viable resources of gas were discovered in Payette County in 2010. Exploration activity is also located in adjacent counties to Payette County. Recent leasing in south central and southeast Idaho suggests exploration interests in these areas. Additional resource discoveries are possible in all of these areas. Presently, IDL has no exploration activities to regulate for fluid minerals located in Core or Important sage-grouse Habitat Zones.

The resources in Payette County were discovered with conventional drilling operations, which utilized vertical well bores that penetrated permeable gas accumulations within site-

specific gas traps. These types of deposits are termed conventional gas (or oil) resources. In contrast, unconventional resources are continuously-distributed oil or gas accumulations in fine-grained rocks, which generally cannot be exploited through conventional methods and techniques. Unconventional resources have not been identified in Idaho, but the potential for their discovery does exist. For endowment lands, the following oil and gas lease stipulations will be included in the lease document and advertised prior to lease auction on tracts within Core and Important Habitat Zones.

#### **15.1.1. Surface Use and Timing**

- a. Controlled surface use and timing limitations as described below will be applied within Core and Important Habitat Zones, unless species occupancy and distribution determined by IDFG recommends otherwise.
- b. No surface occupancy is allowed within 1 km (0.62 mi.) of an occupied lek in the designated Core and Important Habitat Zones.
- c. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000-foot elevation may be used as a general distinction.
- d. Major construction and maintenance activity will be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

#### **15.1.2. Noise**

Limit noise levels from discretionary activities within Core and Important Habitat Zones to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from two hours before sunset to two hours after sunrise during breeding season. Ambient noise levels will be determined by measurements taken at the perimeter of an occupied lek at sunrise.

#### **15.1.3. Fencing**

New and existing wire fence segments constructed by authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.

#### **15.1.4. Water Supply Structures**

Wildlife escape ramps in new and existing open-water storage tanks shall be installed and maintained to facilitate the use of and escape by wildlife.

#### **15.1.5. Constructed Improvements**

- a. Construction methods will be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- b. Infrastructure will be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, will be located along roads already in existence or required to be newly constructed for access to facilities.
- c. Surface disturbances will be clustered in order to limit surface occupancy.
- d. New utility developments and transportation routes will be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- e. Use best available science in concurrence with IDFG to address concerns of towers and other elevated structures as perches for predatory or corvid birds.
- f. New structures with a height over five feet will not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built, or presently exist, the lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- g. Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

#### **15.1.6. Site Reclamation for Leases**

- a. Site reclamation will be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- b. Reclamation activities and plans will consider the ecological site potential. The goal of the reclamation will be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- c. Sites will be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

## **15.2. Mining Activities on Endowment Lands**

Mineral leasing and any subsequent mining activities on state endowment trust lands require authorization and oversight by IDL. IDL uses written procedures, including mineral lease pre-auction inspections, quarterly or yearly mineral lease inspections, and mineral lease enforcement to ensure compliance by authorized parties. The following conservation measures will be incorporated into the IDL mineral leases that are in Core and Important sage-grouse Habitat Zones.

### **15.2.1. Surface Use and Timing**

- a. Controlled surface use and timing limitations as described below will be applied within Core and Important Habitat Zones, unless species occupancy and distribution determined by the Idaho Department of Fish and Game (IDFG) recommends otherwise.
- b. No surface occupancy is allowed within 1 km (0.62 mi.) of an occupied lek in the designated Core and Important Habitat Zones.
- c. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations, project activities will be avoided within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000-foot elevation may be used as a general distinction.
- d. Major construction and maintenance activity will be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

### **15.2.2. Noise**

Limit noise levels from discretionary activities within Core and Important Habitat Zones to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before sunset to 2 hours after sunrise during breeding season. Ambient noise levels will be determined by measurements taken at the perimeter of an occupied lek at sunrise.

### **15.2.3. Fencing**

New and existing wire fence segments constructed by authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.

#### **15.2.4. Water Supply Structures**

Wildlife escape ramps in new and existing open-water storage tanks shall be installed and maintained to facilitate the use of and escape by wildlife.

#### **15.2.5. Constructed Improvements**

- a. Construction methods will be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- b. Infrastructure will be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, will be located along roads already in existence or required to be newly constructed for access to facilities.
- c. Surface disturbances may be clustered in order to limit surface occupancy.
- d. New utility developments and transportation routes will be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- e. Use best available science in concurrence with IDFG to address concerns of towers and other elevated structures as perches for predatory or corvid birds.
- f. New structures with a height over five feet will not be constructed by authorized parties within 1km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within 3 km of breeding period habitats. If these structures must be built, or presently exist, the lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- g. Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

#### **15.2.6. Site Reclamation for Leases**

- a. Site reclamation will be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- b. Reclamation activities and plans will consider the ecological site potential. The goal of the reclamation will be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- c. Sites will be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

### **16. Range Management/Livestock Grazing on Endowment Land**

IDL recognizes that healthy rangelands provide a basic foundation for productive sage-grouse habitat. Conservation and improvement of sage-grouse habitat is consistent with long-term

grazing management systems that support conditions or trends toward healthy rangelands. Within the 2006 Conservation Plan for the Greater Sage-Grouse in Idaho (“2006 Idaho Plan”), IDL agreed to take measures that protect or improve important and critical wildlife habitat, subject to the fundamental mission of IDL to support endowment beneficiaries. Though the impact of livestock grazing to rangelands is recognized as a secondary threat to sage-grouse habitat in Idaho, roughly 619,571 surface acres or 44 percent of endowment rangelands are within Core and Important Habitat Zones. IDL identifies proper livestock grazing as a tool that could benefit sage-grouse habitats by taking into consideration flexibility and site-specific management opportunities.

Identified within the 2006 Idaho Plan, livestock management practices are not stand-alone actions. Management activities should be considered in combinations best characterized by a complete and effective grazing program and that also considers key sage-grouse conservation needs. IDL further recognizes that opportunities exist for state and federal agencies, grazing lessees and university researchers to collaborate on efforts to modify current conditions and needed management actions in terms of livestock grazing in sage-grouse habitats throughout southern Idaho. IDL will administer endowment rangelands and livestock grazing leases in Core and Important Habitat Zones with lease stipulations that are drawn from, in part, the CMs specified within the 2006 Idaho Plan as well as more recent IDFG recommendations.

Issue Addressed	Conservation Measure(s)
Livestock management and leks.	<ol style="list-style-type: none"> <li>1. Use lek route or other relevant information to identify leks where the placement of sheep camps, bed grounds, herding or related activities is repeatedly disturbing displaying birds on active leks. Dates of concern are from March 15 through May 1 in lower elevation with habitats and March 25 through May 15 in higher elevation habitats. Once such leks are identified, IDL will work closely with sheep ranchers, Local Working Groups and/or IDFG to identify mutually agreed upon alternative sites or herding routes that eliminate or reduce disturbance. In selecting such alternative sites/routes, focus on areas away from leks and that do not provide breeding habitat characteristics, where feasible. If such lek-specific CMs cannot be developed (due to time or logistical constraints), domestic sheep grazing activities described above will be avoided within the lesser of 1 km (0.62 mi) or direct line of sight of any such lek during the lekking periods.</li> <li>2. IDL will provide maps to lessees to ensure that sheep operators and herders are aware of the location of possible or occupied leks.</li> </ol>
Livestock management and late brood rearing habitat.	<ol style="list-style-type: none"> <li>1. Due to the preference of forbs by domestic sheep, manage sheep allotments using grazing management techniques that promote and maintain a diversity of desirable annual and perennial forbs. Suggestions include:               <ol style="list-style-type: none"> <li>A. Alternate or rotate areas for spring turnout.</li> <li>B. Promote light, once-over use of vegetation, as opposed to repeated use during the same season</li> </ol> </li> </ol>

Issue Addressed	Conservation Measure(s)
	<p>by the same band or successive bands of sheep.</p> <p>C. Ensure that permittees, foremen, herders and sheep camp tenders are informed of management and movement requirements, such as related to the avoidance of recent burns, burned area rehabilitation seedings or other restoration sites.</p> <p>D. Employ open (loose) herding of sheep as opposed to tightly bunched sheep.</p> <p>2. Manage grazing of riparian areas, meadows, springs, and seeps in a manner that promotes vegetation structure and composition appropriate to the site. In some cases enclosure fencing may be a viable option. However, in some cases, (e.g., enclosed meadows) the availability and quality of herbaceous species may be improved by periodic grazing use of enclosure and should be considered in the grazing management program.</p> <p>3. In agricultural fields where sage-grouse use has been documented or is likely, willing lessees may wish to avoid or limit use of alfalfa by livestock after the last cutting, to provide residual alfalfa for use by sage-grouse broods.</p>
Livestock management during periods of drought.	<p>1. In sage-grouse nesting and brood-rearing habitats, adjust livestock use (season, utilization, stocking, intensity, and/or duration) during drought to minimize the additional stress placed on herbaceous species. This is anticipated to reduce impacts on perennial herbaceous cover, plant species diversity and plant vigor. IDL will cooperate with lessees and federal partners as needed.</p> <p>2. IDL will continue to foster the coordination of drought management activities and outreach through the Idaho Rangeland Drought Task Force committee.</p>
Placement of salt and mineral supplements.	<p>1. When using salt or mineral supplements: a) place them in existing disturbed sites, areas with reduced sagebrush cover, seedings, or cheatgrass sites (for example) to reduce impacts to sage-grouse breeding habitat, b) where feasible, use salts or mineral supplements to improve management of livestock for the benefit of sage-grouse habitat.</p>
Placement of fences and other structures.	<p>1. Findings from Stevens et al. 2012 show that sage-grouse collisions are highly variable spatially, and targeting efforts for fence marking is more strategic and cost-effective. Analysis revealed that terrain ruggedness and distance from the lek were primary factors associated with fence collision risk across the landscape. Use Natural Resource Conservation Service (NRCS) fence collision data and local knowledge to determine low, medium or high risk level around occupied leks. Fence segments within Key Areas will be the first priority.</p> <p>2. New and existing wire fence segments constructed by</p>

Issue Addressed	Conservation Measure(s)
	<p>authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.</p> <p>3. Where feasible, IDL will recommend placement of new fences and structures with consideration of their impact on sage-grouse. In general, avoid constructing new fences within 1 km (0.62 mi) of occupied leks (adopted from Connelly et al. 2000b). Where feasible, place new, taller structures such as corrals, loading facilities, water storage tanks, windmills etc., as far as possible from occupied leks to reduce opportunities for perching raptors. Careful consideration, based on local conditions, will also be given to the placement of new fences or structures near other important seasonal habitats (winter-use areas, movement corridors etc.). In order to reduce potential impacts, fence markers will be used to mitigate mortality within areas identified by IDL, lessees or cooperative partners.</p>
Design and placement of water developments.	<p>1. IDL and lessees will cooperate on site-specific new spring developments in sage-grouse habitat. Spring developments will be designed to maintain or enhance the free-flowing characteristics of springs and wet meadows by the use of float valves on troughs or other features where feasible. Retrofit existing water developments during normal maintenance activities to maintain or enhance lentic, riparian properties and minimize annual maintenance.</p> <p>2. IDL and lessees will cooperate to ensure that new and existing livestock troughs and open water storage tanks are fitted with wildlife escape ramps/ladders to facilitate the use of and escape from troughs by sage-grouse and other wildlife. Floating boards or similar objects will not be used as these are too unstable and are ineffective. IDL and lessees will cooperate to ensure that USDA-NRCS design requirements for wildlife escape ramps are followed when installed.</p>

## 17. Wild Horses and Burros

No direct measures, this item included to maintain sequential numbering system utilized for the BLM *Administrative Draft Proposed Plan*.

## 18. Travel Management

**18.1.** On site traffic should be reduced by use of telemetry and other remote sensing tools.

**18.2.** During operations, existing roads or trails should be employed and activities should be contained as close to existing roads and trails as feasible.

**18.3.** Roads should be designed by authorized parties to an appropriate minimum standard necessary to accommodate their intended purpose.

**18.4.** Road crossings should be constructed by authorized parties at right angles to ephemeral drainages and stream crossings.

## **19. Recreation**

Recreation has been determined to not be a primary threat to sage-grouse in Idaho, but the measures listed above in Sections 13 and 14 will also apply to recreation leases.

## **20. Implementation and Monitoring**

Implementation of the CMs through lease/permit/easement stipulation will be incorporated into existing lease/permit/easement issuance procedures. A copy of the applicable CMs will be provided to all interested applicants for a lease, permit or easement on endowment lands located in Core or Important Habitat Zones, so the applicant is informed of the expected requirements when entering the application process. The CMs will be incorporated into the authorizing document either directly or by separate addendum. See Appendix B for IDL's DRAFT Implementation Plan.

Monitoring of CMs required through lease/permit/easement stipulation will be incorporated into existing lease/permit inspection procedures. Inspection forms will be amended to include a section for documenting that CMs were implemented and an assessment of their effectiveness. See Appendix E for IDL's DRAFT Monitoring Plan (not yet completed).

Procedures for land transactions will be amended to include an analysis of the impacts on sage-grouse when the transaction includes transition lands within Core or Important Habitat Zones. The results of this analysis will be included in the information provided to the Land Board for their review of the proposed transaction.

## **PART II. CONSERVATION MEASURES FOR IDL ACTIVITIES IN THE FIRE PROGRAM AND FOR REGULATED ACTIVITIES IN THE OIL & GAS AND MINERALS PROGRAMS**

For regulatory and assistance activities on private land, CMs will be voluntary BMPs because IDL does not have the statutory authority within its regulatory programs or assistance activities to require adoption by authorized parties. Regulatory and assistance activities include: abandoned mine lands projects; dredge and placer mine permitting; mine reclamation plan approvals; and oil and gas permits (e.g. seismic imaging surveys, well drilling). Where appropriate, IDL will include recommended BMPs within its authorizing documents to encourage compliance.

In addition, IDL has roles and responsibilities in its fire program where CMs will be implemented to address conservation of sage-grouse habitat in Core and Important Habitat Zones.

### **8. Wildfire Preparedness/Prevention**

IDL is committed to conserving habitat for the greater sage-grouse in Idaho, which is under threat from the invasion of annual grasses and the loss of habitat from fire. IDL has developed the following wildfire preparedness and prevention conservation measures that are complementary with the January 5, 2015 U.S. Department of Interior, Secretary of Interior Order Number 3336. The Order from Secretary Jewell sets forth enhanced policies and strategies for preventing and suppressing rangeland fire and for restoring sagebrush landscapes impacted by fire across the West.

**8.1.** IDL will continue to support the ongoing operations of taxing and non-taxing fire districts in Idaho, when requested and as available, through equipment acquired through the Federal Excess Personal Property (FEPP) program and Firefighter Property (FFP) program, and through Volunteer Fire Assistance (VFA) grant fund allocations.

**8.2.** IDL will continue to support the formation and ongoing operations of RFPAs through the IDL South Idaho Fire Program Liaison. This position is the point of contact for any needs or issues raised by RFPAs and their cooperators. The position coordinates information needs on an annual cycle as well as facilitating an annual meeting for all RFPA Board of Directors and their cooperators, held following fire season.

**8.3.** IDL will continue to support, as funding is available, the formation and operation of RFPAs through start-up funding that provides personal protective equipment, radios, firefighting equipment, and training materials.

**8.4.** IDL will continue to utilize burning permits (per Idaho Code 38-115, Rule IDAPA 20.04.01.060) during the designated closed fire season as a fire prevention and control tool. Burning permits acquaint the permit holder with the laws and requirements for safe burning. During times of critical fire hazard, all burning may be stopped by the suspension of burning permits. Closed fire season provides for public safety and the protection of land resources by ensuring that all burning operations which may occur during periods of high

fire danger are conducted under safe conditions and in such manner that the danger of uncontrolled fire spread is minimized.

**8.5.** IDL will continue to participate in the Idaho Fire Restrictions Plan (per Idaho Code 38-115, Rule IDAPA 20.04.01.060; IDAPA 20.04.01.070; IDAPA 20.04.01.090; and IDAPA 20.04.01.120), which is an interagency document that outlines coordination efforts regarding fire restrictions and closures. The purpose of fire restrictions is to reduce the risk of human-caused fires during unusually high fire danger and/or burning conditions. An interagency approach for initiating restrictions or closures helps provide consistency among the land management partners, while defining the restriction boundaries so they are easily distinguishable to the public.

## **9. Wildfire Suppression**

Appendix C outlines how wildfire protection responsibilities are organized in Idaho, and how Idaho funds its fire program, particularly suppression costs for fires that burn on lands protected by the State of Idaho (IDL and two timber protective associations).

None of the IDL forest protective districts have suppression responsibilities within any currently identified Core or Important Habitat Zones. Likewise, as of December 2014, none of the IDL forest protective districts have suppression responsibilities within any currently identified General habitat zone.

When IDL fire suppression resources are dispatched as a cooperating agency to another agency's incident within sage-grouse habitat, the resources will utilize that agency's BMPs as applicable for sage-grouse habitat and as instructed in the dispatched resource's briefing. Interagency cooperation suppression activities are assumed to follow the prioritization associated with the BLM/U.S. Forest Service Fire and Invasive Assessment Team (BLM/FS FIAT) plans.

## **10. Fuels Management**

IDL does not have general regulatory authority over fuels management on non-state rangelands.

## **11. Wildfire Restoration and Rehabilitation**

IDL does not have general regulatory authority over wildfire restoration and rehabilitation on non-state rangelands.

## **12. Habitat Restoration and Vegetation Management**

IDL has limited authority to regulate habitat restoration and vegetation management, but will address vegetation management through voluntary BMPs and permit stipulations. See section 15.

### **13. Invasive Plant Species**

IDL has limited authority to regulate invasive species, but will address invasive species management through voluntary BMPs and permit stipulations. See Section 15.

### **14. Infrastructure Development**

The *Idaho Alternative* defines “infrastructure”:

*... as discrete, large-scale anthropogenic features, including highways, high voltage transmission lines, commercial wind projects, energy development (e.g., oil and gas development, geothermal wells, airports, mines, cell phone towers, landfills, residential and commercial subdivisions, etc.)*

*Infrastructure related to small-scale ranch, home and farm businesses (e.g., stock ponds, fences, range improvements) do not fall within this definition. These issues are not included within this definition, and are addressed in other sections of the Alternative or through local resource management plans.*

Because of the diversity of terrain and vegetation types within the sage-grouse region of Idaho, it is difficult to design a “one size fits all” set of CMs. Science and technology also change over time, and new options or alternatives may be proposed as part of a site-specific management plan. Site-specific management plans submitted by authorized parties should provide equal or better results than the CMs described below. Site specific management plans will be reviewed by appropriate IDL staff and the IDFG prior to a final recommendation from IDL.

IDL has limited authority to regulate infrastructure development, but will address infrastructure development through voluntary BMPs and permit stipulations. See Section 15.

### **15. Minerals**

#### **15.1. Fluid Minerals**

Fluid minerals are resources of oil, natural gas (gas), and natural gas condensate. The first commercially-viable resources of gas were discovered in Payette County in 2010. Exploration activity is also located in adjacent counties to Payette County. Recent leasing in south central and southeast Idaho suggests exploration interests in these areas. Additional resource discoveries are possible in all of these areas. Presently, IDL has no exploration activities to regulate for fluid minerals located in Core or Important sage-grouse Habitat Zones.

The resources in Payette County were discovered with conventional drilling operations, which utilized vertical well bores that penetrated permeable gas accumulations within site-specific gas traps. These types of deposits are termed conventional gas (or oil) resources. In contrast, unconventional resources are continuously-distributed oil or gas accumulations in fine-grained rocks, which generally cannot be exploited through conventional methods

and techniques. Unconventional resources have not been identified in Idaho, but the potential for their discovery does exist.

### **15.1.2. Oil and Gas Activities – Regulatory Compliance**

The IDL is the administrative arm of the Idaho Oil and Gas Conservation Commission (Commission) pursuant to § 47-319(2) which states that the commission is authorized to; "...regulate the exploration for and production of oil and gas, prevent waste of oil and gas and to protect correlative rights, and otherwise to administer and enforce this act. It has jurisdiction over all persons and property necessary for such purposes. In the event of a conflict, the duty to prevent waste is paramount." Under this authority, § 47-321 provides for the commission to establish spacing units which are legally described boundaries overlaying the resource and set a fixed acreage per well, with the well located in the center of the boundary. § 47-321(b) states that these spacing units are established by the Commission in order to; "...result in the efficient and economical development of the pool as a whole..."

At this time for conventional drilling techniques, the default spacing, set by the Commission, is 640 acres for gas and 40 acres for oil. As surface use restrictions grow, the Commission could see requests to modify the default spacing unit in order to limit surface disturbance. As the Commission receives these requests, IDL will provide sage-grouse habitat data so that the Commission, if it chooses, can incorporate such information into its decision establishing a new spacing unit.

The BMPs listed below will be provided to all applicants seeking permit issuance for operations in Core or Important sage-grouse Habitat Zones. If they agree to voluntarily comply with some or all of the practices, those practices will be incorporated as a stipulation in the permit.

#### **15.1.2.1. Oil and Gas Activities**

The following BMPs will be provided to all operators making application to drill a well, treat a well, or conduct seismic explorations in Core or Important Habitat Zones.

##### **a. Wildfire Prevention**

- i. Authorized parties will be required to develop and be prepared to implement a fire prevention and an emergency response plan that covers all aspects of operations, which will include: coordination with local jurisdictions, such as the cities, counties, landowners, IDL, rangeland fire protection associations, and federal land management agencies; emergency contact numbers and information, including 911 and local fire dispatch centers; and fire prevention and safety procedures that will include evacuation routes and procedures, the designated safety meeting place, and emergency shutdown procedures.

- ii. Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.
- iii. Authorized parties will ensure that field personnel are aware of:
  - a. fire prevention and emergency response plan,
  - b. evacuation routes and procedures,
  - c. designated safety meeting places, and
  - d. emergency shutdown procedures.
- iv. Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

#### **b. Invasive Species**

- i. All vehicles and equipment that should travel off approved/designated transportation routes or will be utilized during operations will be cleaned before entry to prevent the spread of seeds and propagules. The equipment will also be cleaned at the conclusion of all field activities.
- ii. Through a cooperative effort, invasive and noxious plant species will be inventoried and monitored pre-disturbance and throughout the life of the project by IDL and the authorized party.
- iii. Reclamation activities should include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) should be certified weed free by the appropriate Federal or State of Idaho agency.
- iv. Authorized parties will use BMPs and appropriate treatments including chemical, mechanical and biological to treat invasive and state listed noxious plant species. When regulated chemicals are determined to be the best treatment, authorized parties will use Idaho licensed professional applicators to treat noxious plant species with the approved and properly documented herbicide. Weeds will be treated promptly when located on a project site.

#### **c. Surface Use and Timing**

- i. Conventional well activity and exploration will not be conducted within 0.62 miles of an occupied lek.

- ii. All pipelines and collector lines will be emplaced utilizing horizontal boring methods with a minimum setback of 0.62 miles of an occupied lek.
- iii. Construction of pipelines will be in accordance with seasonal stipulations regarding no operations or construction from March to July.
- iv. Planned pipeline maintenance will not be conducted between 6 p.m. to 8 a.m., except in an emergency situation, within 0.62 miles of an occupied lek during the breeding season.
- v. Compressor stations and other vital operations shall be placed a minimum of 0.62 miles from an occupied lek, unless screening or other mitigation is determined to be as protective.

**d. Noise**

- i. Noise from permitted well sites will not exceed a 65db daily average threshold during the lekking season, within 0.62 miles of an occupied lek.
- ii. Noise levels may be exceeded for emergency situations including well control, threats to freshwater resources, and other environmental safety concerns.

**e. Fencing**

- i. New and existing wire fence segments constructed by authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.
- ii. As necessary and feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important Habitat Zones.

**f. Constructed Improvements**

- i. Construction methods should be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.

- ii. Infrastructure should be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed for access to facilities.
- iii. Surface disturbances should be clustered in order to limit surface occupancy.
- iv. New utility developments and transportation routes should be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- v. Use best available science in concurrence with IDFG to address concerns of towers and other elevated structures as perches for predatory or corvid birds.
- vi. New structures with a height over five feet will not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built, or presently exist, the power lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- vii. Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

**g. Site Reclamation**

- i. Site reclamation should be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- ii. Reclamation activities and plans should consider the ecological site potential. The goal of the reclamation should be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- iii. Sites should be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

## 15.2. Abandoned Mine Lands Program

The Abandoned Mine Lands Program operates on private, federal, and state lands. IDL works with landowners to address safety closures of dangerous mine openings and reclaim areas to protect human health. Reclamation is also performed to improve water quality and wildlife habitat, but public safety projects take precedence. IDL develops and controls these projects, and can incorporate sage-grouse CMs into the projects. Abandoned mine land projects will implement the following BMPs within Core and Important sage-grouse Habitat Zones.

### a. Wildfire Prevention

- i. Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.
- ii. Authorized parties will ensure that field personnel are aware of:
  - a. fire prevention and emergency response plan,
  - b. evacuation routes and procedures,
  - c. designated safety meeting places, and
  - d. emergency shutdown procedures.
- iii. Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

### b. Invasive Species

- i. Vehicles and equipment operated by IDL or authorized parties that will travel off approved /designated transportation routes will be inspected and cleaned of seeds and propagules to prevent the spread of invasive and noxious plant species.
- ii. Weeds should be inventoried and monitored pre-disturbance by IDL, and throughout the life of the project.
- iii. Reclamation activities should include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) should be certified weed free by the appropriate federal or State of Idaho agency.
- iv. Authorized parties will use BMPs and appropriate treatments including chemical, mechanical and biological to treat invasive and state listed noxious plant species. When regulated chemicals are

determined to be the best treatment, authorized parties will use Idaho licensed professional applicators to treat noxious plant species with the approved and properly documented herbicide. Weeds will be treated promptly when located on a project site.

### **c. Surface Use and Timing**

- i. Controlled surface use and timing limitations should be applied within Core and Important Habitat Zones, unless species occupancy and distribution determined by IDFG recommends otherwise.
- ii. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000-foot elevation may be used as a general distinction.
- iii. Major construction and maintenance activity should be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

### **d. Noise**

Limit noise levels from discretionary activities within Core and Important Habitat Zones to no more than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from two hours before sunset to two hours after sunrise during breeding season. Ambient noise levels should be determined by measurements taken at the perimeter of an occupied lek at sunrise.

### **e. Fencing**

- i. New and existing wire fence segments constructed by authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.
- ii. As necessary and feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes

and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important Habitat Zones.

#### **f. Water Supply Structures**

- i. New or modified spring developments (including pipelines) should be designed by authorized parties to maintain or enhance the free-flowing characteristics of springs and wet meadows, which will help maintain continuity of the pre-developed riparian areas.
- ii. The construction of new ponds or reservoirs by authorized parties should be minimized, except as needed to meet important resource management or restoration objectives, to reduce the potential impact from West Nile Virus on sage-grouse. On projects requiring water to be pumped such as solar, hydro or fossil fuel operation, floated tanks will be allowed to conserve water resources and efforts will be made by the authorized parties to treat these tanks for mosquito species that carry West Nile Virus.
- iii. Wildlife escape ramps in new and existing water troughs and open-water storage tanks shall be installed and maintained to facilitate the use of and escape by wildlife.

#### **g. Constructed Improvements**

- i. Construction methods should be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- ii. Infrastructure should be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed for access to facilities. Requirements from public utilities will be followed for all installations.
- iii. Surface disturbances should be clustered in order to limit surface occupancy.
- iv. New utility developments and transportation routes should be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- v. Use best available science in concurrence with IDFG to address concerns of towers and other elevated structures as perches for predatory or corvid birds.

- vi. New structures with a height over five feet will not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built the power lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- vii. Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

#### **h. Site Reclamation**

- i. Site reclamation should be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- ii. Reclamation activities and plans should consider the ecological site potential. The goal of the reclamation should be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- iii. Sites should be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

### **15.3. Mining Regulatory Program**

The Mining Regulatory program operates on private, federal, and state lands and covers all dredge and placer mining and surface mining operations. Activities classified as exploration, such as drilling or trenching, only require a notification to IDL. Dredge and placer mining operations over ½ acres require a permit and bond. Surface mining operations that produce materials for immediate or ultimate sale require a reclamation plan and bond. Coordinated reviews with Idaho Department of Environmental Quality, Idaho Department of Water Resources, and IDFG are required for operations that may impact water quality.

The BMPs listed below will be provided to all applicants seeking reclamation plan approval or permit issuance for mining operations in Core or Important sage-grouse Habitat Zones. If they agree to voluntarily comply with some or all of the practices, those practices will be incorporated as a condition of reclamation plan or permit approval.

To further contribute to conservation of sage-grouse habitat, IDL will also coordinate with IDFG to evaluate existing mines and their potential impact on sage-grouse habitat. The following best management practices will be suggested to these mine operators. IDL will also work with IDFG to develop an informational brochure for new mine operators so they may consider adopting these BMPs into their proposed operations.

#### **a. Wildfire Prevention**

- i. Authorized parties will be required to develop and be prepared to implement a fire prevention and an emergency response plan that covers all aspects of operations, which will include: coordination with local jurisdictions, such as the cities, counties, landowners, IDL, rangeland fire protection associations, and federal land management agencies; emergency contact numbers and information, including 911 and local fire dispatch centers; and fire prevention and safety procedures that will include evacuation routes and procedures, the designated safety meeting place, and emergency shutdown procedures.
- ii. Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.
- iii. Authorized parties will ensure that field personnel are aware of:
  - a. fire prevention and emergency response plan,
  - b. evacuation routes and procedures,
  - c. designated safety meeting places, and
  - d. emergency shutdown procedures.
- iv. Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

#### **b. Invasive Species**

- i. Vehicles and equipment operated by IDL or authorized parties that will travel off approved/designated transportation routes will be inspected and cleaned of seeds and propagules to prevent the spread of invasive and noxious plant species.
- ii. Through a cooperative effort, invasive and noxious plant species will be inventoried and monitored pre-disturbance and throughout the life of the project by IDL and the authorized party.

- iii. Reclamation activities should include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) should be certified weed free by the appropriate federal or State of Idaho agency.
- iv. Authorized parties will use BMPs and appropriate treatments including chemical, mechanical and biological to treat invasive and state listed noxious plant species. When regulated chemicals are determined to be the best treatment, authorized parties will use Idaho licensed professional applicators to treat noxious plant species with the approved and properly documented herbicide. Weeds will be treated promptly when located on a project site.

**c. Surface Use and Timing**

- i. Controlled surface use and timing limitations should be applied within Core and Important Habitat Zones, unless species occupancy and distribution determined by IDFG recommends otherwise.
- ii. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000-foot elevation may be used as a general distinction.
- iii. Major construction and maintenance activity should be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

**d. Noise**

- i. Limit noise levels from discretionary activities within Core and Important Habitat Zones to no more than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from two hours before sunset to two hours after sunrise during breeding season. Ambient noise levels should be determined by measurements taken at the perimeter of an occupied lek at sunrise.
- ii. Authorized party will keep noise levels on existing infrastructure within the 0.62 mile buffer to 65 decibels or less.

#### **e. Fencing**

- i. New and existing wire fence segments constructed by authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.
- ii. As necessary and feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important Habitat Zones.

#### **f. Water Supply Structures**

- i. New or modified spring developments (including pipelines) should be designed by authorized parties to maintain or enhance the free-flowing characteristics of springs and wet meadows, which will help maintain continuity of the pre-developed riparian areas.
- ii. The construction of new ponds or reservoirs by authorized parties should be minimized, except as needed to meet important resource management or restoration objectives, to reduce the potential impact from West Nile Virus on sage-grouse. On projects requiring water to be pumped such as solar, hydro or fossil fuel operation, floated tanks should be allowed to conserve water resources and efforts should be made by the authorized parties to treat these tanks for mosquito species that carry West Nile Virus.
- iii. Wildlife escape ramps in new and existing water troughs and open-water storage tanks should be installed and maintained to facilitate the use of and escape by wildlife.

#### **g. Constructed Improvements**

- i. Construction methods should be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- ii. Infrastructure should be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed

for access to facilities. Requirements from public utilities will be followed for all installations.

- iii. Surface disturbances should be clustered in order to limit surface occupancy.
- iv. New utility developments and transportation routes should be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- v. Use best available science in concurrence with IDFG to address concerns of towers and other elevated structures as perches for predatory or corvid birds.
- vi. New structures with a height over five feet should not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built the power lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- vii. Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

#### **h. Site Reclamation**

- i. Site reclamation should be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- ii. Reclamation activities and plans should consider the ecological site potential. The goal of the reclamation should be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- iii. Sites should be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

## **16. Range Management/Livestock Grazing**

IDL does not have general regulatory authority over livestock grazing on non-state lands.

## **17. Wild Horses and Burros**

IDL does not have regulatory authority over wild horses and burros.

## **18. Travel Management**

IDL does not have general regulatory authority over travel management on non-state lands.

## **19. Recreation**

IDL does not have general regulatory authority over recreation on non-state lands.

## **20. Implementation and Monitoring**

Implementation of the CMs through voluntary agreement will be incorporated into existing permit procedures. A copy of the applicable CMs will be provided to all applicants for a permit on lands located in Core or Important Habitat Zones. As part of the application, applicants will acknowledge which, if any, CMs they are willing to voluntarily comply with. Those CMs will then be incorporated into the permit as an enforceable stipulation of the permit. See Appendix B for IDL's DRAFT Implementation Plan.

Monitoring of CMs stipulated in the permit will be incorporated into existing permit inspection procedures. Inspection forms will be amended to include a section for documenting that CMs were implemented and an assessment of their effectiveness. See Appendix E for IDL's DRAFT Monitoring Plan (not yet completed).

Procedures for Abandoned Mine Lands projects will be amended to include an assessment of the impact on sage-grouse when the project includes lands within Core or Important Habitat Zones. The results of this assessment will be used to determine the appropriate CMs to be implemented as part of the project.

### Glossary

Page intentionally blank

## Habitat Classifications

**Core Sage-Grouse Habitat:** State of Idaho delineation of strongholds for sage-grouse populations in Idaho. This habitat is the highest priority for conservation efforts and for policies to address primary threats. It includes approximately 65 percent of known active leks and occupied by approximately 73 percent of male sage-grouse counted at leks throughout the Idaho sage-grouse management area.

**General Sage-Grouse habitat:** Occupied (seasonal or year-round) habitat outside of priority habitat. It includes a few active leks and fragmented or marginal habitat, such as two isolated populations of sage-grouse in the East Idaho Uplands and West Central Idaho. These areas have been identified by the BLM in coordination with respective state wildlife agencies.

**Important Sage-Grouse Habitat:** State of Idaho delineation defined as the 75 percent breeding bird density areas. This habitat includes areas of value for migration corridors, connectivity among breeding areas, and long term persistence of each of the two key metapopulations of sage-grouse in Idaho. It includes approximately 25 percent of the known active leks. This habitat is occupied by an estimated 22 percent of sage-grouse males. Captures high quality habitat and populations necessary for providing a management buffer for the core habitat.

**Key Habitat:** State of Idaho delineation of areas of generally intact sagebrush that provide sage-grouse habitat during some portion of the year including winter, spring, summer, late brood-rearing, fall, transition sites from winter to spring, spring to summer, and summer/fall to winter. Key habitat may or may not provide adequate nesting, early brood-rearing, and winter cover due to elevation, snow depth, lack of early season forbs, limited herbaceous cover, or small sagebrush patch size.

**Priority Sage-Grouse habitat:** Areas that have been identified as having the highest conservation value to maintaining sustainable sage-grouse populations. These areas would include breeding, late brood-rearing, and winter concentration areas. The BLM has identified these areas in coordination with respective state wildlife agencies.

## Lek Classification

**Lek:** A traditional courtship display area attended by male sage-grouse in or next to sagebrush-dominated habitat. A lek is designated based on observations of two or more male sage-grouse engaged in courtship displays. Subdominant males may display on itinerant courtship display areas during population peaks. Such areas usually fail to become established leks. Therefore, a site where less than five males are observed strutting should be confirmed active for two years before meeting the definition of a lek (Connelly et al. 2000; Connelly et al. 2003, 2004). Each state may have a slightly different definition of lek, active lek, inactive lek, occupied lek, and unoccupied leks. Regional planning will use the appropriate definition provided by the state of interest.

**Lek buffer:** Buffers are calculated from the center (IDFG GPS coordinate) of the lek. Exact lek edges are difficult to define because leks shift and birds move on any given day.

**Lek complex:** A lek or group of leks within 2.5 kilometers (1.5 miles) of each other between which male sage-grouse may interchange from one day to the next. Fidelity to

leks has been well documented. Visits to multiple leks are most common among yearlings and less frequent for adult males, suggesting an age-related period of establishment (Connelly et al. 2004).

**Lek, abandoned:** A lek in otherwise suitable habitat that has not been active for 10 consecutive years. To be designated abandoned, a lek must be inactive (see above criteria) in at least four nonconsecutive courtship display seasons spanning the 10 years. The site of an abandoned lek should be surveyed at least once every 10 years to determine whether it has been reoccupied by sage-grouse.

**Lek, active:** Any lek that has been attended by male sage-grouse during the courtship display season.

**Lek, destroyed:** A formerly active lek site and surrounding sagebrush habitat that has been destroyed and is no longer suitable for sage-grouse breeding.

**Lek, inactive:** Any lek where sufficient data suggests that there was no courtship display activity throughout a lekking season. Absence of strutting grouse during a single visit is insufficient documentation to establish that a lek is inactive. This designation requires documentation of one of the following scenarios:

- An absence of sage-grouse on the lek during at least two ground surveys separated by at least seven days. These surveys must be conducted under ideal conditions (April 1-May 7 or other appropriate date based on local conditions), no precipitation, light or no wind, half-hour before sunrise to one hour after sunrise).
- A ground check of the exact known lek site late in the courtship display season (after April 15) that fails to find any sign (tracks, droppings, feathers) of strutting activity. Data collected by aerial surveys should not be used to designate inactive status as the aerial survey may actually disrupt activities.

**Lek, occupied:** A lek that has been active during at least one strutting season within the prior 10 years. This is the status IDFG recommends for long term decision making.

**Lek, undetermined:** A lek that has not been surveyed to determine status.

**Lek, unoccupied:** A lek that has either been destroyed or abandoned.

## **Habitat Use and Periods**

**Breeding period:** Includes lekking, nesting and early brood-rearing periods, generally March 1 through June 30 (Connelly et al. 2000b).

- *Early brood rearing habitat:* Generally upland sagebrush habitats relatively close to sage-grouse nest sites. These areas are important to broods during the first few weeks after hatching. Forb and insect abundance and diversity are important factors. (See Connelly et al. 2000b)

**Late brood rearing:** This occurs in a variety of habitats used by sage-grouse from late June to early November.

- *Late Brood-rearing habitat:* Includes mesic sagebrush and mixed shrub communities, wet meadows, and riparian habitats, as well as some agricultural lands (e.g., alfalfa fields).

**Lekking period:** This should be determined locally, but approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000 foot elevation may be used as a general distinction.

**Nesting period:** Generally April 1 through June 15.

**Winter concentration periods:** For the purpose of this plan, generally December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology. IDL shall confer with IDFG biologists for local variations.

- *Sage-Grouse winter habitats:* Occupied annually by sage-grouse and provide sufficient sagebrush cover and food to support birds throughout the entire winter (especially periods with above average snow cover).

Implementation Plans

Page Intentionally blank

# Land Board's Greater Sage-Grouse Conservation Plan Implementation

*Implementation of the Land Board's Plan is contingent upon the federal government's acceptance and incorporation of the Governor's plan in its final decisions on sage-grouse in Idaho.*

## Part I. Implementation Plan for Endowment Land Activities

The following Implementation Plan (IP) will apply to activities on state endowment trust lands within Core and Important sage-grouse Habitat Zones in response to the Land Board's Greater Sage-Grouse Conservation Plan. The following IP addresses authorizations previously granted by IDL and authorizations that may be granted by IDL in the future. These activities include:

- alternative energy development (solar, wind, and geothermal leases and land use permits);
- oil and gas exploration and development (leases and land use permits);
- mining (minerals leases, land use permits and construction permits);
- grazing (grazing leases, land use permits and construction permits);
- miscellaneous commercial activities (commercial leases, land use permits and construction permits); and
- granting of access through rights-of-way, including easements.

This document also addresses the implementation of fire prevention and mitigation measures and wildfire suppression efforts to minimize the impact to sage-grouse and their habitat.

### I. Previous Authorizations Granted by IDL

IDL recognizes that written authorization through leases, permits and easements has been granted to third parties for activities on state endowment trust lands within Core and Important Habitat Zones prior to the approval of the IDL Greater Sage-Grouse Conservation Plan. These authorizing documents logically do not contain the conservations measures identified in the Land Board's Greater Sage-Grouse Conservation Plan that would be included with authorizations granted today or in the future by IDL. To resolve this matter IDL will accomplish the following:

- Within 60 days of the date of the Record of Decision (ROD) for the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS, IDL will complete a comprehensive GIS analysis to determine the type, number and location of all IDL authorizing documents within Core and Important Habitat Zones.

- Within six months of the date of the ROD, IDL will develop instrument modifications for each authorizing document identified in the GIS analysis within Core Habitat Zones. The instrument modifications will identify the appropriate stipulations for the activity and allow the instrument holder the opportunity to agree to these instrument terms.
- Within 18 months of the date of the ROD, IDL will develop instrument modifications for each authorizing document identified in the GIS analysis within Important Habitat Zones. The instrument modifications will identify the appropriate stipulations for the activity and allow the instrument holder the opportunity to agree to these instrument terms.
- Once developed, IDL will mail the instrument modifications to the instrument holders with a cover letter explaining the purpose of the instrument modification and encourage their execution of the document due to the benefits to the greater sage-grouse and their habitat. The letter will identify a 30-day timeframe for their response.
- IDL will follow-up in writing with those instrument holders that do not respond within 30 days, offering them a second opportunity to accept the instrument modification.
- If an instrument holder does not agree to the instrument modification, IDL will attempt to make direct contact with the party to discuss the conservation measures and provide educational and supporting documents that would encourage their participation. In addition, IDL will identify which conservation measures are sticking points and give consideration, on a case-by-case basis, to negotiating conservation measure stipulations and come to an agreement on those measures that are acceptable to the instrument holder. As a fallback measure, IDL would include conservation measures as stipulations in any new authorization following the expiration of the existing authorization.

## **II. Future Authorizations to be Granted by IDL**

For new activities proposed by third parties on state endowment trust lands in Core and Important Habitat Zones and for new instruments generated following the expiration of an instrument that expires after the date of the ROD, IDL will implement conservation measures as enforceable stipulations in authorizing documents such as leases, land use permits, construction permits and rights-of-way.

IDL will develop and implement specific instrument templates that include the appropriate conservation measures as mandatory and enforceable stipulations. As a result, all new authorizations granted by IDL within Core and Important Habitat Zones will contain conservation measures in alignment with the Land Board's Greater Sage-Grouse Conservation Plan. IDL will provide these instrument templates to third parties inquiring about or making application for a proposed activity within a Core and Important habitat zone and explain the significance of these stipulations.

### III. Fire Prevention and Mitigation Measures and Wildfire Suppression Efforts

IDL does not have direct wildfire suppression responsibilities within any greater sage-grouse Core or Important habitats in Idaho. However, IDL does have jurisdictional authority for state lands within greater sage-grouse habitat.

Wildland fire protection for federal, state and private lands within greater sage-grouse habitat in southern Idaho is provided by federal agencies through the **Cooperative Fire Protection and Stafford Act Agreement** and by the cooperative efforts of volunteer RFPAs and fire service organizations (city, county and rural fire departments).

In the interest of promoting conservation efforts of the greater sage-grouse and its habitat under this plan, IDL will:

1. Provide maps to all RFPAs that include the location of any designated Core or Important greater sage-grouse habitat within their RFA boundaries by May 10, 2015 (Beginning date of closed fire season in Idaho as designated in Idaho Code Title 38 Section 115.).
2. On any fire affecting or threatening Important or Core habitat on state or private lands requiring an Incident Management Team (IMT), IDL will assign an IDL line officer to jointly work with the federal protecting agency to develop greater sage-grouse conservation objectives for fire suppression activities that will be incorporated into:
  - a. the Wildland Fire Decision Support System (WFDSS);
  - b. the Leader's Letter of Intent to the team;
  - c. the joint Delegation of Authority; and
  - d. ensure the objectives are fully implemented in daily Incident Action Plans.
3. Conservation objectives will include:
  - a. Incident priorities:
    - i. Firefighter safety
    - ii. Public Safety
    - iii. Improvements
    - iv. Resource Values
      - Sage-grouse Core and Important habitat
      - Other resource and property values (historical, archeological, recreational, aesthetics, livestock, etc.).
  - b. Utilize direct attack as the primary tactic to minimize burned acres in greater sage-grouse Core and Important habitat.
  - c. Accept relatively small acreage, short-term ground disturbance due to heavy equipment use to meet higher objectives.
  - d. Rehabilitation for burned acres will promote reestablishment of greater sage-grouse habitat within or adjacent to Core and Important habitat.
4. IDL will consider and promote fire prevention and mitigation measures including but not limited to:
  - a. Master fuel break systems across all ownerships.
  - b. Proposals to adjust fire restriction boundaries and associated use restrictions in the Idaho Fire Restrictions Plan based on protection of Core and Important greater sage-grouse habitat.

- c. Develop annual grazing plans or targeted grazing practices to reduce fuel loading in locations that would be advantageous as a wildfire control location.

## **Part II. Implementation Plan for IDL's Regulatory and Assistance Activities**

The following Implementation Plan (IP) will apply to regulatory and assistance activities administered by IDL within Core and Important sage-grouse Habitat Zones. The IP was developed in response to the Land Board's Greater Sage-Grouse Conservation Plan. Conservation measures will be voluntary best management practices on private land because IDL does not have the statutory authority within its regulatory or assistance programs to require adoption by authorized parties. The following IP addresses authorizations previously granted by IDL and authorizations that may be granted by IDL in the future. These activities include:

- Dredge and placer mining (exploration notices and permits);
- Surface mining (exploration notices and reclamation plans);
- Oil and gas exploration and development (seismic and drilling permits, spacing requests);
- Abandoned mine land reclamation.

### **I. Previous Authorizations Granted by IDL**

IDL recognizes that written authorizations through permit and plan approvals and contracts have been granted to third parties for activities within Core and Important Habitat Zones prior to the approval of the Land Board's Greater Sage-Grouse Conservation Plan. These authorizing documents do not contain the conservations measures identified in the Land Board's Greater Sage-Grouse Conservation Plan that would be included with authorizations granted today or in the future by IDL. To resolve this matter IDL will accomplish the following:

- Within 60 days of the date of the Record of Decision (ROD) for the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS, IDL will complete a comprehensive GIS analysis to determine the type, number and location of all IDL authorizing documents within Core and Important Habitat Zones.
  - No outstanding abandoned mine lands contracts are present in Core and Important sage grouse Habitat Zones.
- Within 6 months of the date of the ROD, IDL will develop appropriate conservation measures for each authorizing document identified in the GIS analysis within **Core** Habitat Zones. IDL will also notify each operator that their activity falls within this zone, and provide the conservation measures to the operators.
- Within 18 months of the date of the ROD, IDL will develop appropriate conservation measures for each authorizing document identified in the GIS analysis within Important

Habitat Zones. IDL will also notify each operator that their activity falls within this zone, and provide the conservation measures to the operators.

- If impacts to greater sage-grouse habitat are irreversible, IDL will suggest working within the Idaho Mitigation Framework and utilizing the compensatory mitigation process the State Sage-Grouse Advisory Committee develops.
- Ongoing inspections of these operations will include recommendations that give guidance on how the operators can follow the conservation measures

## **II. Future Authorizations to be Granted by IDL**

IDL will develop an information brochure for oil and gas and mining operators who want to explore or develop minerals in Core and Important habitats.

For new activities proposed in Core and Important Habitat Zones and for amendments to existing approved activities, IDL will forward the applications to IDFG for comments and recommendations.

During the review process, IDL will suggest sage-grouse conservation measures to those mine operators based on:

- Feedback from IDFG
- Sage-grouse conservation measures in the IDL plan
- The specific details of the proposed mine

New abandoned mine land projects in Core and Important habitat will be implemented by IDL in conformance with the IDL Greater Sage-Grouse Conservation Plan. This includes inspections and work performed by IDL staff, as well as those performed by contractors and subcontractors.

As a result, all new authorizations granted by IDL within Core and Important Habitat Zones will include recommendations for conservations measures in alignment with the Land Board's Greater Sage-Grouse Conservation Plan. IDL will work with the operators as needed to implement the conservation measures or to implement voluntary mitigation measures, if needed.

## Appendix C

### Wildfire Protection in Idaho Responsibilities and Funding

Page intentionally blank

## **Wildfire Protection in Idaho Responsibilities and Funding Model**

### **How is fire response organized in Idaho?**

There are approximately 53.5 million acres of land in Idaho, which is divided into 16 forest protective districts. Two of these districts cover lands protected by the Forest Service and the Bureau of Land Management (BLM), and two are tribal districts. The State of Idaho – the Idaho Department of Lands (IDL) and two timber protective associations – provide direct wildfire protection on approximately 6.3 million acres of private, state and some federal forest lands.

The BLM provides primary wildfire protection on most of the lands that have sage-grouse habitat in Idaho.

Due to the scattered nature of ownership in Idaho, some state and private lands are located within federal protection areas, while some federal lands are located within state protection areas. These are known as “offset acres.” Fire managers assign a relative value to each acre to characterize how easily fires can be ignited and how difficult those fires likely will be to control. Through an “offset agreement” the federal agencies protect approximately 900,000 acres of private and state endowment land around Idaho in exchange for the State of Idaho protecting approximately 800,000 acres of federal land. Generally speaking, forested lands in Idaho are included in the offset agreement and rangelands in Idaho are not included the offset agreement.

More than 200 local and rural fire districts provide structure protection in generally non-urban parts of the state that would otherwise not have structural fire protection.

Five rangeland fire protection associations (RFPAs) assist the BLM in providing initial attack on rangelands in southern Idaho. IDL works closely with the BLM and ranchers to establish RFPAs to enable quick initial attack of range fires. Approximately 230 ranchers in southern Idaho are members of five different RFPAs, and there are six additional areas where ranchers have begun to have conversations about starting new associations. IDL expects at least one more RFPA to be formed before the start of the 2015 fire season. Continued support of RFPAs is a key part of the IDL Sage Grouse Conservation Plan. The RFPAs are volunteer initial attack organizations and are not intended to participate in extended attack situations.

Page 4 of Appendix C shows a 2014 map of forest protection district boundaries and current RFPA boundaries in Idaho.

### **Funding Fire Suppression in Idaho**

Fire protection funding is grouped into two categories – preparedness and suppression.

- Preparedness: The first is preparedness, providing resources to be ready in advance of an actual fire. This includes hiring firefighters, ensuring they have the necessary training, tools, and supplies, and purchasing or leasing equipment such as fire engines. In FY14 IDL spent approximately \$11 million in preparedness costs.

Preparedness on state-protected lands is funded by a combination of assessments levied on parties who own forested land, federal funds, and the State General Fund.

The forest land assessment is 60 cents per acre with a surcharge for forested parcels with structures. The IDL, in its role as the owner of endowment lands, contributes to preparedness expenses, just like private forest landowners. In FY14 IDL contributed 60 cents per acre on 974,312 endowment acres that receive protection from the fire management function of IDL, for a total of \$584,587.

In recognition that the value Idahoans place on forests is not limited to harvestable timber, Idaho Code spreads the costs of protection beyond timber. While still requiring forest landowners to provide protection, the law limits the potential liability accruing to the landowner by establishing maximum protection assessments and committing general fund tax revenue to cover expenses over that amount.

- **Suppression:** The second component of wildfire protection is suppression. There is a stable source of funding to pay wildfire suppression costs on lands protected by the State of Idaho. When personnel and equipment are dispatched to a fire managed by the State of Idaho, payment for resources assigned to the fire is made from the General Fund through deficiency warrant authority granted by the Idaho Legislature to the State Board of Land Commissioners. Contracts for aircraft also are charged to deficiency warrants. Deficiency warrant authority allows IDL to spend money to promptly suppress wildfires. Deficiency warrants have been used since at least the early 1970s. When the Idaho Legislature convenes in January it reviews the suppression bills incurred during the previous and current fiscal years, and appropriates funds to pay for the expenditures.

The 10-year average of suppression costs on lands protected by the State of Idaho, including the 2014 fire season, is approximately \$10.5 million. The 10-year average fire size on lands protected by the State of Idaho, including the 2014 fire season, is approximately 19,000 acres. In FY14, IDL employed 261 permanent employees and 202 seasonal employees. Fifty-five percent of IDL FY14 permanent employees worked in a forestry and fire capacity, and during fire season the total percentage of permanent employees contributing to IDL fire duties expands because many members of staff who are not categorized as “fire” help in fire efforts. These staff members are part of fiscal, GIS, operational leadership, administrative staff, and executive staff. Sixty percent of the IDL FY14 seasonal workforce worked in forestry and fire (38 percent in fire).

***If a fire starts on forest land in Idaho***, regardless of ownership (federal, state, or private), the protection agency (Forest Service, BLM or IDL) is responsible for paying the suppression bill, not the owner of the land where the fire starts or burns. However, if a fire investigator determines negligence is a factor in igniting a human-caused fire, the responsible party is responsible for paying the suppression costs.

***If a fire starts on privately owned rangeland***, then the responding agency (BLM, rangeland fire protection association, rural fire district, or sometimes the Forest Service) bears the cost of its own suppression action. In cases involving declared emergencies, the Federal Emergency Management Agency (FEMA) may cover a portion of the costs if communities or infrastructure are threatened. The State of Idaho does not have direct wildfire protection responsibility on rangelands.

**Currently by agreement, if a fire starts on rangeland owned by the State of Idaho,** does not spread to another ownership and is suppressed by the BLM, then the IDL will pay the suppression costs. If a fire starts on rangeland owned by the State of Idaho and spreads to another ownership, then IDL will pay a pro-rata share of the BLM's suppression costs. The IDL does not share in suppression costs when a fire starts on another ownership and spreads onto or across rangeland owned by the State of Idaho.

While IDL does incur fire suppression costs when the State of Idaho assists federal fire managers on fires they manage, the federal agencies reimburse IDL for use of State personnel and resources.

### State Board of Land Commissioners Approval Memo

## STATE BOARD OF LAND COMMISSIONERS

April 21, 2015

Regular Agenda

### SUBJECT

IDL Proposed Greater Sage-Grouse Conservation Plan

### BACKGROUND

The Greater Sage-grouse (sage-grouse) is a candidate species currently being reviewed by the US Fish and Wildlife Service (USFWS) to determine listing status under the Endangered Species Act (ESA). As a direct outcome of the proposed ESA listing review, the US Bureau of Land Management (BLM) initiated a draft Land Use Plan Amendment (LUPA) and Environmental Impact Statement (EIS) pertaining to the sage-grouse throughout BLM's management zones within sage-grouse habitat.

The State of Idaho engaged in similar efforts and Governor Otter submitted an Idaho Plan to be considered by the BLM in the EIS alternative analysis.

In October 2014, Director Tom Schultz established a working group which consisted of various IDL staff which oversee programs potentially impacted by the listing of the sage-grouse. This group held regular meetings to develop recommended conservation measures as part of IDL's Proposed Greater Sage-Grouse Conservation Plan based on the group's review of the science and what other western states are proposing, as well as designed to be complementary to Governor's Alternative for federal land management in Idaho.

For proposed activities by third parties on state endowment trust lands, IDL will implement sage-grouse conservation measures as enforceable stipulations in authorizing documents such as leases, permits, and easements. The authorized activities include: alternative energy development (solar, wind, and geothermal); oil and gas exploration and development; mining; grazing; miscellaneous commercial activities; and the granting of access through rights-of-way, including easements. In addition, IDL as the land manager will implement and support fire prevention and mitigation measures and wildfire suppression efforts to minimize the impact to sage-grouse and their habitat.

For regulatory and assistance activities, conservation measures will be voluntary best management practices (BMP's) on private land because IDL does not have the statutory authority within its regulatory programs or assistance activities to require adoption by authorized parties. Regulatory and assistance activities include: Abandoned Mine Lands Projects; Dredge and Placer Mine Permits; Mine Reclamation Plan Approvals; and Oil and Gas Permits (seismic imaging surveys, well drilling). Where appropriate, IDL will include recommended best management practices within its authorizing documents to encourage compliance.

Additionally, for some fire programs, IDL will implement actions through its roles and responsibilities that support enhanced fire preparedness and suppression in sage-grouse habitats.

## DISCUSSION

On February 17, 2015, Idaho Department of Lands (IDL) presented the Proposed Greater Sage-Grouse Conservation Plan to the Land Board as an information item. IDL sought initial feedback from the Land Board and indicated IDL would initiate an extensive stakeholder outreach effort and then come back to the Land Board for final approval of the plan at a future meeting.

Since that time IDL has completed the stakeholder outreach effort across all industries potentially impacted by the plan soliciting feedback on the Proposed Greater Sage-Grouse Conservation Plan using group and individual meetings. These meetings included direct discussions regarding language in the plan and the impacts of the proposed conservations measures on their industry practices.

IDL has revised the Proposed Greater Sage-Grouse Conservation Plan (Attachment 1) based on the feedback from stakeholder groups and on-going interactions with sister agencies. A summary of comments received by IDL is included as Attachment 2. A table of all comments received, with IDL responses, is included as Attachment 3. In addition, IDL's response to the U.S. Fish and Wildlife Service comment letter, written in conjunction with the Office of Species Conservation and Governor's Office, is included as Attachment 4. Finally, an informational sheet with key elements of the draft plan is Attachment 5.

## RECOMMENDATION

The Department recommends the Board approve the proposed Plan.

Upon approval, implementation of the Plan will be contingent on the federal agencies (USFWS and BLM) acceptance and incorporation of the Governor's Plan into the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS. Implementation will begin within 60 days of the Record of Decision (ROD) for the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS.

If the ROD does not include the foundational elements of the Governor's Plan, IDL will reevaluate, revise the Plan if necessary and inform the Board or seek approval as needed.

## BOARD ACTION

A motion was made by Controller Woolf that the Board adopt the Department recommendation, including the language of the second and third paragraphs in the Department's recommendation, and approve the proposed Plan. Attorney General Wasden seconded the motion. The motion carried on a vote of 5-0.

## ATTACHMENTS

## Appendix G

### Idaho Oil and Gas Conservation Commission Approval Memo

## IDAHO OIL AND GAS CONSERVATION COMMISSION

April 23, 2015

Regular Agenda

### SUBJECT

IDL Proposed Greater Sage-Grouse Conservation Plan

### BACKGROUND

The Greater Sage-grouse (sage-grouse) is a candidate species currently being reviewed by the US Fish and Wildlife Service (USFWS) to determine listing status under the Endangered Species Act (ESA). As a direct outcome of the proposed ESA listing review, the US Bureau of Land Management (BLM) initiated a draft Land Use Plan Amendment (LUPA) and Environmental Impact Statement (EIS) pertaining to the sage-grouse throughout BLM's management zones within sage-grouse habitat.

The State of Idaho engaged in similar efforts and Governor Otter submitted an Idaho Plan to be considered by the BLM in the EIS alternative analysis. In October 2014, IDL Director Tom Schultz established a working group which consisted of various IDL staff which oversee programs potentially impacted by the listing of the sage-grouse. This group held regular meetings to develop recommended conservation measures as part of IDL's Proposed Greater Sage-Grouse Conservation Plan based on the group's review of the science and what other western states are proposing, as well as designed to be complementary to Governor's Alternative for federal land management in Idaho.

As a result, IDL will implement sage-grouse conservation measures as enforceable lease stipulations for proposed oil and gas development activities occurring on state endowment lands. Regarding oil and gas regulatory activities under the purview of the Commission, IDL has developed voluntary conservation measures. These conservation measures will be presented as recommended best management practices (BMP's) to companies applying for drilling permits. These companies will then select which BMP's they can comply with to be incorporated as permit conditions. These BMP's will then become required and verified through the inspection process.

### DISCUSSION

On February 12, 2015 the Idaho Department of Lands (IDL) presented the Proposed Greater Sage-Grouse Conservation Plan to the Commission as an informational item. IDL sought initial feedback from the Commission and indicated IDL would initiate an extensive stakeholder outreach effort and then come back to the Commission for final approval of the plan at a future meeting.

Since that time IDL has completed the stakeholder outreach effort by soliciting feedback on the Proposed Greater Sage-Grouse Conservation Plan using group and individual meetings. These meetings

included direct discussions regarding language in the plan and the impacts of the proposed conservation measures on practices of the oil and gas industry.

IDL has revised the Proposed Greater Sage-Grouse Conservation Plan (Attachment 1) based on the feedback from stakeholder groups and on-going interactions with sister agencies. Excerpts from the plan for the Commission's consideration are included as Attachment 2. A summary of the comments received by IDL pertaining to oil and gas is included as Attachment 3. A copy of all comments received related to Oil and Gas, with IDL responses, is included as Attachment 4. Finally, IDL's response to the U.S. Fish and Wildlife Service comment letter, written in conjunction with the Office of Species Conservation and Governor's Office, is included as Attachment 5.

Implementation of the Proposed Greater Sage-Grouse Conservation Plan will occur through voluntary agreements between industry and IDL. Updated Standard Operating Procedures will call for IDL to provide applicants requesting permits to drill within core and important habitat with Conservation Measures (CM's). Applicants will then acknowledge which, if any, CM's can be complied with and incorporated as enforceable permit conditions. Monitoring of CM's stipulated to will be incorporated into existing permit inspection procedures. Inspection forms will be amended to include sections for documenting implementation of CM's as well as an assessment of effectiveness.

#### RECOMMENDATION

The Department recommends the Commission approve the applicable sections of Part II of the proposed Plan.

Upon approval, implementation of the Plan will be contingent on the federal agencies (USFWS and BLM) acceptance and incorporation of the Governor's Plan into the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS. Implementation will begin within 60 days of the Record of Decision (ROD) for the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS.

If the ROD does not include the foundational elements of the Governor's Plan, IDL will reevaluate and revise the Plan if necessary and inform the Commission or seek approval as needed.

#### COMMISSION ACTION

A motion was made by Commissioner Classen that the Commission approve the recommendation. Vice Chairman Chipman seconded the motion. The motion carried on a vote of 5-0.

**Idaho and Southwestern Montana Greater Sage-Grouse Plan Amendment  
Response and Consistency with COT Recommendation Comments on Draft EIS Preferred Alternatives**

<b>Topic</b>	<b>FWS Comments on DEIS</b>	<b>BLM Proposed Plan Resolution</b>
<b>Adaptive Management</b>	1. We recommend that the FEIS include both a hard and a soft [adaptive management] trigger... We believe that inclusion of a soft trigger (10%) in the FEIS would provide increased responsiveness to stochastic threats and additional flexibility for proactive management; both important elements that increase stakeholder participation and early implementation of incentive-based conservation actions.	The PP includes both hard and soft adaptive management triggers. (AM-7, AM-8, AM-9 & AM-10)
<b>Adaptive Management</b>	2. We recommend that an Implementation Team/Commission process be included in the FEIS. The process should also include specificity regarding team composition and how science will inform the process and ultimate decision regarding remediation actions.	The PP includes direction to coordinate with the State of Idaho and Montana on both adaptive management and mitigation to support implementation and consideration of both adaptive management responses and mitigation requirements. (CC-2, CC-4, AM-11, AM-12, MIT-1 & MIT-2)
<b>Adaptive Management</b>	3. An explanation should be provided for why the identified baseline year was selected for the adaptive management triggers.	The PP includes an appendix that describes the delineation and rationale supporting the data sets used to develop the baseline maps. (Appendix I & Appendix H)
<b>Conifer Encroachment</b>	4. We recommend the selected alternative identify a rate at which treatments should be implemented to meet the COT objective. Additionally, removal of pinyon-juniper trees encroaching within 1000 meters of a lek should be the highest priority.	The PP includes conservation measures with sufficient specificity to ensure certainty of implementation and effectiveness needed to meet this measure. Conservation measures include a treatment objective supporting a "no net gain" of conifer. (Table 1 - Treatment Objectives)
<b>Disturbance</b>	5. The DEIS does not provide adequate specificity regarding how the "no net habitat loss" standard would be implemented to determine its consistency with the COT report or whether it would be a suitable replacement for a disturbance cap. Please provide further clarification of how this approach would be consistent with the COT report.	The PP includes both a disturbance cap (3%) and a requirement for no net unmitigated loss resulting from development activities. (AD-1, MIT-3, MIT-4 & Appendix K)
<b>Disturbance</b>	6. Alternative E prescribes a 3 percent anthropogenic disturbance cap in the Core Habitat Zone (CHZ) and a	The PP includes a disturbance cap (3%) that applies to

IDMT\_PUB\_12028  
2.4  
12/7/2015

Topic	FWS Comments on DEIS	BLM Proposed Plan Resolution
	<p>5 percent anthropogenic disturbance cap in the Important Habitat Zone (IHZ). Both of these caps would only apply to fluid mineral development (pg. 2-100). We recommend that a 3 percent disturbance cap be applied to the CHZ and the IHZ and that the cap include other anthropogenic disturbances (for example, Infrastructure as defined by Alternative E, pg. D-33).</p>	<p>large scale anthropogenic disturbance. (AD-1 &amp; Appendix H)</p>
<b>Disturbance</b>	<p>7. The available scientific literature discusses several different spatial scales and evaluates different land use activities than those assessed in the DEIS. Therefore, we recommend that you provide a clear analysis and rationale in the DEIS of the methods you will use to calculate disturbance to sage-grouse habitat.</p>	<p>The PP defines an appropriate analysis scale which is consistent with the broad scale monitoring framework and supports a step-down or roll-up consistent with that direction to appropriately apply to the local scale and consistently relate to the broader scale. (AD-1 &amp; Map 3)</p>
<b>Disturbance</b>	<p>8. The DEIS does not provide adequate specificity regarding how the "no net habitat loss" standard would be implemented to determine its consistency with the COT objective. If it is the intent of Alternative D to implement a 3 percent disturbance cap as well as the above mentioned NSOs and noise stipulations, it would be consistent with the COT objective. Although Alternative E is largely consistent with the COT, we would recommend that the 3 percent disturbance cap be consistently applied across the P ACs (CHZ and the IHZ) and that it include other anthropogenic disturbances (as discussed above).</p>	<p>The PP includes conservation measures with sufficient specificity to ensure certainty of implementation and effectiveness needed to meet this measure. "No net unmitigated habitat loss" and 3% disturbance cap have both been included and further described. (AD-1, AD-2, MIT-4 and Appendix K)</p>
<b>Effects Analysis</b>	<p>9. We recommend that the impact analysis be improved through the following ways:                      a. We need more clarity as to the extent to which proposed actions within each alternative would ameliorate the threats to GRSG within the identified analysis areas. This is not to suggest that the current conservation measures within the range of alternatives are inadequate, but rather to emphasize the need for a more comprehensive impact analysis. Currently, the analysis demonstrates the extent to which an impact is</p>	<p>While the effects analysis is not complete and is undergoing revision and development, USFWS staff is involved in this process and are helping to identify and work with the effects analysis teams to ensure these components are sufficiently addressed in the Final EIS.</p>

Topic	FWS Comments on DEIS	BLM Proposed Plan Resolution
	<p>reduced within a Population Area. However, it should also incorporate the best available science to show how that reduction could ameliorate the associated threat and consequently impact GRSG individuals and populations. The impacts to individuals and associated populations should then be compared across alternatives.</p> <p>b. The analysis should consider the beneficial impacts of best management practices and required specific design features where appropriate.</p> <p>c. The analysis should address the extent to which conservation measures within the alternatives meet the objectives of the COT. For example, we recommend inclusion of the COT matrix with an associated narrative.</p>	
<b>Fire and Invasives</b>	<p>10. We also recommend incorporating literature by the Fire and Invasive Species Team (FIST), which is currently developing landscape prioritization for fire and invasive species, as well as step down assessments.</p>	<p>The PP includes conservation measures that address the step down assessments and wildfire prevention, suppression and post-fire restoration and the commitment to implement findings from these assessments. (WFS-1, WFS-2, WFS-3, WFS-4, WFS-7, FM-4, FM-5 &amp; FM-6)</p>
<b>General</b>	<p>11. We encourage the BLM and FS to resolve any inconsistencies across planning boundaries where these differences do not have a clear basis. Where differences in management are warranted, the rationale for divergent management approaches should be fully explained as they pertain to meeting the COT objectives.</p>	<p>The Proposed Plan (PP) conforms to the NPT guidance on land allocation decisions that are consistent with adjacent planning areas. There are several minor divergences that are more protective of GRSG and their habitat than described in the NPT guidance (fluid minerals, ROWs). (MA-2)<sup>1</sup></p>
<b>General</b>	<p>12. We hope that through our comments, the BLM and FS will expand the detail of several key components to a level where we can fully evaluate the FEIS pursuant to the COT. Some key components include:</p> <p>a. Details on how habitat and disturbance will be monitored;</p> <p>b. Methods of landscape-scale prioritization and implementation of step-down assessments for addressing</p>	<p>The PP includes a description of the monitoring efforts that will be completed to support implementation and evaluation of the PP. 		<p>disturbance cap have both been included and further described. (AD-1, AD-2, MIT-4 and Appendix K)</p> <p>e. Conservation measures identified with sufficient specificity to ensure certainty of implementation and effectiveness needed to meet this measure. Conservation measures include a treatment objective supporting a "no net gain" of conifer. (Table 1 - Treatment Objectives)</p> <p>f. Conservation measures are identified clarifying the exemption process and associated mitigation. (AD-3 &amp; AD-4)</p>
<b>Invasives</b>	<p>14. We need additional clarity for both Alternative D and E as to site-specific actions to meet the COT objective. Both preferred alternatives have appropriately identified the need to work more extensively at a local scale to coordinate and implement actions that will result in improved wildfire and invasive species management strategies. As discussed above for fire, inclusion of commitments to implement conservation projects identified in the step-down assessments will be needed to increase our certainty that actions, necessary for GRSG conservation, will occur.</p>	<p>The PP includes conservation measures that address the step down assessments and invasive species and the commitment to implement findings from these assessments. (WFS-1, ESR-1 &amp; INV-1)</p>
<b>Management Areas</b>	<p>15. We recommend that the habitat categories included in the FEIS be biologically meaningful and pragmatically effective.</p>	<p>BLM and FS have worked in coordination with FWS and the State of Idaho to adjust management zones to more accurately delineate biologically relevant and meaningful areas that are appropriate in coordination with the adaptive management strategy and disturbance threshold. (MA-2)</p>
<b>Mining</b>	<p>16. The COT objective is to maintain stable to increasing GRSG populations and no net loss of GRSG habitats in areas affected by mining. Both Alternative D and Alternative E propose to implement conservation</p>	<p>The PP includes a more detailed description of the mitigation program and also identifies specific implementation actions to develop a detailed mitigation plan in coordination with the states utilizing their</p>

Topic	FWS Comments on DEIS	BLM Proposed Plan Resolution
	<p>measures that meet the COT objective; however, we will need further specificity on mitigation requirements (see general comment on mitigation).</p>	<p>frameworks as a foundation. The state framework identifies metrics and conservation measures to be considered as well as identification of service area considerations. (MIT-1, MIT-2 &amp; Appendix J)</p>
<b>Mitigation</b>	<p>17. To meet several conservation objectives within the COT, a "meaningful mitigation" program must be implemented. Both Alternatives D and E contain some essential elements for a comprehensive mitigation strategy, but we need additional details. We also encourage the inclusion of the concept of "additionality" and a "net conservation benefit" standard. We encourage close coordination with the State on this mitigation element in order to maintain their important collaborative conservation process.</p>	<p>The PP includes a more detailed description of the mitigation program and also identifies specific implementation actions to develop a detailed mitigation plan in coordination with the states utilizing their frameworks as a foundation. (MIT-1, MIT-2 &amp; Appendix J)</p>
<b>Mitigation</b>	<p>18. We need additional detail for both Alternatives D and E regarding how mitigation will be accomplished in future decision making processes. Further clarity is needed in the following areas:</p> <ul style="list-style-type: none"> <li>a. Methodologies or metrics that will be used to determine expected impacts of actions and conservation measures used to offset them.</li> <li>b. Identification of "service areas," or areas where offsets would be focused.</li> <li>c. Inclusion of a transparent and accountable monitoring program that includes performance standards that are used to ensure conservation measures meet predetermined goals and objectives.</li> <li>d. The role of the land management agency(s) if the Alternative E mitigation program were implemented.</li> </ul>	<p>The PP includes a more detailed description of the mitigation program and also identifies specific implementation actions to develop a detailed mitigation plan in coordination with the states utilizing their frameworks as a foundation. The state framework identifies metrics and conservation measures to be considered as well as identification of service area considerations. (MIT-1, MIT-2 &amp; Appendix J)</p>
<b>Monitoring</b>	<p>19. Both Alternatives D and E currently lack a clear explanation of how implementation monitoring would be executed (including intervals and standards). Such an explanation is needed for us to fully evaluate the efficacy of the monitoring being proposed.</p>	<p>The PP includes a description of the monitoring efforts that will be completed to support implementation and evaluation of the PP. (MON-1, MON-2, MON-3, MON-4, MON-5, MON-6, MON-7, Appendix E &amp; Appendix F)</p>

Topic	FWS Comments on DEIS	BLM Proposed Plan Resolution
<b>Monitoring</b>	20. With regard to habitat monitoring, it is currently unclear how habitat change will be monitored within either Alternative D or Alternative E. For example, habitat monitoring discussed in Alternative D (Chapter 2) is significantly different than the Monitoring Framework Plan discussed in Appendix E. While we support the habitat characteristics identified in Alternative E, a more robust description of the habitat monitoring program should be provided.	The PP includes a more detailed description of habitat monitoring efforts. (MON-3, MON-4, MON-5, MON-6, MON-7, Appendix E & Appendix F)
<b>Noise</b>	21. Noise and seasonal stipulations should be considerations during the construction and long-term implementation of land use activities. Your proposed implementation of noise and seasonal stipulations across all alternatives appears to be applied only to initial construction activities.	The PP includes required design features which apply to noise levels associated with leks, these RDFs would be applied to project proposals and developments where and when these concerns exist as either stipulations or conditions of approval. They would apply to both construction and operation (when taken in combination with seasonal restrictions also included as RDFs). (GD-16, GD-17, GD-18, GD-19, Appendix A & Appendix B)
<b>Prescribed Fire</b>	22. We recommend that the FEIS include provisions to eliminate prescribed burning in sage-grouse wintering and breeding [i.e., lekking, nesting and early brood rearing (Connelly et al. 2004, Connelly et al. 2011)] habitats unless biologically justified; If prescribed fire is allowed in GRSG habitats, then we recommend that the FEIS commit to using the risk analysis tool currently in development by WAFWA.	The PP includes conservation measures to address treatments, including prescribed fire. (FM-3)
<b>Wildfire</b>	23. We need additional clarity for...wildfire and invasive species management strategies. The step-down assessments, as identified in Alternative D (Appendix K), provide a sound framework upon which to complete these actions. Inclusion of commitments to implement conservation projects identified in these step-down assessments will be needed to increase our certainty that actions, necessary for GRSG conservation, will occur.	The PP includes conservation measures that address the step down assessments and wildfire prevention, suppression and post-fire restoration and the commitment to implement findings from these assessments. (WFS-1, WFS-2, WFS-3, WFS-4, WFS-7, FM-4, FM-5 & FM-6)

Josh, we don't have 3.1 miles as a layer because it is not an allocation decision and would be applied on a case-by-case basis as we determine the effects of projects during project implementation. Jon

Dear Mr. Carrier,

The Idaho Department of Lands (IDL) has received and appreciates your timely response to the IDL Draft Proposed Greater Sage-Grouse Conservation Plan (Plan).

Part I of the Plan specifically addresses conservation measures to be enforced on state endowment trust lands (endowment lands) in sage-grouse habitat. The trust land management concept differs from the management model of federally owned lands. The management of endowment lands must adhere to a trust mandate embedded in the Idaho Constitution (Article IX, Section 8) – to maximize long-term financial returns to public schools and other beneficiaries – with the State Board of Land Commissioners (Land Board) assigned the duty of overseeing operations of endowment lands and the funds they generate. A small percentage of the lands located within Core and Important sage-grouse habitat zones in Idaho are endowment lands.

The Plan complements Governor C.L. "Butch" Otter's Sage-grouse Conservation Plan (Governor's Plan) for federal lands in Idaho, which the U.S. Fish and Wildlife Service (Service) has stated it supports because it meets the conservation objectives required to prevent a listing under the Endangered Species Act (ESA) (see attached letter dated 4/10/2013).

The Governor's Plan provided the framework on where to focus IDL conservation efforts.

Some of the Service's recommendations on the Plan, if implemented, impose unreasonable constraints on the Land Board's ability and obligation to ensure endowment lands maintain their Constitutionally-derived purpose of generating maximum long-term financial returns to public schools and other state institutions. Also, the additional conservation measures recommended by the Service for inclusion in the Plan, specifically in sections 14 and 15, appear to be a departure from the Service's previously expressed endorsement of the Governor's Plan, which the IDL Plan complements.

Given the Constitutional mandate for management of endowment lands and the small percentage of endowment lands located in Core and Important habitat zones, IDL believes it is unnecessary and problematic that the State of Idaho manage its lands in the same way as federal land managers. The ESA recognizes that if/when species are listed then the federal government has an obligation to recover species, whereas State and private landowners have a duty to avoid take of a species. It is within the same vein that different management strategies are warranted on federal and state lands.

A response to the Service's comments on the IDL plan are found below, with the Service's comments italicized.

### **General Recommendation for IDL Lands and Programs Outside of Key Areas**

#### Section 4. Greater Sage-Grouse Management Areas

*The Plan notes that the State and Bureau of Land Management (BLM) are finalizing the delineation of the sage-grouse habitat zones (i.e. Core, Important and General Management Zones). The final Plan should fully adopt those final habitat zones to achieve state and federal sage-grouse conservation consistency across the landscape.*

IDL concurs with the Service's viewpoint that the Plan should adopt the final habitat zone delineation and nomenclature to achieve consistency across the state and federal sage-grouse landscape. While it is preferable to adopt the federal habitat zones delineation/nomenclature, it would not be prudent to adopt these zones if the Final Environmental Impact Statement (EIS) does not adhere to the three tiered habitat approach agreed upon in 2014, and if Idaho stays with the agreed upon system.

#### Section 7. Mitigation

*We recommend that all project proponents responsible for sage-grouse habitat impacts from infrastructure development be required to participate in the State's mitigation strategy. Compensatory mitigation associated with these direct and indirect sage-grouse impacts should result in a net conservation benefit to sage-grouse.*

IDL recognizes the need for a compensatory mitigation program to account for direct and indirect sage-grouse impacts associated with infrastructure development. The existing Idaho mitigation framework lacks the necessary detail for IDL to require mitigation from infrastructure development project proponents as you recommend. As a trust manager, it would not be prudent to commit to such a program until the details are known. We do note the Land Board has the authority to enter into conservation leases, so a mitigation program, once finalized is implementable on endowment lands. The State of Idaho currently is working to complete the mitigation program for greater sage-grouse.

#### Sections 8, 9, 10, and 11. Fire Prevention, Wildfire Suppression, Fuel Management, and Wildfire Restoration

*We recommend that the Plan include a commitment to cooperate and implement fire prevention, wildfire suppression, fuels management, and wildfire restoration actions on all IDL endowment lands consistent with U.S. Bureau of Land Management/U.S. Forest Service Fire and Invasives Assessment Team (BLM/FS FIAT) plans.*

IDL believes the current Plan adequately addresses your comment. IDL is further hopeful the BLM/U.S. Forest Service Fire and Invasives Assessment Team (BLM/FS FIAT) plans will identify and provide focus for these cooperative commitments. IDL will revise Sections 9-11 to incorporate reference to the FIAT plans.

Section 12. Habitat Restoration and Vegetation Management

*We recommend that the Plan include a commitment to identify priority restoration areas and to cooperate with other agencies and landowners in priority habitat restoration activities on all IDL endowment lands with emphasis on addressing perennial grasslands and juniper encroachment areas within the Core and Important Habitat Management Zones.*

IDL believes the current Plan adequately addresses your comment. IDL's prior and ongoing cooperative efforts with local and federal partners in post wildfire restoration and juniper removal projects is evidence of this. IDL is further hopeful the BLM/FS FIAT plans will identify and provide focus for these cooperative commitments. IDL will revise this section to incorporate reference to the FIAT plans.

Section 13. Invasive Plant Species

*We recommend a commitment to cooperatively implement invasive species management actions identified in the BLM/FS FIAT plans on all IDL endowment lands.*

IDL believes the current Plan adequately addresses your comment, especially since any large scale cooperative invasive species management actions are most likely to be part of a restoration project under Section 12. IDL is further hopeful the BLM/FS FIAT plans will identify and provide focus for these cooperative commitments.

Section 20. Implementation and Monitoring

*We recommend including a commitment that IDL will cooperate with the Idaho Department of Fish and Game, BLM and the U.S. Forest Service sage-grouse population and habitat monitoring on all IDL endowment lands.*

The draft Plan did not include any detail on implementation and monitoring. IDL is currently meeting with the Idaho Department of Fish and Game to develop a monitoring protocol/MOA. The IDL Implementation Plan will be included as an appendix in the revised Plan.

**Key Area Recommendations for IDL Lands and Programs**

Section 5. Adaptive Management

*In circumstances where BLM has determined a hard trigger has been tripped within a Biologically Significant Unit (BSU), we recommend temporary moratoriums be put in place on large-scale infrastructure development in the key areas associated with that BSU.*

IDL views this recommendation as a violation of the fiduciary trust responsibilities bestowed on the Land Board and IDL in managing endowment lands in accordance with the Constitutional mandate. IDL continues to support a general strategy aimed at reducing endowment ownership of Key Habitat within Core Habitat Zones through completion of land exchanges with the BLM. This strategy would provide the greatest levels of certainty for conservation of key sage-grouse habitat.

Section 6. Anthropogenic Disturbance

*To ensure impacts from anthropogenic disturbance are minimized, we recommend application of a 3 percent disturbance cap in the key areas. Absent a disturbance cap, we recommend a moratorium be placed on infrastructure development in key areas until such time that state/federal land transfers (Core and/or Important Habitat for General and/or Non-Habitat) are completed; thereby providing similar levels of protection on these lands through federal land management policy.*

IDL continues to support a general strategy aimed at reducing endowment ownership of Key Habitat within Core Habitat Zones through completion of land exchanges with the BLM. Due to the length of time that previous exchanges have taken, an open-ended moratorium is viewed as a violation of the Land Board and IDL's fiduciary trust responsibilities.

Section 9. Wildfire Suppression

*We recommend increasing capacity for fire suppression through: 1) commitments to establish IDL fire districts in or near the key areas, 2) commitments to establish and expand Rangeland Fire Protection Associations in or near the key areas, 3) commitment to cooperate and prioritize implementation of actions associated with the BLM/FS FIAT plans.*

Item 1 is beyond the scope of the Plan. The assessment, feasibility, and needs analysis to establish new IDL fire districts is a multiyear project requiring multijurisdictional coordination, legislative approval and funding.

Item 2: Rangeland Fire Protection Associations (RFPAs) are voluntary associations that are formed by interested landowners and are not directed or established by IDL. IDL provides guidance, personal protective equipment, and capital equipment to outfit the RFPAs. We can work with interested parties to educate them on the process required to form an RFPAs; however, the IDL cannot unilaterally form them. The State, via the Office of Species Conservation, will make funding available in FY2016 for existing RFPAs (equipment, training, etc.) and to offset some start-up costs for new RFPAs in key areas depending upon needs and priorities.

Item 3 is already addressed in the draft Plan, but we will incorporate a reference to the FIAT plans in our revision.

Section 10. Fuels Management

*In the key areas, fuels management treatments (including brush management) should specifically incorporate sage-grouse seasonal habitat guidelines recommended by the Governor's Task Force or those identified in the BLM/FS Land Use Plan amendments.*

IDL will include your recommendation specifically incorporating the Governor's Task Force seasonal habitat guidelines or those identified in the BLM/FS Land Use Plan amendments for fuels management treatments within the key areas.

Section 11. Wildfire Restoration and Rehabilitation

*In the key areas, restoration objectives should specifically incorporate sage-grouse seasonal habitat guidelines recommended by the Governor's Task Force or those identified in the BLM/FS Land Use Plan amendments. This should include a commitment to implement restoration using native species where available and practicable.*

IDL will include your recommendation specifically incorporating the Governor's Task Force seasonal habitat guidelines or those identified in the BLM/FS Land Use Plan amendments for restoration objectives within the key areas.

Section 12. Habitat Restoration

*In the key areas, habitat restoration objectives should specifically incorporate sage-grouse seasonal habitat guidelines recommended by the Governor's Task Force or those identified in the BLM/FS Land Use Plan amendments. This should include a commitment to implement restoration using native species where available and practicable. Depending on site-specific conditions, sage-grouse habitat treatments could include: mechanical or chemical sagebrush treatments, juniper removal, rangeland seeding, shrub planting, etc.*

IDL will include your recommendation specifically incorporating the Governor's Task Force seasonal habitat guidelines or those identified in the BLM/FS Land Use Plan amendments for restoration objectives within the key areas.

Sections 14 and 15. Infrastructure Development /Land and Realty, and Mineral Leasing

*We recommend avoiding all impacts to sage-grouse seasonal habitats for these land-use activities. Where it is not feasible to avoid all impacts, lek buffers are intended to minimize impacts to sage-grouse. The lek buffers identified below are our minimum distance recommendations within key areas. The following lek buffer-distances are specified as the lower end of the interpreted range in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse - A Review (Open File Report 2014-1239):*

- *linear features (roads) within 3.1 miles of leks;*
- *infrastructure related to energy development within 3.1 miles of leks;*
- *tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks;*
- *low structures (e.g., fences, rangeland structures) within 1.2 miles of leks;*
- *surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks; and*
- *noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.*

*In lieu of these lek buffer-distances, a moratorium could be placed on infrastructure development in key areas until such time that state/federal land transfers (Core and/or Important Habitat for General and/or Non-Habitat) are completed; thereby providing similar levels of protection on these lands through federal land management policy.*

The Service recommends additional buffers around the identified leks in the key areas. These increased buffers would severely impact the Land Board and IDL's ability to manage and generate income from endowment lands. As an example, using the increased buffers

Michael Carrier  
April 3, 2015  
Page 6

suggested in Key Area 1, the usable surface decreased from 81 percent (146,472 acres) to only 37.6 percent (67,707). IDL cannot justify this level of reduced management and potential loss of revenue under the trust mandate under which IDL operates.

Section 16. Range Management/Livestock Grazing

*In the key areas, range management objectives should specifically incorporate the sage-grouse seasonal habitat guidelines recommended by the Governor's Task Force or those identified in the BLM/FS Land Use Plan amendments.*

IDL will be adding the Livestock Impact Conservation Measures from the 2006 Idaho Sage Grouse Plan into this section.

Lastly, IDL will be presenting its final recommendations for conservation measures on endowment lands and for IDL regulatory and assistance programs to the Land Board and Idaho Oil and Gas Conservation Commission for consideration in April 2015.

Thank you again for your timely response. We look forward to working with you during the implementation stage of IDL sage-grouse efforts.

Sincerely,

A handwritten signature in blue ink that reads "Thomas M. Schultz, Jr." in a cursive style.

The Honorable C.L. "Butch" Otter  
Governor of Idaho  
State Capitol  
Boise, Idaho 83702

**APR 10 2013**

Dear Governor Otter:

Thank you for your letter of March 14, 2013 requesting U.S. Fish and Wildlife Service (Service) "concurrence" in regards to Idaho's Greater sage-grouse (GRSG) conservation strategy (Strategy). Before the Service responds to this request, we would like to express our continued appreciation for your leadership in guiding the collaborative approach in which your staff in the Governor's Office, the Office of Species Conservation and the Idaho Department of Fish and Game has worked with us to refine the State's approach to conserving GRSG in Idaho.

The Service remains impressed with and supportive of the science-based adaptive conservation strategy for GRSG you have crafted collaboratively in Idaho, for Idaho-specific needs. In brief, the foundation of the Strategy and most of the specific elements that complete it, are solid and are grounded in scientific concepts and approach important to both the Service and Department of the Interior. While there is much about the current draft that the Service supports; there remain elements that need refinement, clarification, or need to be incorporated into the Strategy for the Service to conclude the entire strategy is consistent with the Service's Greater sage-grouse Conservation Objectives Team (COT) report.

A detailed response to your inquiry is attached. In summary, the integrated nature of the Strategy makes it difficult to "concur" with specific elements as most are interrelated and depend on other elements of the Strategy to function effectively. Nonetheless, our review revealed that the 4 foundational elements of the Strategy (Habitat Zones, Conservation Areas, Population Objective and Adaptive Triggers) are consistent with the COT as is the Livestock Grazing Management element. Therefore, this determination of consistency with the COT reflects "concurrence" for these elements, with the necessary elements noted in our detailed comments (see attachment), for the purpose of BLM IM 2012-043. This "concurrence" should not be construed as being automatically implementable by the BLM. The Service looks forward to working with your Task Force, and BLM as appropriate, to refine, clarify and add aspects of the Strategy as needed for similar support of, for example, the Wildfire Management and Infrastructure elements; and the Implementation Team/Commission. The latter, while an element of the Strategy that that

C.L. "Butch" Otter, Governor  
State of Idaho  
Request for State sage-grouse plan concurrence

needs clarity and refinement is an issue the Service believes is easily addressed. There are numerous examples of such bodies, including as the State has verbally referenced, the process used on the Idaho Roadless Rule. The Service looks forward to assisting the State craft such a process for the Strategy.

Conservation of GRSG is a challenge. It is a challenge due to the geographic scale of the issue; the need of the species for large intact undisturbed geographies of habitat; the difficult nature of the threats in the Great Basin portion of the range; and the relevance of the habitat in questions to myriad conservation and economic needs and interests. Long-term conservation of GRSG will require a strong and sustained commitment by stakeholders across multiple jurisdictions to work together collaboratively. It is for these reasons that the Service commends the State of Idaho for acknowledging and crafting a Strategy that on one hand details proactive conservation actions to address the threats on the landscape, but equally important embraces the uncertainty of how those threats will play out on the landscape and how they will affect GRSG over time by crafting a robust, outcome based scientific strategy that is collaborative and adaptive. This balance between proactive conservation design/actions based on empirical data and assumptions, with a feedback loop from monitoring to inform adaptation in design/action, with stakeholders in the decision loop as an integral part of that process, is a fundamental component of the both the Strategic Habitat Conservation approach the Service employs, and Adaptive Management that the Department of the Interior employs.

We hope this review is helpful. The Service looks forward to continuing our role in this process of on-going refinement of the Strategy, its implementation over time, and as part of the adaptive process it embraces.

Sincerely,

Brian T. Kelly  
Idaho State Supervisor

## **ATTACHMENT**

### **Purpose of the Service's Comments**

We want to be clear regarding the purpose of our comments. First, our comments serve to continue the collaborative and iterative process we have been engaged in with you. We see this review as an important "check-in" and continuation of that process to ensure the Strategy is ultimately best positioned to contribute to a future where listing GRSG under the ESA is unnecessary.

Our comments also provide the requested feedback regarding "concurrence" as referenced in BLM Instructional Memorandum 2012-043. While the Service and BLM are both Department of the Interior Agencies, and we together with the State of Idaho and other partners, are collaborating in the conservation of GRSG; the BLM and Service have different legal authorities and policy requirements. As such, any "concurrence" we may offer on elements of the Strategy should not be construed a priori as being implementable by the BLM. That is a determination BLM must make. The Service acknowledges and respects BLM authority in this regard. The Service stands ready to assist the State and BLM in BLM's approval process where appropriate (e.g., Service review of elements of the Strategy that are modified to be implementable by BLM). Our comments on the Strategy at this juncture are not part of the on-going BLM process to amend and or revise various Resource Management Plans across the range of GRSG. That review process will be completed separately.

Service support of the Strategy in part or whole should not be interpreted as a decision by the Service commensurate with a listing decision under the Endangered Species Act (ESA). That determination will be made when the Service formally reviews the status of the species in 2015. However, our purpose in developing the COT report was to guide the States in the development of conservation actions and strategies so that when we review those efforts in 2015 they would contribute to the conservation of the species in a manner that collectively would address threats such that listing would not be necessary. It is for this reason, our review of the Strategy herein is provided in the context of the COT report.

### **Components of the Strategy**

We frame our review in the context of the three primary elements of the strategy: (1) Foundational Elements, (2) Specific Elements, and (3) Implementation Team/Commission. Foundational elements of the Strategy are those that transcend specific management and conservation actions or reactive adaptive processes once population or habitat triggers are tripped. We refer to four Foundational Elements: Thematic Approach, Conservation Areas, Adaptive Triggers, and Population Objective. Specific Elements identified in the Strategy are those that target specific threats including: wildfire, invasive species, and infrastructure, as primary threats; and recreation, West Nile virus, improper livestock grazing management, and livestock grazing infrastructure as secondary threats. The Implementation Team/Commission

referenced in the Strategy is meant to ensure proper action is taken when a trigger is tripped. As such, for the purposes of our review, we will evaluate the Implementation Team/Commission as a separate operational element of the strategy.

## **Foundational Elements**

Our review of the Strategy revealed a thoughtful, science-based and outcome-driven adaptive management approach to the conservation of GRSG in Idaho. This approach is consistent with the COT report. The Thematic Approach, Conservation Areas, Adaptive Triggers, and Population Objectives are consistent with the COT report and the Service strongly supports these aspects of the State's Strategy.

Examples of how the four Foundational Elements of the Strategy are consistent with the General Conservation Objectives and Specific Conservation Objectives related to Priority Areas for Conservation (PACs) in the COT report include:

1. The designation of a Core Habitat Zone (CHZ) of approximately 5.5 million acres which by itself is currently home to approximately 73% of the male GRSG in Idaho. The CHZ captures the COT report intent of avoiding development in priority areas for conservation (PACs). The Strategy reflects that the development of infrastructure (a primary threat to GRSG) is prohibited in CHZ; with a process for limited exceptions. The Service commends the State for ensuring that any exceptions to the prohibition to infrastructure in CHZ, must meet the conservation standard in the Important Habitat Zone (IHZ; see discussion in next paragraph). While we support the configuration and intent of the CHZ, we look forward to working with the State to clarify how exceptions are determined and specific mitigation strategies if exceptions occur are implemented (see Specific Elements and Implementation Team/Commission headings, below).
2. The designation of an Important Habitat Zone (IHZ), of approximately 4 million acres which by itself is currently home to 22% of the male GRSG in Idaho. The IHZ also captures the COT report intent of stopping the population decline in that while infrastructure is permitted; it is permitted in a way that must demonstrate it will not affect the population trend for the Conservation Area in question. IHZ serves an equally important role in the Strategy as it can serve to buffer loss of habitat due to fire (see #5).
3. The Strategy's use of a measureable population objective, and utilizing monitoring to ensure that objective is met; and setting metrics that trigger changes in practices or review of current practices to ensure the Strategy's conservation objective is met long-term.
4. The use of four separate Conservation Areas in which the adaptive triggers are individually applied adds an increased level of sensitivity to change, that we expect to translate to more timely changes in management if necessary, which will translate to an enhanced ability to ensure the population objective of the

Strategy is met state-wide (the Service appreciates and concurs with the State's desire to have additional peer review of the adaptive triggers).

5. The use of a "hard trigger" that, if tripped, requires IHZ be managed as CHZ, with infrastructure development subject to the same standards in both zones. In essence, if applied to all Conservation Areas, the CHZ would almost double in size. This would add the conservation benefit of CHZ to IHZ until no longer necessary.
6. The COT report also references the importance of incentive-based conservation actions in developing a conservation strategy. The foundational elements of the Strategy provide a context for incentivizing actions to maintain population numbers and intact habitat; and help ensure the conservation and restoration of GRSG in Idaho. The structure of these foundational elements of the Strategy (and specific elements consistent with the COT report and others as they are refined) will help provide stakeholders predictability with regard to GRSG conservation needs.

### **Specific Elements**

*Livestock Grazing Management:* This specific element of the Strategy is consistent with the COT report. The Service supports this aspect of the Strategy because it requires Idaho Rangeland Health Standards (IRHS) be met and it does so in the context of the Strategy. The COT report identifies that if the riparian (IRHS 2) and upland (IRHS 4) rangeland health standard is met, that is the minimum needed to address the threat of grazing on GRSG based on our expertise under the ESA. To achieve this, the Strategy provides an adaptive management process by which adjustments in grazing based on ecological site potential and habitat characteristics would be prioritized as needed outside of normally scheduled permit renewals based on population triggers and cause of declines within each Conservation Area in the Strategy. Additionally, the adaptive management approach the Strategy provides an important framework for deciding what, in addition to IRHS 2 and 4, might be required under IRHS 8 (Threatened, Endangered or Sensitive Species) for GRSG conservation.

As noted above, the COT also references the importance of incentive-based conservation actions in developing a conservation strategy. The Service believes the Livestock Grazing Management Element address the conservation needs of GRSG while providing an important incentive to permittees to be good stewards.

An additional important benefit to the Service of the Livestock Grazing Management element is that the regulation of improper grazing as a threat to GRSG when permits had not yet been analyzed by BLM to meet IRHS for GRSG (IRHS 2, 4; and 8 as needed) would be accomplished through the Strategy on an as needed basis based on population status. This approach is in contrast to requiring all individual permits be conditioned to meet IRHS 2, 4 and 8 (as needed), by the time the Service makes its listing determination—a goal that is likely not achievable. To be clear, the Service supports

adherence to IRHS. Our support for the approach of this element is due to it being a wise approach for regulating the appropriate conservation action for the secondary threat of improper grazing to GRSG where needed, until IRHS necessary for GRSG conservation are achieved at the management area scale. This adequacy of regulatory mechanisms under ESA is an important consideration. Pending more clarity in how the Implementation Team/Commission is staffed and operates once a trigger is tripped; the Service would expect to fully support this element of the Strategy. While we would defer to the BLM on their permit-specific application of these triggers in the context of requirements to enhance and restore rangelands under Federal Lands Policy and Management Act (FLPMA), the Service supports the Livestock Grazing Element in the interim as long as no triggers have been tripped within a Conservation Area.

*Infrastructure:* The specific actions in the infrastructure element are consistent with the COT pending a clearer understanding how the Implementation Team/Commission operates to determine exceptions to CHZ development, development in IHZ, and how referenced mitigation of impacts will work.

*Mitigation:* Mitigation is referenced in multiple elements in the Strategy but there is no explanation of the how mitigation for impacts in CHZ, IHZ and potentially GHZ will work. The Service is aware of preliminary work by your Task Force and the work of the Idaho Sage-grouse Advisory Council and this element and encourages the State to build on these efforts for this element of the Strategy.

*Restoration:* The Service recognized in our letter of August 1, 2012, that one of the many strengths of the Strategy is that habitat in need of restoration was included in and adjacent to CHZ as a priority commitment for restoration and to expand Core habitat. However, the Strategy is largely silent on the important relationship between mitigation and restoration for restoration to occur; what constitutes habitat that is lost versus gained back; and restoration monitoring. The need for how direct and indirect loss of habitat is quantified and what constitutes restored habitat is a missing component of the habitat trigger as well.

*Wildfire Management:* Wildfire and invasive species associated with fire are the greatest threat to long-term persistence of GRSG in the Great Basin and the threat most difficult to manage. The Strategy has been refined to help manage this threat in a significant way. The addition of legislative changes and funding to support the creation of Rural Fire Districts (RFDs) is a significant addition to the Strategy and one the Service supports and that is consistent with the COT report. Viewing wildfire management in the context of Prevention, Response and Restoration and tailoring actions within each is likewise an important refinement. The Service looks forward to working with the State and other partners to help establish more RFDs; and to identify more specific actions under each category of Prevention, Response and Restoration.

One aspect of the strategy that is not a specific fire management action but that the Strategy notes and the Service likewise acknowledges as one of the strongest attributes of the Strategy is how the overarching construct of the Strategy is designed with fire in

mind. The conservation objective of maintaining between 95% and 73% of the males on leks, the establishment of refined habitat triggers that catch declines and adapt practices earlier and by Conservation Area, the identification of areas in need of restoration, the commitment to IRHS are all mechanisms to reduce fire, buffer the effects of fire, and provide for refinement in management in an adaptive construct to reduce the effects of fire in the long term.

*Management on non-Federal Property:* The Strategy to date has focused on Federal properties. This is understandable due to the ongoing Resource and Land Use Management Plan revisions and amendments underway by BLM and the U.S. Forest Service. The Service looks forward to working with the State to ensure the Strategy applies where necessary and appropriate to all properties with adequate state or local regulatory mechanisms.

### **Implementation Team/Commission**

Many of the specific elements of the Strategy are in the Service's view conditionally consistent with the COT pending more clarity how the Implementation Team/Commission is staffed and operates; and how it interacts with scientific support. Because the Strategy is an outcome-based, adaptive strategy, its efficacy is achieved through a balance between proactive actions and reactive steps to adapt and or change actions if necessary. Therefore, the Service needs to understand in more detail how the Implementation Team/Commission functions to evaluate data and inform decisions to adapt management that ensure the Strategy objective is met (e.g., see Infrastructure, above).

### **Summary**

In summary the Strategy is a robust approach to conserving GRSG in the Great Basin. Many components of the Strategy are strong, in particular the underlying foundational elements and grazing management; with wildfire and infrastructure similarly strong pending additional clarity and refinement as noted. The State of Idaho and the stakeholders on the Governor's Task Force have done remarkable work in a compressed timeframe as these aspects of the plan address threats to GRSG in the Great Basin in a way that gives the Service more regulatory certainty, stakeholders more operational certainty, and provides for the conservation of GRSG and sage-brush in Idaho that helps ensure more resiliency to large wildfires. The elements of the Strategy that the Service would welcome more conversations with the State to refine, add or clarify in the Strategy include non-federal properties, restoration, mitigation, and the operation of the Implementation Team/Commission.

C.L. "BUTCH" OTTER  
GOVERNOR

May 1, 2015

Dan Ashe, Director  
U.S. Fish and Wildlife Service  
U.S. Department of the Interior  
1849 C Street NW, Room 3331  
Washington, D.C. 20240-0001

Dear Dan,

The state of Idaho (State) reinforced its strategy to conserve greater sage-grouse (GRSG) and its habitat last month with the approval of additional conservation measures on State endowment trust lands and activities that fall under Idaho Department of Lands (IDL) regulatory and fire-related authorities.

The Idaho State Board of Land Commissioners (Land Board) approved the GRSG Conservation Plan (Land Board's Plan) on April 21, 2015. The Idaho Oil and Gas Conservation Commission (Commission) approved the Land Board's Plan on April 23, 2015. Included with this correspondence is a copy of the Land Board's Plan for your review.

The Land Board's Plan was developed with input from natural resource industry user groups, environmental organizations and relevant State and federal agencies. It is important to point out, however, that the implementation of the Land Board's Plan is contingent upon the incorporation of the foundational elements of the federal alternative (which is my plan) into the relevant Resource Management Plans (RMPs) in Idaho.

In addition to a landscape conservation approach for GRSG within the Land Board's Plan, the State of Idaho has backed up its commitment to GRSG conservation with a legislative appropriation of \$750,000 for additional conservation activities in Idaho. Some of this funding will be applied to projects on State endowment lands.

The State of Idaho has been proactive and collaborative in our efforts to conserve GRSG and its habitat in Idaho while maintaining working landscapes and the economic vitality of the State. These efforts demonstrate Idaho's commitment to the conservation of this iconic western species.

As always – Idaho, "Esto Perpetua"

A handwritten signature in black ink that reads "C.L. Butch Otter".

C.L. "Butch" Otter  
Governor of Idaho

*7. How can we best restore burned areas and areas already converted to non-native (invasive annual grasslands)?*

Restoring sagegrouse habitats which have crossed the threshold into fire maintained invasive annual grasslands is difficult, expensive, and often unsuccessful as evidenced by the continuing expansion of invasive annual grass communities throughout the Great Basin. In spite of ones best efforts, moisture unpredictability from year to year often results in seeding failure, necessitating costly retreatments.

Essential for revegetating these areas is the ability to control invasive annual grass competition, followed by seeding plant materials which can compete effectively with these annual grasses and persist over time in these arid environments.

Herbicides have proven to be the most effective and noninvasive method for controlling annual grasses prior to seeding. Glyphosate (Roundup) is effective, but because it is a contact herbicide, application timing must be specific. Repeated treatments are often required when multiple cheatgrass crops germinate in a given year. Selective soil applied herbicides such as imazapic (Plateau) and sulfometuron methyl (OUST) are most effective and have the added benefit of not harming established perennial grasses, shrubs, and most forbs.

Research on cheatgrass specific fungi and bacteria also show some promise and may prove to be effective future control methods.

Selecting plant materials which can persist in these droughty environments, compete with invasive annual grasses, and persist over time is also essential for long term restoration success. Sagebrush is always seeded on its respective sites. Native grasses and forbs are preferred over introduced species when they can meet the above requirements. New selections are being increasingly developed which can establish in more productive sites with adequate rainfall (greater than 10 inches per year), and especially in recently burned sagebrush communities. However, native perennial grass materials are not widely available nor successfully established in dryer environments.

However, restoring native plant communities in repeatedly burned annual dominated grasslands has proved largely unsuccessful. Considerable speculation and research has attempted to understand why. A lack of mircorhiza, soil nutrients, and other changes to the soil environment from years of invasive annual grass domination is believed to be at least partially responsible. "Assisted succession" is a suggested method for ultimately restoring these areas by revegetating resilient introduced species to break the fire cycle, remove annual grass dominance, and restore soil characteristics which may in time make the site more hospitable to restoring the native community. Accordingly, this is a long term costly process and requires multiple treatments over several years.

Livestock grazing occurs throughout BLM public lands in the subregion, and seeded areas must be rested from livestock use to become established, and then subsequently managed to maintain plant health and vigor. BLM policy typically prescribes a minimum two year or two growing season rest period (from livestock grazing), or until plant establishment objectives are met. In

many cases and during good years, this period of time is adequate for establishing vigorous introduced perennial grass species. However a true native restoration could require years of rest from grazing to become successfully established (depending on plant materials used and site characteristics). Such large scale treatments would have significant repercussions to grazing permittees.

Lastly, the ability to protect these areas from recurring fire is critical to maintaining the reestablished sagebrush component. Until the majority of annual grass dominated landscapes can be rehabilitated to less fire prone species, these short fire cycles will result in a continual loss of these investments, and in the remaining native sagebrush steppe communities.

Red text = new text added for use/consideration

Blue text = suggesting this text/topic be moved to another appropriate section

~~Strikeout~~ = delete this text

Blank field in the NCT NOTES column = no comment/edits/revision noted

When speaking to making specific changes to the FEIS, keep the focus on referencing the reader to the section where the changes were made. Include statements similar to "see Section X.XX of the FEIS for the specific changes made" or "The FEIS was updated to include commenter noted updates" or other similar statement. Always include the section number where the reader will find the changes. If have an example or two to illustrate the point, include that, but avoid excessive laundry lists of changes made to the FEIS.

The laundry lists are probably a result of responding comment by comment and using the comment matrix to help track the changes that do need to be made in the FEIS. The comment matrix is part of the decision file and can be used for "showing our work" that comments were considered and specific changes made to the FEIS. However, that level of specificity is not always necessary in the Where text sounded more like tech edit to the document we marked it or provided suggestion to delete it from this comment analysis document. If it's just an edit, it doesn't need a formal response. All edits can be addressed in the general report/appendix/document intro text as something like, "BLM has reviewed and made changes to the FEIS based on commenter input, including corrected definitions, technical edits, or wording clarifications."

Ensure that all responses referencing the FEIS are written in the past tense. E.g., "The FEIS was updated..." rather than "The FEIS will be updated..." Write it as if the public is reading the published version of the responses.

When saying that the FEIS/DEIS met the NEPA standard, include a cross reference to appropriate NEPA (tab 4) section. In other word, instead of repeating the same Range of Alternatives intro language for each resource topic range of alternatives, simply say, "As noted in section 4.3, NEPA Range of Alternatives, of this report, the alternatives, including the management actions for the XXX program meet the purpose and need for the EIS. "

Same idea for other sections of the NEPA document, Best Available information, impact anlysis, cumulative analysis, etc.

Ensure that the impact analysis is "flowing" in the same direction for all topics. For example, if the issue statement says "BLM didn't address impacts from mining actions on sage grouse", then the team should make sure the issue and response is in the sage grouse impacts analysis tab. If it's in the mining impacts tab, it should be moved to SG.

Reference back to the DEIS or FEIS sections with section numbers, not page numbers. Makes future technical editing easier to follow. E.g., "Additionally, the references sited in the Fire and Fuels affected environment were updated to reflect the new informaton provided by commenters. See Section XX of this FEIS."

For any response where you need to address the issue of budget cost analysis use this:

As a landscape level planning effort, none of the alternatives prescribe project-level or site-specific activities on BLM or USFS managed lands. Furthermore, the agencies' selection of an alternative does not authorize funding to any specific project or activity nor does it directly tie into the agencies' budgets as appropriated annually through the Federal budget process. As a consequence, agencies' costs and differences in program costs across alternatives have not been quantified. Information has been presented in several resource impact sections on the types of costs that might be associated with various sage-grouse conservation measures.

For issues related to PECE, use this information:

When applying the ESA five-factor (particularly regulatory mechanisms) and PECE analysis to the BLM and FS plan decisions, the decisions in the plans will be evaluated based on the certainty of effectiveness that those decisions will contribute to the elimination or adequate reduction of one or more threats to the greater sage-grouse.

[http://www.sagebrushsea.org/esa/FWS\\_PECE\\_q&a.pdf](http://www.sagebrushsea.org/esa/FWS_PECE_q&a.pdf)

This link is to a USFW Q&A paper that informs the PECE policy.

## National Response

Adaptive management is a systematic approach for improving resource management by learning from management outcomes. An adaptive approach involves exploring alternative ways to meet management objectives, predicting the outcomes of alternatives based on the current state of knowledge, implementing one or more of these alternatives, monitoring to learn about the impacts of management actions, and then using the results to update knowledge and adjust management actions.

Incorporating adaptive management into the [insert name of plan] will help ensure a high degree of certainty that the decisions in the plan will effectively contribute to the elimination or adequate reduction of one or more threats to the greater sage-grouse and its habitat.

The agencies will use the data collected from monitoring (Appendix X) to identify any changes in habitat conditions related to the goals and objectives of the plan. The BLM/FS will use the information collected through monitoring to determine when adaptive management triggers are met. The adaptive management soft and hard triggers and land use planning responses to these triggers are in [insert management action where the triggers and responses are referenced].

Soft triggers represent an intermediate threshold indicating that management changes are needed at the project/implementation level to address habitat and population losses. Hard triggers represent a threshold indicating that immediate action is necessary to stop a severe deviation from greater sage grouse conservation

## National Response

Mitigation has been further defined as a Regional Mitigation Framework and is detailed in Appendix X. The Framework is incorporated in the [insert Proposed Plan/Proposed Plan Amendment] and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats.

If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures, then compensatory mitigation projects will be used to fully offset impacts to achieve conservation benefits. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.

Specific mitigation strategies, based on the Framework, will be developed by regional teams within one year of the issuance of the Record of Decision and be consistent with the BLM's Regional Mitigation Manual MS-1794, Forest

## NOTES

Several topics have issue statements related to "BLM needs to consider more/adequate/additional/etc. mitigation." For most of these issue statements, it sounds like BLM needs to consider/disclose the mitigation strategy to address impacts from that resource/use on sage grouse. In such cases, the national mitigation response is appropriate. When the issue statement speaks more about additional topic specific mitigations to address impacts from the SG or other management actions on that resource/use, then it may not be appropriate to respond with the national mitigation language. Closer review of the issue/response in the XX.5 sections is needed.

## National Response

## Monitoring / Disturbance Caps Language

The Monitoring Framework in Appendix X outlines the methods that the BLM and USFS will use to monitor habitats and evaluate the implementation and effectiveness of the planning strategy to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the USFS (36 CFR part 209, published July 1, 2010) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations, based on the sensitivity of the resource to the decisions involved. BLM and USFS will use the methods described in Appendix X to collect monitoring data to evaluate implementation and effectiveness of the Greater Sage-grouse planning strategy and the conservation measures contained in land use plans.

To ensure that the BLM and USFS have the ability to make consistent assessments about sage-grouse habitats across the range of the species, the framework in Appendix X provides the methodology for monitoring the implementation and evaluating the effectiveness of BLM/USFS actions to conserve the species and its habitat through monitoring that informs effectiveness at multiple scales.

Implementation monitoring results will provide information to allow the BLM and USFS to evaluate the extent that decisions from the BLM resource management plans (RMP) and USFS land management plans (LMP) to conserve greater sage-grouse and its habitat have been implemented. Effectiveness monitoring will provide the information to evaluate BLM and USFS actions to reach the objective of the planning strategy (BLM IM 2012-044), to conserve greater sage-grouse populations and habitats.

Monitoring efforts will include data for measurable quantitative indicators of sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions. This information will assist the BLM and USFS with identifying whether or not they are achieving their land use plan goals and objectives, as well as providing information

Use this tab to address the disturbance and cap information  
how formulated; the science behind  
how to implement  
tracking  
monitoring disturbance  
evaluating disturbance

- OR
- 2) Commenters also requested clarification of the 3 percent disturbance cap, including the following:
- The methods by which the 3 percent level was decided.
  - The current level of disturbance in the planning area.
  - What specific activities will count towards the disturbance, including if transmission line disturbance, temporary construction disturbance, water developments, range improvements, and conversion of sage brush to crop/pasture will count towards the disturbance cap.
  - The order of approval for applications for surface disturbing uses.
  - The feasibility of the 3 percent disturbance cap and how it will be implemented.
  - How the disturbance cap will impact development on private lands.

UT 4. Commenters felt there was no methodology or scientific backing for establishing the disturbance cap in the alternatives, and that the BLM/FS needed to demonstrate more range in the disturbance cap amounts presented in the alternatives. There is also no discussion of how this disturbance cap will be implemented.

ID d. Commenters felt there was no methodology or scientific backing for establishing the disturbance cap in the alternatives, and that the BLM/FS needed to demonstrate more range in the disturbance cap amounts presented in the alternatives.

NV-CA 3. The disturbance cap:

NWCO 4. Commenters felt there was no methodology or scientific backing for establishing the disturbance cap in the alternatives, and that the BLM/FS needed to demonstrate more range in the disturbance cap amounts presented in the alternatives.

Lewisto 3. Commenters believed that the DRMPA/DEIS needed  
wn additional explanation for the methodology for establishing the disturbance cap in the alternatives, as well as better explanation for how the actions would be implemented. The BLM needs to show the differences between disturbance cap amounts presented in the alternatives. Fire should be added as a contributing factor in accounting for the disturbance cap.

ND

2) Ample literature establishes a relationship between disturbance and GRSG occupancy and persistence. Two papers in particular establish thresholds of disturbance related to development and GRSG persistence. See Section 4.2, specifically references to Kirol 2012 and Knick 2013 [Note: Check these references with Glenn], which are recent studies done on disturbance thresholds and GRSG. Based on this literature, the alternatives consider a range of appropriate disturbance caps.

While the caps would set a particular level of disturbance, the implementation of the disturbance caps would occur after the RMPA is approved in the Record of Decision. The BLM inventoried GRSG habitat with the best available info at the time of the DEIS, but would also perform additional in-depth analysis & inventory within Utah management zones at the implementation stage. The BLM has added a preliminary disturbance inventory to more accurately assess current disturbance levels and potential impacts across the planning area to Appendix G. This was completed through a collaborative process with the BLM, Forest Service, and USFWS, and included prioritization of management zone. [NOTE TO BLM: Review the previous sentence for accuracy.] In addition, the disturbance cap in the Final EIS was revised to provide additional detail such as enhanced descriptions of what types of activities would count towards the disturbance totals, where disturbance activities would count against the cap, reclamation and habitat requirements for a disturbed area for both temporary and permanent disturbance, and how the cap would be implemented and monitored.

Future activities that are expected to cause disturbance, such as ROW/SUP applications, would be evaluated and approved on a case-by-case basis based upon site-specific determination of the ability to avoid, minimize, and/or mitigate impacts on GRSG habitat at the implementation phase. A proposed project's contribution to the amount of disturbance on the landscape would be evaluated during site-specific NEPA analysis.

Per requirements of NEPA, the BLM considers disturbance in private lands when making land use decisions since actions on private lands could impact the BLM's ability to manage for sage-grouse. So while the BLM cannot make planning or implementation decisions on private lands, the disturbance levels of nearby private lands will be considered in these planning process and future project-level decision. Clarifications to the document have been

4. In determining the disturbance cap level for each alternative, the BLM utilized the recommendations and input specific to each alternative. For example, for Alternative B, the BLM utilized the cap levels recommended in the NTT Report. Conservation measures included in Alternative F focus primarily on GRSG PPH and include a 3-percent disturbance cap in PPH. PPH areas have the highest conservation value to maintaining or increasing GRSG populations. Ample literature establishes a relationship between disturbance and GRSG occupancy and persistence. Two papers in particular establish thresholds of disturbance related to development and GRSG persistence. See Section 4.2, specifically references to Kirol 2012 and Knick 2013, which are recent studies done on disturbance thresholds and GRSG. Based on this literature, the alternatives consider a range of appropriate disturbance caps.

While the caps would set a particular level of disturbance, the implementation of the disturbance caps would occur after the RMPA is approved in the ROD. The BLM inventoried the habitat with the best available info at the time of the DEIS, but would also perform additional in-depth analysis & inventory within Utah management zones at the implementation stage. The BLM and Forest Service have added Appendix XX [new appendix] with preliminary disturbance inventory to more accurately assess current disturbance levels and potential impacts across the planning area. [NOTE TO BLM: EMPSi will update appendix number once it has been added to the FEIS.] This was completed through a collaborative process with the BLM, Forest Service, and USFWS, and included prioritization of management zone. [NOTE TO BLM: Review the previous sentence for accuracy.] In addition, the disturbance cap in the Final EIS was revised to provide additional detail such as enhanced descriptions of what types of activities would count towards the disturbance totals, where disturbance activities would count against the cap, reclamation and habitat requirements for a disturbed area for both temporary and permanent disturbance, and how the cap would be implemented and monitored.

Future activities that are expected to cause disturbance, such as ROW/SUP applications, would be evaluated and d. In determining the disturbance cap level for each alternative, the BLM utilized the recommendations and input specific to each alternative. For example, for Alternative B, the BLM utilized the cap levels recommended in the NTT Report. Conservation measures included in Alternative B focus primarily on GRSG PPH and include a 3-percent disturbance cap in PPH. PPH areas have the highest conservation value to maintaining or increasing GRSG populations.

For Alternative C, conservation measures were mostly focused on ADH (PPH, PGH, and linkage/connectivity habitat). These areas have been identified by CPW in coordination with respective BLM offices, and include a 3-percent cap on disturbance in ADH. This disturbance cap number for Alternatives B and C were incorporated as-is from the NTT Report and conservation group alternatives; the BLM did not modify the caps in the alternatives.

For Alternative D, the BLM intended to protect those areas that were most important for sage-grouse within PPH; in other words, the alternative would protect the best of the best habitat. The BLM utilized information from the Wyoming Core Strategy to support consideration of the five-percent disturbance cap, with the goal to represent the reasonable edge of the range of alternatives with a higher percentage.

While the caps would set a particular level of disturbance, the implementation of the disturbance caps would occur after the RMPA is approved in the Record of Decision. The BLM inventoried the habitat with the best

### 3. Disturbance Cap

In determining the disturbance cap level for each alternative, the BLM utilized the recommendations and input specific to each alternative. For example, for Alternative B, the BLM utilized the cap levels recommended in the NTT Report. Conservation measures included in Alternative B focus primarily on GRSG PPH and include a 3-percent disturbance cap in PPH. PPH areas have the highest conservation value to maintaining or increasing GRSG populations.

[NOTE TO BLM: Input specifics about how the disturbance cap was determined for each alternative. Example: 3% cap came from NTT report.]

In determining the disturbance cap level for each alternative, the BLM utilized the recommendations and input specific to each alternative. For example, for Alternative B, the BLM utilized the cap levels recommended in the NTT Report. Conservation measures included in Alternative B focus primarily on GRSG PPH and include a 3-percent disturbance cap in PPH. PPH areas have the highest conservation value to maintaining or increasing GRSG populations.

For Alternative C, conservation measures were mostly focused on ADH (PPH, PGH, and linkage/connectivity habitat). These areas have been identified by CPW in coordination with respective BLM offices, and include a 3-percent cap on disturbance in ADH. This disturbance cap number for Alternatives B and C were incorporated as is from the NTT Report and conservation group alternatives; the BLM did not modify the caps in the alternatives.

For Alternative D, the BLM intended to protect those areas that were most important for sage-grouse within PPH; in other words, the alternative would protect the best of the best habitat. The BLM utilized information from the Wyoming Core Strategy to support consideration of the five-percent disturbance cap, with the goal to represent the reasonable edge of the range of alternatives with a higher percentage.

While the caps would set a particular level of disturbance, the implementation of the disturbance caps would occur after the RMPA is approved in the Record of Decision. The BLM inventoried the habitat with the best 3. [NOTE TO BLM: clarifications and changes to the disturbance cap in the FEIS will likely come from the National Policy Team. Will likely need to include explanation of the changes made and rationale for changes.]

## Response

n/a

n/a

1. FEIS will identify an Environmentally Preferred Alternative per CEQ regulations.

2. NOTE TO BLM: Is there a requirement to evaluate the plan (assuming Proposed Plan) to the USFWS's Eval Criteria? Is this something that may be done as part of the agreement with USFWS? If not, should include rationale for why not.

3. May already be included in the Summary of Impacts table at the end of chapter 2. If so, include reference to this for the reader.

n/a

While there was consistent direction provided in alternative development, such as BLM WO IM 2012-044, variation across sub-regionals was needed to accommodate the local issues and specific state requirements. The best available science will guide GRS objectives utilized for all sub-regions.

## Response

At multiple stages in the creation of the RMPA/DEIS, the BLM gathered and incorporated public comments during formal comment periods, which included public scoping and meetings before the Draft EIS began and during the public comment period and public meetings that occurred after the Draft EIS was published. All public entities were invited to comment during these formal comment periods, including individuals, organizations, businesses, and local, state, federal, and tribal government entities. Scoping and allowing comments on the Draft EIS is a requirement of the NEPA regulations (40 CFR 1501.7 and 1503) and the BLM planning regulations (43 CFR 1610.2 and 43 CFR 1610.4-1). The intent of these public comment periods is to encourage collaborative public involvement through the process of developing the RMPA/EIS. Per the requirements of 43 CFR 1610.2(d), findings from scoping were documented in a scoping report issued in May, 2012. This report summarized the content of comments and identified major planning issues. Public input received during the scoping process was considered to ensure that all issues and concerns were addressed, as appropriate, in developing the alternatives. The planning team developed planning issues to be addressed in the RMPA, based on broad concerns or controversies related to conditions, trends, needs, and existing and potential uses of planning area lands and resources. See Section 1.5 for a detailed description of the scoping process and outcomes. The substantive comments collected during the public comment period for the Draft EIS were compiled, along with statistics on commenters and affiliations, associated issue statements and responses, and the location of changes to the document, and are included in the RMPA/Final EIS in Chapter XX [or Appendix XX], along with a complete explanation of the procedures followed for analyzing comments. These comments were reviewed to assess inadequacies and missing items from the Draft EIS, and changes were made to the Final EIS as appropriate. See Section XXX for additional details on the comment analysis process.

All substantive comments received on the Draft EIS were considered and reviewed for information that would result in changes to the document. Comments simply stating a preference for or against a specific alternative or opinions without reasonable bias were considered non-substantive since they do not meet the substantive comment requirement of BLM Handbook H-1790-1, Section 6.9.2.1. Form letters, or identical letters submitted by different commenters, were identified as part of the RMPA/DEIS comment response effort. Since these submissions are identical in nature, it is adequate for only one “master” form letter to be included as part of the comment response effort and reviewed

All substantive comments received on the Draft EIS were considered and reviewed for information that would result in changes to the document. Comments simply stating a preference for or against a specific alternative or opinions without reasonable bias were considered non-substantive since they do not meet the substantive comment requirement of BLM Handbook H-1790-1, Section 6.9.2.1. The substantive comments, along with the commenter and associated issue statements and responses, are presented in the Proposed LUPA/Final EIS in Chapter XX [or Appendix XX], along with a complete explanation of the procedures followed for analyzing comments. See Section XXX for additional details on the comment analysis process.

[NOTE TO BLM: Section/Appendix numbers will be updated by EMPSi once this section has been added to the FEIS.]

Form letters, or identical letters submitted by different commenters, were identified as part of the DLUPA/DEIS comment response effort. Since these submissions are identical in nature, it is adequate for only one “master” form letter to be included as part of the comment response effort and reviewed for substantive comments. All form letters will be entered into the project decision file and all commenters will be entered into the project decision file as having submitted a comment during the DLUPA/DEIS comment period.

[NOTE TO BLM: Waiting on direction from national team on how will changes be noted between the DEIS and FEIS. EMPSi will include language on this topic in this response.]

All substantive comments received on the Draft EIS were considered and reviewed for information that would result in changes to the document. Comments simply stating a preference for or against a specific alternative or opinions without reasonable bias were considered non-substantive since they do not meet the substantive comment requirement of BLM Handbook H-1790-1, Section 6.9.2.1. The substantive comments, along with the commenter and associated issue statements and responses, are presented in the Proposed LUPA/Final EIS in Chapter XX [or Appendix XX], along with a complete explanation of the procedures followed for analyzing comments. See Section XXX for additional details on the comment analysis process.

Index of parties, comments, and responses will be provided in the FEIS. Changes made to the EIS will be noted [NOTE TO BLM: how did you want to show the changes? Grey highlight, strike out, etc.?]

The BLM provided public notification as required by FLPMA 103(d), CEQ 40 CFR 1500-1508, and BLM 43 CFR 1600-1610. A press release was issued in July 2011 announcing a strategy to conserve sage-grouse and protect its habitat, followed by additional press releases in December 2011. Pursuant to NEPA requirements (40 CFR 1501.7) and BLM Planning Regulations (43 CFR 1610.2 and 1610.4-1) a Federal Register Notice of Intent (NOI) was published on December 9, 2011 announcing the beginning of a 60 day scoping period. The public was invited to participate in scoping meetings throughout the planning area, and provide comments during the scoping period which was scheduled to end on February 7, 2012 but was extended to March 23, 2012. Throughout development of the draft EIS the BLM has provided information through numerous methods including the Internet, news releases, and social media. Contact information is provided on the project website and interested parties have been encouraged to contact the BLM if they wish. In addition, after the Draft EIS was issued the BLM and USFS held seven workshops in December 2013 to provide information and answer questions about the Draft EIS. The meetings were announced through press releases to local television, radio, and newspapers.

Potential impacts to local economies and cultures are part of the analysis conducted during development of the EIS.

Should this be addressed here or in the socioeconomic section?

Plan	Issue Statement
OR	n/a
UT	The BLM did not coordinate with state and local agencies that would be affected by the actions considered in the EIS, as required by NEPA and FLPMA. Several agencies requested cooperator status for review and revisions to the Final EIS.

ID-SW See note to BLM in response.  
MT

NV-CA The BLM did not coordinate with local agencies that would be adversely economically affected by the actions considered in the EIS. Additionally, the BLM did not coordinate with Elko County on the development of the EIS.

NWCO The BLM did not coordinate with state and local agencies that would be adversely economically affected by the actions considered in the EIS, including the City of Rifle and the Colorado River Fire Rescue Regional Fire Authority. Additionally, the BLM did not coordinate with Garfield County School District on development of the EIS.

Lewisto The BLM and Forest Service should work  
wn with local cooperating agencies if local field office objectives are developed in the future.

ND The USFWS should not be involved in the process of developing local objectives for Greater Sage-Grouse (GRSG) management because the GRSG is not a listed species and they have no authority over BLM land use decisions.

WY9

## Response

n/a

Both the CEQ and BLM Planning regulations define cooperating agency status, including what it is, who is eligible to become a cooperating agency, and how the lead agency should invite participation as a cooperating agency (40 CFR 1501 and 1508; 43 CFR 1601.0-5). Cooperating relationships are limited to government entities, state agencies, local governments, tribal governments, and other Federal agencies that have jurisdiction by law or special expertise. Additionally, per the regulations and BLM policy, there is no coordinating agency status (BLM Desk Guide to Cooperating Agency Relationships and Coordination with Intergovernmental Partners, pages 21 and 31, respectively). To be a cooperating agency, the local agency must meet the eligibility criteria set out in the regulations and policies. The specific role of each cooperating agency is based on jurisdiction by law or special expertise, which is determined on an agency-by-agency basis and identified in the Memorandum of Understanding.

Cooperating agency relationships are described in the Final EIS in Section 5.3, Cooperating Agencies. In December 2011, the BLM sent letters to 15 tribal governments inviting them to be cooperating agencies. The BLM also sent letters to 36 local, state, and federal agencies inviting them to participate as cooperating agencies for the LUPA/EIS. Subsequently, the State of Wyoming and 4 local government agencies in Wyoming requested and were granted cooperating agency status for the Utah Sub-regional LUPA/EIS effort, given the portions of two National Forests that overlap into Wyoming and their proximity to the Utah planning area. To date, 30 agencies agreed to participate on the EIS as designated cooperating agencies, 26 of which have signed Memoranda of Understanding with the BLM's Utah State Office (Table 5.1, Cooperating Agencies).

In addition to the BLM's invitations to a wide variety of agencies to participate as Cooperating Agencies, DOI regulations (43 CFR 46.225(c)) require the BLM, as lead agency, to consider any request by a government entity to participate as a Cooperating Agency (BLM Desk Guide to Cooperating Agency Relationships and Coordination with Intergovernmental Partners, pages 8-9). From the time that the Notice of Intent was published and throughout the development of the EIS, an agency could notify the BLM requesting Cooperating Agency status. Section 202 of FLPMA requires the BLM and Forest Service, to the extent consistent with the laws governing the administration of the public lands, coordinate the land use inventory, planning, and management activities of or for such lands with the land use planning and management programs of other Federal departments and agencies and of the States and local governments within which the lands are located. NOTE TO BLM: In reviewing the comments, the theme among all of them is "BLM should work with cooperating agencies, recognize the work done with other groups, and notify the military when doing burns" which I would suggest are not something that would result in changes to the FEIS or actions; therefore, I would recommend not including this summary. I would suggest that if the information is not already in the FEIS, then you could provide further clarification of the role of cooperating agencies, additional discussions or work with other groups, or information of the follow up actions that would occur with cooperating agencies. If all of this information is already in the document, then the entire summary/response Both the CEQ and BLM Planning regulations define cooperating agency status, including what it is, who is eligible to become a cooperating agency, and how the lead agency should invite participation as a cooperating agency (40 CFR 1501 and 1508; 43 CFR 1601.0-5). Cooperating relationships are limited to government entities: state agencies, local governments, tribal governments, and other Federal agencies that have jurisdiction by law or special expertise (BLM Desk Guide to Cooperating Agency Relationships... Section 4, page 21).

[NOTE TO BLM: Elko County states they were listed as a coordinating agency but were not included in discussions.]

The BLM is working with Elko County as a Cooperating Agency under a signed MOU. Pursuant to FLPMA 202 (c)(9) the BLM engages in ongoing communication regarding coordination of land management activities with other state, local and Tribal governments.

Both the CEQ and BLM Planning regulations define cooperating agency status, including what it is, who is eligible to become a cooperating agency, and how the lead agency should invite participation as a cooperating agency (40 CFR 1501 and 1508; 43 CFR 1601.0-5). Cooperating relationships are limited to government entities: state agencies, local governments, tribal governments, and other Federal agencies that have jurisdiction by law or special expertise. Additionally, per the regulations and BLM policy, there is no coordinating agency status (BLM Desk Guide to Cooperating Agency Relationships and Coordination with Intergovernmental Partners, pages 21 and 31, respectively). To be a cooperating agency, the local agency must meet the eligibility criteria set out in the regulations and policies.

These relationships were described in the Draft EIS in Section 6.3, Cooperating Agencies (page 986). On January 20, 2012, the BLM wrote to 80 local, state, federal, and tribal representatives, inviting them to participate as cooperating agencies for the Northwest Colorado GRS G LUPA/EIS. Twenty-two agencies agreed to participate on the EIS as designated cooperating agencies, all of which have signed MOUs with the Northwest District Office (Table 6.1, Cooperating Agencies). The City of Rifle was one of the 80 invited agencies; however, the City did not accept the invitation. While the BLM did formally invite the State of Colorado, a specific participation invitation letter was not sent to the Colorado River Fire Rescue Regional Fire Authority.

In addition to the BLM's invitations to a wide variety of agencies to participate as Cooperating Agencies, the BLM published the following statement in the Notice of Intent, published in the Federal Register on December 9, 2011:

Federal, State, and local agencies, along with other stakeholders that may be interested or affected by the BLM's or FS's decision on this proposal are invited to participate in the scoping process and, if eligible, may request or be requested by the BLM to participate as a cooperating agency.

DOI regulations (43 CFR 46.225(c)) require the BLM, as lead agency, to consider any request by a government entity to participate as a Cooperating Agency (BLM Desk Guide to Cooperating Agency Relationships and Coordination with Intergovernmental Partners, pages 8-9). From the time that the Notice of Intent was published and throughout the development of the EIS, an agency could notify the BLM requesting Cooperating Agency status. However, the BLM did not receive this notification from the Colorado River Fire Rescue Regional Fire Authority or any other agency or entity [NOTE TO BLM: this sounds like a later implementation level action that they would like to be involved in. A response could address the programmatic nature of this document and defer any future commitments to cooperating agency status to later date. Here is some suggested language, modify as needed.]

As the decisions under consideration by the BLM and the Forest Service are programmatic in nature and would not result in on-the-ground planning decision or actions, the scope of the management actions were considered at a broad, programmatic level. As specific actions come under consideration, such as future local management actions to implement the broad objectives and goals presented here, the BLM and the Forest Service will conduct subsequent NEPA analyses that may include future coordination with local cooperating agencies. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for any site-specific actions. Specifically, GRS G Objectives to be considered have been included in Appendix X Figure Appendix Maps, and will be analyzed during lead book

In March 2010, the US Fish and Wildlife Service (USFWS) published its listing decision for the Greater Sage-Grouse (GRSG) as “Warranted but Precluded” (75 Federal Register 13910, March 23, 2010). Inadequacy of regulatory mechanisms was identified as a major threat in the USFWS finding on the petition to list the GRSG under the Endangered Species Act (ESA). The USFWS has identified conservation measures in resource management plans (RMPs) as the principal regulatory mechanism for protecting GRSG on BLM-administered lands. In response to the USFWS findings, the BLM are evaluating the adequacy of its RMPs and will address, as necessary, amendments to RMPs throughout the range of the GRSG.

The Federal Land Policy and Management Act (FLPMA) and National Environmental Policy Act (NEPA) provide BLM managers with complementary directives regarding coordination and cooperation with other agencies and governments. FLPMA emphasizes the need to insure coordination and consistency with the plans and policies of other relevant jurisdictions. NEPA provides for what is essentially a cooperative relationship between a lead agency (here, BLM) and cooperating agencies in the NEPA process.

Both the Council on Environmental Quality (CEQ) and BLM Planning regulations define cooperating agency status, including what it is, who is eligible to become a cooperating agency, and how the lead agency should invite participation as a cooperating agency (40 CFR 1501 and 1508; 43 CFR 1601.0-5). Cooperating relationships are limited to government entities: state agencies, local governments, tribal governments, and other Federal agencies that have jurisdiction by law or special expertise. To be a cooperating agency, the local agency must meet the eligibility criteria set out in the regulations and policies. The CEQ defines cooperating agency in regulations implementing NEPA, particularly at 40 CFR 1501.6 and 1508.5. CEQ regulations specify that a Federal agency, state agency, local government, or Tribal government may qualify as a cooperating agency because of “. . . jurisdiction by law or special expertise.”

- 1) Jurisdiction by law means “. . . agency authority to approve, veto, or finance all or part of the proposal.” (40 CFR 1508.15)
- 2) Special expertise means “. . . statutory responsibility, agency mission, or related program experience.” (40 CFR 1508.26)

Plan	Issue Statement
------	-----------------

- |        |  |
|--------|--|
| OR 1/3 | <p>1) Commenters stated that the alternatives fail to meet NEPA adequacy because:</p> <ul style="list-style-type: none"><li>• One more of the alternatives fail to meet the purpose and need for the action.</li><li>• Alternatives were too similar and the BLM needs to provide a wider range of alternatives.</li><li>• The BLM needs to consider the alternatives presented by Cooperating Agencies including the County alternatives, the Conservation Groups' alternative (specifically the Harney County Soil and Water Conservation District Rural Community Alternative), and alternatives for the listing of the species or not listing the species.</li><li>• The BLM failed to adequately define the No Action Alternative and did not determine if the existing regulatory mechanisms are insufficient to protect the GRSG.</li><li>• The alternatives do not address the key threats to GRSG as listed by the USFWS, notably fires, invasive weeds, and juniper encroachment.</li><li>• CCAs and CCAAs have not been</li></ul> |
|--------|--|

- OR 2/3 2) Commenters also requested clarification of the 3 percent disturbance cap, including the following:
- The methods by which the 3 percent level was decided.
  - The current level of disturbance in the planning area.
  - What specific activities will count towards the disturbance, including if transmission line disturbance, temporary construction disturbance, water developments, range improvements, and conversion of sage brush to crop/pasture will count towards the disturbance cap.
  - The order of approval for applications for surface disturbing uses.
  - The feasibility of the 3 percent disturbance cap and how it will be implemented.
  - How the disturbance cap will impact development on private lands.

UT I/4 The comments were focused on several issues related to the alternatives presented in the Draft EIS:

1. Commenters believed that the preferred alternative does not meet the stated purpose & need.

2. Commenters felt that the alternatives were all largely the same, and that the BLM needed to provide more distinction (range) between the alternatives.

3. BLM needs to consider the alternatives presented by Cooperating Agencies and Environmental Organizations, including county proposed alternatives, the Sage-grouse Recovery Alternative, and alternatives for the listing of the species or not listing the species.

~~4. Commenters felt there was no methodology or scientific backing for establishing the disturbance cap in the alternatives, and that the BLM/FS needed to demonstrate more range in the disturbance~~

UT3/4

UT4/4

ID-SW I. The alterantives fail to meet NEPA  
MT 1/3 adequacy because:

- a. they (indiividally or collectively) do not meet the purpose and need for the action
- b. alternatives were all largely the same, and that the BLM needed to provide more distinction (range) between them
- c. BLM needs to consider the alternatives presented by Cooperating Agencies and Environmental Organizations, including the County alternatives, the Conservation Groups' alternative, and alternatives for the listing of the species or not listing the species.
- ~~d. Commenters felt there was no methodology or scientific backing for establishing the disturbance cap in the alternatives, and that the BLM/FS needed to demonstrate more range in the disturbance cap amounts presented in the alternatives.~~
- e. specifically that Alternative D needed to include the Ecological Site Descriptions to provide adequate understanding of the current management
- f. and the BLM and Forest Service failed to adequately define the No Action Alternative.

ID-SW  
MT 2/3

ID-SW  
MT 3/3

- NV-CA This category needs to be split into:
- 1/2
1. BLM needs to consider the other alternatives presented by Cooperating Agencies and Environmental Organizations.
  2. Consider an additional alternative
  - ~~3. The disturbance cap:~~
  4. Alternatives B, C, D, and F do not meet the purpose and need

NWCO The comments were focused on several issues related to the alternatives presented in the Draft EIS:

1. Commenters believed that the preferred alternative does not meet the stated purpose & need.
2. Commenters felt that the alternatives were all largely the same, and that the BLM needed to provide more distinction (range) between the alternatives.
3. BLM needs to consider the alternatives presented by Cooperating Agencies and Environmental Organizations, including the Garfield County alternative, the Sage grouse Recovery Alternative, and alternatives for the listing of the species or not listing the species.
4. ~~Commenters felt there was no methodology or scientific backing for establishing the disturbance cap in the alternatives, and that the BLM/FS needed to~~

Lewisto wn The comments focused on several issues related to the alternatives presented in the DRMPA/DEIS:

1. Commenters believed that the stated purpose and need is overly narrow, and that the goals and objectives presented in the alternatives would not meet the purpose for the action, namely conservation of the GRSG.

2. The BLM should modify the alternatives several ways, including changing the Conservation Alternative (Alternative C) to include only those elements that were provided by the conservation organizations, include a No Grazingreduced grazing alternative that included a 50% reduction in actual use, and an alternative that would not include universal closures and NSO stipulations to areas available for leasing.

~~3. Commenters believed that the DRMPA/DEIS needed additional explanation for the methodology for establishing the disturbance cap in the alternatives, as well as~~

ND BLM did not have an alternative that is less restrictive than no surface occupancy (NSO) in priority habitat (PH) and controlled surface use (CSU) in general habitat (GH), and less restrictive than no leasing. BLM is violating its responsibility to develop a balanced preferred alternative that incorporates multiple use concepts.

WY9

## Response

1) In accordance with NEPA, the BLM has discretion to establish the purpose and need for action (40 CFR 1502.13). CEQ regulations direct that an EIS "...shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action" (40 CFR 1502.13). Also, under the CEQ regulations, the BLM and the Forest Service are required to "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources as provided by section 102(2)(E) of the Act [NEPA]." (40 CFR 1501.2(c)). The breadth or narrowness of the purpose and need statement has a substantial influence on the scope of the subsequent analysis. The purpose and need statement provides a framework for issue identification and will inform the rationale for alternative selection. The range of alternatives developed are intended to meet the purpose and need and address the issue; thereby, providing a basis for eventual selection of an alternative in a decision (BLM NEPA handbook and Forest Service Handbook 1909.15 – National Environmental Policy Act Handbook Chapter 10 – Environmental Analysis).

The BLM prepared the Oregon GRSR RMPA/EIS to be applied to lands with greater sage-grouse habitat. This effort responds to the FWS's March 2010 'warranted, but precluded' Endangered Species Act listing petition decision, and that existing regulatory mechanisms in BLM land use plans was inadequate to protect the species and its habitat. The range of alternatives, including the preferred alternative and its components (such as the disturbance caps), focus on areas affected by threats to greater sage-grouse habitat identified by the FWS in the March 2010 listing decision. The primary threats to the sage-grouse across its range are habitat loss and fragmentation (including wildfire), invasive plants, energy development, urbanization and agricultural conversion and grazing. To address the threats, BLM considered a range of changes in management of greater sage-grouse habitats to avoid the continued decline of populations and habitats across BLM-administered lands. This purpose and need provides the appropriate scope to allow the BLM to analyze a reasonable number of alternatives to cover the full spectrum of potential impacts. Formulated by the planning team, the preferred alternative represents those goals, objectives, and actions determined to be most effective at resolving planning issues, balancing resource use at this stage of the process, and meet the stated purpose and need for action. While collaboration is critical in developing and evaluating alternatives, the final designation of a preferred alternative remains the exclusive responsibility of the BLM. See Section 2.13, Considerations for Selecting a Preferred Alternative, for further details.

The range of alternatives the BLM considered during the greater sage-grouse planning process in full compliance with the

The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions. Based on this alternative development process, the BLM considered input from cooperating agencies and associated land use plans, environmental organizations, and the public. The resulting action alternatives offer a range of possible management approaches for responding to planning issues and concerns identified through public scoping, and to maintain or increase GRSG abundance and distribution in the planning area. The relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the five alternatives are described in Table 2-5, Summary Comparison of Resource Allocations in Greater Sage-Grouse Habitats, in Section 2.9, Comparison of Alternatives, of the Draft EIS.

A full description of Alternative A, including the current management and regulatory mechanisms in place, was included as Appendix B in the Draft EIS. These mechanisms are also analyzed throughout the RMPA/DEIS as Appendix A. Current management for sage-grouse or sagebrush habitats are highly variable due to the ages of the incorporated plans and relevant issues when those plans were written. The USFWS determined that "...existing regulatory mechanisms are inadequate...", as listed under Factor D in the USFWS 12-Month Findings for Petitions to List the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered (75 Federal Register 13910-14014, March 23, 2010). When possible, Alternative A was grouped by topic to facilitate comparisons between alternatives.

As described in 2.5.4, Alternative B, the BLM used the GRSG conservation measures recommended in NTT report, as appropriate, to create Alternative B. This is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044 (the BLM must consider all applicable conservation measures developed by the NTT in at least one alternative in the land use planning process).

Whether the Greater Sage-Grouse is determined for listing by the USFWS is outside the jurisdiction of the BLM and beyond the scope of this EIS. As noted in the Purpose and Need, the BLM was to consider regulatory mechanisms that would protect the species and its habitat. As such, the BLM did not develop alternatives should the USFWS choose to list or not list the Greater Sage-grouse.

Additional actions for managing wildland fire, invasive species, and juniper treatments have been added to the alternatives to more fully address these threats to GRSG in the FEIS. Language has been added to Appendix H clarifying how the wildland fire and invasive species assessments were conducted. Clarifications were added on linkages and connectivity between PACs and focal areas in Chapter 3. CCA and CCAs are not a land management action, but rather a programmatic agreement between the BLM, USFWS, NRCS, private landowners, and other local, state, and federal agencies. As such, they cannot be included in the action alternatives. However, they have been added as a RFFA in Chapter 5, along with a cumulative impacts analysis. [Note to BLM: Review this description]

~~2) Ample literature establishes a relationship between disturbance and GRSG occupancy and persistence. Two papers in particular establish thresholds of disturbance related to development and GRSG persistence. See Section 4.2, specifically references to Kiroi 2012 and Knick 2013 [Note: Check these references with Glenn], which are recent studies done on disturbance thresholds and GRSG. Based on this literature, the alternatives consider a range of appropriate disturbance caps. While the caps would set a particular level of disturbance, the implementation of the disturbance caps would occur after the RMPA is approved in the Record of Decision. The BLM inventoried GRSG habitat with the best available info at the time of the DEIS, but would also perform additional in-depth analysis & inventory within Utah management zones at the implementation stage. The BLM has added a preliminary disturbance inventory to more accurately assess current disturbance levels and potential impacts across the planning area to Appendix G. This was completed through a collaborative process with the BLM, Forest Service, and USFWS, and included prioritization of management zone. [NOTE TO BLM: Review the previous sentence for accuracy.] In addition, the disturbance cap in the Final EIS was revised to provide additional detail such as enhanced descriptions of what types of activities would count towards the disturbance totals, where disturbance activities would count against the cap, reclamation and habitat requirements for a disturbed area for both temporary and permanent disturbance, and how the cap would be implemented and monitored. Future activities that are expected to cause disturbance, such as ROW/SUP applications, would be evaluated and approved~~

1. In accordance with NEPA, the BLM and Forest Service have discretion to establish the purpose and need for action (40 CFR 1502.13). CEQ regulations direct that an EIS "...shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action" (40 CFR 1502.13). Also, under the CEQ regulations, the BLM and the Forest Service are required to "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources as provided by section 102(2)(E) of the Act [NEPA]." (40 CFR 1501.2(c)). The breadth or narrowness of the purpose and need statement has a substantial influence on the scope of the subsequent analysis. The purpose and need statement provides a framework for issue identification and will inform the rationale for alternative selection. The range of alternatives developed are intended to meet the purpose and need and address the issue; thereby, providing a basis for eventual selection of an alternative in a decision (BLM NEPA handbook and Forest Service Handbook 1909.15 – National Environmental Policy Act Handbook Chapter 10 – Environmental Analysis).

As stated in the DLUPA/EIS in Section 1.1, Introduction, the BLM and the Forest Service prepared the Utah LUP amendment with an associated EIS to be applied to lands with greater sage-grouse habitat. This effort responds to the FWS's March 2010 'warranted, but precluded' Endangered Species Act listing petition decision, and that existing regulatory mechanisms in BLM and the Forest Service land use plans was inadequate to protect the species and its habitat. The range of alternatives, including the preferred alternative and its components (such as the disturbance caps), focus on areas affected by threats to greater sage-grouse habitat identified by the FWS in the March 2010 listing decision. Formulated by the planning team, the preferred alternative represents those goals, objectives, and actions determined to be most effective at resolving planning issues, balancing resource use at this stage of the process, and meet the stated purpose and need for action. While collaboration is critical in developing and evaluating alternatives, the final designation of a preferred alternative remains the exclusive responsibility of the BLM and Forest Service. See Section 2.9, Preferred Alternative, for further details.

As stated in Section 1.7, Development of Planning Criteria, the LUPA will recognize all valid existing rights. The potential impacts on valid existing rights from management decisions in this plan amendment are further discussed in Section 4.20, Minerals, and Appendix R, Oil and Gas Reasonably Foreseeable Development Scenario for Greater Sage-Grouse Occupied Habitat in Utah Sub-Region.

2. The BLM and Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and Forest Service fully considered the management opportunities presented in the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. In addition, question 2a of the Forty Most Asked Questions Concerning CEQ's National Environmental Policy Act Regulations states that an EIS is required to examine all reasonable alternatives rather than all alternatives (CEQ 40 Questions). As a result, six alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options which address the issues of sage-grouse protection, including a no action alternative (current management, Alternative A), up to a conservation of all occupied GRSG habitat within Utah (Alternative C). Additional alternatives suggested that fit within the range of alternatives are considered to have been adequately analyzed and were not addressed separately.

As described in Section I.5, Planning Processes, of the Draft EIS, the Utah GRSG RMPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the RMPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable.

Public input received during the scoping process was considered to ensure that all issues and concerns would be addressed, as appropriate, in developing the alternatives. The planning team developed planning issues to be addressed in the RMPA, based on broad concerns or controversies related to conditions, trends, needs, and existing and potential uses of planning

The relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the six alternatives are described in Table 2.3, Summary Comparison of Alternatives by Decision, in Section 2.7, Summary Comparison of Alternatives, in the Draft EIS.

As part of the alternatives development process, only alternatives that are considered practical and feasible from a technical and economic standpoint were considered for analysis in the DLUPA/DEIS (CEQ 40 Questions). Some alternatives were considered, but eliminated from analysis for a variety of reasons. See Section 2.8, Alternatives Considered but Eliminated from Detailed Analysis, for explanations of these alternatives and why they were eliminated from consideration.

3. Based on this alternative development process, the BLM considered input from cooperating agencies, environmental organizations, and the public. As described in Section 2.1.2, Alternative B, the BLM used the GRSG conservation measures in A Report on National Greater Sage-Grouse Conservation Measures (NTT 2011) to form BLM management direction under Alternative B, which is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044 (the BLM must consider all applicable conservation measures developed by the NTT in at least one alternative in the land use planning process).

During scoping for the Utah GRSG RMPA/EIS, individuals and conservation groups submitted management direction recommendations for protection and conservation of GRSG and their habitat, including the Sage-grouse Recovery Alternative and proposed disturbance cap. The recommendations, in conjunction with resource allocation opportunities and internal sub-regional BLM input, were reviewed in order to develop BLM management direction for GRSG under Alternative C (Draft EIS, Section 2.1.3, Alternative C).

Alternative D incorporates adjustments to the NTT report (NTT 2011) to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses, and was developed in full cooperation with the Cooperating Agencies taking note of the agencies' concerns with socioeconomic issues.

Alternative E1 is based on the State of Utah's Conservation Plan for Greater Sage-Grouse in Utah, and would apply to all BLM-administered and National Forest System lands located in Utah. Alternative E2 is based on the State of Wyoming's Governor's Executive Orders 2011-05 and 2013-3 with adjustments by the BLM interdisciplinary team, which includes

4. In determining the disturbance cap level for each alternative, the BLM utilized the recommendations and input specific to each alternative. For example, for Alternative B, the BLM utilized the cap levels recommended in the NTT Report. Conservation measures included in Alternative F focus primarily on GRSG PPH and include a 3 percent disturbance cap in PPH. PPH areas have the highest conservation value to maintaining or increasing GRSG populations. Ample literature establishes a relationship between disturbance and GRSG occupancy and persistence. Two papers in particular establish thresholds of disturbance related to development and GRSG persistence. See Section 4.2, specifically references to Kiroi 2012 and Knick 2013, which are recent studies done on disturbance thresholds and GRSG. Based on this literature, the alternatives consider a range of appropriate disturbance caps.

While the caps would set a particular level of disturbance, the implementation of the disturbance caps would occur after the RMPA is approved in the ROD. The BLM inventoried the habitat with the best available info at the time of the DEIS, but would also perform additional in-depth analysis & inventory within Utah management zones at the implementation stage. The BLM and Forest Service have added Appendix XX [new appendix] with preliminary disturbance inventory to more accurately assess current disturbance levels and potential impacts across the planning area. [NOTE TO BLM: EMPSi will update appendix number once it has been added to the FEIS.] This was completed through a collaborative process with the BLM, Forest Service, and USFWS, and included prioritization of management zone. [NOTE TO BLM: Review the previous sentence for accuracy.] In addition, the disturbance cap in the Final EIS was revised to provide additional detail such as enhanced descriptions of what types of activities would count towards the disturbance totals, where disturbance activities would count against the cap, reclamation and habitat requirements for a disturbed area for both temporary and permanent disturbance, and how the cap would be implemented and monitored.

Future activities that are expected to cause disturbance, such as ROW/SUP applications, would be evaluated and approved on a case-by-case basis based upon site-specific determination of ability to avoid, minimize, and/or mitigate impacts on GRSG habitat at the implementation phase. A proposed project's contribution to the amount of disturbance on the landscape will be evaluated during site-specific NEPA analysis. Per requirements of NEPA, the BLM and Forest Service consider disturbance in private lands when making land use decisions since actions on private lands could impact the BLM's ability to manage for

1. a. In accordance with NEPA, the BLM and FS have discretion to establish the purpose and need for action (40 CFR 1502.13). CEQ regulations direct that an EIS "...shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action" (40 CFR 1502.13). Also, under the CEQ regulations, the BLM and the Forest Service are required to "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources as provided by section 102(2)(E) of the Act [NEPA]." (40 CFR 1501.2(c)). The breadth or narrowness of the purpose and need statement has a substantial influence on the scope of the subsequent analysis. The purpose and need statement provides a framework for issue identification and will inform the rationale for alternative selection. The range of alternatives developed are intended to meet the purpose and need and address the issue; thereby, providing a basis for eventual selection of an alternative in a decision (BLM NEPA handbook and Forest Service Handbook 1909.15 – National Environmental Policy Act Handbook Chapter 10 – Environmental Analysis).

As stated in the DLUPA/EIS, the BLM and the Forest Service prepared the Idaho LUP amendment with an associated EIS to be applied to lands with greater sage-grouse habitat. This effort responds to the FWS's March 2010

b. The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, four alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (current management, Alternative A).

Additionally, the resulting action alternatives offer a range of possible management approaches for responding to planning issues and concerns identified through public scoping, and to maintain or increase GRSG abundance and distribution in the planning area. While the goal is the same across alternatives, each alternative contains a discrete set of objectives and

c. Based on this alternative development process, the BLM considered input from cooperating agencies, environmental organizations, and the public. As described in 2.4.2. Alternative B, the BLM used the GRSG conservation measures in A Report on National Greater Sage-Grouse Conservation Measures (NTT 2011) were used to form BLM management direction under Alternative B, which is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044 (the BLM must consider all applicable conservation measures developed by the NTT in at least one alternative in the land use planning process).

During scoping for the IDaho GRSG RMPA/EIS, individuals and conservation groups submitted management direction recommendations for protection and conservation of GRSG and their habitat, including the Sage-grouse Recovery Alternative and proposed disturbance cap. The recommendations, in conjunction with resource allocation opportunities and internal sub-regional BLM input, were reviewed in order to develop BLM management direction for GRSG under Alternative C.

Alternative D incorporates adjustments to the NTT report (NTT 2011) to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses, and was developed in full cooperation with the Cooperating Agencies taking note of the agencies' concerns with socioeconomic issues.

The BLM and Forest Service considered the State of Idaho's Sage-Grouse Conservation Plan in its cumulative effects analysis (Draft EIS Chapter 5, Cumulative Effects, Section 5.4, Special Status Species).

~~d. In determining the disturbance cap level for each alternative, the BLM utilized the recommendations and input specific to each alternative. For example, for Alternative B, the BLM utilized the cap levels recommended in the NTT Report. Conservation measures included in Alternative B focus primarily on GRSG PPH and include a 3-percent disturbance cap in PPH. PPH areas have the highest conservation value to maintaining or increasing GRSG populations. For Alternative C, conservation measures were mostly focused on ADH (PPH, PGH, and linkage/connectivity habitat). These areas have been identified by CPW in coordination with respective BLM offices, and include a 3-percent cap on disturbance in ADH. This disturbance cap number for Alternatives B and C were incorporated as is from the NTT Report and conservation group alternatives; the BLM did not modify the caps in the alternatives. For Alternative D, the BLM intended to protect those areas that were most important for sage grouse within PPH; in other words, the alternative would protect the best of the best habitat. The BLM utilized information from the Wyoming Core Strategy to support consideration of the five-percent disturbance cap, with the goal to represent the reasonable edge of the range of alternatives with a higher percentage. While the caps would set a particular level of disturbance, the implementation of the disturbance caps would occur after the RMPA is approved in the Record of Decision. The BLM inventoried the habitat with the best available info at the time of the DEIS, but would also do additional in-depth analysis & inventory within management zones at the implementation stage.~~

2. While FWS has responsibility for threatened and endangered species, the BLM and the Forest Service manage a significant portion of sage-grouse habitat. Thus, although it is the FWS's responsibility to administer the Endangered Species Act, management of wildlife habitat is within the BLM and the Forest Service's multiple-use mandate and is properly a resource to I. Alternatives:

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, four alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (current management, Alternative A).

2. Consideration of additional alternatives

[NOTE TO BLM: Was the Nevada Greater Sage Grouse Management and Conservation Strategy Plan considered and eliminated as an alternative? If it was considered and eliminated, site the location and summarize rationale. If it was not considered and eliminated, this may need to be added to the document.]

Didn't this become the basis of the States Alternative?

~~3. Disturbance Cap~~

~~In determining the disturbance cap level for each alternative, the BLM utilized the recommendations and input specific to each alternative. For example, for Alternative B, the BLM utilized the cap levels recommended in the NTT Report. Conservation measures included in Alternative B focus primarily on GRSG PPH and include a 3-percent disturbance cap in PPH. PPH areas have the highest conservation value to maintaining or increasing GRSG populations.~~

~~[NOTE TO BLM: Input specifies about how the disturbance cap was determined for each alternative. Example: 3% cap came from NTT report.]~~

#### 4. Alternatives do not meet purpose and need

In accordance with NEPA, the BLM and FS have discretion to establish the purpose and need for action (40 CFR 1502.13). CEQ regulations direct that an EIS "...shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action" (40 CFR 1502.13). Also, under the CEQ regulations, the BLM and the Forest Service are required to "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources as provided by section 102(2)(E) of the Act [NEPA]." (40 CFR 1501.2(c)). The breadth or narrowness of the purpose and need statement has a substantial influence on the scope of the subsequent analysis. The purpose and need statement provides a framework for issue identification and will inform the rationale for alternative selection. The range of alternatives developed are intended to meet the purpose and need and address the issue; thereby, providing a basis for eventual selection of an alternative in a decision (BLM NEPA handbook and Forest Service Handbook 1909.15 – National Environmental Policy Act Handbook Chapter 10 – Environmental Analysis). As stated in the DLUPA/EIS at page 6, the BLM and the Forest Service prepared the Nevada-California LUP amendment with an associated EIS to be applied to lands with greater sage-grouse habitat. This effort responds to the FWS's March 2010 'warranted, but precluded' Endangered Species Act listing petition decision, and that existing regulatory mechanisms in BLM and the Forest Service land use plans was inadequate to protect the species and its habitat. The range of alternatives, including the preferred alternative and its components (such as the disturbance caps), focus on areas affected by threats to greater sage-grouse habitat identified by the FWS in the March 2010 listing decision. Formulated by the planning team, alternatives represent those goals, objectives, and actions determined to be most effective at resolving planning issues, balancing resource use at this stage of the process, and meet the stated purpose and need for action. While collaboration is critical in developing and evaluating alternatives, the final designation of a

In accordance with NEPA, the BLM and Forest Service have discretion to establish the purpose and need for action (40 CFR 1502.13). CEQ regulations direct that an EIS "...shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action" (40 CFR 1502.13). Also, under the CEQ regulations, the BLM and the Forest Service are required to "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources as provided by section 102(2)(E) of the Act [NEPA]." (40 CFR 1501.2(c)). The breadth or narrowness of the purpose and need statement has a substantial influence on the scope of the subsequent analysis. The purpose and need statement provides a framework for issue identification and will inform the rationale for alternative selection. The range of alternatives developed are intended to meet the purpose and need and address the issue; thereby, providing a basis for eventual selection of an alternative in a decision (BLM NEPA handbook and Forest Service Handbook 1909.15 – National Environmental Policy Act Handbook Chapter 10 – Environmental Analysis).

As stated in the DLUPA/EIS at page 6, the BLM and the Forest Service prepared the Northwest Colorado LUP amendment with an associated EIS to be applied to lands with greater sage-grouse habitat. This effort responds to the FWS's March 2010 'warranted, but precluded' Endangered Species Act listing petition decision, and that existing regulatory mechanisms in BLM and the Forest Service land use plans was inadequate to protect the species and its habitat. The range of alternatives, including the preferred alternative and its components (such as the disturbance caps), focus on areas affected by threats to greater sage-grouse habitat identified by the FWS in the March 2010 listing decision. Formulated by the planning team and with input from the cooperating agencies, the preferred alternative represents those goals, objectives, and actions determined to be most effective at resolving planning issues, balancing resource use at this stage of the process, and meet the stated purpose and need for action. While collaboration is critical in developing and evaluating alternatives, the final designation of a preferred alternative remains the exclusive responsibility of the BLM and Forest Service. See Section 1.2

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.14(a)) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. The CEQ regulations do not define "reasonable" alternatives, but do state that "the alternatives including the proposed action" are proposed to respond to "the underlying purpose and need" for the project (40 CFR 1502.13). The range of alternatives for a project proposal is thus normally limited to alternatives that meet the identified purpose and need. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. The CEQ regulations and Forest Service directives (FSM 1950 and FSH 1909.15) give the deciding official discretion to determine the appropriate range of alternatives and to select the alternative that best meets the stated purpose and need. As a result, four alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (current management, Alternative A).

As described in Section 2.3 of the Draft EIS, the Northwest Colorado GRSG RMPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the RMPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions. Public input received during the scoping process was considered to ensure that all issues and concerns would be addressed, as appropriate, in developing the alternatives. The planning team developed planning issues to be addressed in the RMPA, based on broad concerns or controversies related to conditions, trends, needs, and existing and potential uses of planning area lands and resources.

Based on this alternative development process, the BLM considered input from cooperating agencies, environmental organizations, and the public. As described in 2.4.2. Alternative B, the BLM used the GRSG conservation measures in A Report on National Greater Sage-Grouse Conservation Measures (NTT 2011) were used to form BLM management direction under Alternative B, which is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044 (the BLM must consider all applicable conservation measures developed by the NTT in at least one alternative in the land use planning process).

During scoping for the Northwest Colorado GRSG RMPA/EIS, individuals and conservation groups submitted management direction recommendations for protection and conservation of GRSG and their habitat, including the Sage-grouse Recovery Alternative and proposed disturbance cap. The recommendations, in conjunction with resource allocation opportunities and internal sub-regional BLM input, were reviewed in order to develop BLM management direction for GRSG under Alternative C (Draft EIS, page 39).

Alternative D incorporates adjustments to the NTT report (NTT 2011) to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses, and was developed in full cooperation with the Cooperating Agencies taking note of the agencies' concerns with socioeconomic issues. Section 2.6, Alternatives Considered but not Analyzed in Detail, of the Draft EIS, the Garfield County Alternative was analyzed but not considered in detail in the DEIS primarily because it is contained within the existing range of alternatives (page 41). However, the BLM included the alternative as an appendix and requested public comment on it. Based on the public input, the BLM would analyze the alternative and the public comments, then make the determination if it would be part of the Proposed Action in the FEIS. [NOTE TO BLM: will need to add the conclusory statement here regarding whether you accepted it into the FEIS/Proposed RMPA.]

While the State of Colorado did not submit a complete alternative or elements to be considered as part of another alternative, the BLM considered the Colorado Department of Natural Resources' Colorado Greater Sage-Grouse Conservation Plan: The Colorado Package (DEIS Appendix N) in its cumulative effects analysis (Draft EIS Chapter 5, Cumulative Effects, Section 5.4, Special Status Species – Greater Sage-Grouse, page 944).

~~In determining the disturbance cap level for each alternative, the BLM utilized the recommendations and input specific to each alternative. For example, for Alternative B, the BLM utilized the cap levels recommended in the NTT Report. Conservation measures included in Alternative B focus primarily on GRSG PPH and include a 3-percent disturbance cap in PPH. PPH areas have the highest conservation value to maintaining or increasing GRSG populations.~~

~~For Alternative C, conservation measures were mostly focused on ADH (PPH, PGH, and linkage/connectivity habitat). These areas have been identified by CPW in coordination with respective BLM offices, and include a 3-percent cap on disturbance in ADH. This disturbance cap number for Alternatives B and C were incorporated as is from the NTT Report and conservation group alternatives; the BLM did not modify the caps in the alternatives.~~

~~For Alternative D, the BLM intended to protect those areas that were most important for sage grouse within PPH; in other words, the alternative would protect the best of the best habitat. The BLM utilized information from the Wyoming Core Strategy to support consideration of the five-percent disturbance cap, with the goal to represent the reasonable edge of the range of alternatives with a higher percentage.~~

~~While the caps would set a particular level of disturbance, the implementation of the disturbance caps would occur after the RMPA is approved in the Record of Decision. The BLM inventoried the habitat with the best available info at the time of the~~

I. CEQ regulations direct that an EIS "...shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action" (40 CFR 1502.13). Also, under the CEQ regulations, the BLM is required to "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources as provided by section 102(2)(E) of the Act [NEPA]." (40 CFR 1501.2(c)). The breadth or narrowness of the purpose and need statement has a substantial influence on the scope of the subsequent analysis. The purpose and need statement provides a framework for issue identification and will inform the rationale for alternative selection. The range of alternatives developed are intended to meet the purpose and need and address the issue; thereby, providing a basis for eventual selection of an alternative in a decision (BLM NEPA handbook).

An agency's refusal to consider proposed alternatives does not mean that an alternatives analysis is deficient, as long as the agency provides an explanation for why the proposed alternative was not considered in depth. See *Western Watershed Projects et al vs. BLM* (No. 2:10-CV-02896-KJM-KJN), and *Earth Island Inst.*, 697 F.3d at 1022–23.

As stated in the DRMPA/EIS, the BLM is preparing RMP amendments with associated EISs for RMPs applied to lands with GRS habitat. This effort responds to the USFWS's March 2010 'warranted, but precluded' Endangered Species Act listing petition decision, and that existing regulatory mechanisms in BLM land use plans was inadequate to protect the species and its habitat. The plan amendments will focus on areas affected by threats to GRS habitat identified by the USFWS in the March 2010 listing decision. The primary threat to sagebrush habitat in MZ I and specifically within the Yellowstone Watershed population as identified in the COT report is conversion of sagebrush to agricultural lands or other land uses. Infrastructure from energy development also represents a threat. To address the threats, BLM is considering a range of changes in management of GRS habitats to avoid the continued decline of populations and habitats across BLM-administered lands. This purpose and need provides the appropriate scope to allow the BLM to analyze a reasonable number of alternatives to cover the full spectrum of potential impacts.

A monitoring framework was developed by a Disturbance and Monitoring Team that focuses on the implementation and

The BLM considered a reasonable range of alternatives during the GRSG planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and GRSG in the planning area, the BLM fully considered the management opportunities presented in the 1988 North Dakota RMP and record of decision (ROD), and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As described in Section 2.2 of the DEIS, the range of alternatives was developed that meet the purpose and need of the North Dakota Greater Sage-Grouse DRMPA/DEIS – “to identify and incorporate appropriate conservation measures to conserve, enhance and/or restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat”. As a result, four alternatives were analyzed in detail in the North Dakota Greater Sage-Grouse DRMPA/DEIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DRMPA/DEIS represented a full spectrum of options including a no action alternative (current management, Alternative A).

The BLM did consider less restrictive management actions for fluid mineral leasing (see Table 2-3 of the DRMPA/DEIS, page 2-33). Under Alternative A, the NSO within 0.25 mile of active GRSG strutting ground is less restrictive than the NSO within all PH under Alternative D, or no leasing under Alternative C. Alternative B did not apply any NSO or CSU restrictions in GH but would apply minimization of surface-disturbing or disrupting activities (including operations and maintenance) where needed to reduce the impacts of human activities on important seasonal GRSG habitats. These requirements are less restrictive than applying a CSU in GH under Alternative D, or no leasing under Alternative C.

The FLPMA makes it clear that the term “multiple use” means that the Secretary can make the most judicious use of the land for some or all of the resource uses. Therefore, the BLM has the discretion to make decisions that satisfy a range of needs. The term is defined in the FLPMA (Section 103(c)) as “the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people.” Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM’s multiple use mandate does not require that all uses be allowed on all areas of the public

NOTE TO ALL Project

Teams:

The issue statements related to the disturbance cap should be moved out into their own section, not lumped under NEPA range of alternatives. While the issue/response is noted here as deletion, it is copied into the Disturbance tab of the workbook.

decide on the rationale for the  
Proposed Plan)

Plan	Issue Statement
------	-----------------

OR	<p>Commenters stated that the EIS fails to meet NEPA adequacy for baseline data because the scale of baseline data used is too broad and has not been ground-truthed. Commenters also recommended additional sources of data that should be considered/reconciled with current data and questioned if the best available data was used.</p>
----	---

UT The BLM and the Forest Service did not provide sufficient affected environment information to meet NEPA requirements and failed to include local and site-specific information.

ID-SW MT The EIS fails to meet NEPA adequacy for baseline data because the scale of baseline data used is too broad, the EIS failed to include the State and Transition models as part of the baseline information, and the No Action management actions, as presented, do not explain the regulatory mechanisms that are currently available to preserve sage grouse habitat.

NV-CA Issue 1: Commenters expressed concern about lack of site-specific data, especially from local sources, including ranchers. Commenters stated science and methodology relied upon by the agencies in completing the DEIS is flawed and incomplete. The agencies' heavy reliance on the incomplete ESDs and the inadequate disclosure that the relevant variables were incomplete falls well short of NEPA's requirements.

Issue 2: Commenters stated the No Action Alternative is incorrect. The Agencies have artificially deflated the No Action Alternative.

Issue 3: Commenters stated the PPG and PGH maps are inaccurate. The BLM does not provide a quantitative definition of PPH. BLM's current definition of PPH is not only vague and inconsistent but also overly broad. PPH and PGH maps should be amended in the RMPs based on site-specific data

Issue 4: Commenters stated the EIS does not properly address the benefits of livestock grazing in relation to greater sage-grouse habitat conservation.

NWCO n/a

Lewisto BLM must clearly state in the FEIS what  
wn information is not available for the analysis per NEPA regulations, 43 CFR 1502.22(b).

ND The BLM needs to consider new information related to sage-grouse and sagebrush steppe that was published during preparation of the DRMPA/DEIS (see specific referenced materials in comment above).

WY9

## Response

The CEQ regulations require an environmental impact statement to "succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration. The description shall be no longer than is necessary to understand the effects of the alternatives. Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Agencies shall avoid useless bulk in statements and shall concentrate effort and attention on important issues" (40 CFR 1502.15). Additionally, the Oregon GRSG RMPA/EIS is a programmatic NEPA effort to conserve greater sage-grouse and its habitat across a broad geographic area. As such, the BLM described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions.

The BLM complied with these regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The affected environment provided in Chapter 3 and various appendices including Appendices I, K, L, and N in the Oregon GRSG RMPA/EIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the RMPA/EIS.

Programmatic documents are regional in scope and place emphasis on developing broad environmental policies, programs, or plans. Site-specific data is important during implementation level decisions, which may be tiered to the decisions made in this document. Data scales include broad-scale, mid-scale, fine-scale, and site-scale. For this planning document, it is appropriate to utilize data at the mid-scale (e.g., WAFWA management zones) and fine-scale (e.g., sub-region data). For this document, the best available information was used as generated and provided by the organizations and agencies with authority and special expertise to provide that information on a planning scale.

The RMPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM would conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. Site-specific concerns and more detailed environmental descriptions would be addressed when project-level reviews are tiered to the analysis in this EIS (40 CFR 1502.20, 40 CFR 1508.28). In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for any site-specific actions.

The CEQ regulations require an environmental impact statement to "succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration. The description shall be no longer than is necessary to understand the effects of the alternatives. Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Agencies shall avoid useless bulk in statements and shall concentrate effort and attention on important issues" (40 CFR 1502.15). Additionally, the Utah Greater Sage-Grouse LUPA is a programmatic NEPA effort to conserve greater sage-grouse and its habitat across a broad geographic area. As such, the BLM and the Forest Service described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions.

The BLM and the Forest Service complied with these regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The affected environment provided in Chapter 3 and various appendices in the Utah Greater Sage-Grouse LUPA, including Appendices A, N, O, P, and Q, is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS. For example, listing every water quality-impaired stream within the planning area by name would not provide useful information at this broad-scale analysis, particularly where the proposed plan alternatives did not vary the level of riparian protections to provide reduced levels for non-impaired streams. The riparian protections within each alternative were applied to all streams, whether or not they were water quality-impaired. However, understanding the miles of impaired BLM streams, as presented in the DLUPA/EIS at Section 3.6.1, is useful in establishing a baseline by which the BLM may analyze the relative effects of each alternative's broad-based approach.

Since this is a programmatic effort, county-by-county or planning-by-planning area level of detail is not consistent with the level of detail required for a programmatic analysis. Programmatic documents are regional in scope and place emphasis on developing broad environmental policies, programs, or plans. Site-specific data is important during implementation level decisions, which may be tiered to the decisions made in this document. Data scales include broad-scale, mid-scale, fine-scale, and site-scale. For this planning document, we are staying at the mid-scale (e.g., WAFWA management zones) and fine-scale (e.g., sub-region data). For this document, the best available information was used as generated and provided by the organizations and agencies with authority and special expertise to provide that information on a planning scale.

The CEQ regulations require an environmental impact statement to "succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration. The description shall be no longer than is necessary to understand the effects of the alternatives. Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Agencies shall avoid useless bulk in statements and shall concentrate effort and attention on important issues" (40 CFR 1502.15). Additionally, the [name of particular amendment] is a programmatic NEPA effort to conserve greater sage-grouse and its habitat across a broad geographic area. As such, the BLM and the Forest Service described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions.

The BLM and the Forest Service complied with these regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The affected environment provided in [Chapter XX] and various appendices including [cite appendix(ces)] in the [name of particular amendment] is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS. **For example, see specific examples under sections XX.XX, XX.XX, and XX.XX of this report.** ~~[use relevant example for the particular issue...here's one provided: listing every water quality impaired stream within the planning area by name would not provide useful information at this broad-scale analysis, particularly where the proposed plan alternatives did not vary the level of riparian protections to provide reduced levels for non-impaired streams. The riparian protections within each alternative were applied to all streams, whether or not they were water quality impaired. However, understanding the miles of impaired BLM streams, as presented in the DLUPA/EIS at Section 3.5.7, is useful in establishing a baseline by which the BLM may analyze the relative effects of each alternative's broad-based approach.]~~

As specific actions come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. Site-specific concerns and more detailed environmental

Response 1: The CEQ regulations require an environmental impact statement to "succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration. The description shall be no longer than is necessary to understand the effects of the alternatives. Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Agencies shall avoid useless bulk in statements and shall concentrate effort and attention on important issues" (40 CFR 1502.15). Additionally, this EIS is a programmatic NEPA effort to conserve greater sage-grouse and its habitat across a broad geographic area. As such, the BLM and the Forest Service described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions.

The BLM and the Forest Service complied with these regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed action. The affected environment provided in Chapter 3 and various appendices in this EIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS.

As specific actions come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. Site-specific concerns and more detailed environmental descriptions will be addressed when project-level reviews are tiered to the analysis in this EIS (40 CFR 1502.20, 40 CFR 1508.28). In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for any site-specific actions.

Response 2: The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (current management, Alternative A).

n/a

[NOTE TO BLM: this may result in a change to the FEIS in clarification of the information that is/is not available for inclusion. May only need to be a few sentences/one paragraph to clarify the NEPA requirements. If you make the clarification, then include this in the response:]

Before beginning the Lewistown Field Office Greater Sage-Grouse RMPA/EIS and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The RMPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning. However, the BLM recognizes that there are data that are unknown or prohibitively expensive to obtain. Per NEPA regulations at 40 CFR 1502.22, the FEIS has been updated to include information and examples of data that were unavailable

[NOTE TO BLM: These referenced materials need to be reviewed for relevance and whether the information is new. Determine whether the information is already covered in the EIS (although specific reference is to another document), or if the new references change the conclusions of the analysis.]

BLM teams have reviewed the suggested reports/data/articles to determine if they are substantially different than the information cited in the North Dakota Greater Sage-Grouse DRMPA/DEIS. The commenters' additional information was found to provide the [NOTE TO BLM: same/similar information/results/findings] as already noted in the DRMPA/DEIS, therefore inclusion and consideration would not substantially alter the conclusions or analysis. Therefore, they were not incorporated into the FEIS. [NOTE TO BLM: Could expand on the response with specifics of how the information was similar and where it could be found in the EIS.]

NOTE TO BLM: If the report presented different/newer information that reviewer believes should be included in the FEIS, then the response would be: BLM teams have reviewed the suggested reports/data/articles to determine if they are substantially different than the information cited in the North Dakota Greater Sage-Grouse DRMPA/DEIS. The commenters' additional information was found to provide new/updated information that has been incorporated into the FEIS (see Section

NOTE TO ALL

SUBREGIONAL TEAMS:

The OR intro text is very good for setting the stage as to what the requirements are for adequate baseline information/affected environment. Suggest using this intro language in the tab related to general NEPA/Baseline information, but further suggest to move anything specific, such as issues/responses related to sagebrush vegetation baseline information, to the appropriate subtopic issue/response (e.g., sagebrush veg = tab 26)

As noted in the general notes as well as under individual topic baseline sections, this will provide the necessary NEPA standard explanation

Issue/Response #4 - there's a disconnect between the issue & response. Issue notes that there wasn't enough/any impact analysis on the benefits of livestock grazing, yet the response speaks to range of alternatives. Suggest resolving the conflict and moving to the appropriate subsection in livestock grazing (whether alternatives or impact analysis, 16.1 or 16.4)

Issue/Response #5: suggest moving to minerals (leasables?) section.

Plan	Issue Statement
------	-----------------

OR	Commenters noted several issues with the GIS data and analysis conducted in the Draft EIS, including that the maps and data layers do not provide enough detail or are too coarse in scale, do not provide assurances to more localized decision making, some habitat type areas are inaccurately identified in the maps, and some important data is missing or needs to be updated.
----	--

UT The BLM and Forest Service has failed to take the “hard look” required by NEPA because it failed to use adequate baseline data for its analysis. Commenters noted several issues with the GIS data and analysis conducted in the Draft EIS:

- The maps and data layers do not provide enough detail to address "local ecological site variability". The data are too coarse and do not provide assurances to more localized decision making; some habitat type areas are inaccurately identified in the maps.

- BLM and Forest Service used old data layers to develop maps, including PPMA, PGMA, and population area boundaries; BLM and Forest Service should use the newer data layers that local and state agencies developed.

- The agencies must provide a mechanism to ground-truth the proposed PPMA and PGMA habitats on a project-specific basis in order to effectively assess the potential impacts of management decisions.

ID-SW  
MT Commenters noted several issues with the GIS data and analysis conducted in the Draft EIS:

- The maps and data layers do not provide enough detail to address "local ecological site variability". The data are too coarse and do not provide assurances to more localized decision making; some habitat type areas are inaccurately identified in the maps.
- BLM used old data layers to develop maps; BLM should use the newer data layers.

--the BLM needs to be consistent in their edge-mapping across state boundaries when there are different data sets used.

NOTE TO BLM: some comments relate to specific changes for the maps presented in the DEIS, and for the data layers to be made available for download from the BLM website.

NV-CA Issue 1: Commenters requested project level maps and project level mitigation.

Issue 2: Commenters questioned the delineation of the planning area boundary, in particular for Esmeralda County.

NWCO Commenters noted several issues with the GIS data and analysis conducted in the Draft EIS:

- The maps and data layers do not provide enough detail to address "local ecological site variability". The data are too coarse and do not provide assurances to more localized decision making; some habitat type areas are inaccurately identified in the maps.
- BLM used old data layers to develop maps; BLM should use the newer data layers that CPW produced.
- BLM should consider additional variables in the CPW data model to better represent the PPH and PGH areas.

Lewisto Commenters requested clarification as to why there were changes to breeding bird density mapping done by the state; [how the Final RMPA/EIS will address Executive Order No. 2-2013](#); and the RMPA/EIS needs to explain how the final planning document will correspond with the state of Montana GRSG [population management objectives](#)

ND BLM needs to explain the science and rationale behind development of the PH and GH boundaries presented in the DRMPA/DEIS.

WY9

## Response

As noted in Section 4.4, Baseline information, of this report, before beginning the Oregon RMPA/DEIS and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. Additionally, the BLM consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service and Oregon Department of Fish and Wildlife. Considerations included but were not limited to [NOTE: Contact GIS lead, Jeanne, for types of data or GIS layers that were gathered/used. A few examples: threatened and endangered species and their habitats, water quality- limited (303d) streams, deer and elk herd management areas, invasive plants, and uses on State lands]. For GRSG habitat data, the ODFW is periodically collecting and refining population and habitat data for the species, and the Draft EIS notes that the BLM would incorporate any refinements or updates once the data was made available. However, it is not the responsibility of the BLM to modify, change, update, or revise the specific modeling protocol and analysis developed by other agencies or groups.

~~A land use planning level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM realizes that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan level decisions. Land use plan level analyses are typically broad and qualitative rather than quantitative or focused on site specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13). The BLM will conduct subsequent project specific NEPA analyses for projects proposed for implementation under the land use plan. The subsequent NEPA analyses for project specific actions will tier to the land use planning analysis and evaluate project impacts at the appropriate site specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site specific actions.~~

As described above, the RMPA/EIS data and information presented in map and table form is of the appropriate scale and is sufficient to support the broad scale analyses required for land use planning.

In the Final EIS, the management allocations (PPMA and PGMA) will be clipped to BLM-managed lands to provide additional clarification that land use decisions for the RMPA/EIS will only apply to BLM-managed lands, and will not be applied to private, local, or state owned lands.

GIS data for the Oregon RMPA/DEIS was made available to the public when the Draft EIS was published and can be found on

Before beginning the Utah Greater Sage-Grouse LUPA/EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service, the UT Division on Wildlife Resources, and the Public Lands Policy Coordination Office within the Governor's Office. Considerations sage grouse related data layers, including occupied habitat, sage grouse management areas, and lek data. The UT DWR is continually collecting and refining population and habitat data for species, and the Draft EIS notes that the BLM and Forest Service would incorporate any refinements or updates once the data was made available.

As a result of these actions, the data gathered by the BLM and the Forest Service is of the appropriate scale and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives.

~~A land use planning level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM and the Forest Service realize that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan level decisions. Land use plan level analyses are typically broad and qualitative rather than focused on site specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at H-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12—Land Management Planning). The BLM and the Forest Service will conduct subsequent project specific NEPA analyses for projects proposed for implementation under the land use plan. The subsequent NEPA analyses for project specific actions will tier to the land use planning analysis and evaluate project impacts at the appropriate site specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site specific actions.~~

Commenters noted that in the discussion of the data from the Baseline Environmental Report (BER), "...some local data may have been omitted." (DEIS, Section 3.1). Since the BER report covers many states across the western United States, broad-scale national data were deemed to be the most consistent data available. As such, data that may also be collected at a state-

Before beginning the Idaho Sage grouse EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service and [list state agencies, including state wildlife agency]. Considerations included but were not limited to [list the types of data or GIS layers that were gathered/used. A few examples: threatened and endangered species and their habitats, water quality- limited (303d) streams, deer and elk herd management areas, invasive plants, and uses on State lands]. It is not the responsibility of the BLM or FS to modify, change, update, or revise the specific modeling protocol and analysis developed by other agencies or groups. The Draft EIS notes that the BLM and FS would incorporate any refinements or updates if or when the data were made available. [NOTE TO BLM: If and updates or new layers have become available, can note them here.]

As a result of these actions, the data gathered by the BLM and the Forest Service is of the appropriate scale and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives.

~~A land use planning level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM and the Forest Service realize that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan level decisions. Land use plan level analyses are typically broad and qualitative rather than quantitative or focused on site specific actions (BLM Land Use Planning Handbook H 1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12—Land Management Planning). The BLM and the Forest Service will conduct subsequent project specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, [etc.; list others as applicable]. The subsequent NEPA analyses for project specific actions will tier to the land use planning analysis and evaluate project impacts at the appropriate site specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site specific actions.~~

Response 1: As the decisions under consideration by the BLM and the Forest Service are programmatic in nature and would not result in on-the-ground planning decision or actions (e.g., the BLM is not approving an Application for Permit to Drill to start drilling), the scope of the analysis was conducted at a regional, programmatic level. The analysis focuses on the direct, indirect, and cumulative impacts that could potentially result from on-the-ground changes. This analysis identifies impacts that may result in some level of change to the resources, regardless of whether that change is beneficial or adverse.

Response 2: The planning area is the geographic area within which the BLM will make decisions during a planning effort. A planning area boundary includes all lands regardless of jurisdiction; however the BLM will only make decisions on lands that fall under the BLM's jurisdiction (including subsurface minerals). Unless the State Director determines otherwise, the planning area for a RMP is the geographic area associated with a particular field office (43 CFR 1610.1(b)). State Directors may also establish regional planning areas that encompass several field offices and/or states, as necessary.

For this environmental impact statement, decision areas are those public lands and mineral estates within the planning area that are encompassed by all designated habitat (ADH) (which includes preliminary priority habitat [PPH], preliminary general habitat [PGH], and linkage/connectivity habitat).

Before beginning the Northwest Colorado Sage grouse EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service, Colorado Parks and Wildlife (CPW), Office of Surface Mining, Colorado State Land Board, US Dept. of Energy. Considerations included but were not limited to Greater sage-grouse habitat delineated by CPW, threatened and endangered species habitats, deer and elk herd management areas, fluid mineral development areas, solid mineral development areas, mineral potential areas, etc.. It is not the responsibility of the BLM or FS to modify, change, update, or revise the specific modeling protocol and analysis developed by CPW. The CPW is continually collecting and refining population and habitat data for species, and the Draft EIS notes that the BLM and FS would incorporate any refinements or updates once the data was made available by CPW. To date, CPW has neither published nor provided the newer data for use for the FEIS. [NOTE TO BLM: If they do, then state that BLM will incorporate the revised data into the document or analysis.]

As a result of these actions, the data gathered by the BLM and the Forest Service is of the appropriate scale and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives.

~~A land use planning level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM and the Forest Service realize that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan level decisions. Land use plan level analyses are typically broad and qualitative rather than quantitative or focused on site specific actions (BLM Land Use Planning Handbook H 1601 I, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 — Land Management Planning). The BLM and the Forest Service will conduct subsequent project specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, site specific analysis of land use authorizations, lease sales, etc. The subsequent NEPA analyses for project specific actions will tier to the land use~~

[NOTE TO BLM: provide a response regarding clarification of breeding bird density mapping and note if PPH layer is updated]

[NOTE TO BLM: provide insert response from SO regarding Executive Order No. 2-2013 inclusion in the FEIS]

The habitat delineations in the North Dakota Greater Sage-Grouse DRMPA/DEIS were created by the BLM and NDGFD, who is responsible for managing and monitoring GRSG populations. Based on the Baseline Environmental Report (Summary of Science, Activities, Programs, and Policies That Influence the Rangeland Conservation of Greater Sage-grouse [*Centrocercus urophasianus*]) and other recent, published, and peer-reviewed scientific data, and in cooperation with the NDGFD, the BLM created the Preliminary Priority Habitat (PPH) and Preliminary General Habitat (PGH) areas. The descriptions below are how sage-grouse habitat was mapped to delineate PPH and PGH in the North Dakota Greater Sage-Grouse DRMPA/DEIS.

#### Preliminary Priority Habitat

GRSG leks were buffered by 5.3 miles to map PPH. A 4-mile buffer would include approximately 80 percent of nesting GRSG hens; therefore, the 5.3 mile buffer was used in order to capture 100 percent of the nesting hens, and consequently, almost all the habitat for sage-grouse (a small amount of habitat was left on the southeast corner but no birds nearby). Buffering leks produced "bubbles" of PPH, and these boundaries were "softened" to form the northern and eastern edge of PPH. The western and southern boundaries are the states of Montana and South Dakota respectively.

#### Preliminary General Habitat

The PGH for North Dakota is what remained for habitat on the eastern portion of the bird's range; this is the historic range for GRSG. There are no GRSG leks in the PGH area, but birds occasionally use it.

Chapter 4 presents the impacts anticipated from the various alternatives based on best available science and professional judgment. Effects from the current management situation are described in Chapter 3, Affected Environment, and projected impacts from each alternative are identified in Chapter 4.

As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the no action alternative, any adverse environmental effects that cannot be avoided should the alternatives be implemented (e.g., impacts from existing infrastructure), the relationship between short-term uses of the built environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Because land use plan-level decisions are typically broad and qualitative rather than quantitative or focused on site-specific

1. As a landscape level planning effort, none of the alternatives prescribe project-level or site-specific activities on BLM or USFS managed lands. Furthermore, the agencies' selection of an alternative does not authorize funding to any specific project or activity nor does it directly tie into the agencies' budgets as appropriated annually through the Federal budget process. As a consequence, agencies' costs and differences in program costs across alternatives have not been quantified. Information has been presented in several resource impact sections on the types of costs that might be associated with various sage-grouse conservation measures. [NOTE TO BLM- above language from Josh Sidon, Lauren may want to use across all subregions.]
2. Direct the reader to the Effects Summary table in ch 2. Determine whether revisions to the table would be necessary to distinguish more between the effects.
3. Check for the No Action alternative to see if there already is a statement for how existing management/actions would impact the habitat. This may be to direct the reader to a specific section in Ch 4 or several sections.

Response 1: As the decisions under consideration by the BLM and the Forest Service are programmatic in nature and would not result in on-the-ground planning decision or actions (e.g., the BLM is not approving an Application for Permit to Drill to start drilling), the scope of the analysis was conducted at a regional, programmatic level. The analysis focuses on the direct, indirect, and cumulative impacts that could potentially result from on-the-ground changes. This analysis identifies impacts that may result in some level of change to the resources, regardless of whether that change is beneficial or adverse.

Response 2: The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (current management, Alternative A).

Response 3: As stated in the DLUPA/EIS, the BLM and the Forest Service are preparing LUP amendments with associated EISs for LUPs applied to lands with greater sage-grouse habitat. This effort responds to the FWS's March 2010 'warranted, but precluded' Endangered Species Act listing petition decision, and that existing regulatory mechanisms (I suggest adding a statement to plainly state something like "Sage-grouse populations are currently declining, showing that current regulatory mechanism are inadequate." I think we should state it in plain language so the public understands. (Harber)) in BLM and the Forest Service land use plans was inadequate to protect the species and its habitat. The plan amendments will focus on areas affected by threats to greater sage-grouse habitat identified by the FWS in the March 2010 listing decision. The two primary threats to sagebrush habitat are infrastructure from energy development in the eastern portion of the species' range and conversion of sagebrush habitat to annual grasslands due to wildfires in the western portion of the species' range. To address the threats, BLM and Forest Service are considering a range of changes in management of greater sage-grouse habitats to avoid the continued decline of populations and habitats across BLM- and Forest Service-administered lands. This purpose and

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA

The BLM thoroughly explained its consideration and analysis of cumulative effects in the DRMPA/EIS in Section 5.1. The DRMPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future action.

Based on the existing protest resolution related to oil and gas leasing and the standard lease stipulations (Appendix J) that can be applied to leases, the Lewistown Field Office cannot separate management strategies by PH and GH at this time. A RFD is currently being developed in conjunction with the RMP revision that process that the Lewistown Field Office initiated in February 2014. This RMP revision will include an oil and gas leasing decision and a comprehensive list of lease stipulations.

The BLM has complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level.

The DRMPA/EIS contains a qualitative discussion of cumulative effects at the WAFWA Management Zone scale to set the stage for a more quantitative analysis to be contained in the Proposed RMPA/FEIS.

## Response

[Note to BLM: Can direct reader to cumulative impacts; note that the cum impacts are updated based on work done between Draft & Final; see if there is anything specific you can add to clarify how actions in neighboring jurisdictions/states were addressed in the cum. Regional call on whether to roll up effects totals into a region wide estimate as suggested by commenter. ]

The BLM thoroughly explained its consideration and analysis of cumulative effects in the RMPA/EIS in Section 5. The RMPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. The BLM has complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level.

The RMPA/EIS contains a qualitative discussion of cumulative effects at the WAFWA Management Zone scale to set the stage for a more quantitative analysis to be contained in the Proposed Land Use Plan Amendment/FEIS. Additional quantitative cumulative analysis was added to the Final EIS in Section 4.24 [Note To BLM: Waiting for analyses from national team.

The BLM and the Forest Service thoroughly explained its consideration and analysis of cumulative effects in the DLUPA/EIS in Section 4.24. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

The BLM and the Forest Service have complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level.

The DLUPA/EIS contains a qualitative discussion of cumulative effects at the WAFWA Management Zone scale to set the stage for a more quantitative analysis to be contained in the Proposed Land Use Plan Amendment/FEIS. Additional quantitative cumulative analysis was added to the Final EIS in Section 4.24, Cumulative Impacts. [NOTE TO BLM: waiting for analyses from national team. EMPSi will include more details as they become available.] Per 40 CFR 1503, the BLM and Forest Service provided cooperating agencies the opportunity Can direct reader to cumulative impacts; note that the cums impacts are updated based on work done between Draft & Final; see if there is anything specific you can add to clarify how actions in neighbouring jurisdictions/states were addressed in the cums. Regional call on whether to roll up effects totals into a region wide estimate as suggested by commenter.

To be discussed by Joe, Randy Arlene & Lauren.

Analyzing the impacts as a result of assuming that the Greater Sage-grouse may become listed under the ESA is outside the scope; the purpose and need of this plan amendment is to address inadequacy of regulatory mechanisms that were identified as one of the listing factors for GRSG in the USFWS finding on the petition to list GRSG. The USFWS identified the principal regulatory mechanism for the BLM and Forest Service as conservation measures in LUPs. In response to the USFWS findings, as well as the BLM and Forest Service's requirement to manage sensitive species, the BLM and Forest Service are preparing plan amendments with associated EISs to evaluate the incorporation of conservation measures in LUPs for GRSG. Because the purpose of the LUP amendments is to identify and potentially incorporate appropriate conservation measures in LUPs to conserve, enhance and/or restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat, the alternatives in this EIS, therefore, focus on those conservation measures that can be incorporated into the LUPs. Although the potential listing of GRSG would also include conservation measures identified by the USFWS, those conservation measures are not known at this time. Therefore, analysis of

Plan	Issue Statement
OR	<p>The BLM needs to include a monitoring, mitigation, and adaptive management plan/framework in the FEIS that will include specific criteria for determining sage grouse conservation success. The BLM should utilize intra and interstate coordination in the development of the mitigation plan and monitoring framework and provide a description of how these plans will coordinate with the State mitigation plan.</p>

UT 1. BLM and Forest Service needs to release the Monitoring Strategy for public comment and produce a Supplemental EIS to address this change.

2. BLM needs to clarify the relationship between the disturbance thresholds and the monitoring framework.

[NOTE TO EMPSI: Change the section title to Monitoring and Mitigation Measures in all future versions.]

ID-SW  
MT

1. The BLM needs to include a monitoring, mitigation, and adaptive management plan/framework in the FEIS that will include specific criteria for determining sage grouse conservation success and how the disturbance percentages will be calculated.
2. BLM needs to clarify the relationship between the disturbance thresholds and the monitoring framework.
3. The BLM needs to release the mitigation strategy for public review.

NV-CA

1. The BLM needs to include a monitoring, mitigation, and adaptive management plan/framework in the FEIS that will include specific criteria for determining sage grouse conservation success and how the disturbance percentages will be calculated.
2. The BLM needs to define when mitigation would be used and have enough specificity in the mitigation and monitoring plans to implement them in development actions.

NWCO The BLM needs to include a monitoring, mitigation, and adaptive management plan/framework in the FEIS that will include specific criteria for determining sage grouse conservation success and how the disturbance percentages will be calculated. BLM needs to define when mitigation would be used and have enough specificity in the mitigation and monitoring plans to implement them in development actions.

Lewisto Commenters provided additional mitigation  
wn measure to be considered in the FEIS. Commenters also requested the Final RMPA/EIS clarify what type of development the RDFs/mitigation measures in Appendix B and C apply to. Also, the Final RMPA/EIS should provide measurable objectives for mitigation, including "triggers" and measures of success.

ND The final monitoring report was not available for the public to comment on in the DRMPA/DEIS, and the habitat suitability assessment should be clarified. The FEIS needs to clarify how collaboration across jurisdictional boundaries will occur when implementing conservation measures.

WY9

## Response

The BLM complied with the NEPA by including a discussion of measures that may mitigate adverse environmental impacts of the alternatives in the RMPA/EIS. See 40 CFR 1502.14(f), 1502.16(h). Potential forms of mitigation include: (1) avoiding the impact altogether by not taking a certain action or parts of an action; (2) minimizing impacts by limiting the degree or magnitude of the action and its implementation; (3) rectifying the impact by repairing, rehabilitating, or restoring the affected environment; (4) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; or (5) compensating for the impact by replacing or providing substitute resources or environments. 40 CFR 1508.20. The BLM must include mitigation measures in an EIS pursuant to the NEPA; yet the BLM has full discretion in selecting which mitigation measures are most appropriate, including which forms of mitigation are inappropriate. The BLM is also under instruction to follow the Draft Regional Mitigation Manual (Draft MS-1794) as the interim policy until the manual is finalized.

A monitoring framework was developed by a Disturbance and Monitoring Team that focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM worked with WAFWA to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate data-sets will be established so that data can easily be “rolled up” for reporting monitoring results across the range of greater sage-grouse, as defined by Schroeder et al. (2004); by populations and subpopulations as defined by Connelly et al. (2004); by sub-region area; by the seven (WAFWA) Greater Sage-grouse Management Zones (Stiver et al. 2006), and by Priority Areas for Conservation (PACs) as defined in the greater sage-grouse Conservation Objectives Team (COT) Report (U.S. Fish and Wildlife Service 2013).

To accomplish effective monitoring, the BLM will analyze the quantitative and qualitative monitoring data to characterize the relationship among disturbance, implementation actions, and habitat condition at the appropriate and applicable geographic scale or boundary. , [Note to BLM: Check this language after Appendix G is finished by the national team.] When available from WAFWA and/or state wildlife agencies, effectiveness monitoring can be supplemented with population trend information, taking into consideration the lag effect response of populations to habitat changes.

[NOTE TO BLM: The national team is creating language for off-site mitigation and bond requirements. EMPSi will update this response as necessary when that language is available.]

1. While not required by the NEPA, monitoring can be implemented to determine if the decisions are achieving intended environmental objectives, and whether predicted environmental effects were accurate (BLM Handbook H-1601, Land Use Planning Handbook). In a ROD, a monitoring and enforcement program shall be adopted and summarized where applicable for any mitigation (40 CFR 1505.2(c)). Per CEQ 40 questions, 34c, a mitigation and monitoring program has been addressed in the DLUPA/DEIS. A more detailed discussion has been included in the Proposed LUPA/Final EIS as we move towards the required language in the Record of Decision.

2. The BLM and Forest Service revised the monitoring framework and mitigation strategy that are included in the Proposed LUPA/Final EIS as Appendices E and F. The appendices describe the process that the BLM will use to monitor implementation and effectiveness of RMP decisions. The monitoring framework includes monitoring at various scales specific to GRSG habitat, consistent indicators to measure and metric descriptions for each of the scales, analysis and reporting methods, and the incorporation of monitoring results into adaptive management. The need for fine and site-scale specific habitat monitoring will vary by area depending on existing conditions, habitat variability, threats, and land health. To accomplish effectiveness monitoring, the BLM will analyze the monitoring data to characterize the relationship among disturbance, implementation actions and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife agencies, effectiveness monitoring can be supplemented with population trend information, taking into consideration the lag effect response of populations to habitat changes. The BLM and Forest

The BLM and the Forest Service complied with the NEPA by including a discussion of measures that may mitigate adverse environmental impacts of the alternatives in the DLUPA/EIS. See 40 CFR 1502.14(f), 1502.16(h). Potential forms of mitigation include: (1) avoiding the impact altogether by not taking a certain action or parts of an action; (2) minimizing impacts by limiting the degree or magnitude of the action and its implementation; (3) rectifying the impact by repairing, rehabilitating, or restoring the affected environment; (4) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; or (5) compensating for the impact by replacing or providing substitute resources or environments. 40 CFR 1508.20. Taking certain actions [or not taking action, depending on position of issue statement], such as [cite to any specific examples included with comments], is only one of many potential forms of mitigation. The BLM and the Forest Service must include mitigation measures in an EIS pursuant to the NEPA; yet the BLM and the Forest Service have full discretion in selecting which mitigation measures are most appropriate, including which forms of mitigation are inappropriate.

[Cite specifics relevant to the sub-regional for where the alternatives have incorporated mitigation measures designed to avoid or reduce impacts within the management actions and supporting information in the appendices. If there are many, then note that the impacts presented in Chapter 4, therefore, are considered unavoidable and would result from implementing the management actions and mitigations. Cite a few examples of the actions that include specific mitigation measures as part of the alternative(s). Sample: “Action BIO-1: Implement the standard operating procedures (SOPs) contained in Appendix O (Biological Standard Operating Procedures) and Appendix P (Standard Operating Procedures for Oil and Gas) for all project work would help to mitigate effects as a result of oil and gas activities on biological resources.”]

A monitoring framework was developed by a Disturbance and Monitoring Team that focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM and the Forest Service worked with WAFWA to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate data-sets will be established so that data can easily be “rolled up” for reporting monitoring results across the range of greater sage-grouse, as defined by Schroeder et al. (2004); by populations and subpopulations as defined by Connelly et al. (2004); by LUP area; by the seven Mitigation, adaptive management and a monitoring framework were developed by a Disturbance and Monitoring Team that focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM and the Forest Service worked with WAFWA to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate data-sets will be established so that data can easily be “rolled up” for reporting monitoring results across the range of greater sage-grouse, as defined by Schroeder et al. [If needed, based on specifics of comments and/or summary statement, include statement to the effect that broad- and mid-scale monitoring will be conducted as funding allows.] (To be discussed by Joe, Randy Arlene & Lauren.)

[Refer to the Monitoring Framework in the appendix.] To accomplish effective monitoring, the BLM and the Forest Service will analyze the monitoring data to characterize the relationship among disturbance, implementation actions, and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife agencies, effectiveness monitoring can be supplemented with population trend information, taking into consideration the lag

DEIS Appendix G, Surface Reclamation Plan, refers to the White River Field Office because it originated in that field office. The plan would be adopted for the Northwest Colorado Greater Sage-Grouse Land Use Plan Amendments, as specified in DEIS Chapter 2, Alternatives. We have updated the appendix to make it more specific to the Northwest District and the Colorado Greater Sage-Grouse LUP Amendment.

Mitigation, adaptive management and a monitoring framework were developed by a Disturbance and Monitoring Team that focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM and the Forest Service worked with WAFWA to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate data-sets will be established so that data can easily be "rolled up" for reporting monitoring results across the range of greater sage-grouse, as defined by Schroeder et al. (2004); by populations and subpopulations as defined by Connelly et al. (2004); by LUP area; by the seven (WAFWA) Greater Sage-grouse Management Zones (Stiver et al. 2006), and by Priority Areas for Conservation (PACs) as defined in the greater sage-grouse Conservation Objectives Team (COT) Report (U.S. Fish and Wildlife Service 2013).

*[Refer to the Monitoring Framework in the appendix.]* To accomplish effective monitoring, the BLM and the Forest Service will analyze the monitoring data to characterize the relationship among disturbance, implementation actions, and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife *[NOTE TO BLM: need direction for this response based on the national monitoring framework being developed by the National team. The national monitoring response is presented below which can be supplemented with information regarding the other two issues.]*

A monitoring framework was developed by a Disturbance and Monitoring Team that focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM worked with WAFWA to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate data-sets will be established so that data can easily be "rolled up" for reporting monitoring results across the range of GRSG, as defined by Schroeder et al. (2004); by populations and subpopulations as defined by Connelly et al. (2004); by RMP area; by the seven (WAFWA) GRSG Management Zones (Stiver et al. 2006), and by Priority Areas for Conservation (PACs) as defined in the GRSG Conservation Objectives Team (COT) Report (USFWS 2013). *[If needed, based on specifics of comments and/or summary statement, include statement to the effect that broad- and mid-scale monitoring will be conducted as funding allows.]*

*[Refer to the Monitoring Framework in the appendix in FEIS.]* To accomplish effective monitoring, the BLM will analyze the monitoring data to characterize the relationship among disturbance, implementation actions, and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife agencies, effectiveness monitoring can be supplemented with population trend information, taking into consideration the lag effect response of populations to habitat changes.

Or could use this paragraph:

The BLM has drafted a monitoring framework that is included in the Proposed RMPA/FEIS as Appendix X. The appendix describes the process that the BLM will use to monitor implementation and effectiveness of RMP decisions. The monitoring framework includes monitoring at various scales specific to GRSG habitat, consistent indicators to measure and metric descriptions for each of the scales, analysis and reporting methods, and the incorporation of monitoring results into adaptive

NOTE: This is language from the National Response Team. Need to work on this response once the final framework is completed. Need to come up with a response to "The final monitoring report was not available for the public to comment".

A monitoring framework was developed for the North Dakota Greater Sage-Grouse DRMPA/DEIS by a Disturbance and Monitoring Team. The framework focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM worked with Western Association of Fish and Wildlife Agencies (WAFWA) to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate data-sets will be established so that data can easily be "rolled up" for reporting monitoring results across the range of GRSG, as defined by Schroeder et al. (2004); by populations and subpopulations as defined by Connelly et al. (2004); by RMP area; by the seven (WAFWA) GRSG Management Zones (Stiver et al. 2006), and by Priority Areas for Conservation (PACs) as defined in the GRSG Conservation Objectives Team (COT) Report (USFWS 2013). The monitoring framework is not based on the COT Report, but rather follows guidelines established by multiple agencies in the Sage-grouse Habitat Assessment Framework (HAF; Stiver et al. 2010). This approach uses the four orders of GRSG habitat selection (Johnson 1980): first order (broad scale), second order (mid-scale), third order (fine scale), and fourth order (site scale). Habitat suitability assessments are not done as part of this planning process.

[NOTE TO BLM: Refer to the Monitoring Framework in the appendix in FEIS.] To accomplish effective monitoring, the BLM will analyze the monitoring data to characterize the relationship among disturbance, implementation actions, and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife agencies, effectiveness monitoring can be supplemented with population trend information, taking into consideration the lag effect response of populations to habitat changes.

**NOTE TO****SUBREGIONAL TEAMS:**

See Mitigation, Monitoring, and Adaptive Management tabs for national response language.

These issue statements/responses are very similar to those presented under the SG tab (7.9). Suggest reviewing both together and determine if they are the same and can be combined, or if there are specific differences that should be split out.

For example, perhaps this tab should be used to describe the general NEPA requirements/standards for mitigation and monitoring; whereas the specific SG related mitigation, monitoring, adaptive management strategies responses are in section 7.9

Plan	Issue Statement
------	-----------------

OR	The alternatives are overly focused on protecting GRSG and none of them meet FLPMA's multiple use mandate requirement.
----	--

UT	The alternatives are overly focused on protecting sage grouse, would unnecessarily restrict energy development, and don't meet FLPMA's multiple use mandate requirement. BLM and Forest Service must comply with the provisions in FLPMA related to closing areas of 5,000 and 100,000 acres to minerals or other uses.
----	---

ID-SW MT The DLUPA/EIS has failed to comply with the multiple-use mandates found in the BLM's FLPMA and the Forest Service's Multiple Use Sustained Yield Act because it has put protecting greater sage-grouse and sage-grouse habitat above legal requirements for balanced management.

NV-CA Alternatives in the DLUPA/EIS, particularly Alternatives C and F, failed to comply with the multiple-use mandates found in the BLM's FLPMA and the Forest Service's Multiple Use Sustained Yield Act because they are overly focused on protecting greater sage-grouse and sage-grouse habitat.

NWCO The alternatives are overly focused on protecting sage grouse and none of them meet FLPMA's multiple use mandate requirement.

Lewisto The DRMPA/DEIS is overly focused on  
wn protecting sage-grouse and does not meet  
FLPMA's multiple use mandate.

ND The DRMPA/DEIS is overly focused on protecting sage-grouse and does not meet FLPMA's multiple use mandate.

WY9

## Response

The BLM's FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM's multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the BLM to develop and periodically revise or amend its RMPs, which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

As stated in Section 2.3.1 of the DRMPA/DEIS, the alternatives "fulfill the purpose and need for the RMPA." The RMPA is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve GRSG and to respond to the potential of it being listed (see DRMPA/DEIS Section 1.2, Purpose and Need). The BLM's planning processes allow for analysis and consideration of a range of alternatives in the DRMPA/DEIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore GRSG habitat and to eliminate, reduce, or minimize threats to this habitat. As stated on page 2-3, the alternatives "meet the purpose and need for the LUPA." The LUPA is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of it being listed (see DEIS Section 1.2, Purpose and Need).

The BLM's FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM's multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the BLM to develop and periodically revise or amend its Resource Management Plans (RMPs), which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

Consistent with the Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA), the Forest Service manages National Forest System land to sustain the multiple use of its renewable resources in perpetuity while maintaining the long-term health and productivity of the land. Resources are managed through a combination of approaches and concepts for the benefit of human communities and natural resources. Land management plans guide sustainable, integrated resource management of the resources within the plan area in the context of the broader landscape, giving due consideration to the relative values of the various resources in particular areas. The Forest Service is required by statute to have a national planning rule: the Forest and Rangeland Renewable Resources Planning Act of 1974, as amended by the National Forest Management Act of 1976, requires the Secretary of Agriculture to issue regulations under the principles of the Multiple-Use Sustained-Yield Act of 1960 for the development and revision of land management plans.

The Utah Greater Sage-Grouse Land Use Plan Amendment is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of it being listed (see DEIS Section 1.2). Both the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of

NOTE TO BLM: this is the full national response and has been reviewed by SOL:

The BLM's FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM's multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the United States (US) Department of the Interior, Bureau of Land Management (BLM) to develop and periodically revise or amend its Resource Management Plans (RMPs), which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

Consistent with the Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA), the Forest Service manages National Forest System land to sustain the multiple use of its renewable resources in perpetuity while maintaining the long-term health and productivity of the land. Resources are managed through a combination of approaches and concepts for the benefit of human communities and natural resources. Land management plans guide sustainable, integrated resource management of the resources within the plan area in the context of the broader landscape, giving due consideration to the relative values of the various resources in particular areas. The Forest Service is required by statute to have a national planning rule: the Forest and Rangeland Renewable Resources Planning Act of 1974, as amended by the National Forest Management Act of 1976, requires the Secretary of Agriculture to issue regulations under the principles of the Multiple-Use Sustained-Yield Act of 1960 for the development and revision of land management plans.

The [name of particular amendment] is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of its being listed (see Section I.XX, Purpose and Need). Both, the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore greater sage-grouse habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DLUPA/EIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. For

The BLM's FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM's multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the United States (US) Department of the Interior, Bureau of Land Management (BLM) to develop and periodically revise or amend its Resource Management Plans (RMPs), which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

Consistent with the Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA), the Forest Service manages National Forest System land to sustain the multiple use of its renewable resources in perpetuity while maintaining the long-term health and productivity of the land. Resources are managed through a combination of approaches and concepts for the benefit of human communities and natural resources. Land management plans guide sustainable, integrated resource management of the resources within the plan area in the context of the broader landscape, giving due consideration to the relative values of the various resources in particular areas. The Forest Service is required by statute to have a national planning rule: the Forest and Rangeland Renewable Resources Planning Act of 1974, as amended by the National Forest Management Act of 1976, requires the Secretary of Agriculture to issue regulations under the principles of the Multiple-Use Sustained-Yield Act of 1960 for the development and revision of land management plans.

The Nevada and Northeast California LUPA/DEIS is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of its being listed (see Section 1.1.3, Purpose and Need). Both, the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore greater sage-grouse habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DLUPA/EIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. For example, [insert one or more examples of the range of actions considered, include references to sections/table where

As stated on page 32, the alternatives “meet the purpose and need for the LUP or LUPA.” The LUPA is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of it being listed (see DEIS Section 1.2, Purpose of and Need for the Land Use Plan Amendments, on page 6).

The BLM’s FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM’s multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the United States (US) Department of the Interior, Bureau of Land Management (BLM) to develop and periodically revise or amend its Resource Management Plans (RMPs), which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

Consistent with the Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA), the Forest Service manages National Forest System land to sustain the multiple use of its renewable resources in perpetuity while maintaining the long-term health and productivity of the land. Resources are managed through a combination of approaches and concepts for the benefit of human communities and natural resources. Land management plans guide sustainable, integrated resource management of the resources within the plan area in the context of the broader landscape, giving due consideration to the relative values of the various resources in particular areas. The Forest Service is required by statute to have a national planning rule: the Forest and Rangeland Renewable Resources Planning Act of 1974, as amended by the National Forest Management Act of 1976, requires the Secretary of Agriculture to issue regulations under the principles of the Multiple-Use Sustained-Yield Act of 1960 for the development and revision of land management plans.

The Northwest Colorado Greater Sage-Grouse Land Use Plan Amendment is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of it being listed (see DEIS Section 1.2, Purpose of and Need for the Land Use Plan Amendments, on page 6). Both the Forest Service’s and BLM’s planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified

As stated on page 2-3 (Section 2.3.1) of the DRMPA/DEIS, the alternatives “meet the purpose and need for the Lewistown Field Office Greater Sage-Grouse RMPA.” The RMPA is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve GRSG and to respond to the potential of it being listed (see DRMPA/DEIS Section 1.2, Purpose and Need, on page 1-3).

The BLM’s FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM’s multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the BLM to develop and periodically revise or amend its RMPs, which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

The Lewistown Field Office Greater Sage-Grouse RMPA is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve GRSG and to respond to the potential of it being listed (see DRMPA/DEIS Section 1.2, Purpose and Need, on page 1-3). The BLM’s planning processes allow for analysis and consideration of a range of alternatives in the DRMPA/DEIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore GRSG habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. Section 3.3.1, Conditions of the Planning Area, provides an overview of current uses on public lands that may threaten GRSG habitat and populations. The DRMPA/DEIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights.

Additionally, the BLM developed the Lewistown Field Office Sage-Grouse DRMPA/DEIS with involvement from 12 cooperating agencies (see DRMPA/DEIS Section 6.3, Cooperating Agencies, on page 6-4), including USFWS, MFWP, Montana

As stated on page 2-3 (Section 2.3.1) of the DRMPA/DEIS, the alternatives "meet the purpose and need for the North Dakota Greater Sage-Grouse RMPA." The RMPA is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve GRSG and is limited to the very southwestern portion of the North Dakota Field Office. (see DRMPA/DEIS Section 1.2, Purpose and Need, on page 1-3).

The BLM's FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM's multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the BLM to develop and periodically revise or amend its RMPs, which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

The North Dakota Greater Sage-Grouse RMPA is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve GRSG and to respond to the potential of it being listed (see DRMPA/DEIS Section 1.2, Purpose and Need, on page 1-3). The BLM's planning processes allow for analysis and consideration of a range of alternatives in the DRMPA/DEIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore GRSG habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DRMPA/DEIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. As stated in Section 1.7, Development of Planning Criteria (p. 1-113), the RMPA will recognize valid existing rights. Under Alternative D, during implementation level review and decisions, (e.g., approval of an APD, Sundry Notice, etc.) and upon completion of the environmental record of review (43 CFR 3162.5), evaluate whether the conservation measure is "reasonable" (43 CFR 3101.1-2) with the valid existing rights (see pages 2-33 and 2-34 in the DEIS).

Additionally, the BLM developed the North Dakota Greater Sage-Grouse DRMPA/DEIS with involvement from cooperating agencies (see DRMPA/DEIS Section 6.3, Cooperating Agencies, on page 6-4), including USFWS, NDGFD, Bowman County Commissioners, and Bowman-Slope Conservation District to ensure that a balanced multiple-use management strategy to

n/a

As part of the LUPA process, the BLM and Forest Service will make land use planning decisions and utilize data appropriate for that scale of planning and analysis. Conducting field investigations prior to construction is a standard requirement at the implementation level, with involvement of private industry, the BLM, and other appropriate parties. The LUPA/EIS does not define who will conduct these investigations since this decision will be made at the implementation level.

n/a

n/a

n/a

The CEQ regulations require an environmental impact statement to "succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration. The description shall be no longer than is necessary to understand the effects of the alternatives. Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Agencies shall avoid useless bulk in statements and shall concentrate effort and attention on important issues" (40 CFR 1502.15). Additionally, the Lewistown Field Office Greater Sage-Grouse RMPA is a programmatic NEPA effort to conserve greater sage-grouse and its habitat across a broad geographic area. As such, the BLM described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions.

The BLM complied with these regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The affected environment provided in Chapter 3 in the Lewistown Field Office Greater Sage-Grouse RMPA is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the RMPA/EIS. For example, listing every water quality-impaired stream within the planning area by name would not provide useful information at this broad-scale analysis, particularly where the proposed plan alternatives did not vary the level of riparian protections to provide reduced levels for non-impaired streams. The riparian protections within each alternative were applied to all streams, whether or not they were water quality-impaired. However, understanding the miles of impaired BLM streams, as presented in the DLUPA/EIS at Section 3.18.2, is useful in establishing a baseline by which the BLM may analyze the relative effects of each alternative's broad-based approach.

As specific actions come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. Site-specific concerns and more detailed environmental descriptions will be addressed when project-level reviews are tiered to the analysis in this EIS (40 CFR 1502.20, 40 CFR 1508.28). In addition, as n/a

## Response

The BLM land use plans and amendments must be consistent with officially approved or adopted resource-related plans of Indian tribes, other Federal agencies, and State and local governments to the extent that these resource-related plans comport with FLPMA and other Federal laws and regulations (see 43 CFR 1610). The BLM has worked closely with State and local governments during preparation of the Draft RMPA/EIS. The Draft RMPA/EIS lists the cooperating agencies actively involved in the planning process in Section 6.3. To assist in the consistency review, the BLM requested the state, county, and tribal government cooperating agencies review the Draft RMPA/EIS and identify potential inconsistencies between the alternatives and each agency's applicable plans. This allowed state and local cooperating agencies to use their special expertise regarding the familiarity with their own state or local plans.

To assist in the consistency review, the BLM requested the state, county, and tribal government cooperating agencies review the draft RMPA/EIS and identify potential inconsistencies between the alternatives and each agency's applicable plans. This allows the state, local, and tribal cooperating agencies to use their special expertise regarding the familiarity with their own state, local, or tribal plans. On the local level, it is a county's responsibility to accurately identify and communicate any inconsistencies between that county's plan and the proposed alternative.

[Note to BLM: UTSG has a section for Coordination and Consistency, does ORSG need to add one?]

The BLM works to find a balance among uses and needs as reflected in these local government plans and has done so in the preparation of the RMPA/EIS; a list of these plans can be found in Section 1.7, Relationship to Other Policies, Plans, and Programs. While the BLM is not obligated to seek consistency, the agency is required to describe the inconsistencies between the proposed action and the other plans, policies, and/or controls within the EIS. This information has been updated in the FEIS.

[Note to BLM: Need to add this sentence (regarding obligations) to Section 1.7, Relationship to Other Policies, Plans, and Programs, of the FEIS. Also need to ensure that the FEIS describes any such inconsistencies.]

The BLM coordinates with cooperating agencies commensurate with each agency's recognized jurisdiction or expertise. In areas where the State of Oregon has clear jurisdiction, such as wildlife populations, the BLM has worked closely with that State agency. In cases where a county or agency has expertise, such as local county socioeconomic information, the BLM has worked closely with the group to incorporate the information into the EIS. However, the Oregon GRSG RMPA/EIS applies to BLM-managed lands only and does not make any management decisions on State or local lands. Land use plans play a

The BLM land use plans and amendments must be consistent with officially approved or adopted resource-related plans of Indian tribes, other Federal agencies, and State and local governments to the extent that these resource-related plans comport with FLPMA and other Federal laws and regulations (see 43 CFR 1610). The BLM has worked closely with State and local governments during preparation of the Draft LUPA/EIS. The Draft LUPA/EIS lists the cooperating agencies actively involved in the planning process in Section 5.3. As described in Section 5.4, Coordination and Consistency, the BLM requested the state, county, and tribal government cooperating agencies assist in the consistency reviews by reviewing the range of alternatives associated with the draft LUPA/EIS and identify potential inconsistencies between the alternatives and each agency's applicable plans. This allows the state, local, and tribal cooperating agencies to use their special expertise regarding the familiarity with their own state, local, or tribal plans. On the local level, it is a county's responsibility to accurately identify and communicate any inconsistencies between that county's plan and the proposed alternative.

The BLM works to find a balance among uses and needs as reflected in these local government plans and has done so in the preparation of the LUPA/EIS; a list of these plans can be found in Section 1.8, Relationship to Other Policies, Plans, and Programs. The BLM is aware that there are specific State or local laws relevant to aspects of public land management that are discrete from, and independent of, Federal law. However, BLM is bound by Federal law. As a consequence, there may be inconsistencies that cannot be reconciled. The FLPMA requires that BLM's land use plans be consistent with State and local plans "to the extent practical". In a situation where State and local plans conflict with Federal law, there will be an inconsistency that cannot be resolved. Thus, while State County and Federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the Federal agency planning process is not bound by or subject to County plans, planning processes, or planning stipulations. While the BLM is not obligated to seek consistency, the agency is required to describe the inconsistencies between the proposed action and the other plans, policies, and/or controls within the EIS, so that the State and local governments have a complete understanding of the impacts of the PRMP on State and local management options. This information has been updated in the FEIS in Section 1.8.

The BLM coordinates with cooperating agencies commensurate with each agency's recognized jurisdiction or expertise. In areas where the State of Utah has clear jurisdiction, such as wildlife populations, the BLM has worked closely with that State. The BLM land use plans and amendments must be consistent with officially approved or adopted resource-related plans of Indian tribes, other Federal agencies, and State and local governments to the extent that these resource-related plans comport with FLPMA and other Federal laws and regulations (see 43 CFR 1610). The BLM has worked closely with State and local governments during preparation of the Draft LUPA/EIS. The Draft LUPA/EIS lists the cooperating agencies actively involved in the planning process in Section 6.XX. The BLM works to find a balance among uses and needs as reflected in these local government plans and has done so in the preparation of the LUPA/EIS; a list of these plans can be found in Chapter 1, Section 1.XX, Relationship to Other Policies, Plans, and Programs. While the BLM is not obligated to seek consistency, the agency is required to describe the inconsistencies between the proposed action and the other plans, policies, and/or controls within the EIS. This information has been updated in the FEIS. [NOTE TO BLM: Might need to add this sentence (regarding obligations) to Section 1.7, Relationship to Other Policies, Plans, and Programs, of the FEIS. Also need to ensure that the FEIS describes any such inconsistencies.]

The BLM coordinates with cooperating agencies commensurate with each agency's recognized jurisdiction or expertise. In areas where the State of Idaho has clear jurisdiction, such as wildlife populations, the BLM has worked closely with that State agency. In cases where a county or agency has expertise, such as local county socioeconomic information, the BLM has worked closely with the group to incorporate the information into the EIS.

NOTE TO BLM: plans, policies that commenters felt needed to be reviewed for consistency:

Gooding conservation district sage grouse conservation plan

National Academy of Sciences 2013 recommendations for the WHB program

State of MT sage-grouse management strategy

NOTE TO BLM: need to review all of the noted plans/policies for consistency. Update FEIS to include statement (paragraph) to confirm that there are no inconsistencies. Or if there are inconsistencies, how BLM has chosen to resolve them. Include rationale for why or why not inconsistencies were corrected.

In response, include direction to the reader where they can find the new/updated information in the FEIS. E.g., "See Section XXX in the FEIS for additional details."

The BLM land use plans and amendments must be consistent with officially approved or adopted resource-related plans of Indian tribes, other Federal agencies, and State and local governments to the extent that these resource-related plans comport with FLPMA and other Federal laws and regulations (see 43 CFR 1610). The BLM has worked closely with State and local governments during preparation of the Draft LUPA/EIS. The Draft LUPA/EIS lists the cooperating agencies actively involved in the planning process in Section 6.4. The BLM works to find a balance among uses and needs as reflected in these local government plans and has done so in the preparation of the LUPA/EIS; a list of these plans can be found in Chapter 1, Section 1.7, Relationship to Other Policies, Plans, and Programs (see page 26). While the BLM is not obligated to seek consistency, the agency is required to describe the inconsistencies between the proposed action and the other plans, policies, and/or controls within the EIS. This information has been updated in the FEIS. *[NOTE TO BLM: Need to add this sentence (regarding obligations) to Section 1.7, Relationship to Other Policies, Plans, and Programs, of the FEIS. Also need to ensure that the FEIS describes any such inconsistencies.]*

The BLM coordinates with cooperating agencies commensurate with each agency's recognized jurisdiction or expertise. In areas where the State of Colorado has clear jurisdiction, such as wildlife populations, the BLM has worked closely with that

The BLM land use plans and amendments must be consistent with officially approved or adopted resource-related plans of Indian tribes, other Federal agencies, and State and local governments to the extent that these resource-related plans comport with FLPMA and other Federal laws and regulations (see 43 CFR 1610). The BLM has worked closely with State and local governments during preparation of the Draft RMPA/EIS. The Draft RMPA/EIS lists the cooperating agencies actively involved in the planning process in Section 6.3. As described in Section 6.3, starting on June 26, 2012, the BLM has conducted four meetings to date with cooperating agencies. The focus of the meetings was to explain the purpose and need for the RMPA/EIS and the process and to develop a sub-regional management alternative. The entities that were invited to become cooperating agencies were also encouraged to attend the scoping open houses and provide comments during the scoping period (Section 6.1.1). In addition agencies were invited to attend meetings for the draft EIS and encouraged to submit comments on the draft. These agencies have been engaged throughout the planning process, including during alternatives development.

The BLM works to find a balance among uses and needs as reflected in these local government plans and has done so in the preparation of the RMPA/EIS; a list of these plans can be found in Chapter I, Section I.8, Relationship to Other Policies, Plans, and Programs. While the BLM is not obligated to seek consistency, the agency is required to describe the inconsistencies between the proposed action and the other plans, policies, and/or controls in the decision record for the EIS. [NOTE TO BLM: Need to add this sentence (regarding obligations) to Section I.7, Relationship to Other Policies, Plans, and Programs, of the FEIS. Also need to ensure that the FEIS describes any such inconsistencies.]

The BLM coordinates with cooperating agencies commensurate with each agency's recognized jurisdiction or expertise. In areas where the State of Montana has clear jurisdiction, such as wildlife populations, the BLM has worked closely with that State agency. In cases where a county or agency has expertise, such as local county socioeconomic information, the BLM has worked closely with the group to incorporate the information into the EIS.

## Response

Both the CEQ and BLM Planning regulations define cooperating agency status, including what it is, who is eligible to become a cooperating agency, and how the lead agency should invite participation as a cooperating agency (40 CFR 1501 and 1508; 43 CFR 1601.0-5). Cooperating relationships are limited to government entities: state agencies, local governments, tribal governments, and other Federal agencies that have jurisdiction by law or special expertise. Additionally, per the regulations and BLM policy, there is no coordinating agency status (BLM Desk Guide to Cooperating Agency Relationships and Coordination with Intergovernmental Partners, pages 21 and 31, respectively). To be a cooperating agency, the local agency must meet the eligibility criteria set out in the regulations and policies. The specific role of each cooperating agency is based on jurisdiction by law or special expertise, which is determined on an agency-by-agency basis and identified in the Memorandum of Understanding.

These relationships were described in the Draft EIS in Section 6.3, Cooperating Agencies (page 6-2). In December 2011, the BLM sent letters to 35 letters to local, state, federal, and tribal governments inviting them to be a cooperating agency for the Oregon GRSG EMPA/EIS. The BLM also sent 7 more follow-up letters to Native American tribes. To date, 12 agencies agreed to participate on the EIS as designated cooperating agencies, all of which have signed Memoranda of Understanding with the BLM's Oregon State Office (Table 6-1, Cooperating Agencies). The County of Harney was one of the invited agencies and accepted the invitation.

In addition to the BLM's invitations to a wide variety of agencies to participate as Cooperating Agencies, DOI regulations (43 CFR 46.225(c)) require the BLM, as lead agency, to consider any request by a government entity to participate as a Cooperating Agency (BLM Desk Guide to Cooperating Agency Relationships and Coordination with Intergovernmental Partners, pages 8-9). From the time that the Notice of Intent was published and throughout the development of the EIS, an agency could notify the BLM requesting to Cooperating Agency status. However, the BLM did not receive this notification from any agency or entity requesting BLM to consider them for Cooperating Agency status during development of the Draft EIS nor in any of the Draft EIS comment letters; as a result, only the agencies described in Section 6.3 were Cooperating Agencies in the development of the EIS.

All agencies participating as cooperating agencies have been given opportunities to participate during various steps of the planning process, including regular briefings, requests for input on draft alternatives and the administrative draft EIS, and identification of issues and data during scoping and during the DEIS comment period, as required by 40 CFR 1503.2 and 40

## Response

n/a

The BLM and the Forest Service began working together to address conservation of the greater sage-grouse and its habitat in 2010. At that time, the Forest Service's 2012 Planning Rule was not final; it became final May 9, 2012. For plan amendments initiated before May 9, 2012, the Forest Service may complete and approve the amendments under the prior planning regulations, including its transition provisions (36 CFR part 219, published at 36 CFR parts 200 to 299, revised as of July 1, 2010). Land use plan amendments associated with the greater sage-grouse conservation effort are using the 1982 planning rule procedures that are allowed under the transition procedures of the prior planning rule. The 1982 planning rule procedures may be found in 36 CFR parts 200 to 299 Revised as of July 1, 2000 or at [NOTE TO BLM: This is from a national response.]

The framework for the scope of analysis for the project is based upon the BLM and the Forest Service Planning and NEPA manual and handbooks definitions of the planning, decision, and analysis areas. Specifically, Forest Service Manual 1900-Planning Chapter, Zero Code defines the Area of Analysis as "The geographic area within which ecosystems, their components, or their processes are evaluated during analysis and development of one or more plans, plan amendments, or plan revisions. This area may vary in size depending on the relevant planning issue. For a plan, an area of analysis may be larger than a plan area. For development of a plan amendment, an area of analysis may be smaller than the plan area and include multiple ownerships."

For this environmental impact statement, decision areas are those public lands and mineral estates within the planning area that are encompassed by all designated habitat (ADH) (which includes preliminary priority habitat [PPH], preliminary general habitat [PGH], and linkage/connectivity habitat).

Planning Area. The geographic area within which the BLM will make decisions during a planning effort. A planning area boundary includes all lands regardless of jurisdiction; however the BLM will only make decisions on lands that fall under the BLM's jurisdiction (including subsurface minerals). Unless the State Director determines otherwise, the planning area for a RMP is the geographic area associated with a particular field office (43 CFR 1610.1(b)). State Directors may also establish regional planning areas that encompass several field offices and/or states, as necessary.

Plan areas. National Forest System lands covered by land use plans. (36 CFR 219.16)

Plan	Issue Statement
------	-----------------

OR	The BLM has failed to document how the EIS and/or actions considered in the EIS comply with other laws, including Stock Raising Homestead Act of 1916, Administrative Procedure Act (APA), the Energy Policy Act of 2005, Mining and Minerals Policy Act of 1970, Common School Fund (via the Oregon Admissions Acts and the Oregon Constitution), and the Endangered Species Act.
----	--

UT	The BLM has failed to document how the EIS and/or actions considered in the EIS comply with other laws, including the Surface Mining Control and Reclamation Act , Data Quality Act, Regulatory Flexibility Act, Onshore Orders regulating oil and gas development, Energy Policy Act of 2005, Energy Policy and Conservation Act of 2000, Mining and Minerals Policy Act of 1970, Federal Advisory Committee Act, 2000 Defense Department Appropriations Act, and the Taylor Grazing Act.
----	--

ID-SW MT The BLM has failed to document how the EIS and/or actions considered in the EIS comply with other laws, including all Onshore Orders regulating oil and gas development, the Energy Policy Act of 2005 and Energy Policy and Conservation Act of 2000, the Taylor Grazing Act, the Mining and Minerals Policy Act, the Information Quality Act, the Wild Horse and Burro Act, other multiple use mandates (e.g., Multiple-Use Sustained Yield Act of 1960, Forest and Rangeland Renewable Resources Planning Act of 1974, National Forest Management Act of 1976), and compliance with other federal agency regulations (e.g., XXX).

NV-CA The Draft LUPA/EIS does not clearly describe how proposed management actions would comply with other laws, including the General Mining Law, the Taylor Grazing Act, the Public Rangeland Improvement Act, the Energy Policy Act of 2005 and Energy Policy and Conservation Act of 2000, other multiple use mandates (e.g., Multiple-Use Sustained Yield Act of 1960, Forest and Rangeland Renewable Resources Planning Act of 1974, National Forest Management Act of 1976), other federal agency regulations (e.g., Federal Regulatory Energy Commission), and state laws (e.g. Nevada Water Laws).

NWCO The BLM has failed to document how the EIS and/or actions considered in the EIS comply with other laws, including all Onshore Orders regulating oil and gas development, the Energy Policy Act of 2005 and Energy Policy and Conservation Act of 2000, other multiple use mandates (e.g., Multiple-Use Sustained Yield Act of 1960, Forest and Rangeland Renewable Resources Planning Act of 1974, National Forest Management Act of 1976), and compliance with other federal agency regulations (e.g., Federal Regulatory Energy Commission).

Lewisto Commenters requested the BLM to explain why the 2011 GRSG IMs, which add substantive requirements to the National Strategy, and the NOI do not require conformity with the Administrative Procedure Act (APA). The DEIS does not meet the USFWS PECE policy standards. Additionally, commenters state that the BLM should have conducted NEPA analysis on the ND The DRMPA/DEIS is contrary to the Taylor Grazing Act.

## Response

[NOTE TO BLM: This response may need to go up the chain for review.]

The Oregon Greater Sage-Grouse RMPA is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve GRSG and to respond to the potential of it being listed (see DEIS Section 1.2, Purpose and Need). The BLM's planning processes allow for analysis and consideration of a range of alternatives in the RMPA/EIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore GRSG habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The RMPA/EIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights.

The BLM developed the Oregon Greater Sage-Grouse Draft RMPA/DEIS with involvement from cooperating agencies (see DEIS Section 6.3, Cooperating Agencies), including counties, state agencies, and federal agencies, to ensure that a balanced multiple-use management strategy to address the protection of GRSG while allowing for utilization of renewable and nonrenewable resources on the public lands.

The Draft EIS Section 2.5.1, Management Common to All Alternatives, states that all alternatives would comply with state and federal laws, regulations, policies, and standards, including FLPMA multiple use mandates and the implementation of actions originating from laws, regulations, and policies and conformance to day-to-day management, monitoring, and administrative functions not specifically addressed.

[NOTE TO BLM: This response may need to go up the chain for review.]

As noted under Section 5 of this Report, the Draft LUPA/EIS is consistent with the BLM's FLPMA and the Forest Service's Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA). The Utah Greater Sage-Grouse Land Use Plan Amendment is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve GRSG and to respond to the potential of it being listed (see DEIS Section 1.2, Purpose and Need). Both the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore GRSG habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DLUPA/EIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights.

Additionally, the BLM and the Forest Service developed the Utah Greater Sage-Grouse Draft Land Use Plan Amendment/DEIS with involvement from cooperating agencies (see DEIS Section 5.3), including counties, state agencies, federal agencies, and tribes, to ensure that a balanced multiple-use management strategy to address the protection of GRSG while allowing for utilization of renewable and nonrenewable resources on the public lands.

The Final EIS has been updated in Section 1.8, Relationship to Other Policies, Plans, and Programs, to state that all alternatives would comply with state and federal laws, regulations, policies, and standards, and implement actions originating from laws, regulations, and policies. Actions in the Proposed LUPA have been reviewed and found to be consistent and within the bounds of all required laws, regulations, and policies.

Consistent with the BLM's regulations (43 CFR 4130.2(a)) and Land Use Planning Handbook (H-1601-1, Appendix C(II)(B)), the Utah Greater Sage-Grouse LUPA makes appropriate land use planning decisions by identifying lands available or not available for livestock grazing (see DLUPA/DEIS Table 2.1). Further, the Utah Greater Sage-Grouse LUPA complies with the Taylor Grazing Act, which does not preclude the BLM from identifying some lands not available to livestock grazing. As stated in Section 2.1, the action alternatives "meet the purpose and need for the Utah Greater Sage-Grouse LUPA."

On February 9, 2012, the BLM published its updated Information Quality Guidelines in accordance with direction provided by OMB and the Department of the Interior's Data Quality Guidelines. BLM's guidelines are intended to ensure that any information disseminated by the BLM will be high quality, accurate, useable information. If a member of the public feels that

[NOTE TO BLM: This response may need to go up the chain for review.]

As noted under Section 5 of this Report, the Draft LUPA/EIS is consistent with the BLM's FLPMA and the Forest Service's Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA). The Idaho Greater Sage-Grouse Land Use Plan Amendment is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of it being listed (see DEIS Section 1.2, Purpose of and Need for the Land Use Plan Amendments). Both the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore greater sage-grouse habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DLUPA/EIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. Additionally, the BLM and the Forest Service developed the Idaho Greater Sage-Grouse Draft Land Use Plan Amendment/DEIS with involvement from cooperating agencies (see DEIS Section 6.3, Cooperating Agencies), including [ID state wildlife agency, counties, etc.] to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands. The Draft EIS Section 2.5, Management Common to All Alternatives (pages 39 and 40), states that all alternatives would comply with state and federal laws, regulations, policies, and standards, and implement actions originating from laws, regulations, and policies. Actions in the Proposed LUPA have been reviewed and found to be consistent and within the The DEIS Section 2.5, Management Common to All Alternatives (page 15), states that all alternatives would comply with state and federal laws, regulations, policies, and standards, and implement actions originating from laws, regulations, and policies.

Also, as noted under Section 5 of this Report, the Draft LUPA/EIS is consistent with the BLM's FLPMA and the Forest Service's Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA). The Nevada and Northeastern California Greater Sage-Grouse Land Use Plan Amendment is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of it being listed (see DEIS Section 1.3, Purpose of and Need for the Land Use Plan Amendments). Both the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore greater sage-grouse habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DLUPA/EIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights.

Additionally, the BLM and the Forest Service developed the Nevada and Northeastern California Greater Sage-Grouse Land Use Plan Amendment /DEIS with involvement from cooperating agencies (see DEIS Section 6.3, Cooperating Agencies),

*[NOTE TO BLM: This response may need to go up the chain for review.]*

As noted under Section 5 of this Report, the Draft LUPA/EIS is consistent with the BLM's FLPMA and the Forest Service's Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA). The Northwest Colorado Greater Sage-Grouse Land Use Plan Amendment is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of it being listed (see DEIS Section 1.2, Purpose of and Need for the Land Use Plan Amendments, on page 6). Both the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore greater sage-grouse habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DLUPA/EIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights.

Additionally, the BLM and the Forest Service developed the Northwest Colorado Greater Sage-Grouse Draft Land Use Plan Amendment/DEIS with involvement from cooperating agencies (see DEIS Section 6.3, Cooperating Agencies, on page 986 et al.), including Colorado Department of Parks and Wildlife, Garfield County, and 20 others, to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

*[NOTE TO BLM: this issue will need review by the National Comment team.]*

The North Dakota Greater Sage-Grouse RMPA is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve GRSG and to respond to the potential of it being listed (see DRMPA/DEIS Section 1.2, Purpose and Need, on page 1-3). The BLM's planning processes allow for analysis and consideration of a range of alternatives in the DRMPA/DEIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore GRSG habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DRMPA/DEIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights.

Consistent with the BLM's regulations (43 CFR 4130.2(a)) and Land Use Planning Handbook (H-1601-1, Appendix C(II)(B)), the North Dakota Greater Sage-Grouse RMPA makes appropriate land use planning decisions by identifying lands available or not available for livestock grazing (see DRMPA/DEIS Table 2-3, page 2-29). Further, the North Dakota Greater Sage-Grouse RMPA complies with the Taylor Grazing Act, which does not preclude the BLM from identifying some lands not available to livestock grazing. As stated on page 2-3 (Section 2.3.1), the alternatives "meet the purpose and need for the North Dakota

Plan	Issue Statement
------	-----------------

OR	Commenters contended that the NTT report violated NEPA and FLPMA and contained arbitrary and unjustified recommendations related to several topic areas including livestock grazing management, locatable minerals management, sagebrush cover requirements, and the anthropogenic disturbance cap.
----	---

UT Commenters had two opposing views regarding the NTT report. One group suggested that the BLM and the Forest Service should not use the NTT report for various reasons, including that it:

- Is not based on local conditions.
- Has methodological and technical errors.
- Was not peer-reviewed.
- Has authors with conflicts of interests.

In addition, BLM Washington Office Instruction Memorandum 2012-044 directing consideration of the NTT report expired in September 2013, prior to the release of the Draft LUPA/EIS, and thus the NTT report does not need to be considered. The agencies have not justified the need for using the NTT report as the basis for GRSG management direction. Another group suggested that the BLM and Forest Service did not go far enough in conserving GRSG by weakening the recommendations of the NTT report; the findings in the NTT report should have been used as is, without any changes.

ID-SW  
MT Commenters contended that the NTT report is not based on the best available science, and recommendations are overly burdensome. Commenters also assert that the NTT report contains technical and methodological errors, is not based on local conditions, and has not undergone adequate peer review. Commenters questioned why the NTT report was used when the IM requiring its use has expired.

NV-CA Commenters contended that findings contained in the NTT report are based on science that is flawed, arbitrary, outdated, and narrowly focused. Commentors also assert that the NTT report contains technical errors, does not comply with existing laws, and has not undergone adequate peer review.

NWCO Commenters had two opposing views regarding the NTT report. One group suggested that the BLM and the Forest Service should not use the NTT report and only follow existing agency policy for conserving greater sage-grouse. The agencies have not justified the need for using the NTT report as the basis for greater sage-grouse management direction. Another group suggested that the BLM and FS did not go far enough and watered-down the recommendations of the NTT report; the findings should have been used as is, without any changes.

Lewisto Commenters asserted that the NTT report  
wn is inconsistent with FACA and is biased against oil and gas development.

ND It is inappropriate to use the NTT report as the basis for the DRMPA/DEIS as it is overly biased against energy development and fails to consider newer research that considers oil and gas technological advancements.

WY9

## Response

A National Technical Team (NTT) was formed as an independent, science-based team made up of representatives from the BLM, US Fish and Wildlife Service, Natural Resources Conservation Service, US Geological Survey, and state wildlife agencies from Colorado, Nevada, Oregon, Idaho, and Utah, to ensure that the best information about how to manage the greater sage-grouse is reviewed, evaluated, and provided to the BLM and the Forest Service in the planning process. The group produced a report in December 2011 that identified science-based management considerations to promote sustainable greater sage-grouse populations. The NTT report (NTT 2011) used the best current scientific knowledge to guide the BLM planning efforts through management considerations to ameliorate threats, focused primarily on priority greater sage-grouse habitats on public lands. In a letter to Secretary Salazar, dated January 15, 2013, more than 100 scientists endorsed the NTT report, stating that it, “represented comprehensive compilation of the scientific knowledge needed for conserving Sage-Grouse” and that it “offers the best scientifically supportable approach to reduce the need to list Sage-Grouse as a Threatened or Endangered species.” The NTT is staying involved as the BLM and the Forest Service work through the Strategy to make sure that relevant science is considered, reasonably interpreted, and accurately presented; and that uncertainties and risks are acknowledged and documented.

- As a starting point for developing a range of alternatives, the BLM used the NTT report and the Conservation Objectives Team (COT) report, both of which were based upon the best scientific and commercial data available at the time. These reports were not the only source of information for developing a range of alternatives (see Section 7.5, Range of Alternatives). The purpose of these reports were to identify key areas for greater sage-grouse conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. Further, the Summary of

The NTT report was not the sole source of management decisions for the range of alternatives. A National Technical Team (NTT) was formed as an independent, science-based team to ensure that the best information about how to manage the greater sage-grouse is reviewed, evaluated, and provided to the BLM and the Forest Service in the planning process. The group produced a report in December 2011 that identified science-based management considerations to promote sustainable greater sage-grouse populations. The NTT is staying involved as the BLM and the Forest Service work through the Strategy to make sure that relevant science is considered, reasonably interpreted, and accurately presented; and that uncertainties and risks are acknowledged and documented.

In addition to the NTT report, the BLM and Forest Service used the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for GRSG conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved, and the Summary of Science, Activities, Programs, and Policies That Influence the Rangeland Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER) as additional sources of baseline information and management objectives.

The range of alternatives is based upon analysis of public scoping comments as well as information provided in the NTT report, the BER, the COT report, Forest Service Interim Conservation Recommendations for Greater Sage-Grouse and Greater Sage-Grouse Habitat (2012), and State management plans. Input from the BLM and Forest Service interdisciplinary teams and cooperating agencies has also been incorporated. The BLM and Forest Service also incorporated information from scientific literature not included in the above recommendations (e.g., science regarding noise, tall structures, and roads). The alternatives represent different degrees of and approaches to balancing GRSG species and habitat conservation among other resources and resource uses, competing human interests, land uses, and the conservation of natural and cultural resource values, while sustaining and enhancing ecological integrity across the landscape, including plant, wildlife, and fish habitat. For example, Alternative D incorporates adjustments to the NTT report (NTT 2011) based on interdisciplinary team and cooperating agency input and addresses local ecological site variability to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses. PPMAs would be managed so that

A National Technical Team (NTT) was formed as an independent, science-based team to ensure that the best information about how to manage the greater sage-grouse is reviewed, evaluated, and provided to the BLM and the Forest Service in the planning process. The group produced a report in December 2011 that identified science-based management considerations to promote sustainable greater sage-grouse populations. The NTT report (NTT 2011) used the best current scientific knowledge to guide the BLM planning efforts through management considerations to ameliorate threats, focused primarily on priority greater sage-grouse habitats on public lands. The NTT report cited 122 references including published papers published from the formal scientific literature such as Journal of Wildlife Management, Conservation Biology, Biological Conservation, Wildlife Biology, BioScience and others, as well as graduate theses and dissertations, conservation strategies, FWS 2010 finding, and others representing the best available science. The NTT is staying involved as the BLM and the Forest Service work through the Strategy to make sure that relevant science is considered, reasonably interpreted, and accurately presented; and that uncertainties and risks are acknowledged and documented.

As a starting point for developing a range of alternatives, the BLM and FS used the NTT report and the Conservation Objectives Team (COT) report, both of which were based upon the best scientific and commercial data available at the time. The purpose of these reports were to identify key areas for greater sage-grouse conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. Further, the Summary of Science, Activities, Programs, and Policies That Influence the Rangewide Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER) provided additional sources of baseline information and management objectives. [NOTE TO BLM- Clarify in FEIS the policy requirements for Administrative Procedure Act (APA), NEPA relative to IM, and NTT and clarify the NTT process and FACA in the FEIS.]

~~[BLM: Insert rationale for use of IM after expiration]~~ BLM is implementing IM 2012-044 through the Greater Sage-grouse planning effort. When an IM expires without being superseded, it can still be applicable and provide guidance to the BLM. The fact that IM 2012-044 expired does not mean the BLM has no authority to continue to analyze the conservation measures identified in the NTT Report. The BLM is appropriately considering and evaluating the measures in the NTT

A National Technical Team (NTT) was formed as an independent, science-based team to ensure that the best information about how to manage greater sage-grouse habitat is reviewed, evaluated, and provided to the BLM and the Forest Service in the planning process. The group produced a report in December 2011 that identified science-based conservation measures to promote sustainable greater sage-grouse populations (Need to reword. BLM/FS manage habitat not populations.). The NTT is staying involved as the BLM and the Forest Service work through the LUPA/EIS to make sure that relevant science is considered, reasonably interpreted, and accurately presented; and that uncertainties and risks are acknowledged and documented (I don't think this is an accurate statement. I think someone needs to pull the exact language out of each of these reports and use them in these paragraphs.).

As a starting point for developing a range of alternatives, the BLM and FS used the NTT report and the Conservation Objectives Team (COT) report, both of which were based upon the best scientific and commercial data available at the time. The purpose of these reports were to identify key areas for greater sage-grouse conservation, key threats in those areas, and the extent to which threats need to be reduced for the species to be conserved. (The NTT should not be included in this sentence. It did not identify key areas, key threats etc.) Further, the Summary of Science, Activities, Programs, and Policies That Influence the Rangewide Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER) provided additional sources of baseline information. [BER did not provide management objectives-just the best available science. Straight from the BER report page 7:

This document is designed to inform and advance large-area, regional conservation efforts by consolidating information regarding rangewide and regional information about sage-grouse populations and habitats and to act as a bridge between these large-area efforts and regional and local management efforts (that is, forest and range management plans) by providing

*[NOTE to NCT: FS commenter noted need to further clarify how the NTT report was used in EIS process and its relevance in the analysis/alternatives. Specifically should state that the NTT was formulated by the BLM and included representation of members with expertise in sage-grouse management from a number of state and federal agencies. Suggested providing wording that is specific to NTT (as this is the point of the comments, not so much about the COT & BER). Perhaps need to develop wording for responses specific to COT, NTT, & BER individually??]*

A National Technical Team (NTT) was formed as an independent, science-based team to ensure that the best information about how to manage the greater sage-grouse is reviewed, evaluated, and provided to the BLM and the Forest Service in the planning process. The group produced a report in December 2011 that identified science-based management considerations to promote sustainable greater sage-grouse populations. The NTT is staying involved as the BLM and the Forest Service work through the Strategy to make sure that relevant science is considered, reasonably interpreted, and accurately presented; and that uncertainties and risks are acknowledged and documented.

The range of alternatives is based upon analysis of public scoping comments as well as information provided in the NTT report and State management plans [continue to list any other sources of actions included in the alternatives]. The alternatives represent different degrees of and approaches to balancing resources and resource use among competing human interests, land uses, and the conservation of natural and cultural resource values, while sustaining and enhancing ecological integrity across the landscape, including plant, wildlife, and fish habitat. [Example language: For example, Alternative XX incorporates adjustments to the NTT report (NTT 2011) based on cooperating agency input to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses.

Anthropogenic surface disturbance would be managed not to exceed [insert appropriate number or percentage] in ecological sites that support sagebrush within PPH (Figure 2-1, Ecological Sites Supporting Sagebrush in Preliminary Priority Habitat, in Appendix B, Figures). Additional information on disturbance cap management under Alternative D can be found in Appendix E, Disturbance Cap Management. Under Alternative D, the WRFO Reclamation Plan (Appendix F, Surface Reclamation Plan) would be followed for reclamation of lands to go back into rotation under the disturbance caps.]

Greater sage-grouse conservation measures in A Report on National Greater Sage-grouse Conservation Measures (NTT 2011) were used to form BLM and the Forest Service management direction under at least one alternative [note which one(s)], which is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044 (the A National Technical Team (NTT) was formed as an independent, science-based team to ensure that the best information about how to manage the GRSG is reviewed, evaluated, and provided to the BLM in the planning process. The group produced a report in December 2011 that identified science-based management considerations to promote sustainable GRSG populations. The NTT report (NTT 2011) used the best current scientific knowledge to guide the BLM planning efforts through management considerations to ameliorate threats, focused primarily on priority GRSG habitats on public lands. The NTT is staying involved as the BLM work through the National GRSG Strategy to make sure that relevant science is considered, reasonably interpreted, and accurately presented; and that uncertainties and risks are acknowledged and documented.

Under FACA, any time a Federal agency intends to establish, control, or manage a group that gives advice as a group and has at least one member who is not a Federal, Tribal, State, or local government employee, the agency must comply with FACA and the related administrative guidelines developed by the General Services Administration (GSA). The NTT was comprised of only Federal and State government employees and therefore FACA does not apply.

The NTT report (NTT 2011) was not the sole source of management decisions for the range of alternatives. A National Technical Team (NTT) was formed as an independent, science-based team to ensure that the best information about how to manage the GRSG is reviewed, evaluated, and provided to the BLM in the planning process. The group produced a report in December 2011 that identified science-based management considerations to promote sustainable GRSG populations. The NTT is staying involved as the BLM work through the National GRSG Planning Strategy to make sure that relevant science is considered, reasonably interpreted, and accurately presented; and that uncertainties and risks are acknowledged and documented. In addition to the NTT report, the BLM used the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for GRSG conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved, and the Summary of Science, Activities, Programs, and Policies That Influence the Rangewide Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER) as additional sources of baseline information and management objectives.

The range of alternatives is based upon analysis of public scoping comments as well as information provided in the NTT report, the BER, the COT report, and State of North Dakota management plans. Additionally, the BLM interdisciplinary team also contributes to development of the ranges of alternatives. The alternatives represent different degrees of and approaches to balancing resources and resource use among competing human interests, land uses, and the conservation of natural and cultural resource values, while sustaining and enhancing ecological integrity across the landscape, including plant, wildlife, and fish habitat. For example, Alternative D incorporates adjustments to the NTT report based on cooperating agency input to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses. Rather than the NTT recommendation to manage PH so that discrete anthropogenic disturbances cover less than 3 percent of the total GRSG habitat (Alternative B), anthropogenic surface disturbance under Alternative D would be managed to protect PH from anthropogenic disturbances that would reduce distribution or abundance of GRSG.

Greater sage-grouse conservation measures in the NTT report were used to form BLM management direction under at least one alternative, Alternative B in the North Dakota Greater Sage-Grouse RMPA, which is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044 (the BLM must consider all applicable conservation

Need to discuss how using the NTT report doesn't violate NEPA. Also need to include why it's not arbitrary and capricious.

Key points to ensure are included in responses that need to address issue of NTT not scientifically sound:

--NTT scientifically valid

\*methodology is sound

\*peer-reviewed and generated

\*recognized experts in their field

\*recent, current literature and data

utilized for the report

--NTT scope appropriate for programmatic, broad planning level analysis

Use this response for the expired IM issue (WO & SOL provided):  
BLM is implementing IM 2012-044 through the Greater Sage-grouse planning effort. When an IM expires without being superseded, it can still be applicable and provide guidance to the BLM. The fact that IM 2012-044 expired does not mean the BLM has no authority to continue to analyze the conservation measures identified in the NTT Report. The BLM is appropriately considering and evaluating the measures in the NTT Report, in addition to any other relevant science, through the Greater Sage-grouse planning process.

Edit out the "range of alts" paragraphs (national response) to keep to the issue statement point about the NTT report being watered down. And that the NTT wasn't the only source for developing alts.

The BER was used for chapter 3 (baseline data for where disturbance was) and COT as the bar against which the alternatives were measured against.

Use info from UT response here to address the IM expiration issue.

Key points to ensure are included in responses that need to address issue of NTT not scientifically sound:

--NTT scientifically valid

## Response

n/a

n/a

[NOTE TO BLM: The BLM is reviewing suggested literature and will include where necessary.]

~~National Response: The BER report is not the sole source of management decisions for the range of alternatives. A National Technical Team (NTT) was formed as an independent, science-based team to ensure that the best information about how to manage the greater sage-grouse is reviewed, evaluated, and provided to the BLM and the Forest Service in the planning process. The group produced a report in December 2011 that identified science-based management considerations to promote sustainable greater sage-grouse populations. The NTT is staying involved as the BLM and the Forest Service work through the Strategy to make sure that relevant science is considered, reasonably interpreted, and accurately presented; and that uncertainties and risks are acknowledged and documented.~~

A baseline environmental report, titled Summary of Science, Activities, Programs, and Policies That Influence the Rangeland Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER), was released on June 3, 2013, by the U.S. Geological Survey. The peer-reviewed report summarizes the current scientific understanding about the various impacts to greater sage-grouse populations and habitats and addresses the location, magnitude, and extent of each threat. ~~The BER does not provide management options. The report is being used by the BLM and the Forest Service in our efforts to develop regulatory mechanisms and improve our conservation efforts of the greater sage-grouse and its habitat to reduce the potential for listing it under the Endangered Species Act.~~ The data for this report were gathered from BLM, Forest Service, and other sources and were the best available at the range-wide scale at the time collected. The report provides a framework for considering potential implications and management options, and demonstrates a regional context and perspective needed for local planning and decision-making.

The BLM reviewed the literature sources provided by commenters to determine if there were new or updated sources that should be considered in the EIS. BLM's findings of this review were... [insert the results from the literature review. While it doesn't directly address the BER report being updated, it's addressing the point that BLM did make the effort to consider new or updated info in the EIS in addition to the BER report.]

~~In March 2012, the FWS initiated a collaborative approach to develop range-wide conservation objectives for the greater sage-grouse to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. In March 2013, this team of State and FWS representatives, released the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time~~

n/a

Response should stay focused on the point about outdated baseline data and delete the rest about alternatives, NTT and the COT.

Response should also note that the BLM is reviewing the literature. BLM's findings were...

BER title changing from "Draft" to "Final". Note in response whether there were any other updates/changes to the BER when it was finalized.

Plan	Issue Statement
OR	The BLM alternatives are not consistent with the COT report objectives. Several alternatives in the DEIS/LUPA could meet the COT report objectives if adaptive management strategy were implemented to account for the influences of wildfire in conjunction with a disturbance cap.

UT Commenters felt that the USFWS COT report was flawed for various reasons, including:

- Data quality issues and not representing the best available information.
- Subjectivity and overly biased.
- Not being comprehensive.
- Conflict of interest among peer reviewers.

As a result, commenters felt it should not have been used as the basis of the EIS alternatives.

ID-SW  
MT Commenters had two distinct views regarding the COT report. One group considered the report overly biased and not representative of the best available information. The other group suggested the DEIS was not fully consistent with the COT report habitat mapping and therefore requires revision to address those deficiencies.

NV-CA Commenters had two distinct views regarding the COT report. One group considered the report overly biased and not representative of the best available information. The other group suggested the DEIS was not fully consistent with and did not completely meet the COT report conservation objectives and therefore requires additional management actions or clarification to address those deficiencies.

NWCO Commenters had two opposing views regarding the COT report. One group considered the report overly biased and did not represent the best available information; therefore, it should not have been used as the basis of the EIS alternatives. The other group suggested the BLM and FS did not go far enough with the alternatives, and should have taken the actions directly or been consistent with the COT report conservation objectives.

Lewisto Commenters had two distinct views regarding the COT report. One group considered the report lacking in scientific integrity, inconsistent with other laws and mandates, and not representative of the best available information. The other group suggested the DEIS was not fully consistent with and did not completely meet the COT report conservation objectives and therefore requires additional management actions or clarification to address those deficiencies.

ND Commenters had two opposing views regarding the COT report. One group considered the report overly biased and did not represent the best available information; therefore, it should not have been used as the basis of the DRMPA/DEIS alternatives. The other group suggested the BLM needs to revise their alternatives regarding prescribed fire to be consistent with the COT report.

WY9

## Response

In March 2012, the FWS initiated a collaborative approach to develop range-wide conservation objectives for the greater sage-grouse to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. In March 2013, this team released the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for greater sage-grouse conservation, key threats in those areas, and the extent to which threats need to be reduced for the species to be conserved. The report serves as guidance to Federal and state agencies, and others in focusing efforts to achieve effective conservation for this species. In addition to the COT report, the BLM and FS used the National Technical Team (NTT) report and the Summary of Science, Activities, Programs, and Policies That Influence the Rangewide Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER) as additional sources of baseline information and as a starting place for developing management objectives.

In developing the Draft LUPA/EIS, the BLM and FS sought to develop a range of alternatives with management objectives and actions that are consistent with the conservation measures and objectives outlined in the COT Report. To conserve GRSG habitat, proposed management follows the basic principles of: (1) avoiding the impact of an activity; (2) minimizing impacts by limiting the degree of activity; and (3) mitigating for an impact by improving or enhancing greater sage-grouse habitat. Each of the alternatives considers different means for accomplishing this strategy. For example, some alternatives place greater emphasis on avoidance of impacts, whereas other alternatives place more emphasis on minimization and mitigation. Appendix I demonstrates how the BLM and FS addressed the threats to the populations in the Nevada and Northeastern California sub-region. The BLM and FS are continuing to work with the FWS and State agencies to develop a proposed plan

In March 2012, the USFWS initiated a collaborative approach to develop range-wide conservation objectives for the greater sage-grouse to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. In March 2013, this team of state and FWS representatives released the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for GRSG conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. The report serves as guidance to federal land management agencies, state GRSG teams, and others in focusing efforts to achieve effective conservation for this species. The USFWS will use the COT report to evaluate the alternatives and measure the sufficiency of regulatory mechanisms in reducing threats for the various PACs. In addition to the COT report, the BLM and Forest Service used the National Technical Team (NTT) report and the Summary of Science, Activities, Programs, and Policies That Influence the Rangewide Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER) as additional sources of baseline information and management objectives.

Additionally, development of the range of alternatives was based upon analysis of public scoping comments as well as information provided in the NTT report, the BER, the COT report, Forest Service Interim Conservation Recommendations for Greater Sage-Grouse and Greater Sage-Grouse Habitat (2012), and State management plans. Input from the BLM and Forest Service interdisciplinary teams and cooperating agencies has also been incorporated. The BLM and Forest Service also incorporated information from scientific literature not included in the above recommendations (e.g., science regarding noise, tall structures, and roads). The alternatives represent different degrees of and approaches to balancing GRSG species and habitat conservation among other resources and resource uses competing human interests, land uses, and the conservation of natural and cultural resource values, while sustaining and enhancing ecological integrity across the landscape, including plant, wildlife, and fish habitat. For example, Alternative D incorporates adjustments to the NTT report (NTT 2011) based on interdisciplinary team and cooperating agency input and addresses local ecological site variability to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses. PPMAs would be managed so that discrete anthropogenic disturbances cover less than 5 percent of the total GRSG habitat regardless of ownership (Figure 2.3, Greater Sage-Grouse Priority/General Management Areas-Alternative D, in Appendix A, Maps). Alternative D, also includes mitigation, monitoring, and adaptive management strategies. Alternative D in some cases

In March 2012, the FWS initiated a collaborative approach to develop range-wide conservation objectives for the greater sage-grouse to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. In March 2013, this team released the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for greater sage-grouse conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. The report serves as guidance to Federal land management agencies, State greater sage-grouse teams, and others in focusing efforts to achieve effective conservation for this species. In addition to the COT report, the BLM and FS used the National Technical Team (NTT) report and the Summary of Science, Activities, Programs, and Policies That Influence the Rangeland Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER) as additional sources of baseline information and as a starting place for developing management objectives.

In developing the Draft LUPA/EIS, the BLM and FS sought to develop a range of alternatives with management objectives and actions that are consistent with the conservation measures and objectives outlined in the COT Report. To conserve GRSG habitat, proposed management follows the basic principles of: (1) avoiding the impact of an activity; (2) minimizing impacts by limiting the degree of activity; and (3) mitigating for an impact by improving or enhancing greater sage-grouse habitat. Each of the alternatives considers different means for accomplishing this strategy. For example, some alternatives place greater emphasis on avoidance of impacts, whereas other alternatives place more emphasis on minimization and mitigation.

Table 2-20 demonstrates how the BLM and Forest Service management actions under each alternative address the threats to the populations in the Idaho and southwestern Montana sub-region. In Idaho, Core and Important Habitat Zones under Alternative E were used to derive the PACs in the COT. [Can also reference the table in Chapter 4 showing overlap of habitat areas under each alternative with PACs] The BLM and Forest Service are continuing to work with the USFWS and State agencies to develop a proposed plan that fully addresses developing the appropriate triggers and identifying each of the threats in the COT report.

[NOTE TO BLM: Clarify in the FEIS the validity of NTT, COT, and BER as relative to the established standards of scientific integrity under the ESA, the Data Quality Act, and the Presidential and DOI memoranda and orders. Ensure the FEIS clarifies In March 2012, the FWS initiated a collaborative approach to develop range-wide conservation objectives for the greater sage-grouse to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. Appendix I demonstrates how the BLM and FS addressed the threats to the populations in the Nevada and Northeastern California sub-region. The BLM and FS are continuing to work with the FWS and State agencies to develop a proposed plan

In March 2012, the FWS initiated a collaborative approach to develop range-wide conservation objectives for the greater sage-grouse to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. In March 2013, this team of State and FWS representatives, released the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for greater sage-grouse conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. The report serves as guidance to Federal land management agencies, State greater sage-grouse teams, and others in focusing efforts to achieve effective conservation for this species.

Additionally, development of the range of alternatives was based upon analysis of public scoping comments as well as information provided in the COT as well as several other sources, such as the NTT report, the BER, and the 2008 Colorado Greater Sage-grouse State Management Plans (see Section 1.1.1, 2.1.1, and Chapter 4 for references to how the reports and other information was used in alternative development). The alternatives represent different degrees of and approaches to balancing resources and resource use among competing human interests, land uses, and the conservation of natural and cultural resource values, while sustaining and enhancing ecological integrity across the landscape, including plant, wildlife, and fish habitat. For example, all alternatives considered within this planning process are consistent with conservation measures and objectives outlined in the COT Report and follow the basic principles of: (1) avoiding the impact of an activity; (2) minimizing impacts by limiting the degree of activity; and (3) mitigating for an impact by improving or enhancing greater sage-grouse habitat. Each of the alternatives considers different means for accomplishing this strategy. For example, some

In March 2012, the USFWS initiated a collaborative approach to develop range-wide conservation objectives for the GRSG to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. In March 2013, this team released the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for GRSG conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. The report serves as guidance to Federal land management agencies, State GRSG teams, and others in focusing efforts to achieve effective conservation for this species. In addition to the COT report, the BLM used the National Technical Team (NTT) report and the Summary of Science, Activities, Programs, and Policies That Influence the Rangewide Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER) as additional sources of baseline information and as a starting place for developing management objectives.

In developing the DRPA/DEIS, the BLM sought to develop a range of alternatives with management objectives and actions that are consistent with the conservation measures and objectives outlined in the COT Report. To conserve GRSG habitat, proposed management follows the basic principles of: (1) avoiding the impact of an activity; (2) minimizing impacts by limiting the degree of activity; and (3) mitigating for an impact by improving or enhancing greater sage-grouse habitat. Each of the alternatives considers different means for accomplishing this strategy. For example, some alternatives place greater emphasis on avoidance of impacts, whereas other alternatives place more emphasis on minimization and mitigation.

[Section 2.11 (Table 2-5) in the DRMPA/DEIS demonstrates how the BLM addressed the threats to the populations in the Lewistown Field Office planning area. Alternatives may reduce threats to varying degrees, but the primary and driving threats for the Yellowstone Watershed Population and Belt Mountains populations (Agriculture Conversion of private land) would remain. COT p. 65 further explains expectations for Yellowstone Watershed Population despite BLM efforts/restrictions for

In March 2012, the USFWS initiated a collaborative approach to develop range-wide conservation objectives for the GRSG to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. In March 2013, this team of State and USFWS representatives, released the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for GRSG conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. The report serves as guidance to Federal land management agencies, State GRSG teams, and others in focusing efforts to achieve effective conservation for this species. In addition to the COT report, the BLM used the National Technical Team (NTT) report and the Summary of Science, Activities, Programs, and Policies That Influence the Rangewide Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER) as additional sources of baseline information and management objectives.

The range of alternatives is based upon analysis of public scoping comments as well as information provided in the NTT report, the BER, the COT report, and State of North Dakota management plans. The alternatives represent different degrees of and approaches to balancing resources and resource use among competing human interests, land uses, and the conservation of natural and cultural resource values, while sustaining and enhancing ecological integrity across the landscape, including plant, wildlife, and fish habitat. For example, Alternative D incorporates adjustments to the NTT report (NTT 2011) based on cooperating agency input to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses. Rather than the NTT recommendation to manage PH so that discrete anthropogenic disturbances cover less than 3 percent of the total GRSG habitat (Alternative B), anthropogenic surface disturbance under Alternative D would be managed to protect PH from anthropogenic disturbances that would reduce distribution or abundance of GRSG.

Greater sage-grouse conservation measures in the NTT report (NTT 2011) were used to form BLM management direction under at least one alternative, Alternative B in the North Dakota Greater Sage-Grouse RMPA, which is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044 (the BLM must consider all applicable conservation measures developed by the NTT in at least one alternative in the land use planning process).

Use the National response specific to the COT information.

This issue also needs to be split out.

1. COT Rpt
2. Disturbance cap
3. Adapt Manage

X-ref the sections where disturbance cap & adapt manage are responded to.

Revise the response to address the adequacy of the report. Key points to include:

- \*COT was used to assess the pop & habitat threats in current conditions
- \*based in scientifically accepted methodology for the type of study
- \*used relevant and current data for the report
- \*composition/expertise of team members who wrote the report. A USFWS product based on coordination between FWS and the States (G&F dpts & Gov's offices)

How used in alts:

- \*COT was what the FWS identified as conservation objectives that would help ameliorate threats to the GrSG pops & habitat. \*BLM/FS compared the range of alts to the COT objectives. Basically the grading bar against which the FWS is judging BLM/FS
- \*not the only scientific doc used as part of developing the alts
- \*During formulation of the FEIS, BLM/FS met with partners to help meet the COT report objectives to the extent practicable.

see points presented for response to UT issue and ensure key points and rationales are included in response as needed (COT = scientifically valid & used appropriately in EIS)

see points presented for response to UT issue and ensure key points and rationales are included in response as needed (COT = scientifically valid & used appropriately in EIS)

Might include additional info re: use of the COT as the bar which alternatives were assessed and findings from the results??

review response to ensure key points about COT validity & appropriate use in alts are included. See points noted in UT.

review response to ensure key points about COT validity & appropriate use in alts are included. See points noted in UT.

Plan	Issue Statement
OR	Commenters stated that BLM Washington Office Instruction Memoranda 2012-043 and 2012-044 should have undergone NEPA analysis since they constitute rulemaking.
UT	The BLM and Forest Service have existing guidance and policies to manage for special status species, including candidate species such as greater sage-grouse.
ID-SW MT	The BLM and Forest Service should include additional information to improve consistency with USFWS's Policy for Evaluation of Conservation Efforts.
NV-CA	Commenters expressed concern about the lack of consideration of BLM Manual 6840 in the EIS, particularly in the alternatives. In addition, commenters questioned the formation of alternatives based on the NTT report and why the NTT report was included especially since the IM has expired and has not been re-issued.

WY9

## Response

{Note to BLM: May need a national response for this comment. Kate Krebs emailed Lauren Mermejo on April 16 for response.}

The BLM and Forest Service do have existing laws, regulations, and guidance for special status species including greater sage-grouse. These are listed in Chapter I under Section 1.7.1, Preliminary Planning Criteria, and Section 1.8, Relationship to Other Policies, Plans, and Programs. While such relevant guidance does exist, the USFWS finding stated that “existing regulatory mechanisms are inadequate to protect the species. The absence of adequate regulatory mechanisms is a significant threat to the species, now and in the foreseeable future.” This planning process is intended to provide more specific, planning-level direction for land managers in order to conserve GRSG on a sub-regional scale and by providing regulatory The BLM and Forest Service are working closely with the USFWS to ensure certainty of implementation and effectiveness to the extent possible. However, certain management actions, such as restoration activities, are contingent on funding availability and thus some uncertainty remains.

While not mentioned specifically, Manual 6840 is incorporated into the planning criteria under the following bullet (page I-X):

- The approved LUPAs will comply with BLM direction, such as FLPMA, NEPA, and CEQ regulations at 40 CFR Parts 1500-1508; DOI regulations at 43 CFR Part 4, and 43 CFR Part 1600, BLM Manual 6840; the BLM H-1601-1 Land Use Planning Handbook, "Appendix C: Program-Specific and Resource-Specific Decision Guidance Requirements" for affected resource programs (BLM 2005a); the 2008 BLM NEPA Handbook (H-1790-1; BLM 2008e); and all other applicable BLM policies and guidance.

~~{Note to BLM: Consider including more information on Manual 6840 in the EIS, perhaps mentioning it in the planning criteria bullet above and/or including more details under Alternative A.} it was added to the paragraph above and needs to be included in the FEIS~~

~~For further details related to how and why the NTT was used in alternative development, see response in section 7.1, NTT Report. The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage grouse Draft LUPA/EIS planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The alternatives are comprised of management actions, allocations, and BMPs/RDFs that serve as regulatory mechanisms to conserve greater sage grouse and their habitat. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (current management, Alternative A), which incorporates and analyzes existing guidance including BLM Manual 6840, IM 2005-024, Fundamentals for Standards for Rangeland Health, and existing BMPs.~~

~~The NTT report is not the sole source of management decisions used for the development of the range of alternatives. Greater sage grouse conservation measures in A Report on National Greater Sage grouse Conservation Measures (NTT-~~

Use WO response for why IM is not considered rulemaking and doesn't need to undergo NEPA analysis.

**Matt will provide to CAG**

**OUT OF SCOPE. DELETE FROM REPORT.**

Explanation to ID: this is outside of BLM's control. It's a USFWS process and BLM has no influence on it at all. Therefore, do not address in the report.

NCT agrees that the bullet point planning criteria is sufficient to respond to the issue of consideration of Man. 6840. Delete the NOTE TO BLM (not needed)

The second part of the issue statement ("formation of alternatives based on the NTT...") can simply be cross referenced back to Section 7.1 where the response is more focused on this topic. No need to repeat wording here.

Keep response for the IM issue here, but delete your language and use WO provided language (see red text).

Plan	Issue Statement
------	-----------------

OR

Some commenters felt that existing regulations are adequate to protect greater sage-grouse, while others felt that the alternatives in the DEIS/LUPA are inadequate. Commenters proposed revisions or requested additional details and clarifications to the alternatives related to greater sage-grouse. Topics of concern included:

- Invasive plant treatments
- Conifer encroachment
- Wildland fire
- Goals for the alternatives
- Disturbance cap
- Candidate Conservation Agreements (with Assurances)
- Habitat connectivity [Note to BLM: Don't forget about this one as it does not fit closely with any one resource; add info about connectivity habitat mapping and analysis.]
- ACEC mapping and management
- Fences

Commenters were also concerned about greater sage-grouse habitat mapping, including the scale of the map, lack of field

UT 1/2 Commenters provided specific recommendations to meet the COT report objectives. Commenters had specific issues with the range of management actions specific to GRSG:

- The need for changes or additions to the existing alternatives and maps, such as the noise level considerations, requirements for review by a GRSG implementation working group, and survey requirements.
- Management actions are arbitrary, without scientific backing. Commenters also suggested new literature that should be included in the alternatives.
- The BLM needs to provide more details on various aspects of the alternatives for clarification.
- The BLM considered an insufficient range of alternatives.
- The BLM needs to explain the scientific basis and methodology for its identification of preliminary priority management areas (“PPMA”) and preliminary general management areas (“PGMA”).
- Site-specific decisions (COAs) should be

ID-SW Commenters proposed revisions or  
MT requested additional details and clarifications to the alternatives related to GRSG. Topics of concern included:

- The size of lek buffers
- Level of predator control
- Need for and size of disturbance cap
- Restrictions on wind energy development
- Noise restrictions
- Livestock grazing management changes
- Inadequate description of adaptive management and monitoring
- Need for an improved definition of no net unmitigated loss
- Leasable mineral restrictions
- Juniper removal
- Existing and new fencing as they relate to sage-grouse strikes and mortality
- Lack of active habitat restoration
- Habitat monitoring

Commenters were concerned about greater sage-grouse habitat mapping, including suggesting clarifications or revisions to the habitat map and concerns about using the map for site-scale projects.

Commenters were also concerned that

NV-CA Commenters pointed out inconsistencies and suggested clarifications to the alternatives related to GRSG, including:

- Clarifying the definition of no unmitigated loss
- How maps would be revised over time
- Whether site-specific assessments would be conducted at the project level
- Adding more description to the No Action Alternative
- Framing the analysis according to threats rather than BLM and Forest Service programs

Commenters also questioned the accuracy and application of the maps and habitat mapping criteria. Commenters did not feel that management actions provided regulatory certainty.

NWCO Commenters had specific issues that they felt BLM should have considered in the range of management actions specific to sage grouse:

- BLM should add an Enhanced Mitigation/Expanded Use Authorization Program to the range of alternatives.
- BLM has failed to consider a full range of alternatives regarding the NSO buffer; they've only considered the 4-mile NSO buffer and need to consider other buffer distances.
- BLM should include a discussion/table that describes how the alternatives compare in protecting sage grouse. (done)
- BLM should include some incentives, including monetary compensation, to preserve grouse habitat on private lands.

Lewisto wn Commenters suggested changes to the alternatives related to GRSG, including:

- Consideration for Important Bird Area boundaries and areas outside of GRSG habitat
- Additional lek buffers
- Changes to grazing management
- Inclusion of a disturbance cap
- Inclusion of West Nile virus management measures
- Providing more regulatory certainty
- Including more guidance from the NTT report or public-proposed alternatives

ND 2/2 BLM should consider the following within the range of alternatives:

1. Sage-grouse Recovery Alternative as presented by conservation groups
2. 32dba limit at 0.25 miles from leks
3. Disturbance percentage, well density, and timing limits
4. Residual summer height of 18 cm to 10.2 inches throughout sage grouse nesting habitat during the nesting season
5. Recommendations from the North Dakota Game and Fish Department Sage Grouse Management Plan

Additionally, the BLM needs to clarify the range of management actions for protecting sage-grouse outside PH areas, including GH. Specifically, the BLM needs to clearly identify the merits of protecting and additional 80 acres of GH in Alternative C.

ND 2/2

WY9

## Response

The BLM and Forest Service do have existing laws, regulations, and guidance for special status species including greater sage-grouse. These are listed in Chapter I under Section I.XX, Preliminary Planning Criteria, and Section I.XX, Relationship to Other Policies, Plans, and Programs. While such relevant guidance does exist, the USFWS finding stated that “existing regulatory mechanisms are inadequate to protect the species. The absence of adequate regulatory mechanisms is a significant threat to the species, now and in the foreseeable future.” This planning process is intended to provide more specific, planning-level direction for land managers in order to conserve GRSG on a sub-regional scale and by providing regulatory mechanisms to further GRSG conservation.

As noted above in the response in Section 4.3, Range of Alternatives, and Section 2.3, Alternatives Development Process of the Draft EIS describes how the Oregon GRSG LUPA/EIS planning team employed the BLM planning process to develop a reasonable range of alternatives for the LUPA. The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office LUPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, and ~~or~~ to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions regarding other resources from the existing field office LUPs are acceptable and reasonable, and ~~therefore remain unchanged in this planning amendment.~~ ~~In these instances, there was no need to develop alternative management prescriptions.~~

As previously noted, the relative emphasis given to particular resources and resource uses differs across the alternatives to ensure consideration of the full spectrum of alternatives, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the six alternatives are described in Table 2-5, Summary Comparison of Resource Allocations in Greater Sage-Grouse Habitat, and in Section 2.9, Comparison of Alternatives, of the Draft EIS.

[Note to BLM: Address each bullet point above and state whether revisions to the EIS were made based on the comments

[BLM ACTION ITEM FOR FEIS: The alternatives development process does not appear to be well-described in the EIS. Consider including a section on alts development]

As noted above in the response in Section 4.3, Range of Alternatives, Section 1.5 of the Draft EIS describes how the Utah GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable, and therefore remain unchanged in this planning amendment. ~~In these instances, there was no need to develop alternative management prescriptions.~~ The BLM considered the NTT report and incorporated applicable actions, per IM 2011-044, under Alternative B. The BLM considered a range of alternatives, see Section 2.8.3, Citizen Proposed Alternative in Alternatives Dismissed from Detailed Analysis, for rationale. Impacts on wintering GRSG and habitats is discussed in Section 4.2. Restoration of historical GRSG habitat is considered.

Also as previously noted, the relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the five alternatives are described in Table 2.1, Description of Alternatives A, B, C1, C2, D, E1, and E2, in Section 2.7, Summary Comparison of Alternatives, of the Draft EIS.

Additionally, the BLM and the Forest Service used the best available scientific data, including recent sources such as the COT report, NTT report, and BER to develop management recommendations, strategies and regulatory guidelines to meet GRSG management objectives in the 2006 WAFWA Greater Sage-grouse Comprehensive Conservation Strategy. These documents

Several places throughout the EIS cite a wide range of scientific research that show the need for specific habitat requirements (at multiple spatial scales) and buffer distances proposed in the range of alternatives. Objectives and actions in Table 2.1 have been updated to identify the technical basis for requirements proposed in the alternatives. The Chapter 4 analysis (Section 4.2) has been modified to summarize the impacts and findings from scientific literature referenced. [BLM ACTION ITEM FOR FEIS (Renee): modify analysis sections with any new literature if appropriate] Comments related to requests for identifying specific vegetation cover and height were reviewed and considered. This level of specificity would be arbitrary given the wide range of variability in vegetation types and ecosystems in the planning area. Suggested guidelines will be taken into consideration but where site-specific science is not available, recommendations from best available science, such as those provided in Connelly et al. 2000 and Hagen et al. 2007 will be used. [NOTE TO BLM: Check this language.] Although there are existing disturbances, such as transmission lines, in occupied GRSG habitat, there is not research to suggest that transmissions lines are beneficial to GRSG. However best available science and anecdotal evidence does suggest that there can be adverse impacts from transmission lines [NOTE TO BLM (Renee): cite science]. Therefore new disturbance, including from new transmission lines, should be limited in important GRSG habitat. [BLM ACTION ITEM FOR FEIS (Renee): Add clarification to Ch4 regarding new disturbances in GRSG habitat.]

While the BLM does have the authority to do certain things under Manual 6840 to protect species, as stated in Section 1.2 of the Draft LUPA/Draft EIS, “this effort responds to the USFWS’s March 2010 “warranted, but precluded” ESA listing petition decision. Inadequacy of regulatory mechanisms was identified as a significant threat in the USFWS finding on the petition to list the GRSG. The USFWS identified the principal regulatory mechanisms for the BLM and the Forest Service as conservation measures embedded in LUPs. Changes in management of GRSG habitats are necessary to avoid the continued decline of populations that are anticipated across the species’ range. These plan amendments will focus on areas affected by threats to GRSG habitat identified by the USFWS in the March 2010 listing decision.” In other words, current management is not sufficient to protect the species from being listed as threatened or endangered under the ESA. Therefore the BLM and Forest Service must take additional steps and make additional decisions to protect the species.

Action MA-GRSG-8 (p. 2-38 of Draft LUPA/Draft EIS) has been updated to say “will not” instead of “should not”, as suggested by a commenter (Comment UTSG-14-0151-25). [BLM ACTION ITEM FOR FEIS: Make sure this is done in the alternatives matrix.]

As noted above in the response in Section 4.3, Range of Alternatives, Section 2.1 of the Draft EIS describes how the Idaho and southwestern Montana GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA and worked closely with the State with assistance from the US FWS . The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office LUPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions regarding other resources from the existing field office LUPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

As previously noted, the relative emphasis given to particular resources and resource uses differs, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the six alternatives are described in Table 2-2, Comparative Summary of Alternatives by Acres Allotted, and in Section 2.6, Detailed Description of Alternatives, of the Draft EIS.

Regarding the following issues:

The size of lek buffers -lek buffers will be revised in final plan/FEIS reflecting additional review of best science.

- Level of predator control
- Need for and size of disturbance cap- Additional specificity regarding the disturbance cap has been further explained in the FEIS.
- Restrictions on wind energy development
- Noise restrictions. Noise and seasonal stipulations for both construction and long-term implementation of land use activities has been included in the final EIS. [NOTE TO BLM (from Makela)- Project leads should discuss how to consistently address impacts from military flights and firm up discussion at 4-15. Consider adding additional detail from Mt. Home AFB Integrated Resource Mgt. Plan.]

As noted above in the response in Section 4.3, Range of Alternatives, Section 2.3 of the Draft EIS describes how the Nevada and Northeastern California GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in individual field office and forest LUPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from individual field office and forest LUPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions. As stated in the DEIS (last paragraph pg. 3-9), the habitat objectives were developed based on current research conducted within the Great Basin sagebrush type, as opposed to sagebrush-steppe vegetation types, and is specific to the Nevada and Northeastern California Sub-region within the LUPA/EIS project boundary. GRSG Habitat Objectives (Table 2-6) does not include residual vegetation heights. Current management, (Alt. A) does include grass height based on Connelly et al. 2000. However, the GRSG LUPA/DEIS has revised GRSG habitat objectives based on local and recent work by Coates et al. 2011 and Coates and Delehanty 2010. These studies have documented successful nesting at sites with greater or equal to 10% of residual and live perennial grass cover. The commenter's interpretation of Hausleitner et al (2005) research was inaccurate and does not meet the definition of best available science. The authors noted that: "Managers must be cautious in measuring grass cover and height at any time during incubation. These results represent a single year of sampling and need to be verified under different climatic conditions and geographical locations within GRSG range."

The rationale to designate PGH to PPH after a fire is based on the best available science discussed below. In addition, due to BLM/FS Emergency Stabilization and Rehabilitation (ES&R) efforts after a wildfire it is essential to elevate PGH adjacent to a wildfire to PPH while ES&R treatments are given the opportunity to recover. The most effective strategy to stabilize or recover GRSG populations is to protect existing habitat (Stiver et al. 2006). Areas of high biological value combined with low anthropogenic disturbances represent regions where conservation actions can be immediately implemented (Doherty et al. 2011).

"Emergency actions" and BLM's need to respond to drought is covered by the Nevada Drought Handbook (NVH-1730-1)

As noted above in the response in Section 4.3, Range of Alternatives, Section 2.3 of the Draft EIS describes how the Northwest Colorado GRSG RMPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the RMPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

Also as previously noted, the relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the four alternatives are described in Table 2-2, Comparative Summary of Alternatives, in Section 2.8, Summary Comparison of Alternatives, of the Draft EIS.

Additionally, the 4-mile buffer for GrSG habitat protection is supported and was derived from research performed by several noted sage-grouse scientists including Holloran 2005, Walker et al. 2007, Tack 2009, Johnson et al. 2011. For example, from the NTT report: "Impacts as measured by the number of males attending leks are most severe near the lek, remain discernible out to >4 miles (Holloran 2005, Walker et al. 2007, Tack 2009, Johnson et al. 2011), and often result in lek extirpations (Holloran 2005, Walker et al. 2007). Negative effects of well surface occupancy were apparent out to 3.1 miles, the largest radius investigated, in 2 of 7 study areas in Wyoming (Harju et al. 2010). Curvilinear relationships show that lek counts decreased with distance to the nearest active drilling rig, producing well, or main haul road and that development within 3 to 4 miles of leks decrease counts of displaying males (Holloran 2005).

All well-supported models in Walker et al. (2007) indicate a strong negative effect, estimated as proportion of development within either 0.5 miles or 2 miles, on lek persistence. A model with development at 4 miles had less support, but the regression coefficient indicated that negative impacts within 4 miles were still apparent. Two additional studies reported negative impacts apparent out to 8 miles on large lek occurrence (>25 males; Tack 2009) and out to 11.7 miles on lek trends

Section 1.5 of the DRMPA/DEIS describes how the Lewistown Field Office Greater Sage-Grouse RMPA/EIS planning team employed the BLM planning process to develop a reasonable range of alternatives for the RMPA. The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

- Consideration for Important Bird Area boundaries and areas outside of GRSG habitat
- Additional lek buffers
- Changes to grazing management
- Inclusion of a disturbance cap
- Inclusion of West Nile virus management measures:

~~Despite concerns over impacts of the West Nile virus on sage grouse, actual prevalence of the virus in wild populations remains unknown (Walker et al. 2007). The impacts of the virus on Sage grouse in the future will depend on temperature, rainfall, and changes in vector distribution. Temperature strongly affects physiological and ecological processes that influence West Nile virus transmission, and outbreaks are typically associated with prolonged periods of above-average temperature and drought (Walker et al. 2007). Due to the climate of the planning area, the spread of the West Nile virus and impacts to sage grouse in the planning area are speculative at this time and, therefore, was not included in the scope of the cumulative impact analysis in the PRMPA/FEIS. The BLM understands the potential threat to greater sage grouse from the West Nile virus. To prevent the spread of the West Nile virus, the DRMPA/EIS specifically addresses management of water disposal pits (Section 4.17.7).~~

B.L. Walker, David E. Naugle, Kevin E. Doherty, And Todd E. Cornish. 2007. West Nile Virus And Greater Sage Grouse: Estimating Infection Rate In A Wild Bird Population. Avian Diseases Digest Sep 2007 : Vol. 2, Issue 3, Pg(S) E14 E14 Doi: 10.1637/1933-5334(2007)2[E14:Wnvags]2.0.Co;2

As noted above in the response in Section 4.3, Range of Alternatives, Section 2.3 of the DRMPA/DEIS describes how the North Dakota GRSG RMPA/EIS planning team employed the BLM planning process to develop a reasonable range of alternatives for the RMPA. The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this DRMPA/DEIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the 1988 North Dakota RMP and ROD, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the 1988 North Dakota RMP and ROD are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

Also as previously noted, the relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the four alternatives are described in Table 2-2, Comparative Summary of Alternatives, in Section 2.10, Summary Comparison of Alternatives, of the DRMPA/DEIS.

I. During scoping for the North Dakota Greater Sage-Grouse RMPA/EIS, individuals and conservation groups submitted management direction recommendations, including the Sage-grouse Recovery Alternative, for protection and conservation of GRSG and their habitat. The recommendations received during scoping, in conjunction with resource allocation opportunities and internal sub-regional BLM input, were reviewed to develop the management direction for GRSG under Alternative C. Conservation measures in the alternative are focused on both PH and GH. These areas have been identified by NDGFD and USFWS in coordination with BLM.

The BLM acknowledges that there could be a large number of variations to alternatives put forth in the RMPA process. However, the BLM is not required to analyze in detail each unique variation, including those variations determined not to meet the RMP's purpose and need or those determined to be unreasonable given BLM mandates, policies, and programs including the FLPMA and other Federal laws and regulations applicable to public lands. The CEQ states that when there are potentially a very large number of alternatives only a reasonable number of examples covering the full spectrum of alternatives must be analyzed and compared in the EIS (Forty Most Asked Questions Concerning CEQ's NEPA Regulations).

3. [John Carlson to provide direction related to disturbance percentage.] Because the action alternatives make unleased areas either No Lease or No Surface Occupancy, setting well density parameters in unleased areas would not apply. The impacts of well densities are disclosed in Table 4-6 in the DEIS. Since most of the high development potential has already been leased, and due to the small amount of BLM minerals in the planning area, the surface disturbance and well densities do not change significantly among the alternatives (even between the alternatives that have no lease vs. the no-action. Alternatives Ba and C would apply a seasonal restriction on exploratory drilling that prohibits surface-disturbing activities during the nesting and early brood-rearing season in all PH during this period.

4. As stated in the DEIS on page 2-29, under Alternative D the BLM would conduct land health assessments in PH that include (at a minimum) indicators and measurements of structure/condition/composition of vegetation specific to achieving GRSG habitat objectives. Local objectives would be developed at the field office level in partnership with NDGFD and USFWS, and incorporated into AMPs or livestock grazing permits as appropriate incorporating best available science. Residual summer height requirements would be incorporated during these rangeland health assessments.

5. As stated in on page 1-19 in Section 1.8.8 of the DEIS, the purpose and need for the North Dakota Greater Sage-Grouse RMPA/EIS is consistent with the goal of the Management Plan and Conservation Strategies for Greater Sage-Grouse in North Dakota, which is to provide for long-term conservation and enhancement of sagebrush steppe/mixed-grass prairie habitats in North Dakota in a manner that will support a self-sustaining GRSG population, a diversity and abundance of other wildlife species, and human uses. Additionally, the North Dakota Game and Fish Department is a cooperating agency for the DEIS and they contributed to the development of the range of alternatives.

As described in Section 2.4.5 of the DRMPA/DEIS, the conservation measures under Alternative B are focused on PH (32,900 acres), and measures under Alternative C are focused on both PH and GH (32,980 acres). The BLM acknowledges that there is only 80 acres of BLM-administered land delineated as GH. However, as indicated in Table 2-2, Alternative D would apply conservation measures for mineral resources on split-estate lands. These measures would protect GH on non-BLM-administered lands (e.g., over 5,000 acres of unleased fluid mineral estate; approximately 80,000 acres of coal resources; and approximately 50,000 acres of solid minerals). In addition to specific management actions being applied to both PH and GH under Alternative C, the biological benefits to sage-grouse are greater under Alternative C because of the implementation of stricter management actions. For example, Alternative C would not site wind energy developments in PH

Use provided language in red text for issue re: existing regs adequate for protecting sg

Also cross reference back to Tab/Section 4.3 regarding NEPA requirements for appropriate/adequate range of alts language.

Recommend that the response stick to the range of alternative issue and don't address the individual bullet points. If these topics of concern are included in responses of the relevant sections, reference the reader to the other sections. E.g., fire alternative actions can be found in Section 12, Fire, for details.

For language regarding how COT was used in EIS and ties into alt development/review, reference response in section/tab 7.3, as well as response for NTT use in alts in section/tab 7.1. Don't need to duplicate language here.

Not clear why the response focuses on scientific uncertainty? This isn't part of the issue statement, so why covered in detail in the response?

1) range of alts are adequate. reference back to 4.3 for details. Implementation requirements (working group review & survey requirements) = this action is at the planning level analysis & actions, not implementation.

2) regarding scientific backing, reference the reader to sections 7.1 (NTT) and 7.3 (COT), and appropriate section in the EIS for how alts were developed

3) see direction in point 1) above.

Also cross reference back to Tab/Section 4.3 regarding NEPA requirements for appropriate/adequate range of alts language.

Recommend that the response stick to the range of alternative issue and don't address the individual bullet points. If these topics of concern are included in responses of the relevant sections, reference the reader to the other sections. E.g., fire alternative actions can be found in Section 12, Fire, for details.

For 6840 reference, cite back to planning criteria (included in general "BLM will follow laws, regs, etc." bullet)

include a cross reference to section 7.9 for details related to the mitigation plan. Also include reference to appendix that will be mit, monitoring, and AM info in the FEIS.

Also cross reference back to Tab/Section 4.3 regarding NEPA requirements for appropriate/adequate range of alts language.

also reference back to NTT & COT responses for info on how these info was incorporated into alts.

Recommend that the response stick to the range of alternative issue and don't address the individual bullet points. If these topics of concern are included in responses of the relevant sections, reference the reader to the other sections. E.g., fire alternative actions can be found in Section 12, Fire, for details.

Plan	Issue Statement
------	-----------------

OR	<p>Commenters suggested new or additional literature for the BLM to consider in the DEIS/LUPA. In addition, commenters questioned the accuracy and adequacy of information in the DEIS/LUPA. Topics of concern included:</p> <ul style="list-style-type: none"><li>• Accuracy of habitat mapping</li><li>• Effects of livestock grazing, roads, noise, and infrastructure</li><li>• Accuracy of greater sage-grouse population and habitat condition estimates.</li><li>• Wildland fire management</li><li>• West Nile virus</li></ul>
----	--

UT 1/2 Commenters provided several references and studies that the BLM and Forest Service did not consider in the EIS but should include or consider in the EIS. Also, commenters questioned the accuracy and validity of the NTT Report.

ID-SW Commenters suggested new or additional  
MT literature for the BLM and Forest Service to consider in the DLUPA/EIS related to:

- Determination of GRSG population size and trends – inaccuracy of past counts; insufficient data to determine trend.
- Effects of livestock grazing, predation, drought, noise, and anthropogenic development
- Appropriate lek buffers and disturbance cap to incorporate
- Mitigation
- Hunting– outside scope but managed via the Idaho and Montana state plans
- GRSG habitat requirements
- Accuracy of the habitat mapping
- Infrastructure
- West Nile virus

NV-CA 1/6 Commenters suggested new or additional literature for the BLM and Forest Service to consider and suggested re-interpretations of some of the literature cited in the DLUPA/EIS. Topics commenters were concerned about include:

- Predation and perch discouragers
- Greater sage-grouse habitat requirements
- Noise
- Use of Rangeland Health Assessments
- Disease
- Hunting
- Monitoring protocol
- How population size is measured
- Impacts from mineral development and grazing

Commenters were also concerned about greater sage-grouse habitat mapping, including:

- How and when to update the habitat map on a site-specific basis
- Use of updated maps in the Nevada Conservation Plan
- Map accuracy
- Caution against site-specific use

NV-CA

NWCO Commenters provided several references  
1/2 and studies that BLM did not consider in the  
EIS but should include or consider in the EIS.  
Also, commenters questioned the accuracy  
and validity of the NTT Report.

NWCO  
2/2

Lewisto wn Commenters suggested new or additional literature for the BLM to consider in the FEIS. Topics commenters were concerned about include impacts from:

- Grazing Disturbance, including stubble height requirements
- Energy development and disease
- Transmission lines
- Noise

Commenters noted inaccuracies in the EIS or requested additional information

Commenters were also concerned about GRSG habitat mapping, including suggesting clarifications or revisions to the habitat map and questioning how the map will be updated.

ND The DRMPA/DEIS does not include current and accurate sage-grouse population data and does not consider the adjacent Montana sage-grouse population. The DRMPA/DEIS failed to include a detailed description of the current land and acoustic disturbance in the planning area. The DRMPA/DEIS failed to map and present GRSG wintering habitat as part of the baseline requirement.

WY9

## Response

The BLM used the most recent and best information available that was relevant to a land-use planning-level analysis including the Baseline Environmental Report (BER; Manier et al. 2013), NTT report (NTT 2011), and COT report (USFWS 2013).

Additionally, the BLM consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service, ODFW, scientific literature, field and district office data, and [list other sources]. Considerations included but were not limited to [list the types of data or GIS layers that were gathered/used].

As a result of these actions, the BLM gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the DLUPA/EIS, and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives (Chapter 4). As a result, the BLM has taken a “hard look,” as required by the NEPA, at the environmental consequences of the alternatives in the DLUPA/EIS to enable the decision maker to make an informed decision. Finally, the BLM has made a reasonable effort to collect and analyze all available data.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM realizes that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13). The BLM will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, [etc.; list others as applicable]. The subsequent NEPA analyses for project-specific actions will tier to the land-use planning analysis and evaluate project impacts at the appropriate site-specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site-specific actions.

Of the suggested studies and references put forth by the commenters, the BLM reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined that...

[NOTE TO BLM: If the information is essentially the same, then state this. If there were references that you determined were truly new, then note that they were included in the FEIS and if possible, provide the specific locations where.]

[Note: Would be good to have a summary explanation of the scientific background of the disturbance cap that is the same

Before beginning the Utah Sage grouse EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

~~The BLM and the Forest Service used the most recent and best information available that was relevant to a land use planning level analysis including the COT report, NTT report, the GRSG Monograph, and Baseline Environmental Report (BER; Manier et al. 2013) to develop management recommendations, strategies and regulatory guidelines to meet GRSG management objectives in the 2006 WAFWA Greater Sage grouse Comprehensive Conservation Strategy. These documents were based on recent, published, and peer reviewed scientific data developed by an interdisciplinary team of federal and state scientists and resource managers. Scientific uncertainty was addressed in these documents, particularly in the BER [NOTE TO BLM: Is this true?]. Uncertainty can relate to the spectrum of conclusions regarding impacts, variability of species requirements across habitats, and opposing viewpoints. The BLM and Forest Service also incorporated information from scientific literature not included in the above recommendations (e.g., science regarding noise, tall structures, and roads).~~

~~The BER assisted the BLM and the Forest Service in summarizing the effect of their planning efforts at a range wide scale, particularly in the affected environment and cumulative impacts sections. The BER looked at each of the threats to greater sage grouse identified in the Fish and Wildlife Service's "warranted but precluded" finding for the species. For these threats, the report summarized the current scientific understanding, as of report publication date (June 2013), of various impacts to greater sage grouse populations and habitats. The report also quantitatively measured the location, magnitude, and extent of each threat. These data were used in the planning process to describe threats at other levels, such as the sub-regional boundary and WAFWA Management Zone scale, to facilitate comparison between sub-regions. The BER provided data and information to show how management under different alternatives may meet specific plans, goals, and objectives. [NOTE TO BLM: Is this true?]~~

~~As a result of these actions, the BLM and the Forest Service gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the DLUPA/EIS, and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives (see Chapter 4, Environmental Consequences). As a result, the BLM and the Forest Service have taken a "hard look," as required by the NEPA, at the environmental consequences of the alternatives in the DLUPA/EIS to enable the decision maker to make an informed decision. Finally, the BLM and the Forest Service have made a reasonable effort to collect and analyze all available data.~~

~~A land use planning level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM and the Forest Service realize that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan level decisions. Land use plan level analyses are typically broad and qualitative rather than quantitative or focused on site specific actions (BLM Land Use Planning Handbook H-1601-I, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12—Land Management Planning). The BLM and the Forest Service will conduct subsequent project specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, etc. [NOTE TO BLM: List others as applicable] The subsequent NEPA analyses for project specific actions will tier to the land use planning analysis and evaluate project impacts at the appropriate site specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site specific actions.~~

~~Of the suggested studies and references put forth by the commenters, the BLM and Forest Service reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined that...~~ [ACTION BLM: need to insert results from new data review]

A description of the habitat mapping process is presented in Section xx. [BLM: Include description of how the map was created and why it is accurate/appropriate]. The revised mapping process developed by USGS is described as follows: ~~The USGS Western Ecological Research Center (WERC) developed a Greater Sage Grouse habitat map based on a generalized linear mixed model approach in the Nevada and Northeastern California Sub-region. The mapping process is a data driven approach that uses existing GRSG telemetry locations and mapping products as multiple environmental factors to model the probability of GRSG occurrence throughout the sub-region. This process results in resource selection functions that are used to create a habitat suitability index and predict the relative importance of all areas, even those where data are lacking. These methods have been accepted in the peer reviewed scientific literature and have been shown to be valuable for identifying areas meaningful to GRSG populations. (Citation: Peter Coates; U. S. Geological Survey, Western Ecological Research Center)~~

Before beginning the Nevada and Northeastern California Sage grouse LUPA/EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

The BLM and the Forest Service used the most recent and best information available that was relevant to a land-use planning-level analysis including the Baseline Environmental Report (BER; Manier et al. 2013 ), NTT report (NTT 2011), and COT report (USFWS 2013). Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service [Nevada Department of Wildlife, California Department of Wildlife and USGS]. Considerations included but were not limited to [male lek attendance data, telemetry data, vegetation data, fire history, etc. A few examples: threatened and endangered species and their habitats, water quality- limited (303d) streams, deer and elk herd management areas, invasive plants, and uses on State lands]. As a result of these actions, the BLM and the Forest Service gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the DLUPA/EIS, and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives (Chapters 4 and 5). As a result, the BLM and the

[NOTE TO BLM: If the information is essentially the same, then state this. If there were references that you determined were truly new, then note that they were included in the FEIS and if possible, provide the specific locations where.] BLM clarifies that the results from Nonne et al. 2013 were not labeled as final results, and should not be called such. This report documented the completion of the 10-year field component of the study and was intended to highlight preliminary results at that time and to present the results to cooperators. None of the results should be considered final (including those reported in Gibson et al. 2013) until they have undergone a formal peer review as part of the publication process. The authors acknowledge that they should have been clearer in pointing this out in previous drafts of their progress reports. The discrepancy between the reported results in Nonne et al. (2013) and Gibson et al. (2013) stem from an improvement in the researchers ability to account for spatial and temporal heterogeneity among GRSG individuals. Their earlier progress reports attempted to assess the influence of transmission lines on various demographic rates by considering the effect of the transmission line as a distance-based variable, in which heterogeneity among individuals through space and time that was not associated with the transmission line is accounted for with environmental covariates as additive effects. Although these methods are still widely used (DeGregorio et al. 2014, Lebeau et al. 2014, McNew et al. 2014), they assume that the variable in question affects all individuals that are a similar distance from the source equally, regardless of other potentially confounding factors, such as individual quality or habitat suitability. It is possible to model interactions between covariates to account for this potential confounding variation, however as model complexity increases, covariate interactions may become difficult to interpret and can be sensitive to sparse or outlier data. In Gibson et al. (2013), the authors developed alternative methods that were able to more appropriately account for these potential sources of heterogeneity related to variable environmental conditions. They predicted demographic rates at the individual level in the absence of a transmission line effect, and then assessed whether the realized demographic rates of these individuals deviated from prediction based on their distance from the transmission line. For example, if a female's individual characteristics and the habitat surrounding her nest site suggested she should have a high probability of success, was her realized nest survival rate lower than expected because she was located closer to the transmission line.

After appropriately accounting the differences among GRSG individuals, the researchers found that support for an effect of distance from the transmission line on GRSG demographics was variable across demographic rates. Distance from transmission line was not associated with variation in nesting propensity, nor was it supported to influence male lek

The Holechek documents relate to setting stocking rates, evaluating grazing intensity, etc. and emphasize conservative stocking to maintain rangeland productivity and multiple use. We need to remember that the #1 GRS objective in Table 2.6 (General) is to meet ALL rangeland health standards. Nevada (and California I assume) has upland health standards for each geographic area. The Holechek docs would most directly address situations where we are not meeting the upland health standard due to unacceptable patterns or levels of use. We made sure we included that "Objective" because Nevada specific research seemed to emphasize sagebrush canopy cover as opposed to herbaceous cover especially as related to nesting success. The team that worked on Table 2.6 was concerned that some would argue that you did not need herbaceous cover in Nevada, hence the inclusion of the "General" objective. We could summarize this part of Mike's response to state that Holecheck was not used or referenced because it discusses site specific/project level analysis which requires additional NEPA analysis (Environmental Assessments) at the Field Office level. This analysis would include a Rangeland Health Assessment (Table 2.6) for individual allotments and if it is determined that the allotment is not meeting Rangeland Health Standards and grazing is identified as the casual factor, it would trigger changes in grazing management which could include a change in stocking rates, utilization, season of use, duration, etc. In addition, herbaceous stubble height was the accepted "norm" based on Connelly & Braun and others. However, the NV/CA DLUPA/EIS has revised GRS habitat objectives based on local and recent work by Coates et al. 2011 and Coates and Delchanty 2010. In the USFWS 2010 Listing Decision (75 Federal Register. 13910), the USFWS stated "Based on the best scientific and commercial information available, we conclude that predation is not a significant threat to the species such that the species requires listing under the Act as threatened or endangered." The USFWS acknowledged that increasing patterns of landscape fragmentation are likely contributing to increased predation on the species and identified two areas where predators may be limiting GRS populations because of intense habitat alteration and fragmentation. One of the two areas identified is within the Nevada and Northeastern Sub region in Northeastern Nevada. Greater GRS are susceptible to predation from egg to adult, leading to the hypothesis that predator control would be an effective conservation tool for GRS populations. Generally, GRS nest success and adult survival are high; suggesting that on average predation is not a limiting factor to GRS populations. GRS face a suite of predators in sagebrush communities, however, none of the predators specialize in GRS (Hagen 2011, p 95-100). Predator management research has not provided sufficient evidence to support implementation of predator control to

A recent predator study was conducted by Lockyer et al. (2013) in the Virginia Mountains of Northeastern Nevada within the Great Basin. This study revealed that common ravens accounted for 46.7% of nest depredations within the study area. However, Lockyer et al. clearly stated that this study was not representative of the entire Great Basin for two main reasons. The first was due to significantly lower GRSG cumulative nest survival rates, which were documented at 22.4% within the study area. This survival rate is significantly lower than other published results for GRSG in the Great Basin. Secondly, the study area is not representative of the entire Great Basin or of the NV/CA sub-region due to increased anthropogenic disturbances. Anthropogenic disturbances and raven abundance is positively associated with human caused habitat alterations.

Of the suggested studies and references put forth by the commenters, the BLM reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the DLUPA/ EIS, or if the references provided the same information as already used or described in the DLUPA/ EIS.

The BLM determined that attempts to assess the influence transmission lines on various demographic rates by considering the effect of the transmission line as a distance based variable do not always include the effect of covariates. For example, heterogeneity among GRSG individuals through space and time which is associated with the transmission line is not always accounted for with environmental covariates as additive effects. Although these methods are still widely used (DeGregorio

- Central Montana research focuses on more mesic sagebrush steppe habitat types, as opposed to NV/CA specific.
- Connelly, et al focuses on sage grouse habitat across their distribution and includes areas within Idaho and Montana.
- GRSB Habitat Objectives (Table 2-6) do not include residual vegetation heights. Current management (Alt. A) does include grass height based on Connelly et al. 2004. The GRSB DEIS has revised GRSB habitat objectives based on local and recent work by Coates et al. 2011 and Coates and Delehanty 2010. These studies have documented successful nesting at sites with greater or equal to 10% of residual and live perennial grass cover.

Though threats such as diseases may be significant at a localized level, particularly if habitat quantity and quality is compromised (COT 2013), West Nile Virus was not identified by USFWS in their 2010 Listing Decision as a significant threat to GRSB within the NV/CA Sub region. The LUPA/DEIS specifically addresses the significant threats addressed by USFWS. The studies that were cited/discussed by the commenter were specific to areas of oil and gas development in MT, WY, etc. and are not representative of the NV/CA Sub region.

Despite concerns over impacts of the West Nile virus (WNV) on GRSB populations, actual prevalence of the virus in wild populations remains unknown (Walker et al. 2007). Although the WNV has been documented in Nevada and California (1 detection in each state, within the Bi-State population outside of the NV/CA Sub region), the impacts of the WNV on GRSB in the future will depend on temperature, rainfall, and changes in vector distribution. Temperature strongly affects physiological and ecological processes that influence WNV transmission, and outbreaks are typically associated with prolonged periods of above average temperature and drought (Walker et al. 2007). Due to the climate of the planning area, the spread of the WNV and impacts to GRSB in the planning area are speculative at this time and, therefore, was not included in the scope of the cumulative impact analysis in the DLUPA/EIS. The USFWS also concluded that, “at this time, we find that neither disease nor predation is a sufficiently significant threat to GRSB now or in the foreseeable future that it requires listing under the Act as threatened or endangered based on this factor (USFWS 2010).

The BLM understands the potential threat to GRSB from the WNV and has made reference to it in the DEIS under the Impact Analysis for GRSB and GRSB Habitat (Section 4.3; 4.3.2; 4.3.5; 4.3.6; 4.3.9), Riparian Areas and Wetlands (Section 4.5.5) and Water Resources (Section 4.16.2 and 4.16.3). Additionally, development of artificial ponds can increase the likelihood of the creation of pools of standing water, which can serve as mosquito breeding habitat, increasing the ability for WNV to spread into landscapes otherwise not at risk to the pathogen (USFWS 2010). To prevent the spread of the WNV, As stated in the DEIS (last paragraph pg. 3-9), the habitat objectives were developed based on current research conducted within the Great Basin sagebrush type, as opposed to sagebrush steppe vegetation types, and is specific to the Nevada and Northeastern California Sub region within the LUPA/EIS project boundary. GRSB Habitat Objectives (Table 2-6) does not include residual vegetation heights. Current management, (Alt. A) does include grass height based on Connelly et al. 2000. However, the GRSB LUPA/DEIS has revised GRSB habitat objectives based on local and recent work by Coates et al. 2011 and Coates and Delehanty 2010. These studies have documented successful nesting at sites with greater or equal to 10% of residual and live perennial grass cover. The commenter’s interpretation of Hausleitner et al (2005) research was inaccurate and does not meet the definition of best available science. The authors noted that: “Managers must be cautious in measuring grass cover and height at any time during incubation. These results represent a single year of sampling and need to be verified under different climatic conditions and geographical locations within GRSB range.”

Before beginning the Northwest Colorado Sage grouse EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

The BLM and the Forest Service used the most recent and best information available that was relevant to a land-use planning-level analysis including the Baseline Environmental Report (BER; Manier et al. 2013). The BER assisted the BLM and the Forest Service in summarizing the effect of their planning efforts at a range-wide scale, particularly in the affected environment and cumulative impacts sections. The BER looked at each of the threats to greater sage-grouse identified in the Fish and Wildlife Service's "warranted but precluded" finding for the species. For these threats, the report summarized the current scientific understanding, as of report publication date (June 2013), of various impacts to greater sage-grouse populations and habitats. The report also quantitatively measured the location, magnitude, and extent of each threat. These data were used in the planning process to describe threats at other levels, such as the sub-regional boundary and WAFWA Management Zone scale, to facilitate comparison between sub-regions. The BER provided data and information to show how management under different alternatives may meet specific plans, goals, and objectives.

[NOTE TO BLM: Placeholder for possible national response that addresses how opposing science was addressed in the process, and uncertainties associated with the approaches or the science used. E.g., Uncertainty was addressed by analyzing several alternatives that that incorporated varying levels of protection for the species. Opposing science was largely reviewed/addressed in documents such as the BER. The BER was specifically developed to review the best available science relative to Greater Sage-Grouse, habitat requirements, threats, etc., as well as depict spatial information on where threats are germane. It is a comprehensive document that summarizes the literature, and many of the citations provided by commenters are included in that assessment. In the final, it might be a good idea to have a specific section for these issues.] This information is discussed in the FEIS in Sections XX, XX, and XX.

Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service, Colorado Parks and Wildlife (CPW), Office of Surface A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM and the Forest Service realize that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The BLM and the Forest Service will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, site specific analysis of land use authorizations, and lease sales. The subsequent NEPA analyses for project-specific actions will tier to the land-use planning analysis and evaluate project impacts at the appropriate site-specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site-specific actions. Of the suggested studies and references put forth by the commenters, the BLM reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined that...

Before beginning the Lewistown Field Office Greater Sage-Grouse RMPA/EIS and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The RMPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

The BLM used the most recent and best information available that was relevant to a land-use planning-level analysis including the Baseline Environmental Report (BER; Manier et al. 2013), NTT report (NTT 2011), and COT report (USFWS 2013). Additionally, the BLM consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the USFWS and [list state agencies, including state wildlife agency]. Considerations included but were not limited to [list the types of data or GIS layers that were gathered/used. A few examples: threatened and endangered species and their habitats, water quality- limited (303d) streams, deer and elk herd management areas, invasive plants, and uses on State lands].

As a result of these actions, the BLM gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the DRMPA/DEIS, and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives (Chapter 4). As a result, the BLM has taken a “hard look,” as required by the NEPA, at the environmental consequences of the alternatives in the DRMPA/DEIS to enable the decision maker to make an informed decision. Finally, the BLM has made a reasonable effort to collect and analyze all available data.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM realizes that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13). The BLM will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, [etc.; list others as applicable]. The subsequent NEPA analyses for project-specific actions will tier to the land-use planning analysis and evaluate project impacts at the appropriate site-specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public

As noted above in the response in Section 4.5, GIS Data and Analysis, the habitat delineations were created by the BLM and USFWS in collaboration with NDGFD who is responsible for managing and monitoring GRSG populations. Based on the Baseline Environmental Report and other recent, published, and peer-reviewed scientific data, and in cooperation with the NDGFD, the BLM created the Preliminary Priority Habitat (PPH) and Preliminary General Habitat (PGH) areas. Section 3.3.1, Conditions of the Planning Area, describes the existing conditions of leks and GRSG on all land ownerships in the planning area. Sections 3.3.2, Conditions on BLM-Administered Lands, describes the conditions of leks and GRSG on BLM-administered lands in the planning area.

As described in Section 1.3, the North Dakota Greater Sage-Grouse RMPA/DEIS amendment only provides management direction for the BLM North Dakota Field Office. The planning area for the North Dakota Greater Sage-Grouse RMPA/EIS is composed of BLM-administered lands, US Department of Agriculture (USDA), Forest Service (Forest Service) lands, State of North Dakota lands, USFWS-managed lands, and private lands within the North Dakota Field Office. The description of the existing conditions in the DEIS and the analysis of direct impacts only includes the lands within the planning area (North Dakota Field Office). The Miles City Field Office is currently revising their RMP. The analysis in the Miles City RMP revision will address the impacts to the Montana portion of the GRSG population in WAFWA Management Zone I. However, as stated in Section 5.2.1, the cumulative effects analysis study area for GRSG extends beyond the planning area boundary and consists of WAFWA Sage-Grouse MZ I, which includes the Montana portion of the population.

NOTE TO BLM: The “DRMPA/DEIS failed to include a detailed description of the current land and acoustic disturbance in the planning area” portion of the issue summary should get a response to. [John Carlson to provide direction]

For the North Dakota Greater Sage-Grouse RMPA/EIS, areas identified as having the highest conservation value to maintaining sustainable GRSG populations were designated as PH. These areas would include breeding, late brood-rearing,

Cite reference to section/tab 4.4 for general language associated with NEPA requirements of baseline info and definition of best available info. No need to repeat it here.

Recommend that the response stick to the baseline/best available issue and don't address the individual bullet points. If these topics of concern are included in responses of the relevant sections, reference the reader to the other sections. E.g., fire alternative actions can be found in Section 12, Fire, for details.

Stock language for findings from review of the literature from commenters is coming -

Cite reference to section/tab 4.4 for general language associated with NEPA requirements of baseline info and definition of best available info. No need to repeat it here. Same goes for the NTT info (section 7.1)

Stock language for findings from review of the literature from commenters is coming - insert it when provided by NCT.

There's a disconnect between the points in the summary statement and the points that the response is hitting on. Suggest deleting the parts that are irrelevant or revising the issue statement to better reflect the points covered

TMI - keep it to the stock  
language for review of  
relevant info.

Makela note: deleted from

Plan	Issue Statement
------	-----------------

OR Commenters provided suggestions on how to improve or modify the impact analysis ~~for~~ on greater sage-grouse ~~from other actions in~~ several ~~topic areas~~ including:

- Disturbance cap
- Hunting
- Livestock grazing
- Wild horses and burros
- Recreation
- Infrastructure
- West Nile virus

UT BLM should revise some of their assumptions, including the assumption that the analysis did not include historic or potential habitat. The DLUPA/DEIS fails to adequately analyze the impacts ~~to~~ on sage-grouse and its habitat from other wildlife, infrastructure, grazing travel. The DLUPA fails to accurately describe the nature and type of effects to GRSG and their habitat from existing resource uses and activities. The DLUPA/DEIS fails to analyze the effectiveness of current rangeland health standards, The BLM and Forest Service did not do enough analysis of impacts to GRSG outside PH and GH. The DLUPA/DEIS is not consistent in its evaluation of indirect impacts associated with various disturbances. The thresholds concept is not adequately analyzed.

The BLM did not do enough analysis for actions in the Priority Habitat areas.

The DEIS fails to analyze the impacts to GRSG from hunting.

ID-SW MT 1/2 The BLM and Forest Service should conduct additional, more comprehensive analysis of the impacts on greater sage-grouse to provide more substantiated conclusions. Commenters provided suggestions on how to improve or modify the impact analysis for greater sage-grouse in several topic areas including:

- Hunting
- Predation
- Anthropogenic disturbance, disturbance caps, and lek buffers
- Expanding on beneficial effects on GRSG from range improvements
- Greater sage-grouse population size and trend
- Livestock grazing, fences, and trailing
- Noise as related to low-level military overflights
- Success of habitat improvement projects
- Prescribed fire
- Herbicides
- West Nile virus
- More detailed analysis of Alternative A
- Climate change
- Need to identify areas for restoration

ID-SW  
MT 2/2

NV-CA Summary Statement 1

1/2 Commenters pointed out conflicts between GRSG and resource use management that would have negative impacts on GRSG, including livestock grazing, wild horses and burros, and hunting.

Summary Statement 2

Commenters provided suggestions on how to improve or strengthen the impact analysis for greater sage-grouse in several areas including:

- Improving the summary of the effects of conservation measures
- Increasing the geographic area of the effects analysis
- Impacts from conversion of private lands
- Fire
- Minerals and the relation to disturbance caps/no unmitigated loss
- Lek buffers
- Roads
- Noise
- Fences
- Providing a more detailed analysis of Alternative A

NV-CA [Note to BLM: Suggest considering changes  
2/2 to the DEIS based on the following comment  
numbers:

- 0087-1: Summary of conservation measures
- 0109-3: Conversion of private lands
- 0116-9: Fire and GRSG habitat
- 0285-17: Impacts of minerals, no unmitigated loss/disturbance cap, adequacy of lek buffers, impacts from roads, noise, fences
- 0285-34: deficiencies in Alternative E; impacts from fire breaks
- 0381-2: Improve Alternative A analysis]

[Note to BLM from MZ: In general, I think letter 0285 was incorrectly coded and that too much text from that letter was coded under 7.7. EMPSi will need to re-look at this.]

NWCO BLM should revise some of their assumptions, including the assumption that the analysis did not include historic or potential habitat. Also, the BLM did not do enough analysis for actions in the Priority Habitat areas.

Lewisto  
wn Commenters provided suggestions on how to improve or strengthen the impact analysis for GRSG in several areas including:

- GRSG impact indicators
- Analysis of Alternative A
- Roads associated with livestock grazing
- Vertical structures
- Fences
- Impacts from livestock as compared to native ungulates
- Consideration for impacts outside GRSG habitat and ACECs.

ND 1/2 The DRMPA/DEIS fails to adequately illustrate how conservation measures for infrastructure development would protect GRSG in the long term. The BLM failed to adequately address impacts to GRSG from predation. The DRMPA/DEIS fails to adequately analyze the impacts to sage-grouse outside PH areas. The FEIS should describe the effects of climate change on GRSG populations for both of these sections of the report.

ND 2/2

WY9

## Response

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The DLUPA/EIS contains only planning actions and does not include any implementation actions. Effects on GRSG population levels are not required to be quantified as part of the impact analysis. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

In its 12 month finding, the US Fish and Wildlife Service determined that the threat of hunting, "is not significant to the species such that it causes the species to warrant listing under the Act" (75 Federal Register 13966, March 23, 2010). Thus hunting was not analyzed in detail in the Draft Land Use Plan Amendment/DEIS. However, changes have been made to the Proposed Land Use Plan Amendment/FEIS to include analysis of the cumulative effects of hunting on GRSG.

[BLM: Eventually need to fill this in:] Impacts from XX on greater sage-grouse were considered in Section 4.x of the Draft

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Impacts were considered on ... See Section 4.XX of the Draft EIS. [ACTION BLM (Renee): Provide direction if any changes to analysis is necessary.]

In its 12 month finding, the US Fish and Wildlife Service determined that the threat of hunting, "is not significant to the species such that it causes the species to warrant listing under the Act" (75 Federal Register 13966, March 23, 2010). Thus hunting was not analyzed in detail in the Draft Land Use Plan Amendment/DEIS. However, changes have been made to the Proposed Land Use Plan Amendment/FEIS to include analysis of the cumulative effects of hunting on GRSG.

[BLM ACTION ITEM FOR FEIS (Renee): Add analysis (in EIS) of indirect impacts on predation/mortality of GRSG from

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. Effects on GRSG population levels are not required to be quantified as part of the impact analysis. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

[BLM: Eventually need to fill this in:] Impacts from XX on greater sage-grouse were considered in Section 4.x of the Draft EIS. Include discussion of what changes were made and where. If no change made, describe why the impact analysis is adequate for that topic. Some template text:

While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS's impact analysis relevant to [speak to the specific topic or theme of the issue statement, e.g., anticipated fluid mineral development of the planning area] was found to need additional information and support for the

In its 12 month finding, the US Fish and Wildlife Service determined that the threat of hunting, “is not significant to the species such that it causes the species to warrant listing under the Act” (75 Federal Register 13966, March 23, 2010). Thus hunting was not analyzed in detail in the Draft Land Use Plan Amendment/DEIS. However, changes have been made to the Proposed Land Use Plan Amendment/FEIS to include analysis of the cumulative effects of hunting on GRSG.

Regarding the following issues:

- Hunting
  - Predation
  - Anthropogenic disturbance, disturbance caps, and lek buffers. [NOTE TO BLM: Makela- Discuss recomm. for managing lek viewing. Consult 2006 ID GRSG plan for wording.]
  - Expanding on beneficial effects on GRSG from range improvements
  - Greater sage-grouse population size and trend. –[NOTE TO BLM: Makela- Discuss approach to predicting population trajectories under alternatives.]
  - Livestock grazing, fences, and trailing. –Fence collision risks have been clarified in the FEIS per research done by Stevens (XXXX). [NOTE TO BLM: clarify fence collision risk per Stevens in the FEIS.]
  - Noise as related to low-level military overflights. – [NOTE TO BLM- Discuss military overflight/noise issue with Planning Leads. Is there a regional approach?]
  - Success of habitat improvement projects
  - Prescribed fire
  - Herbicides
  - West Nile virus
  - More detailed analysis of Alternative A
  - Climate change
  - Need to identify areas for restoration
  - Coal suitability- [NOTE TO BLM: Makela- Discuss coal mining. Clarify (IDMTSG-14-0153-39).]
- [NOTE TO BLM: Makela- Planning leads discuss comment IDMTSG-14-0242-16 from the USFWS.]

~~The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. The alternatives represent different degrees of and approaches to balancing resources and resource use among competing human interests, land uses, and the conservation of natural and cultural resource values, while sustaining and enhancing ecological integrity across the landscape, including plant, wildlife, and fish habitat.~~

~~Additionally, all alternatives considered within this planning process are consistent with conservation measures and objectives outlined in the COT Report and follow the basic principles of: (1) avoiding the impact of an activity; (2) minimizing impacts by limiting the degree of activity; and (3) mitigating for an impact by improving or enhancing greater sage grouse habitat. Each of the alternatives considers different means for accomplishing this strategy. For example, some alternatives place greater emphasis on avoidance of impacts, whereas other alternatives place more emphasis on minimization and mitigation.~~

~~The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.~~

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be

~~The DEIS uses the most recent science which shows burning and/or manipulation of sagebrush is not beneficial in occupied GRSG habitats and that retention and restoration of existing GRSG habitats should be the highest priority (see Baker, 2011 and Connelly et al. 2011). Individual RMPs/LUPs can be referenced by the public for information on current management (Alt A). The DEIS specifically addresses amendments to the existing RMPs/LUPs. Current management actions for GRSG within existing BLM and FS RMPs/LUPs have been deemed inadequate by the USFWS. Hence, the warranted but precluded finding of GRSG by the USFWS. See the 2010 USFWS listing decision on GRSG for more detail on the warranted, but precluded decision.~~

~~[BLM: Eventually need to fill this in:] Impacts from XX on greater sage grouse were considered in Section 4.x of the Draft EIS. Include discussion of what changes were made and where. If no change made, describe why the impact analysis is adequate for that topic. Some template text:~~

~~While a land use planning level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS's impact analysis relevant to [speak to the specific topic or theme of the issue statement, e.g., anticipated fluid mineral development of the planning area] was found to need additional information and support for the conclusions/findings. The BLM and the Forest Service have updated this information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary information to make informed land use plan level decisions. Specifically, [insert a summary of the information that was updated and include a citation for where the reader could find it in the FEIS]. The DEIS is at a sub-regional scale not individual GRSG populations. The DEIS does include a discussion of the threats within each subpopulation and management zone. Appropriate conservation measures/management actions are based on the best available science which can be found in the BER.~~

~~The DEIS discusses the linkage of public and private lands and the potential for increased disturbance on private lands, additionally GRSG mapping efforts have given "checkerboard" GRSG habitats a lower priority designation (i.e. general habitat or non-habitat) where applicable. See the following sections: 4.3.2 Nature and Types of Effects, under Land Uses and Realty Management, 4.12.5; 4.12.6; 4.12.7; 4.12.8; 4.12.9 Impacts from Renewable Energy, 4.13.5; 4.13.6; 4.13.7; 4.13.8; 4.13.9~~

As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

[NOTE to BLM: include additional language to the national response regarding the use of assumptions and how they aid in recognizing and resolving some of the uncertainty. As assumptions made for the analysis directly relate to the outcomes of The DRMPA/DEIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DRMPA/DEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DRMPA/DEIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13). The DRMPA/DEIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

[NOTE TO BLM: if changes are made use text below.]

Impacts from XX on GRSG were revised in Section 4.2 of the FEIS. [Include discussion of what changes were made and where.] Some template text: While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS's impact analysis relevant to [speak to the specific topic or theme of the issue statement, e.g., anticipated fluid mineral development of the planning area] was found to need additional information and support for the conclusions/findings. The BLM has updated this information in the Proposed RMPA/FEIS to provide the necessary information to make informed land use plan-level decisions. Specifically, [insert a summary of the information that was updated and include a citation for where the reader could find it in the FEIS.]

~~Greater sage grouse conservation measures in A Report on National Greater Sage grouse Conservation Measures (NTT 2011) were used to form BLM management direction under Alternative B in the North Dakota Greater Sage Grouse RMPA, which is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044 (the BLM must consider all applicable conservation measures developed by the NTT in at least one alternative in the land use planning process). During scoping for the North Dakota Greater Sage Grouse RMPA/EIS, individuals and conservation groups submitted management direction recommendations, including the Sage grouse Recovery Alternative, for protection and conservation of GRSG and their habitat. The recommendations received during scoping, in conjunction with resource allocation opportunities and internal sub-regional BLM input, were reviewed to develop the management direction for GRSG under Alternative C. Conservation measures in this alternative are focused on both PH and GH.~~

The DRMPA/DEIS provides an adequate discussion of the environmental consequences of the presented alternatives. As required by 40 CFR 1502.16, the DRMPA/DEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented.

The DRMPA/DEIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1. Resource management plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1). The DRMPA/DEIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

As stated in Section 1.6.4, Issues Considered but Not Further Analyzed, in the DRMPA/DEIS, predator control is outside the scope of RMPA. The State of North Dakota possesses primary authority and responsibility for managing wildlife within the state. The BLM has authority to manage GRSG habitat and have provided analysis to describe how the numerous management actions across the range of alternatives could affect the habitat and indirectly the effects of predation. However, the DEIS did not explicitly connect the effects of infrastructure and altering sagebrush habitat with the effects this could have on predators and predation of GRSG. Structural range improvements such as fences represent potential predator perches, and altering the sagebrush habitat of the GRSG can create an influx of predators into an area and lead to a population decline. Roads, fences, power lines, trails and other disturbances may make access easier for potential predators and increase risks to the species. The DEIS calls for measures that will substantially reduce disturbances in the bird's habitat, thus reducing predation risk. The DEIS also calls for careful monitoring of grazing allotments within sage-grouse nesting habitat to ensure suitable grass and forb cover is reserved so we can minimize the associated predation risks. This information has been included in the Final EIS in Section NOTE TO BLM: XX [NOTE TO EMPSI: need to provide analysis of impacts to GRSG from predation under each alternative – DEIS only discusses in the Nature and Type of Effects section] to more clearly state

NOTE: check for the hunting cumulative effects analysis. This is an individual plan discussion of the cumulative effects of hunting. It is not part of the subregional cumulative effects analysis.

Re assumptions: reference back to general NEPA response where it's covered 4.6.

no need to go point by point in the response. Just reference where to find the analysis in the FEIS.

Do include specific statement that coal was not an issue for analysis because there are no coal deposits within the planning area.

Include red paragraph about hunting. NOTE: check for the hunting cumulative effects analysis. This is an individual plan discussion of the cumulative effects of hunting. It is not part of the subregional cumulative effects analysis.

Issue statement #1 is confusing  
- consider rewriting.

1st & 2nd paragraphs are not  
appropriate for cum impact  
analysis discussion. Deleted.

Insert red text for intro  
language

Capture assumption guidance:

I. assumptions meet NEPA adequacy and follow guidance for development and use in analysis. NEPA handbook reference.

Explain why adequate.

Cross reference assumptions bit to general NEPA response in 4.0

clarify that sections that are OK and include the citation where the info is OK in the EIS.

For info that was NOT ok in the DEIS, be sure to include citations for where info was update/revised in the FEIS.

1st paragraph of the response does not hit on the point of the issue (how the measures would protect GrSG in the long run). Need to show (in the EIS or explain here) how the actions in Alt C would protect SG in the long run. If benefits are demo'd in the EIS, cite where found or where FEIS has been updated to demonstrate analysis.

Cite in the document where other points were discussed in the EIS (whether DEIS or FEIS).

Plan	Issue Statement
OR	The BLM needs to provide additional analysis regarding the cumulative effects of mining, vegetation treatments, and fences on greater sage-grouse. In addition, the cumulative effects analysis shows that the alternatives do not meet the purpose and need.

UT Commenters suggested that the BLM did not address the cumulative impacts of the sage grouse actions on non-BLM or Forest Service lands adequately. Commenters questioned the accuracy of cumulative impact analysis by WAFWA management zone.

ID-SW The BLM and Forest Service need to provide  
MT additional analysis regarding the cumulative effects of livestock grazing and land treatments. In addition, the agencies should predict greater sage-grouse population changes based on expected cumulative actions.

NV-CA 1/3 The cumulative effects analysis is deficient, as it should include analysis of issues beyond BLM and Forest Service authority, such as hunting and predation. Positive impacts to GRSG should be included, as well as the GRSG conservation measures implemented on the Modoc National Forest.

[Note to BLM: suggest reviewing all comments under this code, as they may result in changes to the EIS]

NV-CA

2/3

NWCO Commenters suggested that the BLM did not address the cumulative impacts of the sage grouse actions on non-BLM or National Forest System lands, and that BLM and FS should include a table or section that compares the anticipated outcomes of each alternative in protecting sage grouse populations.

Lewisto wn The BLM has not fully considered cumulative impacts on GRSG, particularly actions on adjacent lands. The BLM should include the Montana Greater Sage-Grouse Habitat Conservation Strategy in the cumulative effects section.

ND The DRMPA/DEIS failed to adequately address cumulative effects from West Nile virus.

WY9

## Response

The BLM and the Forest Service **analyzed** ~~thoroughly explained its consideration and analysis of~~ cumulative effects in the DLUPA/EIS in Section 4.XX. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

The BLM and the Forest Service have complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level.

The cumulative effects analysis discussion of relevant cumulative actions for WAFWA Management Zone IV and WAFWA Management Zones II and VII have been updated to be specific to the applicable zones. [NOTE TO BLM: Update this language as needed, this section was a copy/paste from Zone III instead of being modified to fit.]

~~The BLM thoroughly explained their consideration and analysis of cumulative effects to GRSG in the DLUPA/EIS in Section 4.X. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. The BLM has complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level. There may be a decline in GRSG population numbers and habitat that may continue for a period of time, despite implementing the Proposed Plan, but the~~

The BLM and the Forest Service ~~thoroughly explained its consideration and analysis of~~ analyzed cumulative effects in the DLUPA/EIS in Section 4.24.3, Special Status Species – Greater Sage-Grouse. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

The BLM and the Forest Service have complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level.

The cumulative effects analysis discussion of relevant cumulative actions for WAFWA Management Zone IV and WAFWA  
The BLM and Forest Service ~~thoroughly explained their consideration and analysis of~~ analyzed cumulative effects to GRSG in the DLUPA/EIS in Section 4.16. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. **This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.** The BLM and Forest Service have complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level.

The BLM and Forest Service added quantitative analysis to Section 4.16 related to XXX topics. [Note to BLM/FS: insert description of any revisions made or if not, why not]

[NOTE TO BLM: Refine cumulative effects section as appropriate regarding cumulative effects analysis on existing fences, prescribed burning and other proposed treatments, and domestic livestock grazing.]

The BLM and Forest Service thoroughly explained their consideration and analysis of analyzed cumulative effects to GRSG in the DLUPA/EIS in Section 4.16. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective. The BLM and Forest Service have complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level.

~~Despite concerns over impacts of the West Nile virus (WNV) on GRSG populations, actual prevalence of the virus in wild populations remains unknown (Walker et al. 2007). Although the WNV has been documented in Nevada and California (1 detection in NV in 2005 and 2 detections in CA 2004 & 2005 outside of the NV/CA Sub-region) (Walker and Naugle 2011), the impacts of the WNV on GRSG in the future will depend on temperature, rainfall, and changes in vector distribution. Temperature strongly affects physiological and ecological processes that influence WNV transmission, and outbreaks are typically associated with prolonged periods of above-average temperature and drought (Walker et al. 2007). Due to the climate of the planning area, the spread of the WNV and impacts to GRSG in the planning area are speculative at this time and, therefore, was not included in the scope of the cumulative impact analysis in the DLUPA/EIS. The USFWS also concluded that, "at this time, we find that neither disease nor predation is a sufficiently significant threat to GRSG now or in the foreseeable future that it requires listing under the Act as threatened or endangered based on this factor (USFWS 2010). The BLM and Forest Service understands the potential threat to GRSG from the WNV and has made reference to it in the~~

## GRSG Hunting Response

Contemporary hunting seasons in the Nevada and Northeastern California Sub-region are generally very conservative due to their length and bag limits. The Nevada GRSG hunting season is limited to 10-15 days with a bag limit of 2 birds daily and 4 birds in possession. While California allows a 2 day season and a bag limit of 2 birds per permit. Where GRSG populations are considered rather small and/or isolated, hunting seasons have been closed. Five counties in Nevada and over 20 hunt units have been closed to GRSG hunting since 1997. In California, two hunt zones were closed in 2012 and 2013 due to large wildfires within the Buffalo Skedaddle Population Management Unit. These units will likely remain closed to GRSG hunting in future years until significant habitat and population recovery occurs.

The biological issue remains whether or not hunting GRSG is additive, and contributes to population declines, or compensatory with other sources of mortality (e.g. predation). Research conducted on GRSG hunting indicates that local circumstances, such as overall population size and connectedness, habitat condition and proximity to urban areas may play an important role as to whether mortality is additive or compensatory. In a long-term study conducted in Eureka County, Nevada, Blomberg et al. (2013) found that human harvest accounted for 2 percent of all mortality and did not adversely impact GRSG populations.

There are ancillary benefits to GRSG hunting. Even though few hunters purchase a hunting license specifically for GRSG hunting, hunting license dollars are used to match federal grants (Pittman-Robertson Act) to conduct monitoring work annually, conduct research projects and implement habitat enhancement and restoration projects. Additionally, wings from hunter harvested GRSG are analyzed annually to determine nest success, recruitment and overall population viability. Cessation of hunting would likely eliminate the usage of hunting license dollars as a match for federal aid grants and greatly reduce annual monitoring efforts, research and habitat restoration projects that are currently funded through this mechanism. (NDOW 2014). (Review Comments to the Nevada and Northeastern California Sub-Area Sage-grouse LUPA/DEIS)

BLM needs to add National/WO verbiage on predation:

Predator Control Response:

In the USFWS 2010 Listing Decision (75 Federal Register. 13910), the USFWS stated “Based on the best scientific and commercial information available, we conclude that predation is not a significant threat to the species such that the species

Predator management research has not provided sufficient evidence to support implementation of predator control to improve GRSG populations over broad geographic or temporal scales. The limited information available suggests predator management may provide short-term relief for GRSG population sinks in the few cases where the situation has been documented (Hagen 2011, p95-100). Most GRSG research has failed to quantify predator community structure or predation rates in relation to habitat variables, let alone within the landscape contexts. Thus, it is not currently possible to understand relationships among habitat structure, demographic rates of GRSG, and the predator community of an area and to incorporate these into broad-scale based predator management programs for GRSG. It is critical for future GRSG conservation efforts to quantify these variables to better understand the impacts of predation on GRSG life history (Hagen 2011, p95-100). The most effective long-term predator management for GRSG populations may be through maintaining connectivity of suitable habitats (Shroeder and Baydack 2001).

A recent predator study was conducted by Lockyer et al. (2013) in the Virginia Mountains of Northeastern Nevada within the Great Basin. This study revealed that common ravens accounted for 46.7% of nest depredations within the study area. However, Lockyer et al. clearly stated that this study was not representative of the entire Great Basin for two main reasons. The first was due to significantly lower GRSG cumulative nest survival rates, which were documented at 22.4% within the study area. This survival rate is significantly lower than other published results for GRSG in the Great Basin. Secondly, the study area is not representative of the entire Great Basin or of the NV/CA Sub-region due to increased anthropogenic disturbances. Anthropogenic disturbances and raven abundance is positively associated with human-caused habitat alterations.

USFW Service 2010 Listing Decision (75 Federal Register. 13910)

Shroeder and Baydack 2001

As noted previously in Sections 4.6, 4.7, and 7.7 of this Report, the BLM and FS complied with the CEQ regulations for developing the direct, indirect, and cumulative impacts analysis.

Chapter 4, Table 4.2 Comparison of Alleviated Threats to GRSG in Northwest Colorado by Alternative provides an overview of how each threat would be alleviated on BLM and National Forest System lands. In addition to this table, the BLM and Forest Service prepared a cumulative impact analysis contained in Chapter 5, Section 5.4 that describes the cumulative impacts arising from each threat on all habitat and land ownerships. It would be difficult to prepare a table that shows how threats would be alleviated on private lands, but the Colorado Package also identifies Greater sage-grouse conservation activities that are happening and/or are planned to happen on private lands. In addition, the BLM and Forest Service have prepared a Tier II Cumulative Effects Analysis that will be completed at the WAEWA Management Zone 2 level

The BLM ~~thoroughly explained its consideration and analysis of~~ analyzed cumulative effects to GRSG in the DRMPA/DEIS in Section 5.2. The DRMPA/DEIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. The BLM has complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level.

The DLUPA/EIS contains a qualitative discussion of cumulative effects at the WAFWA Management Zone scale to set the stage for a more quantitative analysis to be contained in the Proposed Land Use Plan Amendment/FEIS. Additional quantitative cumulative analysis was added to the Final EIS in Section 5.2, Greater Sage Grouse [NOTE TO BLM: waiting for analyses from national team. Will include more details as they become available.]

[NOTE TO BLM: insert description of any revisions made or if not, why not]

[Depending on the specifics of the issue, note anything additional that supports the present and future actions regardless of

The BLM thoroughly explained its consideration and analysis of analyzed cumulative effects to GRSG in the DRMPA/DEIS in Section 5.2. As stated in Section 5.2.2, WAFWA Management Zone I Analysis, the BLM may require certain management of or changes to the design of stock ponds, coal-bed methane ponds, and other anthropogenic water sources associated with uses of public lands to reduce the likelihood for mosquito breeding and disease transmission. Alternative A does not contain any provisions for restricting the spread of West Nile virus. Alternatives B, C and D would design new water features for livestock such that they do not contribute to the spread of West Nile virus. Although the specific design and extent of deployment of these protective features is unclear, the provision makes Alternatives B, C and D more likely to reduce the threat of disease to

## NCT Notes

## Regional Team NOTES, EDITS, COMMENTS

Clarify summary statement and/or response. What is considered in the summary statement doesn't jive with the specifics noted in the response. Suggest revising the summary statement for specifics in the response or eliminate the specifics in response and keep the issue statement more general.

for 2nd sentence in issue statement, reference back to general NEPA 4.3 response re: how all the alts meet the P/N.

NCT to provide language to  
BLM re: cum analysis for  
WAFWA zones.

NCT to provide language to  
BLM re: cum analysis for  
WAFWA zones.

Replace this detail with the general language that your cum analysis is OK (see red text). Keep WNV language, but don't need to include impact analysis language (strike out). Keep the explanation for Madoc not included.

Reconcile the issue statement with response; disconnect between general issue statement and detailed response.

**NTC to draft additional response for WNV issue.**

This is detail that is not identified in the issue statement. NCT recommends scaling back the response to the more generalized response that reflects the general nature of the issue statement.

If want to include some reference to the subissues, suggest setting up issue statement with language such as "...inadequate cumulative analysis in topics including hunting, predation, etc..." Then provide a simple cross reference for where the analysis is provided in the EIS. E.g., Hunting is addressed in the FEIS section XXX; predation is addressed in section XXX; etc.

Included the general language if needed (CA: double check the canned language to see if general cum analysis language is in either section 4.6, 4.7 or 7.7. If not include it here. Same as NV above.)

Add in red text.

Re: the State plan, probably just need to say whether the plan was incorporated into the cumulative analysis or that the plan didn't come out in time to include or consider.

Use the provided language for  
intro (see red text).

Plan	Issue Statement
OR	The BLM's mitigation strategy needs clarification, particularly related to the disturbance cap, RDFs, compensatory mitigation, and monitoring. The primary threats to the bird's survival of wildfire, invasives, and juniper encroachment are not thoroughly addressed.

UT Commenters encouraged BLM and Forest Service to incorporate in the LUPA management objectives and directive that permit development of an Enhanced Mitigation/Expanded Use Authorizations Program. More detail should be provided in the FEIS regarding the ways in which the disturbance caps would be monitored and implemented. The DLUPA/DEIS failed to provide hard evidence that compensatory mitigation actually increases sage grouse populations. The DLUP/DEIS failed to provide science describing effectiveness of proposed mitigation. The BLM needs to clarify how mitigation would be required for private lands and valid existing rights.

The BLM should consider the following mitigation measures in the FEIS:

- Sage-grouse “banking program/system”
- Compensatory mitigation of all unavoidable direct, indirect and cumulative impacts
- Larvicide applications for West Nile virus
- On-sight hierarchy

ID-SW MT The BLM and Forest Service mitigation strategy is inadequate or needs clarifications. Topics of concern include:

- Certainty that mitigation will be implemented
- Lack of scientific evidence that mitigation and habitat restoration results in greater sage-grouse population increases
- Adequacy of the monitoring program
- Effectiveness of compensatory mitigation
- How mitigation proposals will be evaluated
- Siting of mitigation actions
- Durability of mitigation investments
- Consideration of using mitigation banks
- Creation of a mitigation program
- Framework behind exceptions and associated mitigation, e.g., science behind allowing exceptions; offsetting losses and prove mitigation is successful
- Need for mitigation given the restrictive management in the alternatives
- Link between compensatory mitigation and adaptive management

NV-CA The success of mitigation and sagebrush restoration is limited and the BLM and Forest Service should not use a broad-scale map as a basis for site-specific mitigation. Mitigation should be feasible and consistently applied. Commenters requested clarification and/or revisions to various mitigation measures, including the mitigation banking program and several BMPs/RDFs. [Note to BLM: consider reviewing the following comments for changes to the EIS:

- 0052-8
- 0120-14 through 18
- 0132-12
- 0188-25
- 0344-14

NWCO The BLM needs to consider a comprehensive mitigation and monitoring program for sage grouse that includes explicit criteria for determining the adequacy of the management actions.

Lewisto Commenters provided recommendations to  
wn strengthen or clarify mitigation measures. The BLM should provide more details on their adaptive management strategy, monitoring, [fire and invasive species management](#), and mitigation, including compensatory mitigation.

ND The DRMPA/DEIS should consider a moratorium on the construction of coalbed methane wastewater retention and infiltration reservoirs.

WY9

## Response

The BLM and Forest Service have updated the FEIS with additional information for the mitigation, monitoring and adaptive management strategies.

Mitigation has been further defined as a Regional Mitigation Framework and is detailed in Appendix X. The Framework is incorporated in the [insert Proposed Plan/Proposed Plan Amendment] and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats.

If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures, then compensatory mitigation projects will be used to fully offset impacts to achieve conservation benefits. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.

Specific mitigation strategies, based on the Framework, will be developed by regional teams within one year of the issuance of the Record of Decision and be consistent with the BLM's Regional Mitigation Manual MS-1794, Forest Service Handbook FSH 1909.15, and CEQ regulations at 40 CFR 1508.20.

The Monitoring Framework in Appendix X outlines the methods that the BLM and USFS will use to monitor habitats and evaluate the implementation and effectiveness of the planning strategy to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the USFS (36 CFR 219.12) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations, based on the sensitivity of the resource to the decisions involved. BLM and USFS will use the methods described in Appendix X to collect monitoring data to evaluate implementation and effectiveness of the Greater Sage-grouse planning strategy and the conservation measures contained in land use plans. To ensure that the BLM and USFS have the ability to make consistent assessments about sage-grouse habitats across the range of the species, the framework in Appendix X provides the methodology for monitoring the implementation and evaluating the effectiveness of BLM/USFS actions to conserve the species and its habitat through monitoring that informs effectiveness at multiple scales.

Implementation monitoring results will provide information to allow the BLM and USFS to evaluate the extent that decisions from the BLM resource management plans (RMP) and USFS land management plans (LMP) to conserve greater sage-grouse

The BLM and Forest Service have updated the FEIS with additional information for the mitigation, monitoring and adaptive management strategies.

Mitigation has been further defined as a Regional Mitigation Framework and is detailed in Appendix X. The Framework is incorporated in the [insert Proposed Plan/Proposed Plan Amendment] and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats.

If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures, then compensatory mitigation projects will be used to fully offset impacts to achieve conservation benefits. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.

Specific mitigation strategies, based on the Framework, will be developed by regional teams within one year of the issuance of the Record of Decision and be consistent with the BLM's Regional Mitigation Manual MS-1794, Forest Service Handbook FSH 1909.15, and CEQ regulations at 40 CFR 1508.20.

The Monitoring Framework in Appendix X outlines the methods that the BLM and USFS will use to monitor habitats and evaluate the implementation and effectiveness of the planning strategy to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the USFS (36 CFR 219.12) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations, based on the sensitivity of the resource to the decisions involved. To ensure that the BLM and USFS have the ability to make consistent assessments about sage-grouse habitats across the range of the species, the framework in Appendix X provides the methodology for monitoring the implementation and evaluating the effectiveness of BLM/USFS actions to conserve the species and its habitat through monitoring that informs effectiveness at multiple scales.

Implementation monitoring results will provide information to allow the BLM and USFS to evaluate the extent that decisions from the BLM resource management plans (RMP) and USFS land management plans (LMP) to conserve greater sage-grouse

The BLM and Forest Service have updated the FEIS with additional information for the mitigation, monitoring and adaptive management strategies.

Mitigation has been further defined as a Regional Mitigation Framework and is detailed in Appendix X. The Framework is incorporated in the [insert Proposed Plan/Proposed Plan Amendment] and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats.

If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures, then compensatory mitigation projects will be used to fully offset impacts to achieve conservation benefits. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.

Specific mitigation strategies, based on the Framework, will be developed by regional teams within one year of the issuance of the Record of Decision and be consistent with the BLM's Regional Mitigation Manual MS-1794, Forest Service Handbook FSH 1909.15, and CEQ regulations at 40 CFR 1508.20.

The Monitoring Framework in Appendix X outlines the methods that the BLM and USFS will use to monitor habitats and evaluate the implementation and effectiveness of the planning strategy to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the USFS (36 CFR 219.12) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations, based on the sensitivity of the resource to the decisions involved. BLM and USFS will use the methods described in Appendix X to collect monitoring data to evaluate implementation and effectiveness of the Greater Sage-grouse planning strategy and the conservation measures contained in land use plans. To ensure that the BLM and USFS have the ability to make consistent assessments about sage-grouse habitats across the range of the species, the framework in Appendix X provides the methodology for monitoring the implementation and evaluating the effectiveness of BLM/USFS actions to conserve the species and its habitat through monitoring that informs effectiveness at multiple scales.

Implementation monitoring results will provide information to allow the BLM and USFS to evaluate the extent that decisions from the BLM resource management plans (RMP) and USFS land management plans (LMP) to conserve greater sage-grouse

The DLUPA/EIS contains planning actions and does not include site-specific implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis (EIS) and expand the environmental analysis when more specific information is known.

BLM describes best management practices (BMPs) as "state-of-the-art mitigation measures". The aim of BMPs is to protect wildlife, air quality, landscapes, and other natural resources. BMPs tend to be general principles for resource protection and are not in themselves regulatory in nature. BLM's policy is that all "Field Offices consider BMPs in National Environmental Policy Act (NEPA) documents to mitigate anticipated impacts to surface and subsurface resources. BMPs are not "one size fits all." The actual practices and mitigation measures best for a particular site are evaluated through the NEPA process and vary to accommodate unique, site-specific conditions and local resource conditions.

Mitigation, adaptive management and a monitoring framework were developed by a Disturbance and Monitoring Team that focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM and the Forest Service worked with WAFWA to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate datasets will be established so that data can easily be “rolled up” for reporting monitoring results across the range of greater sage-grouse, as defined by Schroeder et al. (2004); by populations and subpopulations as defined by Connelly et al. (2004); by LUP area; by the seven (WAFWA) Greater Sage-grouse Management Zones (Stiver et al. 2006), and by Priority Areas for Conservation (PACs) as defined in the greater sage-grouse Conservation Objectives Team (COT) Report (U.S. Fish and Wildlife Service 2013). [If needed, based on specifics of comments and/or summary statement, include statement to the effect that broad- and mid-scale monitoring will be conducted as funding allows.]

[Refer to the Monitoring Framework in the appendix.] To accomplish effective monitoring, the BLM and the Forest Service will analyze the monitoring data to characterize the relationship among disturbance, implementation actions, and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife The BLM and Forest Service have updated the FEIS with additional information for the mitigation, monitoring and adaptive management strategies.

Mitigation has been further defined as a Regional Mitigation Framework and is detailed in Appendix X. The Framework is incorporated in the [insert Proposed Plan/Proposed Plan Amendment] and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats.

If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures, then compensatory mitigation projects will be used to fully offset impacts to achieve conservation benefits. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.

Specific mitigation strategies, based on the Framework, will be developed by regional teams within one year of the issuance of the Record of Decision and be consistent with the BLM’s Regional Mitigation Manual MS-1794, Forest Service Handbook FSH 1909.15, and CEQ regulations at 40 CFR 1508.20.

The Monitoring Framework in Appendix X outlines the methods that the BLM and USFS will use to monitor habitats and evaluate the implementation and effectiveness of the planning strategy to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the USFS (36 CFR 219.12) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations, based on the sensitivity of the resource to the decisions involved. BLM and USFS will use the methods described in Appendix X to collect monitoring data to evaluate implementation and effectiveness of the Greater Sage-grouse planning strategy and the conservation measures contained in land use plans. To ensure that the BLM and USFS have the ability to make consistent assessments about sage-grouse habitats across the range of the species, the framework in Appendix X provides the methodology for monitoring the implementation and evaluating the effectiveness of BLM/USFS actions to conserve the species and its habitat through monitoring that informs effectiveness at multiple scales.

Implementation monitoring results will provide information to allow the BLM and USFS to evaluate the extent that decisions from the BLM resource management plans (RMP) and USFS land management plans (LMP) to conserve greater sage-grouse There are no coalbed natural gas wells projected for any of the proposed alternatives under the oil and gas RFD used for analysis in the DRMPA/DEIS. This type of energy development is not an issue in the North Dakota Greater Sage-Grouse planning area.

**NOTE TO  
SUBREGIONAL TEAMS:**

The responses were replaced with new National response language. Please follow this information for responding to the issues of mitigation strategy, monitoring plan, and adaptive management. Specific national language for each topic are provided in the mitigation, monitoring, and adaptive management tabs in the workbook.

Also, the second issue statement is not clear how it relates to the mitigation and/or monitoring strategies.

Rest of the response should address whether BLM accepted the proposed additional mitigation measures. If already considered in EIS, note where they are ("see section XX")

Statement: Consistency  
applied with Bureau-wide  
strategy see Ap XX in FEIS.

This is good intro language to use in other areas too.

Use language for effectiveness and implementation monitoring to address individual points of clarification (e.g., commenters said not enough info on monitoring for disturbance cap, fire, etc.)

NOTE TO BLM: NCT inserted the suggested language for site specific analysis & BMP application.

Blue text should be addressed under the appropriate topic rather than generically under mitigation/monitoring for sage grouse. Also, response to blue issue is not provided in this response.

Last paragraph re: BMPs is not addressed in the issue statement. suggest deleting it or revising the issue statement and keeping the response text.

why is this here? Should be deleted or issue statement clarified to note that the moratorium is a suggested mitigation measure provided by commenters.

Plan	Issue Statement
------	-----------------

OR A number of comments were provided related to the range of alternatives for ACECs and RNAs:

1. The DRMPA/DEIS inconsistently qualifies RNAs. On the one hand stating that RNAs are intended to be undisturbed and managed for minimum human disturbances and on the other hand describing them as areas where disturbances have occurred in the past and allowing for future disturbances.

2. The RMPA does not evaluate whether the added ACEC purposes (GRSG) are compatible with the existing uses and management prescriptions. Some existing relevant and important values appear to be incompatible with GRSG management (e.g., wild horses, grand fir forests, and old growth juniper).

3. The analysis of the relevance and importance criterion doesn't provide scientific support for the conclusions that the areas are uniquely necessary for GRSG. The BLM doesn't analyze whether the areas require special management attention and no special management attention specific to the

UT The BLM can use other administrative designations other than areas of critical environmental concern, such as Priority Areas, to protect Greater Sage-Grouse. Commenters recommended that BLM designate a proportion of the preliminary priority habitat as greater-sage-grouse priority areas, and that they be considered for designation as Areas of Critical

ID-SW  
MT Issue 1: In the Draft EIS/LUPA, the BLM/FS did not accurately or consistently represent the number of ACECs being proposed under each alternative, particularly Alternative C.

Issue 2: Alternatives in the Draft EIS/LUPA do not provide an adequate range of management actions for ACECs by only considering new ACECs under two of the action alternatives (C and F).

Issue 3: Whether ACECs or another administrative designation, the BLM/FS should ensure any administrative designation established for the protection of sage-grouse habitat will provide adequate non-discretionary protections.

NV-CA BLM has not provided sufficient details regarding population numbers and critical needs in the specifically identified areas, or consideration for other administrative designations besides ACECs to manage Greater Sage Grouse habitat.

NWCO n/a

Lewisto The BLM has the authority to designate the  
wn potential GRSG ACEC even though it  
overlaps with PH. This overlap does not  
justify failing to designate the ACEC and the  
fact that a proposed PH may overlap with an  
ACEC does not obviate the need for the PH.

ND n/a  
WY9

## Response

The BLM considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM fully considered the management opportunities presented in the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, five action alternatives were analyzed in detail in the RMPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the RMPA/EIS represented a full spectrum of options.

As noted in section 4.3, NEPA Range of Alternatives, of this report, the alternatives, including the management actions for the fire program meet the purpose and need for the EIS. All or part of Key RNAs identified in the Final EIS would be closed under the preferred alternative to all disturbance types, including livestock grazing, OHV, minerals development, and lands and realty actions. The reason for these closures would be for research-related activities, including studying natural sagebrush communities important to sage-grouse in the absence of land disturbing activities, as well as studying the effects of climate change on these vegetative communities. Minimum disturbance could be allowed in a controlled manner to conduct research related to land management activities. Such activities could include weed treatments to protect natural plant communities, fuels treatments research, and grazing research. A very limited amount of disturbance may occur for administrative purposes, but this would be contained within small areas and would have only short-term impacts.

Appendix I has been updated to include only tables for ACECs and RNAs and the goals and objectives have been moved to the appropriate sections in Chapters 2 and 3. Appendices I and J have been reviewed for consistency with the rest of the document and updated where needed.

No new ACECs or RNAs will be created or designated as part of the proposed action in the Final EIS. A subset of 5 ACECs and 22 RNAs would change management goal to improve protections for GRSG habitat. [Note to BLM: Include rationale for why not including new ACECs in proposed alternative.] Within this subset, only portions of an ACEC or RNA may change. These types of designations are not in the BLM Land Use Planning Handbook (H-1601-1). The BLM has determined that, under any of the alternatives, management proposed to protect GRSG would be equivalent to protections afforded via an ACEC or other designation.

Response 1: [NOTE TO BLM: Review EIS/LUPA for consistent representation of proposed ACECs under Alternatives C and F.]

Responses 2 and 3: **As noted in section 4.3, NEPA Range of Alternatives, of this report, the alternatives, including the management actions for the fire program meet the purpose and need for the EIS.** Alternatives within the EIS have established that not all protective management for the Greater Sage Grouse is limited to ACEC designation. Only Alternatives C and F proposed to establish ACECs for the protection and management of the Greater Sage Grouse. While the other alternatives do not propose such designations, they still contain similarly specific management prescriptions to manage and protect the Greater Sage Grouse and its habitat that would be equivalent to protections afforded via an ACEC or other designations.

In general, when determining the Relevance values for a potential ACEC, a wildlife resource consists of but is not limited to “habitat for endangered, sensitive or threatened species or habitat essential for maintain species diversity. Specific population numbers are not identified as a requirement for a relevance value. Population numbers are not identified for Importance values; which requires that the resource have a substantial significance and value to satisfy this criterion. Importance values require that the resource have special worth, consequence, meaning, distinctiveness or cause for concern. Other values can include:

- Sensitive, endangered, threatened or vulnerable to adverse change etc.
- Warrants special protection to satisfy national priority concerns or mandates of FLPMA.

This EIS at 1.3 Purpose and Need provides the rationale for the critical need to protect Greater Sage Grouse populations.

**Within the range of alternatives, there are management actions provided to protect sage-grouse some of which are ACECs. For example, Alternatives within the EIS have established that not all protective management for the Greater Sage Grouse is limited to ACEC designation. Only Alternatives C and F proposed to establish ACECs for the protection and management of the Greater Sage Grouse. Alternative E has identified areas as Sage-Grouse management areas (SGMAs) not ACECs. Alternatives B and D identify areas as Primary Priority and General Management Areas which in effect are not designations such as an ACEC but still contain similarly specific management prescriptions to manage and protect the Greater Sage**

n/a

The assertion that the BLM cannot designate PH as a special management area is correct. However what the BLM has done in the DRMPA/DEIS is identify priority areas (habitat) for management for GRSG. In these areas, management prescriptions are identified. These areas are not synonymous and should not be confused with special management areas or special designation areas.

In developing the Proposed RMPA/Final EIS, the Authorized Officer reviewed the environmental analysis and determined that special management attention is not required to protect the potential ACEC because management prescriptions laid out for GRSG, which the ACEC was designed to protect, are sufficient to protect the species [NOTE TO BLM: Please review this language and ensure that it is correct/appropriate. A determination of this sort is required in the FEIS or ROD (see BLM Manual 1613.33.E., Rationale for Designating or Not Designating)]. This is documented on page 4-126 of the Draft RMPA/EIS, which says, "Management actions in the new GRSG ACEC would be the same as those actions proposed for GRSG habitat outside the ACEC, including ROW exclusion areas, closures to mineral entry, and livestock grazing limitations." In other words, the ACEC would not provide any additional protection for the species on top of what is proposed outside of the potential ACEC.

In the absence of ACEC designation, the BLM must still analyze impacts on GRSG from federal actions that may affect the species or its habitat in accordance with the NEPA.

Issue statement 5 sounds like opinion. Is it relevant to include here?

No need to create redundant statements. Refer back to 4.3 Range of Alts for standard NEPA requirements.

The linkages between what statements are being responded to with response paragraphs is a bit unclear. Perhaps use numbering in the paragraphs to correlate to numbered issue statements.

Last paragraph of the response (the 20/50 issue) isn't addressed in the issue statement. Consider adding something to the issue statement to address it.

Second sentence sounds like opinion/voting. Suggest deleting it as the response does not address it.

Suggest referencing back to NEPA 4.3 range of alternatives as intro to response on issue 2 and perhaps expand a bit more on the explanation for why ACECs were addressed in 2 alts. See red text. Suggest changing the "should" in issue statement 3 to "needs" - sounds less like an opinion that way.

Issue statement should link the population numbers and critical needs back to the R&I criteria of ACECs (as touched on in the first sentence of the response).

Issue statement is confusing.  
--BLM can designate ACEC  
when it overlaps with PH  
--If it overlaps then BLM can't  
use that excuse to NOT  
designate an ACEC  
--Just because you have an  
existing ACEC, you still need  
to designate PH

Also, not clear how the  
response is addressing the  
points of the issue statement.  
Suggest revising the issue  
statement to fit response, or  
revising the response to make  
the link with the key issue of

## Response

The priority RNAs listed in Table I-2, Existing Priority RNAs for Long-Term Monitoring, have been reviewed for their applicability and relevance. **Of the RNAs that were reviewed, some were determined to meet the applicability and relevance criteria and** ~~as listed in the DEIS, have been reviewed for~~ ~~that have been determined to be crucial for long-term monitoring;~~ **they** have been reclassified as Key RNAs in the FEIS. **Those that did not meet the criteria, were dropped from further consideration as a special designation.** Appendix I has been updated accordingly. The Burro Spring/Spanish Lake Allotment has been removed from the list of key RNAs in the FEIS.

[Note to RIM: Review this response for accuracy.]

n/a

n/a

One of the alternatives within the EIS does identify PPH areas as potential ACECs.

n/a

The process for determining whether or not a nominated ACEC meets the relevance and importance criteria is detailed in Appendix E, Area of Critical Environmental Concern Evaluation of Relevance and Importance Criteria, of the Draft RMPA/EIS.

According to BLM Manual 1613, Areas of Critical Environmental Concern, an area must meet at least one relevance and one importance criterion to be considered as a potential ACEC and analyzed in resource management plan alternatives (see BLM Manual 1613.11, Identification Criteria). Through the evaluation process, the BLM determined that the nominated ACEC for GRSG met relevance criteria for a fish and wildlife resource and a natural process or system. The nominated GRSG ACEC also met the importance criteria because it warrants national priority/FLPMA protection (see page E-3).

BLM Manual 1613, Areas of Critical Environmental Concern, directs that, "All areas which meet the relevance and importance criteria must be identified as potential ACEC's and fully considered for designation and management in resource

n/a

Issue statement should be updated to say what criteria are not being met.

While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the DEIS's impact analysis relevant to effects to air quality from oil and gas development from removing or restricting development of transmission lines in ROWs was found to need additional information and support for the conclusions/findings. The BLM and the Forest Service have updated this information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary information to make informed land use plan-level decisions. Specifically, [EMPSi ACTION ITEM; insert a summary of the information that was updated and include a citation for where the reader could find it in the FEIS.].

In regards to impacts from livestock grazing, land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/DEIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered

ND n/a

WY9

Response

NCT Notes

Assessing the impacts of grazing on climate change is outside the scope of this document, except as it pertains to reducing impacts on GRS and GRS habitat within the planning area and in consideration of valid existing rights and the BLM's multiple use mandate under the Federal Land Policy and Management Act. The Draft EIS evaluated alternatives that would incorporate GRS habitat objectives into BLM grazing allotments and permit renewals (Alternatives D and E) and that would remove livestock grazing from allotments in priority and general habitat (Alternative C and, to a lesser extent, Alternative F), and the associated effects these alternatives would have on GRS and GRS habitat. The BLM considered a reasonable range of alternatives as relates to grazing during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. The analysis presented in the EIS will allow decision makers to make an informed decision pertaining to the effects of differing livestock grazing scenarios on GRS and its habitat.

[BLM note: BLM to ask Lauren M. about requirement for and language for climate change

The DLUPA/EIS provides an adequate discussion of the environmental consequences of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1

Suggest making first paragraph more specific to climate change. Where was this discussed in the EIS? Consider incorporating the NEPA regulations into the second paragraph or combining the first and second paragraph.

Per the requirements of NEPA as noted above, the effects of livestock grazing on GRS and GRS habitat are discussed in Section 4.2 under Impacts from Domestic Livestock Forage Use (Herbivory) (page 4-37 of the DLUPA/DEIS), including the compounding effects of drought conditions on the herbivory (page 4-41 of the DLUPA/DEIS).

Regional climate change projections were developed as part of the Colorado Plateau Rapid Ecological Assessment (REA; Bryce et al. 2012) and are summarized in Section 3.4.1, Conditions Statewide (Climate Change) of the DLUPA/DEIS. The methodology for the regional modeling is described in Section 3.2.7 of the REA and the results of the modeling are contained in Section 5.4 of the REA; both sections are available at Internet Web site:

[http://www.blm.gov/wo/st/en/prog/more/Landscape\\_Approach/reas/coloplateau.html](http://www.blm.gov/wo/st/en/prog/more/Landscape_Approach/reas/coloplateau.html). As described in Section 3.4.1 of the DLUPA/DEIS (page 3-42), the northern part of the

n/a

- BLM needs time to check the "new" alternative E to see if comment still applies.

n/a

Text stating that climate change has the potential to produce warmer and drier conditions that may increase the potential for the spread of cheatgrass and other invasive plants over current conditions has been added to Section 5.2, Spread of Weeds, and Section 5.4, Vegetation. As described in these sections in the DRMPA/DEIS, under all alternatives, integrated vegetation management would be used to control, suppress, and eradicate noxious and invasive species. Under Alternatives B, C, and D, vegetation management and restoration would prioritize sagebrush re-establishment and weed control as part of habitat management. In addition, an adaptive management strategy has been incorporated as Section XX into the Final EIS that further outlines how the BLM will monitor changing vegetative conditions, including changes that may result from drought and from climate change. [NOTE TO BLM: If adaptive management strategy does not apply to this comment, please delete this sentence from the response.]

Consider revising issue statement because the reference to Beschta et al. is confusing as new literature is not included in the summary. There does not seem to be a reference to new literature in the summary yet the response references literature.

[Change to FEIS- add climate change text to section 5.2 and 5.4 as indicated above]

The reference cited, Beschta et al. 2012, reports that domestic livestock and other ungulates alter vegetation, soils, hydrology, and wildlife species composition and abundances that exacerbate the effects of climate change on western landscapes, and that removing or reducing livestock grazing across large areas of public land would alleviate a widely recognized and long-term stressor and make ecosystems less susceptible to the effects of climate change.

Assessing the impacts of grazing on vegetative resilience on public lands in light of climate change is outside the scope of this document, except as it pertains to reducing impacts on GRS and GRS habitat within the LFO planning area and in consideration of valid existing rights and the BLM's multiple use mandate under the Federal Land Policy and

n/a

n/a

The BLM and Forest Service recognize the tribal sovereignty of federally recognized indigenous tribes as well as the laws that clarify the relationship between the federal government and Native American Tribes and the requirement to conduct consultation. The BLM and FS initiated Governemtn to Government consultation with the Fort McDermitt Paiute and Shoshone Tribe in December of 2011. In addition, they were invited to participate in the planning effort as a cooperating agency but choose not to sign a formal MOU. Formal Governemtn to Government consultation continued in 2012 with face-to-face meetings with the BLM in June and July and with the Forest Service in June and Novemeber of 2013. The BLM and FS are committed to continue formal consultation with all federally recognized Native American Tribes in the Sage Grouse conservation efforts.

## Response

Assessing the impacts of grazing on cultural resources is outside the scope of this document, except as it pertains to reducing impacts on GRSG and GRSG habitat within the planning area and in consideration of valid existing rights and the BLM's multiple use mandate under the Federal Land Policy and Management Act. The Draft EIS evaluated alternatives that would incorporate GRSG habitat objectives into BLM grazing allotments and permit renewals (Alternatives D and E) and that would remove livestock grazing from allotments in priority and general habitat (Alternative C and, to a lesser extent, Alternative F), and the associated effects these alternatives would have on GRSG and GRSG habitat. The BLM considered a reasonable range of alternatives as relates to grazing during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. The analysis presented in the EIS will allow decision makers to make an informed decision pertaining to the effects of differing livestock grazing scenarios on GRSG and its habitat. Therefore, impacts of livestock grazing on the cultural and historic resources within the planning area is not analyzed in this planning effort.

The BLM regulations in 43 CFR 1600 and the NEPA process detailed in the CEQ regulations in 40 CFR 1500 guide preparation of plan amendments. As stated in Section 1.2, the purpose for the LUP amendments is to identify and incorporate appropriate conservation measures in LUPs to conserve, enhance and/or restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat. Because this LUP Amendment is a targeted amendment to conserve GRSG, the alternatives in the DEIS included management actions for resource programs that could conserve GRSG and its habitat. Impacts to local customs and culture are analyzed in Section 4.22. Social and Economic Impacts. of the DEIS.

## Response

The BLM has revised chapter 3 to state that Fort McDermitt Paiute and Shoshone Tribe of Nevada and Oregon and Burns Paiute have identified sage grouse as important to their culture. Land management on Tribal Reservations is not within the scope of the project. See Purpose and Need.

No cultural resource inventories were undertaken as part of this LUPA. Information from broad-scale assessments was used to help set the context for the decision-making process. As stated in Section 4.1.1.1, Methods and Assumptions, (DEIS, page 4-160) the information on cultural resources in the planning area is based on the results of industry, BLM, and Forest Service inventory projects and depicts the relative potential for cultural resource sites within the planning area. However, as these data are geographically biased toward past project-oriented undertakings and cannot accurately predict where and how many resources may exist in unsurveyed areas, this analysis does not attempt to quantify affected resources.

## Response

n/a

As stated in Section 4.11.1, Methods and Assumptions, (page 4-160) potential impacts on cultural resources and their settings from subsequent undertakings (implementation of the planning decisions or site-specific project proposals) require separate compliance with NEPA and Section 106, and result in the continued identification, evaluation, and mitigation of cultural resources to the National Register of Historic Places. Per the Utah Protocol and standard BLM and Forest Service operating procedures, effects on cultural resources eligible for listing in the National Register of Historic Places and potentially eligible cultural resources would be mitigated. If previously undiscovered resources are identified during an undertaking work would be suspended while the resource is evaluated and mitigated to avoid any further impact

## Response

The assessments in Appendix H will be analyzed in the FEIS. Site assessments and NEPA review will be conducted for specific projects. Appendix H, Greater Sage-Grouse Wildland Fire and Invasive Species Assessment, describes a minimal framework example and suggested approach for this assessment.

Before using prescribed fire, the BLM assess local conditions for potential invasive plant invasion. Section 4.6.2, Nature and Types of Effects, notes that while prescribed fire does have beneficial uses, the presence of noxious weeds and the potential of weeds to spread after a prescribed fire would need to be monitored on a site-specific basis. Alternative E specifically notes that prescribed burns should occur at higher elevation in the absence of cheatgrass. If the BLM were to use prescribed fire, the area would be monitored with the intention of preventing cheatgrass invasion

[BLM note: BLM to ask Lauren M. when the Greater Sage-Grouse Wildfire and Invasive Species Habitat Assessments will be

n/a

n/a

- Active and Passive fire management-varies based on a site specific basis and specific variables in that area. Add reference to veg and fire/fuels ch 2 management actions that refer to the FIAT assessment/prioritization process for suppression, and veg/fuel treatments.
- Refer to Action D-FFM-19 [globally replace with new proposed action reference] in Table 2.4 for provisions for habitat restoration.
- Reference Table 2-4 Action D-FFM-HFM-3 which discusses full range of fuel techniques which include active and passive restoration.
- Prescribed burns- page 4-68-
- Alternative B (NTT Alternative) Do not use burning in less than 12 inch sage brush.
- In conjunction with NRCS, BLM has allocated specific funding specific for sage grouse habitat restoration and protection.
- Action D-Veg I addresses the management of Juniper/conifer encroachment and Action D-FFM-19 in Table 2.4 addresses management of invasives.-Woodlands threaten sage grouse because these habitats do not support sage grouse.

The BLM did consider IM 2013-128 in the EIS development; and the BMPs from the IM were included in the Draft EIS and have been analyzed in the PDF/RDF Appendix.

n/a

Delete this from here. The comments (it's not an issue statement) is all about alternatives so move it to section 12.1. This section (12.0) is specifically for fire policy/reg type comments. See issue under NWCO.

Plan	Issue Statement
OR	<p>1. The RMPA/DEIS does not analyze wildfire management in a manner that fulfills the purpose and need of the document. The Greater Sage-Grouse Wildland Fire and Invasive Species Assessment noted in the Preferred Alternative needs to be completed and included in the RMPA/DEIS.</p> <p>2. The BLM failed to analyze the role of Rangeland Fire Protection Districts. According to FLPMA the BLM needs to coordinate with these associations and the BLM should better evaluate the benefits of this coordination. The BLM should also share wildfire risk assessment information with cooperating agencies and Rangeland Fire Protection Associations.</p> <p>3. The BLM needs to ensure fire response time is minimized and needs to be careful not to close or restrict the construction of new roads that could enable firefighters to have the quickest response time. The RMPA/DEIS needs to include decision-making priorities for fires that extend across BLM districts and jurisdictions.</p>
UT	<p>Commenters included information about the inclusion of fire in the disturbance cap and the effects of fire on sagebrush availability. Additionally, commenters questioned the use of various treatment types such as prescribed fire in GRSG habitats and appropriateness of best management practices.</p>

ID-SW MT The BLM and the Forest Service should examine the location and size of proposed fuel breaks in further detail as fuel breaks in large areas of intact sagebrush limit fire and related habitat destruction. Specifically, one commenter requests use of green-strips, including non-native species, for fuel breaks. Use of prescriptive fire as a management tool should be further examined. The FEIS should consider the quality, sustainability, or relative importance of habitat to GRSG when determining whether it is appropriate to maintain the 15% sagebrush canopy in key/core habitat. Timelines for long-term fire management measures should be established in the FEIS. One commenter recommends that measures be implemented one year after the ROD. Implementation details of fire control measures should be specified. The BLM/Forest Service should acknowledge the importance of flexibility in fire management plans in the FEIS and allow for on-the ground decision making for effective fire-management. Alternative language should be

NV-CA The management action should apply to brood rearing and winter habitat as well as nest habitat. ~~It may not be appropriate to maintain 15% sagebrush canopy in all key/core habitat in an area where removal and creation of a fuel break would have net beneficial effects on GRSG.~~ Clearly define how readjustment of resources to provide suppression for Sage Grouse habitat would be coordinated with the local fire departments. Nevada Rural Electric Association requests the flexibility to fight wildfire that threaten their infrastructure within authorized ROWs and requests

NWCO BLM needs to modify the alternatives for fire management actions to 1) not count habitat loss due to wild fires in the disturbance cap; 2) not place protection of the sage-grouse over protecting life and property; and 3) include additional conservation measures to alternatives, such as not reduce canopy cover to less than 15% on all ADH, apply appropriate seasonal restrictions to all ADH, and include a risk analysis, for a prescribed

Lewisto Commenters requested the following  
wn 1/1 alternative modifications: that no prescribed burning be allowed in PH and GH or if allowed, that it should only be allowed on a case-by-case basis if it can be shown that impacts are neutral or beneficial to GRSG; that treatment of sagebrush habitat be a last alternative for fuels management; and that the FEIS explain why prescribed burning in GRSG habitat is included in the preferred alternative if it is not currently practiced.

Appropriate grazing should be recognized in the RMPA as a primary tool in the prevention of wildfire and reduction of invasive weeds—two of the primary threats

ND 1/1 The BLM should consider the elimination of prescribed fire in all action alternatives.

WY9

## Response

1. The assessments in Appendix H will be analyzed in the FEIS. Site assessments and NEPA review will be conducted for specific projects. Appendix H, Greater Sage Grouse Wildland Fire and Invasive Species Assessment, describes a minimal framework example and suggested approach for this assessment. As noted in section 4.3, NEPA Range of Alternatives, of this report, the alternatives, including the management actions for the fire program meet the purpose and need for the EIS. Additionally, the Greater Sage-grouse Wildland Fire and Invasive Species Assessment, which provides a framework for site assessments, was updated and finalized. See Appendix XX of this FEIS. The assessments will be conducted during implementation of the planning decisions from the ROD.

2. BLM coordinates with RFPAs, rural fire protection districts, and state/Tribal partners for improved fire management actions, such as initial attack. To facilitate safety, efficiency, effectiveness, all partners must meet minimum training and equipment standards.

[BLM note: Response needs wordsmithing by BLM. This comment will result in changes to the DEIS.]

3. New roads can fragment habitat, can increase human-caused fires, and can facilitate weed invasion. The BLM seeks to find a balance between roads used for fire response, public access, and protecting natural resources.

4. Juniper is not a noxious weed or invasive plant. Fire and vegetation management coordination occurs in order to manage fuels.

[BLM note: BLM to place fuels management for invasives, juniper, fire risk (e.g. fuels breaks) in the vegetation section of alternatives matrix.]

5. The design and location of fuel breaks and fuels treatments are analyzed for site-specific projects. Prescribed fire and grazing are considered at various intensities in the alternatives. The Vegetation section of Table 2-6 contains an action for seed sources with respect to climate change.

The BLM and the Forest Service considered a reasonable range of alternatives during the GRSG planning process in full compliance with the NEPA (see section 4.3, NEPA Range of Alternatives, of this report, as well as Chapter 2 of the FEIS). The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and GRSG in the planning area, the BLM and the Forest Service fully considered the the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/DEIS that best addressed the issues and concerns identified by the affected public.

The DLUPA/DEIS considered a range of alternatives. Within that the range of alternatives fire is included as disturbance under Alternative C and E. Fire is not counted as disturbance under alternatives B or D. Under the proposed plan fire would not be counted as disturbance but would be taken into consideration when evaluating habitat availability-percent sagebrush on the landscape. The EIS also considers a range of alternatives considering use of prescribed fire within priority management areas and use of certain best management practices.

The BLM has provided Monitoring and Adaptive Management strategies in the FEIS, see Appendices XX and XX. The strategies provide a framework would be put in place to account for habitat losses due to natural causes (fire and invasives) and/or population declines at the appropriate localized scale. [NOTE TO BLM: Are adaptive management strategies being

The BLM and the Forest Service considered a reasonable range of alternatives during the GRSG planning process in full compliance with the NEPA (see section 4.3, NEPA Range of Alternatives, of this report, as well as Chapter 2 of the FEIS). The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/DEIS that best addressed the issues and concerns identified by the affected public.

The DEIS management actions in Table 2-2 provide for a range of level of use of fuel breaks, including use of green-strips. The fuels RDFs under Alternatives XX do not exclude the use of non-native species for fuel breaks. These RDFs will be adopted in the preferred alternative [ensure language is correct for RDFs]

Management actions for prescribed fire will be modified in the preferred alternative to include restricting use of prescribed fire in intact Wyoming sagebrush [Need to make sure changes are added to FEIS, add reference to appropriate section here]. [Need input from sage-grouse team in relation to 15% canopy cover language changes]

This FEIS/RMPA is intended to direct planning level actions. Timelines and details for implementation will be specified in future site specific planning efforts.

Alternative language will be reviewed and revised for clarity as needed.

- Prescribed mitigation came from action B-FFM-HFM-9 (NTT Report) and action F-FFM-HFM-9. See action B-FFM-HFM-9. Alternative D has implementation actions which are tiered to the local GRSG landscape wildfire and invasive species assessment described in GEN-1 [replace with new management action code] utilizing best available science related to the conservation of GRSG.
- Coordinate and collaborate with federal, tribal, state, local governments, as well as associations sanctioned through either California or Nevada states that meet fire standards for effective and efficient wildfire response.

The BLM took into account the recommendations made from the cooperating agencies as well as the input provided by the public. This information was reviewed for content against the current range of alternatives. The recommendations were found to fall within the range of alternatives. Additional coordination with cooperating agencies between the Draft EIS and Final EIS resulted in changes which are presented in the FEIS (see *Section XXX of the FEIS*).

Section 1.5 of the DRMPA/DEIS describes how the Lewistown Field Office Greater Sage-Grouse RMPA/EIS planning team employed the BLM planning process to develop a reasonable range of alternatives for the RMPA. The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives (see section 4.3, NEPA Range of Alternatives, of this report). ~~The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.~~

Alternative D would allow management actions, including prescribed fire, to occur where they are most beneficial to GRSG as detailed in site-specific analysis, if site specific NEPA analysis shows that a prescribed burn would benefit GRSG, then a plan amendment would not be required to allow the project.

Section 4.5.2, Nature and Types of Effects in the Wildland Fire Management and Ecology section states, "Range grazing management can impact the ability to manage fire as a natural process through changes in fine fuels availability (e.g., grasses). Livestock grazing reduces fuel loads, so retiring allotments may lead to increased fuels in site specific locations. Conversely, increasing AUMs could reduce fuel loads." The effects of grazing on wildland fire risk for each alternative is included in Prescribed fire is a necessary tool and to remove prescribed fire as a tool would take away the option of ignition for slash piles, including burning conifers that are removed and piled. Also, removal of prescribed fire would not make it possible to utilize prescribed fire for silver sage management. Silver sage responds positively to fire, unlike Big Sage. In addition prescribed fire may be needed for potential riparian management. The use of prescribed fire is not being eliminated in the alternatives because it can be used to benefit GRSG (i.e., when reducing conifers to benefit GRSG habitat, pile burning is a beneficial tool). Any fuels projects would only be approved if they would meet the goals and objectives for GRSG.

NOTES from NCT: based on info in responses, many of these points sound out of scope for the P/N.

1. Response doesn't answer the point. Reference back to the P/N response in Section 4.3 of this workbook and that fire actions are appropriate for the P/N. Assumed that the noted Assessment is the same as the FIAT report, so new language reflects that FIAT was updated and final version is in Ap. XX in FEIS.

2. is not part of the alternatives discussion. Suggest moving out to 12.4 (cum impacts) as the issue notes the failure to analyze. Response could include statement that coordination is known to benefit both agencies, and the cooperation was part of the NEPA & planning processes. Probably doesn't require update to the FEIS cum analysis section.

3. More about coordination and implementation actions, not the planning level actions considered in the EIS. Out of Scope. If want to discuss fire coordination as an issue, suggest moving it to 12.0.

4. Also about coordination, not alternatives. Move to another section, possibly 12.0 where it can be addressed more generally. Second part is hinting at monitoring, so either move issue/response to Mitigation section (12.5) or cross reference to that. Can direct reader to the new Mitigation, Monitoring & AM strategy appendices, as well as cross reference to section 7.9 of the comment report where these will be discussed in detail.

struck out sentences in issue statement are opinion and should not be included. Last 2 sentences in issue statement are about coordination - suggest moving them out to section 12.0 (they don't fit with alternatives).

Good issue & response language. Other areas should consider using it to respond when suggested commenter alts/actions are not warranted.

Plan	Issue Statement
OR	The RMPA/DEIS does not address or analyze the significant role that ranchers and Rangeland Fire Protection Associations play in wildfire control. Also, grazing should be recognized in the RMPA/DEIS as a primary tool in the prevention of wildfire and invasive weed reduction.
UT	The DEIS failed to include citations indicating that implementation of fuel breaks in sagebrush systems where herbaceous forage remained reduce the ignition potential or spread of fire.
ID-SW MT	The FEIS should include citations indicating that implementation of fuel breaks in sagebrush systems reduces the rate of spread of fire. In addition, citations should be provided to support the use of prescribed fire to improve GRSG habitat. The BLM and Forest Service should recognize livestock grazing as an effective fire management tool due to its role in controlling invasive plants and decreasing fuel loads.

- NV-CA
- ~~1. An economical and efficient way to remove excess grass is with an on-off grazing system.~~
  - ~~2. The BLM fails to cite literature describing the use of fire breaks to slow or reduce effects of wildfires.~~
  - ~~3. Commentors suggested additional references which should be considered in the EIS.~~
  - ~~4. We strongly encourage the BLM to cooperate with UNR and begin to demonstrate these positive effects throughout the DEIS planning area.~~
  - ~~5. Clarify what will be used for the base line to determine improved ecological conditions.~~
  - ~~6. The fire return interval is much longer than stated in the EIS.~~

Commenters suggested that BLM needed to support their information in the affected environment chapter with additional references. Commenters also provided several new/additional references that BLM

## Response

RFFPA coordination will be included in the Proposed Plan. Analysis of the role that RFPAs play in wildfire control cannot be analyzed because data are not available involving RFPAs that meet National Wildfire Coordinating Group standards.

[BLM note: This response will result in new text for the Proposed Plan. Needs wordsmithing by BLM.]

Grazing does not prevent wildfires. However, grazing can modify fire behavior and effects. Language in Chapter 2 will be clarified to identify that targeted grazing is a biological tool for vegetation management.

[BLM note: This response will result in new text for the Proposed Plan.]

Fuel breaks are not intended to eliminate the possibility of fire ignition or fire spread. A fuel break is intended to be used in conjunction with firefighters as a control line for fire suppression. They are designed to interrupt the continuity of heavy fuels which decreases fire behavior and/or slows fire spread, providing more opportunities for safe fire suppression. A proper fuel break should be maintained periodically to ensure the efficacy of the break. BLM Utah closely monitors the effectiveness of fuel breaks and larger fuels treatments, and documents successful interactions with wildfire in the Fuels Treatment Effectiveness Module. Research supports the idea that coupling fuel breaks with area-wide fuel treatments can reduce the size, intensity, and effects of wildland fires (2000, Agee, J. K.; Bahro, B.; Finney, M. A.; Omi, P. N.; Sapsis, D. B.; Skinner, C. N.; van Wagtenonk, J. W.; Weatherspoon, C. P. The use of fuel breaks in landscape fire management. *Forest Ecology and Management*, 127: 55 – 66). Additional information has been added to FEIS in Chapter 4 discussing the purpose. **The EIS affected environment section provides the appropriate information for the scope and scale of the project (see section 4.4, NEPA Baseline Information of this report). However, upon BLM and Forest Service reviews and public comment suggestions, some sections in Chapter 3 have been updated and revised to include clarifications or new information. Section 3.XX, [insert section name], in the FEIS has been revised to update information regarding fuelbreaks and section 3.XX, [insert section name], has been updated to clarify the relationship between livestock grazing and fire. The following language has been added to Chapter 3 address fuelbreaks:**

~~A fuelbreak is defined as a strategically located wide block, or strip, on which a cover of dense, heavy, or flammable vegetation has been permanently changed to one of lower fuel volume or reduced flammability, as an aid to fire control. The treatment objective may also be a permanent change to a new vegetation cover. (Green 1977). This 1977 report summarizes more than 17 years of the program's experience. Type—converting the land to grassland and then managed grazing and browsing by goats was recommended for long—term maintenance of the fuel—break system. The effectiveness of fuelbreaks remains a subject of debate within and outside of the fire management community. There are many reasons for this broad range of opinion, among them that objectives can vary widely, fuelbreak prescriptions (width, amount of fuel reduction, maintenance standards) may also vary, they can be placed in many different fuel conditions, and may be approached by wildland fires under a variety of normal to extreme weather conditions. Furthermore, fuelbreaks are never designed to stop fires but to allow suppression forces a higher probability of successfully attacking a wildland fire (Agee et al 2000.)~~

~~Green, L.R. 1977. Fuelbreaks and other fuel modifications for Wildland fire control. USDA Agricultural Handbook 499, 79p. 2000, Agee, J. K.; Bahro, B.; Finney, M. A.; Omi, P. N.; Sapsis, D. B.; Skinner, C. N.; van Wagtenonk, J. W.; Weatherspoon, C. P. The use of fuel breaks in landscape fire management. *Forest Ecology and Management*, 127: 55—66 Targeted grazing was included in the alternatives as a tool for fire management, as long as in compliance with ID Standards and Guidelines. The following has been added to Ch 3 to clarify the relationship between livestock grazing and fire:~~

~~There are several ways that contemporary livestock grazing practices can affect the extent and severity of fires in sagebrush dominated ecosystems, including cumulative effects that occur on decadal time scales to alter plant community composition and those observed as yearly changes in fuel loads. Livestock grazing can change the relative proportions of shrubs, perennial grasses, and annual grasses over decades, altering the fuel composition. On an annual basis, grazing can reduce the amount of herbaceous fine fuels, including cheatgrass, forbs and small twigs of woody plants. Grazing can reduce fire spread and~~

The EIS affected environment section provides the appropriate information for the scope and scale of the project (see section 4.4, NEPA Baseline Information of this report). However, upon BLM and Forest Service reviews and public comment suggestions, some sections in Chapter 3 have been updated and revised to include clarifications or new information. Section 3.XX, [insert section name], in the FEIS has been revised to include additional reference support to the information presented; section 3.XX [insert section name] was revised to clarify criteria used for baseline and improved ecological condition assessment; section 3.XX etc.

Additionally, Of the suggested studies and references put forth by the commenters, the BLM and Forest Service reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined that...

- ~~Refer to management of Livestock Grazing. Grazing is a management strategy which is discussed in the grazing portions of the document. Refer to Management Action D-FFM-HFM-3.~~
- ~~The BLM has added language to Chapter 4 – Wildland Fire Nature and Types of Effects to address fuel breaks per Agee et al. (2000), Stratton (2004), Finney (2007), Finney et al. (2007), and Alexander et al. (2004)~~
- ~~The BLM is reviewing additional references which will be considered and incorporated in the references as necessary.~~
- ~~The BLM actively coordinates with UNR and other universities through the Great Basin Consorsium, the Missula Fire Lab, joint fire science, and the USGS.~~
- ~~The BLM does need to clarify criteria used for baseline and improved ecological conditions. The management strategies used to determine baseline ecological conditions are consistent with those used in Miller et al (2013), WAFWA, etc. Can be found in Table 2 of Resilience to stress and disturbance and Resistance to Bromus tectorum L. Invasion in Cold Desert Shrublands of Western North America.~~
- ~~Added table in Ch 3 with the different sage species and PJ fire return interval with citations from FEIS. FEIS citations refer to Big sage as having a FRI of 15 – 25 years for presettlement and 15 – 40 years post settlement. [BLM follow up on specific~~

OR	<p data-bbox="235 184 735 415">Commenters noted that BLM and Forest Service did not provided adequate analysis for how the disturbance cap could hamper wildfire response and the impacts from BLM coordiantion with the Rangeland Fire Protection Associations.</p> <p data-bbox="235 426 735 615"><del>The 3% disturbance cap hampers the ability to quickly respond to wildfire and the impact of the disturbance cap on wildfire suppression efforts was not adequately analyzed.</del></p> <p data-bbox="235 625 735 814"><del>The DEIS should include fire in the Preferred Alternative 3% cap on anthropogenic disturbances and in any other percentage limits on anthropogenic disturbance, as was recommended by USFWS.</del></p> <p data-bbox="235 825 735 930"><del>The RMPA/DEIS should evaluate the impacts of coordination with the Rangeland Fire Protection Associations and coordination</del></p>
UT	<p data-bbox="235 951 735 1098">Commenters suggested that Alternative D should be revised to meet the COT objectives for fire.</p>
ID-SW MT	<p data-bbox="235 1098 735 1446">The DEIS does not contain sufficient analysis of indirect impacts of reduced grazing on fuel loads and related wildfire risk. Additionally, the analysis of impacts of fire suppression activities should be reexamined. It is particularly important that this analysis is clarified as lack of sufficient regulatory mechanisms for wildland fire was cited as a primary threat to GRS in the EWS listing</p>

- NV-CA 1. Resolve the discrepancy in Ch.4 at 109 claiming between 1992 and 2011 human-caused-fires resulted in the loss of 305,076 acres. This is inconsistent with the acreage BLM reports in Chapter 3 at 75 which indicates that 198,691 acres burned due to human caused ignitions between 1992-2011.
2. Constructing livestock enclosures around post-fire recovery areas is impractical for large-burn areas.
3. Placing more limitation on mineral development will not indirectly decrease risk of fire; this assumptive unsubstantiated statement and should not be include in the FEIS/LUPA document.
4. The statement "Federal Ownership" should be corrected the federal government doesn't own the land.
5. Clarify how the elimination of cross-country travel will show significant changes in human caused ignition or a reduction of invasive grasses.

NWCO Commenters noted that the assumptions for the fire impacts analysis were flawed and requested BLM to include a strategy for identifying sagebrush landscapes that are at risk from fire in order to avoid conversion of landscapes to being dominated by invasive species.

ND n/a  
WY9

## Response

Responding to a wildfire is unrelated to a disturbance cap. RFPA coordination will be included in the Proposed Plan. Analysis of the role that RFPAs play in wildfire control cannot be analyzed because data are not available involving RFPAs that meet National Wildfire Coordinating Group standards.

[BLM note: This response will result in new text for the Proposed Plan. Needs wordsmithing by BLM.]

As indicated by the USFWS COT evaluation, many of the measures recommended are currently included within the preferred alternative in the DLUPA/DEIS. In addition, many of these measures are already used by the BLM as part of standard fire management policy and procedures. Specific language that states GRSG must occupy an area for restoration to be considered successful is included in the range of alternative under alternative C.

The impact analysis provides the appropriate information for the scope and scale of the project (see section 4.6, NEPA Impact Analysis, of this report). Upon BLM and Forest Service reviews and public comment suggestions, some sections in Chapter 4 have been updated and revised to include clarifications to the text. Section 4.XX, [insert section name], in the FEIS has been revised to clarify the impacts of reduced grazing on fuel loads. [BLM/Forest Service- need to add review impacts in Ch 4 for consistency with this language added to chapter 3 for relation between grazing and fire. .Review impacts analysis to make sure that impacts analysis has sufficient info on impacts of reduced grazing on fuel loads]

In addition, impacts analysis discussion has been modified to clarify the impacts of different suppression measures proposed by Alternative.[BLM/Forest Service- need to review and modify discussion of impacts of fire suppression measures (i.e. specific conservation measures under B vs. approach under F)]

- The discrepancy in Chapter 4 at 109 has been noted and changes will be made in Chapter 3 & 4 as needed.
- Mineral reduction (page 4-127) -This assumption is based on Shlisky et al 2007 which shows a correlation between mining and risk of wildfire by introducing new ignition sources.
- The term "Federal Ownership" should be changed to federally managed lands in the document.
- See Human Caused fires in the Impacts from Recreation Management in Section 4.8.3 on page 4-129.
- Impacts from Alternative E would be less than that of Alternative A because not more than five percent of the occupied and suitable and 20 percent in potential habitat would undergo habitat disturbance. This in turn will cause a shift in Condition Class to a more historical regime. (from 4.8.8 Impacts from greater sage-grouse management)
- Table 2.6 states fuel loading requirements and fuel loading is covered in the Chambers assessment table and FIAT assessment.

The DLUPA/EIS describes the methodology and assumptions used for conducting the impact analysis (see Section 4.7.2 of the Draft EIS). **As noted in section 4.6, impact analysis, of this report**, the methodology and assumptions provide an adequate starting point for discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. ~~As required by 40 CFR 1502.24, the DLUPA/EIS identified methodologies used and made reference to the scientific and other sources relied upon for conclusions in the analysis. Based on these methodologies and assumptions, the DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.~~

In regards to the request for a fire strategy, land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions, such as developing local fire and weed management strategies. Any future site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is

## Response

The assessments in Appendix H will be analyzed in the FEIS. Site assessments and NEPA review will be conducted for specific projects. Appendix H, Greater Sage-Grouse Wildland Fire and Invasive Species Assessment, describes a minimal framework example and suggested approach for this assessment.

ES&R successes/failures take 5-10 years to determine.

The cumulative impacts section for Alternative B briefly touched on fuel buildup due to reduced grazing in noting the restrictions could result in higher fuel loads and more intense fires. The other alternatives will be revised to discuss the cumulative impacts of reducing grazing. Reasonably foreseeable future actions, such as the Holloway and Miller Homestead ES&R, are not actual planning decisions.

[BLM note: BLM to identify how this will change the DEIS.]

ID-SW	n/a
MT	
NV-CA	Emergency response to wildfires should be included in the plan and should include the use of air tankers. Additionally, the Rangeland Fire Protection Association model should be applied to all LUPA/DEIS
NWCO	n/a
Lewisto wn I/I	Commenters requested that mitigation and monitoring be clearly listed and discussed in the FEIS.
ND WY9	n/a

## Response

The RDFs are kept more general so that they can be applied more widely to various situations. The flexibility would be lost were they made more specific. Changes in Proposed Plan will add specificity where possible.

n/a

n/a

Note to BLM: Remove the word "heavy" from the term "heavy air tankers" to "air tankers" to resolve issue. BLM should look into the Rangeland Fire Protection Association model.

- Emergency response is addressed in the document. TMA-311 and FFM-HFM-45 alternative E addresses the air tanker issue.

n/a

The BLM has drafted a monitoring framework that is included in the Proposed RMP Amendment/FEIS as Appendix X. The appendix describes the process that the BLM will use to monitor implementation and effectiveness of RMP decisions. The monitoring framework includes monitoring at various scales specific to GRSG habitat, consistent indicators to measure and metric descriptions for each of the scales, analysis and reporting methods, and the incorporation of monitoring results into adaptive management. The need for fine and site-scale specific habitat monitoring will vary by area depending on existing conditions, habitat variability, threats, and land health. To accomplish effectiveness monitoring, the BLM will analyze the monitoring data to characterize the relationship among disturbance, implementation actions and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife agencies, effectiveness monitoring can be supplemented with population trend information, taking into consideration the lag effect response of populations to habitat changes. [NOTE TO BLM: revise response if necessary based on new monitoring

n/a

If making specific edits, suggest simply noting that "BLM has clarified Section XX.XX in response to comments regarding air takers."

Not sure how this belongs in the fire section. Suggest clarifying the fire connection in the issue statement & response, and including a cross reference to the mitigation/monitoring response (either 4.9 or 7.9).

## Response

n/a

n/a

1. As stated in Chapter 1, Section 1.1, Background in the DRMP, this plan amendment effort is the result of the July 2011, BLM National Greater Sage-Grouse Planning Strategy (BLM 2011). The Strategy responds to the March 2010, US Fish and Wildlife Service (USFWS) 12-Month Finding for Petitions to List the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered (75 Federal Register [FR] 13910, March 23, 2010) (2010 Finding). In the 2010 Finding, the USFWS concluded that GRSG was “warranted, but precluded” for listing as a threatened or endangered species. The “precluded” determination for the sage-grouse listing was because the listing other species was a priority. The USFWS reviewed the status and threats to GRSG in relation to the five Listing Factors provided in Section 4(a)(1) of the Endangered Species Act (ESA). Of the five Listing Factors reviewed, the USFWS determined that Factor A, “the present or threatened destruction, modification, or curtailment of the habitat or range of the Greater Sage-Grouse,” and Factor D, “the inadequacy of existing regulatory mechanisms” posed “a significant threat to the Greater Sage-Grouse now and in the foreseeable future” (USFWS 2010). The USFWS identified the conservation measures in LUPs as the principal regulatory mechanisms for the BLM and Forest Service.”

In the 2010 Finding, the USFWS identified the conservation measures in LUPs as the principal regulatory mechanisms for the BLM and Forest Service. In response to the USFWS findings, the BLM and Forest Service intend to prepare plan amendments with associated Environmental Impact Statements (EISs) to incorporate specific conservation measures across the range of the GRSG, consistent with national BLM and Forest Service policy. The planning strategy will evaluate the adequacy of BLM and Forest Service LUPs and address, as necessary, amendments throughout the range of the GRSG. The BLM and Forest Service are responsible for managing the habitat for which the GRSG inhabits. A Notice of Intent was published in the Federal Register (December 9, 2011) to initiate the amendment of LUPs across nine western states, including the Idaho and Southwestern Montana Sub-Region. The ID/swMT Plan Amendment and EIS is one of fifteen separate EISs that are currently being conducted to analyze and incorporate specific conservation measures across the range of the GRSG, consistent with National BLM and Forest Service policy. A goal of all such LUPAs is to ensure consistency of goals objectives and management actions, to the extent practicable, across the region, as well as across the range of the GRSG. Implementing the “no action” alternative would allow current management actions to continue and would likely result in listing the species as threatened or endangered therefore requiring the USFWS to implement species conservation actions and policies to protect

2. The BLM has drafted a monitoring framework plan that is discussed within the Draft Resource Management Plan Amendment/ EIS in Chapter 2, Section 2.2.3, Brief Description of the Action Alternatives which is included in Appendix E, Greater Sage-Grouse Draft Monitoring Framework Plan. Appendix E describes the process that the BLM will use to evaluate the implementation and success of the BLM and USFS land use plans in maintaining and restoring habitat conditions necessary to support sustainable GRSG populations. Monitoring data will also be used to help inform adaptive management under these plans and meets the requirements under the Policy for Evaluation of Conservation Efforts When Making Listing Decisions (PECE) (50 CFR Vol. 323 68, No. 60). The monitoring framework includes monitoring at multiple scales specific to GRSG habitat, consistent indicators to measure and metric descriptions for each of the scales, analysis and reporting methods, and the incorporation of monitoring results into adaptive management. The need for fine and site-scale specific habitat monitoring will vary by area depending on existing conditions, habitat variability, threats, and land health. To accomplish effectiveness monitoring, the BLM will analyze the monitoring data to characterize the relationship among disturbance, implementation actions and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife agencies, effectiveness monitoring can be supplemented with population trend information, taking into consideration the lag effect response of populations to habitat changes.

The BLM and Forest Service are currently in the process of finalizing a Monitoring Framework which will be included in the Proposed RMP Amendment/FEIS. The Monitoring Framework will describe the process that the BLM and Forest Service will use to monitor implementation and effectiveness of LUP decisions and will include: methods, data standards, and intervals of monitoring at broad and mid scales; consistent indicators to measure and metric descriptions for each of the scales; analysis and reporting methods; and the incorporation of monitoring results into adaptive management. The need for fine and site scale specific habitat monitoring may vary by area depending on existing conditions, habitat variability, threats, and land health. Indicators at the fine and site scales will be consistent with the Habitat Assessment Framework; however the values for the indicators could be adjusted for regional conditions.

[NOTE TO BLM: A new monitoring framework and response language is being drafted by the national team. This section will

## Response

n/a

n/a

n/a

n/a

The BLM and the Forest Service describe the effects of predation on sage-grouse in the Draft EIS; the information used here and in the affected environment was taken from the Baseline Environmental Report (the BER) and note that *[summarize what the discussion was, specifically noting any reference the commenters make to an particular issue or topic; include page number references from the BER]*. The BLM and the Forest Service have authority to manage the habitat and have provided analysis to describe how the numerous management actions across the range of alternatives could affect the habitat and indirectly the effects of predation. Altering the sagebrush habitat of the greater sage-grouse can create an influx of predators into an area and lead to a population decline. Roads, fences, power lines, trails and other disturbances may make access easier for potential predators and increase risks to the species. The Draft EIS calls for measures that will substantially reduce disturbances in the bird's habitat, thus reducing predation risk. This information can be found in Section XX, page XX of the

suggest combining issue  
statement and response with  
that for ID under 14.1 Range  
of Alts

Plan	Issue Statement
OR	<p>Commenters have two opposing views regarding ROW avoidance areas. One group suggested that ROW avoidance areas did not provide enough protections for GRSG. Another group suggested that ROW avoidance areas would be too restrictive for developers. Commenters were concerned that the alternatives were too restrictive on renewable energy development given the low current potential for development of wind resources or advancement of technology which could make the current potential more feasible. The alternatives failed to adequately describe the requirements related to burying existing overhead transmission lines. The FEIS should clarify management direction for new ROWs under Alternative C. The DEIS failed to adequately map timing restrictions for construction, or operation and maintenance of transmission and distribution infrastructure under Alternative D. The DEIS failed to adequately provide the detail on the terms and conditions that would be included for any issuance of a ROW in PGMA. BLM should consider the following within</p>

UT Commenters suggested additions to the range of alternatives considered and provided information on the feasibility of the alternatives (e.g., implementation of the disturbance cap). Commenters described impacts on GRSG from ROW/SUP authorizations including linear and site-type facilities. Commenters also noted that the BLM and USFS must address both existing and future development.

ID-SW Commenters requested clarification of  
MT language in the DEIS, specific to Alternative D, such as types of exclusions and whether lands identified for disposal under current Land Use Plans would be affected. They suggested that agencies might want to recognize the ability of valid existing rights to develop infrastructure necessary for the development of projects; electric utilities request confirm that aboveground fiber optic lines would be allowed under the authorized action. Other commenters would like all land set aside under a special management designation for sage-grouse and be managed as ROW exclusion areas. The BLM should consider developing corridor routes as an alternative. Corridor routes need to be identified and designated for all users. Place emphasis on co-location of new ROW with existing ROWs, prioritize burying lines, use perch diverters. On the other hand, colocation of transmission lines on common structures can affect the reliability rating of each line and could result in a decrease of transfer capability and lead to the need for even more lines; there are

NV-CA Commentors had concerns regarding proposed management actions in the DEIS related to new and existing ROW development, particularly the comparative benefits for GRS habitat from underground versus overhead powerline placement, feasibility of co-locating new powerlines and communication infrastructure in or adjacent to existing ROWs, and potential limitations on the expansion of existing infrastructure. Commentors requested clarification or recommended specific changes to proposed management. Commenters requested clarification on what is energy development. Commenter requested that BLM exempt all utility corridors from GSG restrictions.

NWCO The BLM should modify Alternative D to include statements that the BLM/USFS will strive to retain public ownership of PPH, to acquire non-federal lands important to GRSG, to include the criteria and/or process for determining what constitutes a healthy and stable or increasing GRSG population, and to include the criteria and/or process for determining what constitutes an adverse effect to GRSG due to habitat loss and disruptive activities.

Lewisto Commenters requested BLM consider suggested management actions, including PH under Alternative D be changed from ROW avoidance areas to ROW exclusion areas for oil and gas development, power lines, and wind energy development. In addition, the FEIS should reference the FWS 2012 Land-based Wind Energy Guidelines where such development may ultimately be considered in ROW avoidance or other areas.

ND n/a  
WY9

## Response

As noted above in the response in Section 4.3, Range of Alternatives, Section X.X of the Draft EIS describes how the Oregon GRSG LUPA/EIS planning team employed the planning process to develop a reasonable range of alternatives for the LUPA. The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions. Additionally, during the development of the Final EIS, the BLM coordinated with cooperating agencies and considered public comments to determine changes to the management actions and mitigation measures. The EIS affected environment section provides the appropriate information for the scope and scale of the project (see section 4.3 Range of Alternatives of this report for additional details). However, upon BLM and Forest Service reviews, and public comment suggestions, some sections in Chapter 2 and 3 [include appropriate sections/page numbers] have been updated and revised to include clarifications or new information. Some of these clarifications include:

~~Lek buffers will be incorporated in the final EIS.~~

~~Burial or relocation of power lines must be technically and financially feasible.~~

~~Per BLM Handbook H-38-09-1 section 5.3.1.4, "Non-exclusive access, while guaranteed to mining claimants or their designee by the Mining Law, is not unfettered. In special status areas, where the operations would present a risk to the resources that support the special status area designation, the BLM can condition access effects on their resources, the BLM may limit access to constructed roadways or decide in some circumstances that access by means other than a motor vehicle (such as via aircraft or pack animal) is sufficient for the operator to complete their desired activity."~~

~~Geothermal and Oil and Gas are leasable minerals, therefore it is not a ROW.~~

~~Seasonal restrictions as identified are addressing only fluid minerals. The ROW is regulated by required design features.~~

The impacts of the alternatives are adequately discussed in Chapter 4 of the DEIS. None of the comments identified specific deficiencies in the existing analysis or provided additional information for inclusion in the impact analysis. **Chapter 4 Section 4.24, Cumulative Impacts, adequately discusses both existing and future development.**

As stated in Section 1.7, Development of Planning Criteria, the LUPA will recognize valid existing rights. Section XXX of the FEIS discusses how valid existing rights may be impacted by the management actions in this LUP amendment. [EMPSi ACTION ITEM FOR FEIS: Add discussion to Chapter 4 lands and realty section on what happens with valid existing rights when the disturbance cap is already exceeded - i.e., they can be developed with required mitigation measures]+C4

Future ROW/SUP applications would be evaluated and approved on a case-by-case basis based upon site-specific determination of ability to avoid, minimize, and/or mitigate impacts on GRSG habitat at the implementation phase. A proposed project's contribution to the amount of disturbance on the landscape will be evaluated during site-specific NEPA analysis.

[EMPSi ACTION ITEM FOR FEIS Check whether Lands and Realty analysis recognizes that access to valid existing rights could be precluded in certain instances under this amendment. If not discussed, add this discussion (based on discussion in minerals analysis). This is most likely to occur where leases are wholly contained within GRSG habitat in largely undeveloped areas.] [EMPSi ACTION: If new analysis is required in FEIS, update response to indicate sections revised in FEIS.]

[EMPSi ACTION ITEM FOR FEIS Check whether the disturbance impacts of underground transmission lines are discussed in The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (Alternative A). **There is no requirement that any alternative developed meet the objectives of the COT report. Instead, the report, based upon the best scientific and commercial data available at the time, identifies key areas for greater sage-grouse conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. The report serves as guidance to Federal land management agencies, State greater sage-grouse teams, and others in focusing efforts to achieve effective conservation for this species.**

Proposed avoidance and exclusion area designations vary by alternative, as explained in the DEIS on page 2-33 in Table 2-3. Under Alternative D, all new ROWs, unless specifically excluded, would be avoided, whenever possible, see LR-3 (ex. wind facilities, etc). Required design features that would apply to specific types of facilities in greater sage-grouse habitat are located in Appendix X, **including reclamation of lands once facility are removed.**

~~The EIS/LUP includes an alternative that allows for placement of fiber optic lines on existing infrastructure (Alternative D-Action LR-6 and LR-7 in Table 2-18).~~ **Alternative E provides for co-location of new infrastructure development if the project is co-located within the footprint for existing infrastructure, to the extent practicable.**

Under Alternative D Table 2-18, LR-9, new power lines outside of existing ROWs, would be buried, where feasible. ~~Reclamation of lands, once facilities are removed are part of standard BMPs, Appendix C.~~ Amendments to existing facilities that are otherwise excluded may be allowed under Alternative D, LR-6. Under Alternative D, lands currently identified for retention within priority greater sage-grouse habitat would be retained unless disposal of those lands would increase the extent or provide for connectivity of priority habitat (LR -19 and LR-21), Alternatives A through F propose retention of all utility corridors (Table 2-18).

As noted above in the response in Section 4.3, Range of Alternatives, Section 1.5 of the Draft EIS describes how the Utah GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Management actions included in the Draft EIS/LUPA for the underground placement of powerlines are intended to reduce the potential for long-term impacts on GRSG habitat and species viability. Literature (include citations from Habitat objectives table see table 2.6) demonstrates that overhead powerlines provide perching opportunities for ravens and other avian predators. Additional research (citation table 2.6) suggests that GRSG avoid lekking and brood rearing activity in areas within line-of-sight of overhead powerlines. Additionally, while the placement of powerlines underground may result in greater short-term GRSG habitat disturbance, over the long-term and following appropriate reclamation of the surface above underground lines, there would be less surface disturbance. Considerations of costs associated with undergrounding are solely within the purview of the Nevada and California Public Utilities Commissions and are outside the scope of the EIS/LUPA.

Management actions included in the Draft EIS/LUPA for the co-location of new infrastructure within existing ROWs, corridors or communication lease areas are intended to reduce the amount of surface disturbance in GRSG habitat and concentrate new development in habitat areas already affected by anthropogenic activities. The BLM and FS recognize that co-location is not feasible in all circumstances, particularly for new powerlines. Under all alternatives, the BLM and FS would continue to review proposed infrastructure projects on a case-by-case basis within and outside GRSG habitat. Such a review would include preparation of the appropriate NEPA documentation and coordination with the responsible federal, state, and local permitting agencies.

[BLM: What is the definition of 'no longer in service?'] – Rights of ways that are “No longer in service” includes infrastructure no longer needed or being utilized by ROW or leaseholder; this could include old facilities on com sites, telephone poles/lines, or expired ROWs, 2900 permits and R&PP lease cases who no longer have authorizations.

[BLM: How to address CBDs specific recommendations?] – The management actions inside and outside GRSG conservation

As noted above in the response in Section 4.3, Range of Alternatives, Section 1.5 of the Draft EIS describes how the Utah GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office LUPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office LUPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions. Under the preferred alternative (Alternative D), the BLM/FS will retain public ownership of PPH except for disposal of tracts that are not capable of altering greater sage-grouse populations (p 585 and table 2.4 p 148) and greater sage-grouse habitat values will be considered when acquiring lands (table 2.4 p 149). Criteria exists that identifies defines a healthy and stable or increasing greater sage-grouse population as well as for what constitutes an adverse effect to greater sage-grouse populations (Manier 2013) and was referenced in the DEIS (Section 3.4.3 References p 272).

~~As noted above in the Section 4.3 of this Report, Section 2.3 of the Draft EIS describes how the Northwest Colorado GRSG planning team employed the BLM and Forest Service planning processes to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. During the development of the Final EIS, the BLM and Forest Service met with the USFWS to determine changes to the management actions and mitigation measures to meet the purpose and need of the action. The outcome from these Section 1.5 of the DRMPA/DEIS describes how the Lewistown Field Office Greater Sage-Grouse RMPA/EIS planning team employed the BLM planning process to develop a reasonable range of alternatives for the RMPA. The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.~~

Proposed Alternative D for FEIS will make PH wind energy ROW exclusion and GH avoidance. Appendix D will b+C6e modified to include additional RDFs for existing oil and gas leases and add RDFs for ROW related projects once NPT guidance is provided. USFWS wind energy guidelines will apply for development in GH (an avoidance areas) and will be added as an Appendix to the FEIS

## NCT Notes

## Regional Team NOTES, EDITS, COMMENTS

To eliminate redundancy, suggest streamlining response to include cross reference to section 4.3, then move into specifics related to L/R.

Crossed out text is duplicate information in 4.3 and should be eliminated here. Crossed out text is either unnecessary or it wasn't apparent how it was responding given the issue statement.

Included content to reference  
last comment in issue  
statement.

Strike through replaced by  
inserted red text to address  
topic more broadly. Replaced  
RDF Appendix C with X as  
letter will be different in FEIS.  
Strike through re: BMPs  
replaced with red text  
discussion about RDFs.

Included national response addressing adequacy of range of alts (red). Unnecessary to include citation from table 2.6, merely include reference to that table (strike out). Are you using both definitions of utility-scale? Seems potentially conflicting.

Red text is national response indicating adequacy of range of alternatives considered. Strike thru below of some of same natl response. Moved your addtl range of alt discussion up.

Plan	Issue Statement
OR	n/a
UT	Commenters stated that the BLM and the Forest Service did not provide sufficient affected environment information to meet NEPA requirements. For example, commenters noted that there was no baseline disturbance inventory. In addition, commenters identified reasonably foreseeable lands and realty actions that should be considered as part of the affected environment.

ID-SW Commenters had concerns with specific  
MT Lands and Realty impact analysis assumptions. In particular, commenters questions the validity of the following assumptions: power lines and other vertical structures in areas naturally devoid of perching opportunities provide a perch for raptors and increase the potential for GRSG to abandon leks (Ellis 1984); and mitigation by burying lines or including design features that do not encourage perching on lines would reduce perching opportunities and subsequent impacts on GRSG (Connelly et al. 2000). IPC suggest that a more complete statement is included in the USGS report regarding the effects of energy developments on sage-grouse lek persistence in relation to Walker et al. (2007) study+B3. It appears that selective use is being made of the information provided by Walker et al. (2007), Doherty et al. (2008, Holloran (2005), and Aldridge and Boyce (2007) as they evaluated Coal Bed Natural Gas wells, but did not evaluate effect of powerlines. Lyon and Anderson (2003) evaluated the effect of vehicular traffic associated with

NV-CA 1/2 The DEIS does not reference all relevant studies, policies or regulations related to lands and realty actions. Commenters provided the following references to be considered: [then list] OR Commenters suggested that the BLM and the FS should have considered several additional references in their analysis.

NWCO The BLM needs to double check the miles of transmission line presented in Table 3.14 as the numbers appear to overestimate the amount of lines.

Lewisto The FEIS should explain the rationale for  
wn determining avoidance and exclusion areas and how avoidance will be implemented. The FEIS failed to include information on wind farms on non-BLM lands in the planning area and did not adequately represent the potential for wind farms to be developed given the high wind potential of 42 000

ND The description of transmission line footprints in the DRMPA/DEIS is inaccurate. Division of State Lands are not labeled correctly in the DRMPA/DEIS.

WY9

## Response

n/a

The CEQ regulations require an environmental impact statement to "succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration. The description shall be no longer than is necessary to understand the effects of the alternatives. Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Agencies shall avoid useless bulk in statements and shall concentrate effort and attention on important issues" (40 CFR 1502.15). Additionally, the Utah Greater Sage-Grouse LUPA is a programmatic NEPA effort to conserve greater sage-grouse and its habitat across a broad geographic area. As such, the BLM and the Forest Service described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions.

The BLM and the Forest Service complied with these regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The affected environment provided in Chapter 3 and various appendices including Appendices A, N, O, P, and Q in the Utah Greater Sage-Grouse LUPA is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS.

As specific actions come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. Site-specific concerns and more detailed environmental descriptions will be addressed when project-level reviews are tiered to the analysis in this EIS (40 CFR 1502.20, 40 CFR 1508.28). In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for any site-specific actions.

The following changes have been made to the FEIS in response to comments:

- Information regarding existing infrastructure and potential for future development (including future renewable energy development) is included in Sections XXX and XXX of the FEIS (lands and realty and renewable energy sections chapter 3 and chapter 4) (NOTE: Consider moving wind RFD information to Chapter 31. TEMPSi ACTION ITEM FOR FEIS: add

Many reports have been prepared for the development of management recommendations, strategies, and regulatory guidelines. The National Technical Team report (NTT 2011), Conservations Objectives Team (COT; FWS 2013), and the Summary of Science, Activities, Programs and Policies that Influence the Rangewide Conservation of Greater Sage-Grouse (also referred to as the Baseline Environmental Report [BER]; Manier et al. 2013) are the most widely used reports that have been incorporated in BLM and Forest Service EISs that address the effects of implementing greater sage-grouse conservation measures on lands they manage. Additionally, the BLM and the Forest Service developed the Idaho Draft Environment Impact Statement/Land Use Plan Amendment with involvement from cooperating agencies, including Idaho Department of Fish and Game to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

Management actions included in the Draft EIS/LUPA for the underground placement of powerlines are intended to reduce the potential for long-term impacts on GRSG habitat and species viability. Literature (~~reference include citations from Habitat objectives table~~) demonstrates that overhead powerlines provide perching opportunities for ravens and other avian predators. Additional research (~~citation reference same table as above~~) suggests that GRSG avoid lekking and brood rearing activity in areas within line of sight of overhead powerlines. Additionally, while the placement of powerlines underground may result in greater short term GRSG habitat disturbance, over the long term and following appropriate reclamation of the surface above underground lines, there would be less surface disturbance.

~~Management actions included in the Draft EIS/LUPA for the co-location of new infrastructure in existing ROWs or communication lease areas are intended to reduce the amount of surface disturbance in GRSG habitat and concentrate new development in habitat areas already affected by anthropogenic activities. The BLM and FS recognize that co-location is not feasible in all circumstances, particularly for new powerlines. Under all alternatives, the BLM and FS would continue to review proposed infrastructure projects on a case by case basis. Such a review would include preparation of the appropriate NEPA documentation and coordination with the responsible federal, state, and local permitting agencies.~~

BLM and the Forest Service are reviewing C5 scientific literature provided by commenters regarding the effects of powerlines on greater sage-grouse, buffers, perch diverters, and overhead versus burying lines, and the agencies will revise the FEIS, as appropriate.

Before beginning the NV/NECA Draft EIS/LUPA and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. A National Technical Team (NTT) was formed as an independent, science-based team to ensure that the best information about how to manage the greater sage-grouse is reviewed, evaluated, and provided to the BLM and the Forest Service in the planning process. The group produced a report in December 2011 that identified science-based management considerations to promote sustainable greater sage-grouse populations. The NTT is staying involved as the BLM and the Forest Service work through the Strategy to make sure that relevant science is considered, reasonably interpreted, and accurately presented; and that uncertainties and risks are acknowledged and documented.

A baseline environmental report, titled Summary of Science, Activities, Programs, and Policies That Influence the Rangeland Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER), was released on June 3, 2013, by the U.S. Geological Survey. The peer-reviewed report summarizes the current scientific understanding about the various impacts to greater sage-grouse populations and habitats and addresses the location, magnitude, and extent of each threat. The BER does not provide management options. The report is being used by the BLM and the Forest Service in our efforts to develop regulatory mechanisms and improve our conservation efforts of the greater sage-grouse and its habitat to reduce the potential for listing it under the Endangered Species Act. The data for this report were gathered from BLM, Forest Service, and other sources and were the "best available" at the range-wide scale at the time collected.

In March 2013, a team of State and FWS representatives, released the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for greater sage-grouse conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. The report serves as guidance to Federal land management agencies, State greater sage-grouse teams, and others in focusing efforts to achieve effective conservation for this species.

Additionally, Greater sage-grouse conservation measures in A Report on National Greater Sage-grouse Conservation

The BLM and the Forest Service complied with CEQ regulations in describing the affected environment and when providing scientific justification for the nature and types of impacts described in Chapter 4, Environmental Consequences. Of the suggested studies and references put forth by the commenters, the BLM and Forest Service reviewed [BLM GRSG team to review studies (e.g. NV Energy 2010 study) which may contradict information in DEIS] them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined that...[NOTE TO BLM: If the information in the commentors' citations is essentially the same, then state this. If there were references that you determined were truly new, then note that they were included in the FEIS and if possible, provide the specific locations where the citations were used. (I would add to this that if the citation was not included or the same, then include a response that indicates new citations will be considered/evaluated and included if they present new information. Something like this from the national template might be appropriate:

"While a land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data, a thorough review of the EIS's baseline data relevant to [speak to the specific topic or theme of the issue statement, e.g., anticipated fluid mineral development of the planning area] is necessary. The BLM and the Forest Service have updated this information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary basis to make informed land use plan-level decisions. Specifically, [insert a summary of the information that was updated and include a citation for where the reader could find it in the FEIS.]" ]

Regarding conversion of BLM/FS lands for agricultural use via the Desert Lands Entry Act, the DEIS precludes disposal of PPH in the land tenure section. For DLE actions, lands have to be identified for disposal.

[Pull in language from 14.1 regarding short- vs. long-term impacts from undergrounding vs. overhead placement].

While the placement of powerlines underground may result in greater short-term GRSG habitat disturbance, over the long-term and following appropriate reclamation of the surface above underground lines, there would be less surface disturbance. (Based on the Summary statement, this response is not applicable. If there's a comment addressing this topic, then include it in the Summary statement, otherwise, delete. Obviously, I didn't take the time to go back to the comments.)

]Regarding conversion of BLM/FS lands for agricultural use via the Desert Lands Entry Act, the DEIS precludes disposal of PPH in the land tenure section. For DLE actions, lands have to be identified for disposal. [Pull in language from 14.1 regarding

As noted previously in Section 7.6 of this Report, the BLM and the Forest Service complied with CEQ regulations in describing the affected environment. Of the suggested studies and references put forth by the commenters, the BLM and FS reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined that The data presented in Table 3.14 is taken from the BER, and while it is coarse data, represents one of the sources of best available data.

[NOTE TO BLM: If the information is essentially the same, then state this. If there were references that you determined were truly new, then note that they were included in the FEIS and if possible, provide the specific locations where ]  
[NOTE TO BLM: Please respond to the comment regarding rationale.]

Information has been added to Section 3.21, Renewable Energy, to further describe active and planned wind energy developments in and adjacent to the planning area.

[NOTE TO EMPSi: Change to FEIS- update section 3.21 as indicated]

~~A ROW is a permit issued to a project proponent. The ROW is issued with a specific boundary the proponent will administer. A "footprint" is an area used for impacts analysis.~~ A **transmission line** footprint is contained within a ROW boundary and is used to analyze the direct and indirect impacts from disturbance related to the transmission line. In the North Dakota Greater Sage-Grouse DLUPA/DEIS, the analysis of transmission line footprint impacts is based on the Baseline Environmental Report (Summary of Science, Activities, Programs, and Policies That Influence the Rangeland Conservation of Greater Sage-grouse [*Centrocercus urophasianus*]) (BER). Based on the BER the 650-foot-wide (200 m) footprint is the direct area of influence (buffer) of transmission lines on GRSG. The following sources were used in the BER to determine the area of influence buffer:C32

Include Habitat objectives table by reference to it in the EIS rather than inclusion of specific references in the response. Strike through text doesn't appear to be needed as it doesn't address the issue statement.

Red text added to issue statement seems appropriate as responses states that commenters provided references. As is, the issue statement doesn't address additional references provided.

Strike out "previously" as  
seems to adopt a dismissive  
tone. Some strike outs merely  
editorial. Include FS in red.

Strike out and red to better  
focus response to issue.

Plan	Issue Statement
------	-----------------

OR	The DEIS failed to accurately analyze the impacts to private lands from ROW avoidance areas.
----	--

UT Commenters stated that impacts on existing valid rights and state lands from lands and realty decisions needed to be clarified. Commenters noted the need to discuss impacts of lands and realty decisions on private lands and mineral development.

ID-SW MT As compared to Alternative A included in the DEIS, the BLM/FS should have concluded that because of Alternative E's adaptive trigger strategy, that impacts from wind energy would be reduced.

The agencies should carefully evaluate the impacts of stipulating co-location of electrical powerlines. Table 3-36 grossly over-estimates the acreage of transmission lines within greater sage-grouse habitat. The Draft EIS provides an unsupported assumption that the footprint for a transmission line is 656-feet wide.

Information on the impact of transmission lines on a landscape level would be more appropriate to reference in relation to sage-grouse persistence in the landscape and that information from Walker et al. 2007 has been used selectively in regards to transmission infrastructure.

NV-CA 1/2 The BLM and FS did not fully analyze the adverse and beneficial direct and indirect effects of proposed lands and realty and renewable energy management actions identified in the DEIS.

NV-CA 2/2

NWCO n/a

Lewisto wn Given the infrastructure and miles of road and powerlines already authorized, how will the continued alteration of habitat maintain or improve conditions for GRSG?

ND The BLM failed to discuss the impacts to school trust lands from the addition of extensive fencing.

WY9

## Response

The DLUPA/EIS provides an adequate discussion of the environmental consequences of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Impacts of lands and realty decisions on renewable energy development are discussed in Section 4.19, Renewable Energy, of the FEIS. Discussion of impacts of lands and realty decisions on private lands has been added to the FEIS in Section 4.18, Lands and Realty.

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

*Impacts from lands and realty to wind energy were discussed in DEIS/LUPA Chapter 4, page 4-331. BLM groups Alternative A and Alternative E together in regards to impacts on wind energy. Under Alternative E, the BLM and the Forest Service would limit impacts from wind and solar energy development through the use of triggers in addition to the general stipulations identified in the GRSG section, as well as required design features best management practices that would also apply to Alternative A. This will be clarified in the FEIS.*

Management actions included in the Draft EIS/LUPA for the co-location of new infrastructure in existing ROWs are intended to reduce the amount of surface disturbance in GRSG habitat and concentrate new development in habitat areas already affected by anthropogenic activities. The BLM and FS recognize that co-location is not feasible in all circumstances, particularly for new powerlines. Under all alternatives, the BLM and FS would continue to review proposed infrastructure

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-I, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). (From national RTC template, which is sufficient to answer this Summary statement. If the draft responses below remain, then the Summary statement should be revised to reference them and the Responses must be completed. At this point, I'm hesitant to invest the time necessary to complete the responses until its decided whether it necessary to keep them.)

- Indirect effects (socioeconomic, invasive weeds, increased short- and long-term disturbance) and negative consequences from burying powerlines (see language from 14.1). While the placement of powerlines underground may result in greater short-term GRSG habitat disturbance, over the long-term and following appropriate reclamation of the surface above underground lines, there would be less surface disturbance. Application of BMPs and reclamation standards address invasive weeds during construction activities, such as undergrounding powerlines.

Response to address comments related to:- Indirect effects (socioeconomic, invasive weeds, increased short- and long-term disturbance) and negative consequences from burying powerlines (see language from 14.1). While the placement of powerlines underground may result in greater short-term GRSG habitat disturbance, over the long-term and following appropriate reclamation of the surface above underground lines, there would be less surface disturbance. Application of BMPs and reclamation standards address invasive weeds during construction activities, such as undergrounding powerlines.

- Impacts from solar energy development and management of solar energy zones. BLM will manage within solar variance zones and provide a definition. BLM to review Solar PEIS determine conflicts between solar variance areas and GRSG habitat areas. Determine if solar variance areas overlap GRSG habitat. - Citation (Shlisky 2007) added to FEIS to support analysis.- Effects from biofuel activities - the BLM is not creating incentives for the creation or facilitation of a biomass industry. Incentivization of biofuels is outside the scope of the EIS. - Blanket application of anti-perch devices on transmission towers - application of anti-perch devices for existing structures would be evaluated at the time of ROW renewal and on a case-by-case basis. - BLM: Evaluate level of impacts between transmission lines and distribution lines and incorporate different management actions as appropriate. Distribution Line (e.g., 12.5 kV; 34.5 kV): Lines used for transmitting energy to its end use, including commercial facilities, small factories or a small transformer outside a group of houses. Transmission Lines (e.g., 230 kV; 345 kV; 500 kV): Used for transmitting electrical energy over great distances. BLM added the definition of distribution lines to the documents glossary. Impacts from these two different lines vary and would be

n/a

The analysis focuses on the direct, indirect, and cumulative impacts that could potentially result from on-the-ground changes. This analysis identifies impacts that may result in some level of change to the resources, regardless of whether that change is beneficial or adverse. The requisite level of information necessary to provide an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives is to provide the public and the decision maker with the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented (40 CFR 1502.16).

The cumulative impacts associated with past, present, and reasonably foreseeable actions, including roads and powerlines, on GRS and GRS habitat are described in Section 5.2, Greater Sage-Grouse. Some restrictions are currently in place for travel; for example, cross-country OHV travel is prohibited and must remain on existing travel routes except for administrative purposes (see sections 1.8.7, Off-Highway Vehicle Record of Decision and Proposed Plan Amendment for Montana, North Dakota, and Portions of South Dakota, and 3.11.1 Comprehensive Travel And Transportation Management-Current Conditions). Management actions proposed in this RMP amendment strive to reduce the threats to GRS and GRS habitat on BLM-administered lands in the planning area; however, as described in Section 5.2, overall trends toward habitat loss and fragmentation are likely to continue in isolated populations, particularly in the Dakotas and Powder River Basin, while the northern Montana, northern Great Basin, and Snake-Salmon-Beaverhead Rivers subpopulations, which are

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. None of the alternatives in the DRMPA/DEIS propose to eliminate livestock grazing from BLM-administered lands; therefore, an analysis of impacts from extensive fencing from eliminating livestock grazing is not necessary in the DEIS. The reference to "extensive fencing to segregate it from private lands to prevent unauthorized grazing" on page 2-18 of the DRMPA/DEIS is part of the discussion of why an alternative that eliminated livestock grazing from BLM-administered lands was not included in the range of alternatives in the North Dakota Greater Sage-Grouse DRMPA/DEIS.

*The BLM understands the potential impact to school trust lands from extensive CIO fencing and has made reference to it in Section*

Either include comment/issue about renewable energy in issue statement or delete response.

Red paragraph from national responses as is appropriate. Strike out/red as BMPs are being called required design features and they will apply to the LUPA, not necessarily Alt A. Based on NPT direction, new utility scale and/or commercial development/ROWs will be excluded in priority (medial) and at a minimum avoided in general habitat. Potentially, italicized paragraph needs revision based on NPT direction.

Added red paragraph from national responses as is appropriate. Agree with comment that issue statement should be revised to reflect responses addressed or delete the responses. Not necessarily a big deal to edit the issue statement by including a brief list of the specific issues (already included in the response) and then the revise the existing responses.

Red content from national response.

Appears that the issue statement doesn't sufficiently capture commenter(s) concern(s) regarding elimination of grazing OR response should be revised to focus on existing issue statement. Consider red content provided from national responses as sufficient. Clarify direction to BLM and EMPSi and intent of response. "Made reference" doesn't satisfy issue statement.

Response

n/a

As the decisions under consideration by the BLM and the Forest Service are programmatic in nature and would not result in on-the-ground planning decision or actions (e.g., the BLM is not approving an Application for Permit to Drill to start drilling), the scope of the analysis was conducted at a regional, programmatic level. The analysis focuses on the direct, indirect, and cumulative impacts that could potentially result from on-the-ground changes. This analysis identifies impacts that may result in some level of change to the resources, regardless of whether that change is beneficial or adverse. The CEQ established implementing regulations for NEPA, requiring that a Federal agency identify relevant information that may be incomplete or unavailable for evaluating reasonably foreseeable significant adverse impacts in an EIS (40 CFR, Part 1502.22). If the information is essential to a reasoned choice among alternatives, it must be included or addressed in an EIS. Knowledge and information is, and will always be, incomplete, particularly with infinitely complex ecosystems considered at various scales. The DEIS included a reasonably foreseeable development scenario for wind projects in GRSG habitat (see Section 4.19). A list of specific reasonably foreseeable future actions proposed in GRSG habitat is also included in Table 4.55 in Section 4.24.2.

+C4

n/a

The BLM and the Forest Service thoroughly explained its consideration and analysis of cumulative effects in the DLUPA/EIS in Section XX.XX. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. As such, the BLM and the Forest Service have complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level. The DLUPA/EIS considered past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions.

BLM identified existing wind energy ROW applications, including the China Mountain project, in Table 5.1 of the DEIS. A decision on the China Mountain wind project has been temporarily deferred. All proposed development plans will be reviewed for consistency with the amended land use plan.

Mt. Hope record of decision was issued in 2012. If they have started construction, then table needs to be updated. Where is the project being considered (Chapter 3 or future development in Ch. 5?). [Wendy to provide califcaton language]. BLM has not received an application for a potential wind project on the Diamond Range. The Mt. Hope EIS relates to a mineral development project and is addressed in the minerals section [confirm with minerals team]. C6

BLM has not received an application for a potential wind project on the Diamond Range. The Mt. Hope EIS relates to a

## Response

The BLM and the Forest Service complied with the NEPA by including a discussion of measures that may mitigate adverse environmental impacts of the alternatives in the DLUPA/EIS. See 40 CFR 1502.14(f), 1502.16(h). Potential forms of mitigation include: (1) avoiding the impact altogether by not taking a certain action or parts of an action; (2) minimizing impacts by limiting the degree or magnitude of the action and its implementation; (3) rectifying the impact by repairing, rehabilitating, or restoring the affected environment; (4) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; or (5) compensating for the impact by replacing or providing substitute resources or environments. 40 CFR 1508.20. Taking certain actions [or not taking action, depending on position of issue statement], such as [cite to any specific examples included with comments], is only one of many potential forms of mitigation. The BLM and the Forest Service must include mitigation measures in an EIS pursuant to the NEPA; yet the BLM and the Forest Service have full discretion in selecting which mitigation measures are most appropriate, including which forms of mitigation are inappropriate.

Mitigation has been further defined in the FEIS as a Regional Mitigation Framework and is detailed in Appendix X. The Framework is incorporated in the [insert Proposed Plan/Proposed Plan Amendment] and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats.

If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures, then compensatory mitigation projects will be used to fully offset impacts to achieve conservation benefits. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.

Specific mitigation strategies, based on the Framework, will be developed by regional teams within one year of the issuance of the Record of Decision and be consistent with the BLM's Regional Mitigation Manual MS-1794, Forest Service Handbook FSH 1909.15, and CEQ regulations at 40 CFR 1508.20.

Mitigation, adaptive management and a

The BLM and the Forest Service complied with the NEPA by including a discussion of measures that may mitigate adverse environmental impacts of the alternatives in the DLUPA/EIS. See 40 CFR 1502.14(f), 1502.16(h). Potential forms of mitigation include: (1) avoiding the impact altogether by not taking a certain action or parts of an action; (2) minimizing impacts by limiting the degree or magnitude of the action and its implementation; (3) rectifying the impact by repairing, rehabilitating, or restoring the affected environment; (4) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; or (5) compensating for the impact by replacing or providing substitute resources or environments. 40 CFR 1508.20. Not taking action, such as differentiating types of mitigation between transmission and distribution lines, is only one of many potential forms of mitigation. The BLM and the Forest Service must include mitigation measures in an EIS pursuant to the NEPA; yet the BLM and the Forest Service have full discretion in selecting which mitigation measures are most appropriate, including which forms of mitigation are inappropriate.

Additionally, Site-specific concerns and more detailed environmental descriptions will be addressed when project-level reviews are tiered to the analysis in this EIS (40 CFR 1502.20, 40 CFR 1508.28). In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for any site-specific actions. Mitigation has been further defined in the FEIS as a Regional Mitigation Framework and is detailed in Appendix X. The Framework is incorporated in the [insert Proposed Plan/Proposed Plan Amendment] and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats. The Monitoring Framework in Appendix X outlines the methods that the BLM and USFS will use to monitor habitats and evaluate the implementation and effectiveness of the planning strategy to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the USFS (36 CFR 219.12) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations, based on the sensitivity of the resource to the decisions involved. BLM and USFS will use the methods described in Appendix X to collect monitoring data to evaluate implementation and effectiveness of the Greater Sage-grouse planning strategy and the conservation measures contained in land use plans.

RDFs included in the DEIS are based on best management practices included in the NTT report and are based on the best available science at the time of publication. RDFs in Appendix J were clarified in the FEIS, where appropriate.

## Response

n/a

Section XXX of the FEIS [in Chapter 4 fluid minerals alt A] recognizes that there are technical limitations on both horizontal and directional drilling [EMPSi ACTION ITEM FOR FEIS Add "horizontal" to this section] and that the use of these technologies may not provide access to all formations containing fluid mineral resources.

Language has been added to the reasonably foreseeable development scenario describing the current limitations and potential future conditions of directional and horizontal drilling technology. The reasonably foreseeable development scenario predicts development over a period of 15-20 years and, at times, assumes that technological advances (such as improved drilling methods) will continue to occur. Therefore, estimated future well development in the reasonably foreseeable development scenario is not necessarily tied to current limitations of directional and horizontal drilling.

Clarification has been added to the document noting that horizontal drilling may not be technologically feasible in all cases in Sections XXXX.

[NOTE TO BLM: May need to follow up with ICF on socioeconomic impacts.]

n/a

Nevada BLM has developed standardized stipulations for fluid minerals. For riparian areas NSO and a CSU stipulation for a 500-foot buffer around the riparian area.

- UT
1. The DLUPA/EIS violates valid existing rights by applying additional restrictions to existing mineral leases.
  2. The DLUPA/EIS should not apply blanket restrictions in this programmatic document. Site-specific restrictions tailored to individual circumstances are more appropriate.
  3. The restrictions on leasable mineral development proposed in the DLUPA/EIS are too vague to be consistently enforced.
  4. The restrictions on leasable mineral development proposed in the DLUPA/EIS are too burdensome and will have unintended negative consequences. Other measures would work just as well and provide more flexibility for developers.
  5. The restrictions on leasable mineral development proposed in the DLUA/EIS are not stringent enough to adequately protect GRSG.

ID- The DEIS needs a better explanation on how  
SW valid existing rights are defined and how they  
MT will be protected, including fringe or  
preference right leases. The alternatives need  
to follow the NTT report recommendations  
more closely, as well as reflect current  
USFWS policy recommendations.  
The BLM needs to clarify the location of non-  
leased Known Phosphate Areas in relation to  
GRSG habitat. The plan is potentially more  
restrictive to phosphate leasing than a listing  
under the ESA and did not properly define  
the environmental baseline for leasable  
minerals. Without prohibiting new phosphate  
mining in GRSG habitat, the LUPA does not  
protect GRSG from the potential impacts of  
selenium being released to the environment  
and poisoning wildlife, including GRSG,  
through transport in air and water and  
subsequent bioaccumulation. The EIS fails to  
explain or discuss the authority that the BLM  
has to close public lands to leasable mineral  
prospecting and leasing under the LUPA  
process under Alternatives B, C and D.

NV- The BLM and Forest Service should provide  
CA additional detail and/or revisions regarding  
leasable minerals alternatives, including  
provisions for an appeal process associated  
with SSUS-3, requiring reclamation instead of  
restoration, and specifying an NSO buffer  
distance. All priority habitats should be found  
unsuitable for coal leasing to provide  
regulatory certainty.  
The DEIS did not accurately reflect the state  
alternative in terms of withdrawals.  
Commenters asserted Alternative B  
management (specifically application of the 3%  
disturbance cap) is inappropriate for existing  
leases.  
Commenters noted that restoration is too  
rigorous of a standard to meet and the term  
should be replaced with reclamation with the  
type of plant community specified at the time

NW The BLM needs to consider additional actions  
CO or clarifications to existing actions within the  
range of alternatives. Some of the  
management actions are not compliant with  
current management policies and guidance.  
[NOTE TO BLM: the actions noted in the  
comments came from the USFWS letter.]

Lewis town The BLM needs to consider additional actions or clarifications to existing actions within the range of alternatives, including RDFs, BMPs, disturbance cap, and well pad density. Also, commenters requested clarification on the life span of the existing protest resolution decision that does not allow oil and gas leasing of nominated parcels that would require a special stipulation that would protect important wildlife values.

ND n/a

WY9

Closure in PGMA and PPMA is already considered in the alternatives.

CSU consideration is considered in alternative D, discussing NSO buffers, water closures, etc.

NOTE TO BLM: Review the following citation for 10 km NSO

Naugle, D.F., K.E. Doherty, B.L. Walker, M.J. Holloran, and H.E. Copeland. 2011. Energy development and Greater Sage-Grouse. Pp. 489-503 in S.T. Knick and J.W. Connelly (editors). Greater Sage-Grouse: ecology and conservation of a landscape species and its habitats. Studies in Avian Biology (vol. 38). University of California Press. Berkeley, CA.

\*\*New alternative proposed : phased leasing alternative-less than 1/3 of planning area.

As noted ~~above~~ **previously** in the response in Section 4.3, Range of Alternatives, Section 1.5 of the Draft EIS describes how the Utah GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives.

1. As stated in Section 1.7, Development of Planning Criteria, the LUPA will recognize all valid existing rights. The potential impacts on valid existing rights from management decisions in this plan amendment are further discussed in Section 4.20, Minerals, and Appendix R, Oil and Gas Reasonably Foreseeable Development Scenario for Greater Sage-Grouse Occupied Habitat in Utah Sub-Region.
2. The range of alternatives analyzed in Section 2.6, Detailed Comparison of Alternatives, of the DEIS included alternatives that focus on both site-specific and broad restrictions, and the impacts of these varying types of restrictions are analyzed in Section 4.20.2, Nonenergy Leasable Minerals. In appropriate cases where broad restrictions are applied, exceptions ensure that these restrictions are only applied where appropriate.
3. Where appropriate, the BLM has added clarity to explain how restrictions will be applied and has clarified definitions of terms in the FEIS Glossary (Volume II). Definitions of restrictions and explanations of how they will be applied are included in Section 4.20.2 and Table 2.1. [EMPSi ACTION ITEM FOR FEIS: add definitions of restrictions and explanations of how they are applied to minerals development.]

[NOTE TO BLM: The BLM should examine the existing discussion of valid existing rights that will survive the proposed LUPA and should expand that discussion if it seems insufficient.]

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/DEIS that best addressed the issues and concerns identified by the affected public. The DLUPA/DEIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. BLM agrees that it cannot impose an NSO on an existing lease. A definition of valid and existing rights has been added to the Glossary in the FEIS.

[NOTE TO BLM: Multiple changes were recommended to the FEIS by Porter- see separate tracking sheet.]

[NOTE TO BLM: Have minerals program elaborate on where the phosphate leases are relative to the management designations for the various Alternatives. Makela- is there an adequate baseline description for leaseable minerals? Also, BLM look into the issue of restrictions in proposed plan relative to restrictions under an ESA listing for minerals development.]

[NOTE TO BLM: determine whether there are mineral leases in the ACECs proposed by

The establishment of an appeal process is outside the scope of work for this document. DEIS is consistent with current BLM/FS best management practices for restoration (see existing list of best management practices). ~~The Executive Summary does not provide the level of specificity as the remainder of the document.~~

It seems that only one portion of the summary is addressed (the appeal process).

Additional information should be included to address the other aspects of the issue. Additionally, the issue summary does not reference the executive summary, so the last statement in the first paragraph is confusing.

DEIS Action D FFME 15 will be revised to read: "Insure bonds are sufficient for costs relative to reclamation."

As noted above in the Section 4.3 of this Report, Section 2.3 of the Draft EIS describes how the Northwest Colorado GRSG RMPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the RMPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

Also as previously noted, the relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the four alternatives are described in Table 2-2, Comparative Summary of Alternatives, in Section 2.8, Summary Comparison of Alternatives, of the Draft EIS.

Additionally, Sections 4.3 and 7.5 of this report discuss how the BLM and the Forest Service complied with CEQ regulations in developing the range of alternatives and the spectrum of actions considered all meet BLM and FS regulations, policy and guidance. During the development of the Final EIS, the BLM and FS met with the USFWS to determine changes to the management actions and mitigation measures. The outcome from these meetings resulted in noted clarifications and edits to the alternatives and

Section 1.5 of the DRMPA/DEIS describes how the Lewistown Field Office Greater Sage-Grouse RMPA/EIS planning team employed the BLM planning process to develop a reasonable range of alternatives for the RMPA. The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

As discussed in section 1.3, Proposed Action, there is an existing protest resolution decision affecting lands managed within the LFO that does not allow oil and gas leasing of nominated parcels that would require a special stipulation to protect important wildlife values, which includes PPH and PGH, or PH and GH. New leasing of areas with important wildlife values cannot occur until the BLM completes a plan amendment/EIS or a new/revised RMP/EIS, including oil and gas leasing decisions identified in a ROD. Because this RMPA only considers management actions for GRSG and does not address oil and gas leasing options for other wildlife resource values, oil and gas leasing will not be addressed in this RMPA/EIS. (The LFO RMP revision process will begin in 2013, which will address oil and gas leasing for the entire LFO planning area boundary.)

Also as previously noted, the relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no

~\*  
Lewis n/a  
town

ND The BLM needs to justify the assumption that all new wells will be drilled from a single pad. BLM needs to consider an array of studies that address the impacts of well density on sage-grouse (see specific references in above comment).

WY9

The BLM reviewed the additional studies and information and incorporated it into the document as appropriate. [Note to BLM: review studies and determine if/where changes in the document are needed.]

As stated on page ES-4 of the Draft RMPA/EIS, "...the management directions and actions outlined in this RMPA/EIS will apply only to BLM-administered surface lands in the planning area (Table ES-2) and BLM-administered federal mineral estate that may lie beneath other surface ownership, often referred to as split-estate lands. These two areas are collectively referred to as the decision area."

The BLM has corrected the inconsistency in leased acres.

*The BLM is working to find state surface with federal minerals.*

1. This clarification has been added to Section XXXX of the FEIS [NOTE: add language to Minerals Ch 3 and 4 sections]. [EMPSi ACTION ITEM FOR FEIS: add this information.]

2. The RFD included in the DEIS is not a mineral potential report and therefore is not subject to the requirements of Manual 3060. By law, a mineral potential report is not required for land-use planning efforts (see Manual 3031, Energy and Mineral Resource Assessment). The BLM has collated sufficient information to support the analysis in this broad-scale planning document. For the Utah Sub-regional GRSG DEIS, including this RFD, the BLM used a modified version of the oil and gas potential map contained in the USGS publication Summary of Science, Activities, Programs, and Policies That Influence the Rangeland Conservation of Greater Sage-Grouse (*Centrocercus urophasianus*), also known as the Baseline Environmental Report (BER). This map was originally included in a peer reviewed document titled Mapping Oil and Gas Development Potential in the US Intermountain West and Estimating the Impacts to Species (Copeland et al). During development of the DEIS the baseline map was reviewed by qualified BLM mineral specialists, including geologists and petroleum engineers, in the BLM Utah State Office. Numerous changes were made to the map to more accurately reflect oil and gas potential in the planning area. For example, approximately 3,339,234 acres of additional moderate potential, and 265,278 acres of additional high potential were identified. A modified version of the map developed by Copeland et al was used for this EIS because it estimates oil and gas potential for all GRSG habitat in planning area and there are few if any products similar to this available. Oil and gas potential maps were included in the mineral reports completed for the Cedar City, Price, Vernal, Richfield, and Kanab RMPs; these maps were not used because the combination of these maps does not provide information on oil and gas potential covering all GRSG habitat located in the Utah planning area. In addition, these mineral potential reports, which were completed for individual planning units were not edge-matched, meaning when the layers were placed

The reasonably foreseeable development scenario for oil and gas assumes a conventional oil and gas field. The current development occurring in the Payette area of Idaho is not within sage grouse habitat. BLM's preferred management action has been changed in the FEIS to applying a year-round No Surface Occupancy stipulation in PPMA and PMMA. Seasonal restrictions would be applied in PGMA. Lands outside of sage grouse habitat would not be subject to stipulations developed in this EIS.

[NOTE TO BLM: Review section on 4-8 for best available science for basis of decisions. Have a biologist help determine.]

~~The DEIS is based on the best available science available at the time of publication. The BLM will review additional literature (e.g. hydraulic fracturing) to determine applicability for the FEIS as it becomes available.~~

As noted in section 4.4, affected environment, the CEQ regulations require an environmental impact statement to "succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration."

The affected environment provided in Chapter 3 and various appendices including Appendices A, N, O, P, and Q in the Utah Greater Sage-Grouse LUPA is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS.

Hydraulic fracturing would not increase the number of exploration wells. It is used to enhance production. Therefore, this new technology would not modify the RFD scenario in the DEIS.

Noise related impacts on GRSG habitat is analyzed in the DEIS and will be further refined in the FEIS. Impacts on mineral development from noise mitigation measures (e.g. buffers/set-backs) will be further addressed in the FEIS based on the management actions in the proposed plan.

[NOTE to BLM: Review the cited source and determine if the information is already included in the DEIS or should be added to the FEIS. If not included, write rationale for why source was not cited/used. If the sources are essentially the same information as presented in the EIS, then use this response below:]

As noted previously in Section 7.6, Best Available Information, the BLM and the Forest Service complied with CEQ regulations in describing the affected environment. Of the suggested studies and references put forth by the commenters, the BLM reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined n/a

NOTE TO BLM: The “BLM needs to justify the assumption that all new wells will be drilled from a single pad” portion of the issue summary should get a response to.

NOTE TO BLM: These referenced materials need to be reviewed for relevance and whether the information is new. Determine whether the information is already covered in the EIS (although specific reference is to another document), or if the new references change the conclusions of the analysis.

All future leasing would either be an NSO or NL in the action alternatives; therefore, well density limits are not applicable to future lease development in the North Dakota Greater Sage-Grouse LUPA/EIS. Additionally, BLM cannot change the current well densities in the planning area.

BLM teams have reviewed the suggested studies to determine if they are substantially different than the information cited in the DEIS. The commenters’ additional information was found to provide the [NOTE TO BLM: same/similar information/results/findings] as already noted in the DEIS, therefore inclusion and consideration would not substantially alter the conclusions or analysis. Therefore, they were not incorporated into the FEIS. [NOTE TO BLM: Could expand on the response with specifics of how the information was similar and where it could be found in the EIS.]

NOTE TO BLM: If the report presented different/newer information that reviewer believes should be included in the FEIS, then the response would be: BLM teams have reviewed the suggested studies to determine if they are substantially different than the information cited in the DEIS. The commenters’ additional information was found to provide new/updated information that has been incorporated into the FEIS (see Section

Plan	Issue Statement
------	-----------------

OR n/a

UT 1. The impact analysis should include oil shale because existing oil shale leases will be impacted by these management actions.  
2. The analysis in the DLUPA/EIS should consider the fact that fluid mineral extraction operations can only be relocated where resources exist and are accessible.  
3. The impacts of the management actions proposed in the DLUPA/EIS on leasable minerals will be more severe than those discussed in the document based on the totality of the restrictions that would be applied.

ID- The impact analysis in the DEIS of  
SW management actions on leasable mineral  
MT development is insufficient.

NV- The BLM and Forest Service should provide a  
CA quantitative context for impacts.  
Commenters also had concerns about the impacts on fluid mineral development from NSO stipulations without modifications, waivers, and exceptions.

NW The BLM has failed to adequately disclose the  
CO impacts of the noted restrictions on oil and  
gas operations.

BLM needs to provide further analysis to show the effectiveness of using a less restrictive action/mitigation rather than a more restrictive one. The oil and gas analysis was overly biased in presenting adverse effects from oil and gas developed and not presenting the adverse effects created by other programs/uses.

Lewis The DRMPA/DEIS fails to clarify how best  
town management practices will be applied to valid  
existing rights.

ND The DRMPA/DEIS fails to clarify how best management practices will be applied to valid existing rights for fluid minerals.

WY9

Response

NCT Notes

1. Analysis of impacts of the management actions proposed under this LUPA/EIS on oil shale has been added to Section XXX of the FEIS (Ch 3 and 4 leasable mineral sections). [EMPSi ACTION ITEM FOR FEIS: add this information.] [EMPSi ACTION ITEM FOR FEIS: Information regarding Enefit's RD&D area as well as the preferential lease right (PRL) area needs to be added to the body of the EIS (Ch 4 and Ch 3)]. No oil shale or tar sands development is allowed in GRSg habitat per the 2012 PEIS except for in the Asphalt Ridge area and the RD&D and PRL area. BLM needs to disclose the impacts of these operations on GRSg and the impacts of GRSg management on these two operations. Potential impacts on these operations could occur from BLM's lands and realty management decisions (ROW exclusion/avoidance precluding access) and mitigation requirements (BLM to elaborate on these further). Enefit's RD&D operation constitutes a valid existing right. [EMPSi ACTION ITEM: (Does the PRL area constitute a valid existing right or can BLM deny the lease? KP need to research this.)]

Response 2: clarify where analysis has been supplemented (other resource sections, appendix, etc.)

2. This analysis is already included in Section 4.20.2 of the DEIS and has been supplemented as necessary.

3. Impact analysis has been revised as appropriate to discuss additional impacts of seasonal limitations, closures, and RDFs [EMPSi ACTION ITEM FOR FEIS:: Add information on nature and type of impacts including closures and blocks of land - could hinder exploration on isolated leased parcels-, seasonal restrictions and safety concerns, etc.]. [NOTE: Check coal and fluids impacts analysis for impacts of overlapping impacts of seasonal habitats on minerals development. Seasonal restrictions overlapping could The acres of unleased KPLA land unavailable for development by alternative will be corrected in the Ch. 4 tables in the FEIS. The section describing the impacts from leasable minerals management for Alt E will be revised. The impacts of non-energy leasable minerals management actions to socio-economics will be included in the FEIS and the impacts with respect to disturbance caps will be analyzed in more detail.

[NOTE TO BLM: Tables of acres of unleased KPLA land unavailable for development by alternative in Ch. 4 need to be corrected.]

[NOTE TO BLM: Impacts from leasable minerals management in alt E needs to be revised.]

[NOTE TO BLM: Include a discussion of the effects of phosphate management actions to socio-economics in Ch 4. Also, references to section 4.11.2 should be corrected and should refer to section 4.12.2.]

[NOTE TO BLM: Distinguish between Impacts from Alts F and B. Note: This is a Quantitative context for current and future disturbance associated with fluid minerals can be found in Appendix H: Oil and Gas RFDs.

The rationale for the NSO stipulation without waivers, exceptions, or modifications is part of Alternative D; however, the range of other alternatives would allow for exceptions, modifications, or waivers.

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

The impacts from leasable mineral development on sage grouse and its habitat are discussed in Section 4.4.2; impacts from the management actions and conservation

Valid existing rights are discussed in sections 1.6.3, Issues Identified, and 1.7 Development of Planning Criteria, and several locations throughout Chapter 4. As stated in Section 1.7, Development of Planning Criteria (p. 1-14), the RMPA will recognize valid existing rights. In the Management Common to All Alternatives (Section 2.4.4, p. 2-8), the BLM further clarifies this by stating that valid existing rights will be honored, which include any leases, claims, or other authorizations established before a new or modified authorization, change in land designation, or new or modified regulation is approved.

When an oil and gas lease is issued, it constitutes a valid existing right; the BLM cannot unilaterally change the terms and conditions of the lease. Existing leases would not be affected by new closures and/or areas administratively unavailable for lease, and restrictions could not be added to existing leases. Surface use and timing restrictions resulting from this RMPA cannot be applied to existing leases. Existing leases would not be terminated until the lease expires. However, based on site- or project-specific environmental analysis, conditions of approval (COA) could be applied at the APD and Sundry Notice stage and at subsequent development stages to mitigate potential impacts from oil and gas operations within existing lease areas, providing the leaseholder's right to develop the lease remains intact (Section 2.4.4, p. 2-8).

Appendix C and Appendix D of the Lewistown Field Office Greater Sage-Grouse DRMPA/DEIS contains required design features (RDFs) and best management practices (BMPs) that could be applied as COA at the APD and Sundry Notice stages for existing leases. The RDFs and BMPs are designed to protect GRSG habitat. The use and application of specific RDFs and BMPs would be made during the environmental analysis process for individual proposals on a case-by-case basis. Additional language in Appendix D regarding these rights will be included with the updated appendix.

As stated in Section 1.7, Development of Planning Criteria (p. 1-113), the RMPA will recognize valid existing rights. In the Management Common to All Alternatives (Section 2.4.4, p. 2-6), the BLM further clarifies this by stating that valid existing rights will be honored, which include any leases, claims, or other authorizations established before a new or modified authorization, change in land designation, or new or modified regulation is approved. Under Alternative D, during implementation level review and decisions, (e.g., approval of an APD, Sundry Notice, etc.) and upon completion of the environmental record of review (43 CFR 3162.5), evaluate whether the conservation measure is “reasonable” (43 CFR 3101.1-2) with the valid existing rights (see pages 2-33 and 2-34 in the DEIS).

When an oil and gas lease is issued, it constitutes a valid existing right; the BLM cannot unilaterally change the terms and conditions of the lease. Existing leases would not be affected by new closures and/or areas administratively unavailable for lease, and restrictions could not be added to existing leases. Surface use and timing stipulations resulting from this RMPA cannot be applied to existing leases. Existing leases would not be terminated until the lease expires. However, based on site- or project-specific environmental analysis, conditions of approval (COA) could be applied at the APD and Sundry Notice stage and at subsequent development stages to mitigate potential impacts from oil and gas operations within existing lease areas, providing the leaseholder’s right to develop the lease remains intact (Section 2.4.4, p. 2-6).

Appendix B, Greater Sage-Grouse Habitat Required Design Features and Best Management Practices, contains required design features (RDFs) and best management practices (BMPs) that could be applied as COA at the APD and Sundry Notice stages for existing leases. The RDFs and BMPs are designed to protect GRSG habitat. The use and

## Response

n/a

Additional information on the cumulative impacts on the Western Phosphate Field has been added to Section 4.24.21, Minerals, of the FEIS. [EMPSi ACTION ITEM FOR FEIS: Add information on this based on info provided by BLM]

The BLM and the Forest Service thoroughly explained its consideration and analysis of cumulative effects in the DLUPA/EIS in Section 4.24.20. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

Additional information on the cumulative impacts on the Western Phosphate Field, unleased KPLAs, socio-economic impacts from loss of phosphate resources, reasonably foreseeable actions, and proposed conservation measures have been added to Section XXX (minerals cumulative impacts). [NOTE TO BLM: Review cumulative section and add necessary information.]

The FEIS will address cumulative impacts analyses that are incomplete and inconsistent with other sections of the DEIS.

Plan Issue Statement

- OR n/a
- UT
  1. Requiring off-site mitigation regardless of site-specific circumstances is contrary to current BLM mitigation policy
  2. The BLM needs to modify its language on exceptions, waivers, and modifications to stipulations

ID- The reliance upon vague RDFs under  
SW Alternative D is a failure of the BLM to adopt  
MT best science that calls for specific restrictions based on observed GRSG response to surface disturbances.

NV- Off-site mitigation is not a viable conservation  
CA strategy, as evidenced by research in Wyoming.

NW Additional reclamation bonding requirements  
CO are unnecessary as both federal and state  
government require bonding, and the  
additional requirements go against current  
regulations (43 CFR 3104 and 36 CRF 228  
Subpart E).

Lewis Commenters requested that mitigation for  
town prospecting permits for non-energy leasable  
mineral development be described or defined.

ND The DRMPA/DEIS fails to adequately analyze  
the effectiveness of mitigation associated with  
existing, undeveloped oil and gas leases in PH  
and GH.

BLM failed consider non-heliportable type  
drilling best management practices for seismic  
operations.

<p><del>[NOTE TO BLM: Adaptive management and monitoring language is still being developed at the national level, which includes off-site mitigation.]</del></p>	Use the national mitigation language or include a cross reference to the reader to find it in section 7.9 as part of the response too if needed.
<p>[BLM ACTION ITEM FOR FEIS: Change name of Table K-1 to be inclusive of other land use authorizations; not just oil and gas]</p>	Use the national mitigation language or include a cross reference to the reader to find it in section 7.9 as part of the response too if needed.
<p>I. [NEEDS SOLICITOR REVIEW] Proposed response: The regional mitigation strategy developed as part of this EIS process is consistent with its interim Management Policy regarding off-location mitigation as outlined in IM-2012-142, which was released on June 13, 2013.</p>	Red text of the mitigation language is provided if needed.
<p>Mitigation has been further defined as a Regional Mitigation Framework and is detailed in Appendix X. The Framework is incorporated in the Utah GRSG LUPA/EIS and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats.</p>	
<p>If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures, then compensatory mitigation projects will be used to fully offset impacts to achieve conservation benefits. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.</p>	
<p>Specific mitigation strategies, based on the Framework, will be developed by regional teams within one year of the issuance of the Record of Decision and be consistent with</p>	
<p>The RDFs were adopted from BMPs in Appendix D of the NTT report. In that appendix, it states that "BMPs are continuously improving as new science and technology become available and therefore are subject to change. Include from the following BMPs those that are appropriate to mitigate effects from the approved action." Wording from NNT report has been added to the discussion of RDFs in the FEIS.</p>	Assume NNT should be NTT?
<p>[NOTE TO BLM: BLM to examine whether the reliance upon RDFs constitutes a "reasonable" alternative. If BLM determines it is reasonable, this response should explain why that is so, and indicate that no change is made to the document. If BLM cannot justify Alternative D as "reasonable", this should be identified and Alternative D should be</p>	
<p>The BLM considers off-site mitigation a viable tool in the GRSG conservation strategy to facilitate mineral development.</p>	Add rationale as to why it is considered viable. The issue statement says that it is <b>not</b> viable.

The BLM considers off-site mitigation a viable tool in the GRSG conservation strategy to facilitate mineral development.

Requiring mitigation prior to leasing is not a viable management option because it would leave to the federal government to decide what can be leased based on mitigation requirements. BLM does not have the funds or workforce to pre-screen leases for mitigation requirements when there is no guarantee that the lease will be purchased or developed.

Regarding curtailment of mineral development, there needs to be a higher level (SOL) review of disturbance cap as it relates to all mineral development and mineral rights.

Appendix C and Appendix D of the Lewistown Field Office Greater Sage-Grouse DRMPA/DEIS contains required design features (RDFs) and best management practices (BMPs) that could be applied to non-energy leasables. The RDFs and BMPs are designed to protect GRSG habitat. The use and application of specific RDFs and BMPs would be made during the environmental analysis process for individual proposals on a case-by-case basis. [NOTE TO BLM: provide direction if additional language is necessary.] A monitoring framework was developed for the North Dakota Greater Sage-Grouse DRMPA/DEIS by a Disturbance and Monitoring Team. The framework focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM worked with Western Association of Fish and Wildlife Agencies (WAFWA) to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate data-sets will be established so that data can easily be "rolled up" for reporting monitoring results across the range of GRSG, as defined by Schroeder et al. (2004); by populations and subpopulations as defined by Connelly et al. (2004); by RMP area; by the seven (WAFWA) GRSG Management Zones (Stiver et al. 2006), and by Priority Areas for Conservation (PACs) as defined in the GRSG Conservation Objectives Team (COT) Report (USFWS 2013).

[NOTE TO BLM: Refer to the Monitoring Framework in the appendix in FEIS.] To accomplish effective monitoring, the BLM will analyze the monitoring data to characterize the relationship among disturbance, implementation actions, and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife agencies, effectiveness monitoring can be supplemented with population trend information, taking into consideration the lag effect response of populations to habitat changes.

The BLM did consider non-helioportable drilling BMPs for seismic operations in Alternative A (see Table 2-3, page 2-33). All alternatives in the North Dakota Greater Sage-Grouse EIS limit travel to existing roads and trails; therefore, geophysical

## Response

[Note to BLM: Please review for accuracy. May need to go up to solicitor's office for review.]

According to the Department of the Interior Solicitor's Opinion M-37008, dated October 4, 2002, "...the BLM has the authority to consider, through the land use planning process, a permittee's proposal to relinquish a grazing permit in order to end grazing on the permitted lands and to assign them for another multiple use. If the lands are within an established grazing district, BLM must analyze whether the lands are no longer "chiefly valuable for grazing and raising forage crops", as required under the Taylor Grazing Act, and express its rationale in a record of decision. The BLM must also consider whether the elimination of livestock grazing as a principal or major use of the public lands triggers congressional reporting requirements. A decision to cease livestock grazing is not permanent. It is subject to reconsideration, modification and reversal in subsequent land use plan decisions."

Additionally, under Section 4 of the Multiple-Use Conflict Resolution Act of 2005, a permittee or lessee may waive, at any time, a valid existing grazing permit or lease authorizing commercial livestock grazing on Federal lands. At which time, the Secretary of the Interior, at the request of the BLM, shall cancel grazing permits and leases waived under this section and permanently retire the associated grazing allotments from commercial livestock grazing, notwithstanding any other provision of law. The Multiple-Use Conflict Resolution Act of 2005 also authorizes the permittee to donate their valid existing grazing

The Lewistown Field Office Greater Sage-Grouse RMPA is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve GRSG and to respond to the potential of it being listed (see DRMPA/DEIS Section 1.2, Purpose and Need, on page 1-3). The BLM's planning processes allow for analysis and consideration of a range of alternatives in the DRMPA/DEIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore GRSG habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DRMPA/DEIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights.

Consistent with the BLM's regulations (43 CFR 4130.2(a)) and Land Use Planning Handbook (H-1601-1, Appendix C(II)(B)), the Lewistown Field Office Greater Sage-Grouse RMPA makes appropriate land use planning decisions by identifying lands available or not available for livestock grazing (see DRMPA/DEIS Table 2-3, page 2-31). Further, the Lewistown Field Office Greater Sage-Grouse RMPA complies with the Taylor Grazing Act, which does not preclude the BLM from identifying some lands not available to

FLPMA [Sec. 4100.0-5] defines an AUM as "the amount of forage necessary for the sustenance of one cow or its equivalent for a period of 1 month." FLPMA [Sec. 4230.8-1(c)] states that "For purposes of calculating the fee, an animal unit month is defined as a month's use and occupancy of range by 1 cow, bull, steer, heifer, horse, burro, mule, 5 sheep, or 5 goats over that age of 6 months at the time of entering the public lands or other lands administered by the Bureau of Land Management, by any such weaned animals regardless of age; and by such animals that will become 12 months of age during the authorized period of use. No charge shall be made for animals under 6 months of age at the time of entering the public lands or other lands administered by the BLM; that are the natural progeny of animals upon which fees are paid, provided they will not become 12 months of age during the authorized period of use, nor for progeny born during that period."

Plan	Issue Statement
------	-----------------

OR Some commenters stated that the DEIS should have included a no grazing alternative as well as a 50% reduction from actual use in order to comply with NEPA requirements for a reasonable range of alternatives. Commenters questioned the need for additional restrictions on grazing management, citing that existing regulations and rangeland health standards protect GRSG habitat. They also question how the prioritization of rangeland health standard assessments would impact other species in the area.

Commenters question request clarification on the use of the HAF in the preferred alternative and how it correlates to rangeland health assessments. In particular, they noted the need to utilize local ecological site conditions and provided suggested details for implementation.

Commenters also request clarification on the requirements for fences.

Commenters questioned the rationale for

UT Several commenters requested an alternative that reduces or eliminates livestock grazing on public lands. However other commenters asserted the benefits of grazing in terms of fuel reduction and preservation of GRS habitat, and/or stated that it was not proven that grazing damages GRS habitat, or that there was any benefit to reducing grazing adjacent to burned areas. Many commenters expressed concern about the use of rangeland health standards, specifically whether they would be based on Connelly and Hagen's research, how clearly those standards and objectives would be stated, and how they would be enforced. Two commenters suggested using reference areas to judge habitat recovery or impacts of no grazing, and others suggested adaptive management and monitoring of grazing controls.

Commenters noted that conservation measures (RDFs/BMPs) applied to grazing permits should be appropriate for the vegetation or ecological potential of the area in question, and be implemented at the

ID-SW MT Several commenters requested that the LUPA/EIS provide specifics regarding habitat assessments schedules and standards, use of ecological site descriptions, require terms and condition for permits, and grazing restrictions for priority or general habitat. Two commenters suggested that BLM and Forest Service immediately close to grazing all allotments that fail to meet GRSG habitat objectives, and one commenter suggested that one of the alternatives should completely eliminate commercial grazing on public lands.

Commenters recommended that reduced utilization levels be further considered in alternatives. A commenter says that the BLM and Forest Service failed to take a hard look at removal of livestock from significant habitat areas. Commenters also requests clarification of the 25% reduction under Alternative F.

Multiple commenters requested that the alternatives require closure of voluntarily relinquished allotments.. Commenters questioned why changes to grazing management are needed when livestock

NV-CA Some California commenters pointed out that California grazing permittees are already subject to guidelines to protect GRSG, developed by NE CA SG Working Group. Therefore they oppose the guidelines in Alt D, and suggest that California allotments be removed from the geographic scope of NVCA EIS/LUPA. Another commenter requested that at least one alternative allow for expanding or retaining the current level of livestock grazing.

Multiple commenters claimed that the preferred alternatives threaten existing water rights under Nevada water law, and should be revised. Multiple commenters also stated that permanent retirement of grazing privileges is not authorized without Congressional action; other commenters suggested “resting” AUMs instead of retiring them. Multiple commenters noted that the use of Key Management Areas to monitor and adjust grazing conditions conflicts with the Nevada Rangeland Monitoring Handbook.

Some commenters requested that the entire burden of restoring/maintaining GRSG

NWCO Commenters were divided on what changes would need to be made to alternatives. Some commenters wanted alternatives for livestock grazing changed to be consistent with BLM's multiple use mandate, and incorporate range BMPs that are focused on sound range management. Other commenters wanted the livestock grazing alternatives to include terms and conditions for grazing permits that assure that sage-grouse habitat requirements are met, are consistent with NTT recommendations, and that conservation measures prevent adverse impacts from livestock range improvement projects on sage grouse habitat. Additionally, BLM should consider drought in the habitat objectives and apply BLM IM 2013-094.

Lewisto Many commenters noted an apparent  
wn 1/2 contradiction in the RMPA/DEIS, focused on  
the question of whether grazing in the LFO  
has an adverse effect on GRSG and habitat:  
Chapter 5 states that grazing does not  
constitute a substantial threat to GRSG  
because there are ongoing management  
actions in LFO intended to preserve GRSG  
habitat, however Alternatives B and D  
include further constraints on grazing, and  
Alternative C closes all habitat to grazing  
entirely. Commenters also requested more  
evidence from BLM supporting the assertion  
that grazing does, or does not, damage  
GRSG or GRSG habitat. More specific  
comments included: prioritizing habitat  
assessments and fence removals; Alternative  
C does not meet the Purpose and Need  
because it does not allow for connectivity,  
population expansion, or historic habitat; the  
suggestion that grazing restrictions be  
limited to timing/intensity rather than  
reductions in AUMs; and several citations in  
support of the assertion that leaving grazing  
areas fallow in the long term results in re-  
establishment of native forbs and grasses.

Lewisto  
wn 2/2

ND Commenters had two opposing views regarding the range of alternatives related to livestock grazing. One group felt the BLM has inadequately justified the need to change existing, or propose new, livestock grazing management actions in order to protect sage-grouse. The other group requested the BLM include more restrictive management actions for livestock grazing, including analyzing a no grazing alternative and 50% reduction from actual use in permitted grazing. The DRMPA/DEIS fails to provide any rationale for adopting State of North Dakota habitat parameters instead of peer-reviewed scientific literature.

WY9

## Response

The EIS planning team employed the BLM planning process to develop a reasonable range of alternatives for the RMPA, as described in Section 4.3, NEPA Range of Alternatives, in this section. ~~The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. The BLM complied with CEQ regulations in developing the range of alternatives, including a no action alternative, and the spectrum of actions considered all meet BLM regulations, policy and guidance. The DEIS considered a full range of alternatives for grazing levels, including Alternative A, which proposed no reduction in grazing levels, Alternative C, which analyzed no grazing in the planning area, and Alternative F, which analyzed a reduced grazing level of 62.5%. See Section 2.9 for a complete comparison of alternatives.~~

All or part of Key RNAs identified in the Final EIS would be closed under the preferred alternative to all disturbance types, including livestock grazing, OHV, minerals development, and lands and realty actions. The reason for these closures would be for research related activities, including studying vegetative communities that do not contain land disturbing activities which are important to sage-grouse, as well as studying the effects of climate change on these vegetative communities. For all remaining ACECs and RNAs, ~~for~~ areas not meeting rangeland health standards where livestock grazing is a contributing factor, **or areas** are not meeting the management goals of the ACEC/RNA, grazing would be modified before the next grazing season. The intent of the land use plan amendment is to change management under all resource programs, where necessary, to benefit Sage Grouse habitat.

The document has been updated to remove the ACEC/RNA voluntary relinquishment clause. Objectives and actions from Appendix I have been moved into the body of the document for the FEIS for better clarification for the reader. Changes have been made to Chapters 2, 3, and 4 to clarify the proposed alternatives. Impacts from any additional fencing required in Key RNAs have been updated in Chapters 4 and 5. The RMPA/EIS has also been updated by removing the 20% PPMA and 50% PGMA habitat thresholds for RNAs. This was a method used in the Draft EIS as a way to filter out potential areas of

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/DEIS identified GRS habitat objectives, percent cover, residual cover, and grasses and forb heights.

In accordance with IM 2012-069 and BLM's Land Use Planning Handbook, the DEIS considered what range of alternatives was necessary to address unresolved conflicts among available resources. Alternative C1 eliminates grazing entirely within occupied habitat and Alternative C2 reduces grazing in occupied habitat accordingly.

Habitats will be managed to meet habitat guidelines from scientific literature (e.g., Connelly et al. 2000 and Hagen et al. 2007), where such standards can be met. Adjustments from the guidelines may be made, but must be based on documented regional variation of habitat characteristics (e.g., sagebrush type, ecological site potential), quantitative data from population and habitat monitoring, and evaluation of local research. A toolbox of permit conditions and conservation measures such as RDFs and BMPs would be available to District Managers to choose from when granting or renewing grazing permits, as applicable for each individual allotment within priority habitat. Blanket, one-size-fits-all standards and objectives would not be imposed on permittees under the amended RMPs.

Increased grazing and associated AUMs was considered in Section 2.8.1 in the DEIS, but was eliminated from detailed analysis.

While livestock grazing was not recognized as a primary threat to GRSG, it is included on the USFWS list of potential threats, therefore, adjustment to grazing management actions are applied accordingly.

The ID/SWMT LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. The BLM and the Forest Service complied with CEQ regulations in developing the range of alternatives and the spectrum of actions considered all meet BLM and Forest Service regulations, policy and guidance. Alternatives including reduction/removal of livestock grazing were considered due to the identification by the USFWS of livestock grazing as one factor threatening GRSG.

Grazing use would be modified when it is identified as the cause for not meeting Sage Grouse objectives. The intent of the land use plan amendment is to change management under all resource programs, where necessary, to benefit Sage Grouse habitat. Standards and Guidelines include examination of causal factors for factor 8 of RHS in determination [BLM please revise language as needed]

As stated in the preferred alternative [mgmt. action #] habitat objectives would be adjusted based on ecological site conditions. Site specific requirements would be specified in NEPA for permit renewal. Language in the preferred alt. has been modified to clarify. [site pp of languages]

Reduction in AUMs under Alternative F would be specified in site specific decisions at the permit renewal level. Language in the FEIS for Alternative F reduction has been clarified

[BLM and Forest Service- need to review the language in Alt F mgmt. actions related to the 25% reduction and review related analysis. Determine if revision needed to table 4-5].

[need to include language on hard-look at reduction in grazing – Nika drafting]

Neither the Taylor Grazing Act nor FLPMA requires that all uses be allowed on all areas of the public lands. The BLM's FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people.

- Unless the State Director determines otherwise, the planning area for a RMP is the geographic area associated with a particular field office (43 CFR 1610.1(b)). The geographic scope of this planning effort includes the Northeast California grazing allotments; if habitat assessments indicate that GRSG habitat in those areas is meeting objectives, few changes are likely to be made to grazing conditions for those permits.

[BLM needs to develop an answer to the Water Law question.]

- The monitoring approach identified in the LUPA/FEIS complies with the Nevada Monitoring Handbook (2006).
- As noted above in Section 4.3 of this Report, Section 2.3 of the Draft EIS describes how the Utah GRSG RMPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the RMPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives.
- Neither the Taylor Grazing Act nor FLPMA requires that all uses be allowed on all areas of the public lands. The BLM's FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The purpose of the multiple-use mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the BLM to develop and periodically revise or amend its Resource Management Plans (RMPs), which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.
- Grazing use would be modified when it is identified as the cause for not meeting Sage Grouse objectives. The intent of the land use plan amendment is to change management under all resource programs, where necessary, to benefit Sage Grouse habitat.

- Funding and scheduling of district-level assessment efforts is outside the scope of this program-level NEPA process. However, as a result of this LUPA Land Health Assessments will become a priority in GRSG habitat.

- The proposed habitat objectives for Sage Grouse and the guidelines for establishing allowable use levels if not meeting those objectives were developed based on the most current science (including USGS, NDOW, Connelly and Hagen's sage grouse habitat standards), and would be used to assess rangeland health of allotments prior to granting or renewing grazing permits. A toolbox of permit conditions and conservation measures such as RDFs and BMPs would be available to District Managers when granting or renewing grazing permits, as applicable for each individual allotment within priority habitat. The Preferred Alternative provides for an adaptive management approach on a case by case basis to protect GRSG habitat when GRSG habitat is not meeting GRSG habitat objectives. Part of this is continuing land health assessments in PPMA and PGMA

BLM will edit LG 4 to say prioritized because of IM-2012-43 and other IMs.

Current policy carried out throughout all alternatives directs the districts to identify and mitigate hazard fences.

The Preferred alternative provides for 35-40% utilization while not meeting LHS and when meeting will monitor to protect GRSG habitat.

LG 10 and table 2-7 address PFC requirements and habitat conditions

BLM and FS will comply with Nevada Water Law.

BLM will add a discussion that implementation level management is defined and addressed during the annual grazing application process.

BLM will edit text to clarify that management actions will be taken only when habitat objectives are not trending upward and grazing is the responsible cause.

BLM will add a response about targeted and prescriptive grazing (LG13 and Veg alts).

As noted above in the Section 4.3 of this Report, Section 2.3 of the Draft EIS describes how the Northwest Colorado GRSG RMPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the RMPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

Also as previously noted, the relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the four alternatives are described in Table 2-2, Comparative Summary of Alternatives, in Section 2.8, Summary Comparison of Alternatives, of the Draft EIS.

Additionally, Sections 4.3 and 7.5 of this report discuss how the BLM and the Forest Service complied with CEQ regulations in developing the range of alternatives and the spectrum of actions considered all meet BLM and FS regulations, policy and guidance.

During the development of the Final EIS, the BLM and FS met with the USFWS to determine changes to the management actions and mitigation measures. The outcome from these meetings resulted in noted clarifications and edits to the

The BLM considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and GRSG in the planning area, the BLM fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, four alternatives were analyzed in detail in the DRMPA/DEIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DRMPA/DEIS represented a full spectrum of options including a no action alternative (current management, Alternative A). The range of alternatives is based upon analysis of public scoping comments as well as information provided in the NTT report, the BER, the COT report, the Montana Strategy, and relevant peer-reviewed scientific research. The alternatives represent different degrees of and approaches to balancing resources and resource use among competing human interests, land uses, and the conservation of natural and cultural resource values, while sustaining and enhancing ecological integrity across the landscape, including plant, wildlife, and fish habitat.

Alternatives B and D are not intended to eliminate grazing in the planning area altogether, but to provide management options to further preserve GRSG habitat if it is determined that the current strategies are not sufficient. Habitat objectives provided in the Management Plan and Conservation Strategies for Sage-Grouse in Montana Plan (2005) will be incorporated into Standards and guidelines for rangeland health under Alternatives B and D. Whether or not standards are being met will be determined prior to renewing grazing authorizations. A toolbox of permit conditions and conservation measures such as RDFs and BMPs (Appendix C and D) would be available to Managers to choose from when granting or renewing grazing authorizations, as applicable for each individual allotment within priority habitat.

[NOTE TO BLM: need to review new citations to see if there is more that can be included regarding the science of grazing vs. GRSG.]

Regarding statements that current grazing levels leading to land health issues: All grazing allotments within the planning area including those in GRSG habitat that were determined to not be meeting land health standards due to livestock grazing have had management changes implemented, as demonstrated in Table 3-45(Lewistown Field Office Planning Area – Land Health Assessment) and discussed in the DEIS pp 3-66. Previously completed site specific EAs to renew grazing authorizations are

Neither the Taylor Grazing Act nor FLPMA requires that all uses be allowed on all areas of the public lands. The BLM's FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The purpose of the multiple-use mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the BLM to develop and periodically revise or amend its RMPs, which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data or identification of site-specific actions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The BLM will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, etc. The subsequent NEPA analyses for project-specific actions will tier to the land-use planning analysis and evaluate project impacts at the appropriate site-specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site-specific actions.

Removal and marking of specific fences is an implementation level action and would not be addressed in the FEIS. However, fences within GRSG PH and GH are currently being evaluated, mapped, and marked with the priority on fences with high and moderate collision risks as determined by using the NRCS developed Fence Collision Risk Tool GIS application. These efforts have been incorporated into the cumulative effects analysis found in Chapter 4.

As stated on page 2-3 (Section 2.3.1) of the DRMPA/DEIS, the alternatives “meet the purpose and need for the North Dakota Greater Sage-Grouse RMPA.” The RMPA is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve GRSG and to respond to the potential of it being listed (see DRMPA/DEIS Section 1.2, Purpose and Need, on page 1-3).

Section 2.3 of the North Dakota Greater Sage-Grouse DRMPA/DEIS describes how the North Dakota Greater Sage-Grouse RMPA/EIS planning team employed the BLM planning process to develop a reasonable range of alternatives for the RMPA. The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the 1988 North Dakota RMP, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the 1988 North Dakota RMP and ROD are acceptable and reasonable.

Also as previously noted, the relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the four alternatives are described in Table 2-2, Comparative Summary of Alternatives, in Section 2.10, Summary Comparison of Alternatives, of the DRMPA/DEIS.

As stated in Section 2.8.2, Eliminate Livestock Grazing from BLM-Administered Lands, in the DRMPA/DEIS, an alternative that eliminated livestock grazing on BLM-administered lands in the planning area was not analyzed in detail. In accordance with IM 2012-169 and BLM’s Land Use Planning Handbook, the BLM considered what range of alternatives was necessary to address unresolved conflicts among available resources. As a result of this process, an alternative reducing grazing use by 50 percent in the Big Gumbo area was developed in coordination with the USFWS and NDGFD. No issues or conflicts have been identified during this land use planning effort that require the complete elimination of livestock grazing within the planning area for their resolution. Where appropriate, removal of livestock and adjustments to livestock use, have been incorporated into this planning effort. Because the BLM has considerable discretion through its grazing regulations to determine and adjust stocking levels, seasons-of-use, and grazing management activities, and to allocate forage to uses of the

Review issue statement for opinions and reword or remove as needed. Consider consolidating issue statement to reflect condensed nature of response.

Many of the issue statements sound like opinion or voting. Reword or remove as appropriate.

Both issue statement and response sound as if written comment by comment. Please consolidate.

Plan	Issue Statement
------	-----------------

OR 1/2 Multiple commenters asserted and presented citations supporting their position that grazing benefits GRSG and helps prevent fires. Other commenters presented citations supporting the position that grazing damages GRSG habitat and other environmental resources. Some commenters stated that there are no studies that tie appropriately managed livestock grazing to population changes in GRSG. Both sets of commenters claim that the EIS fails to adequately support its conclusions regarding the potential harm to GRSG habitat posed by grazing.

Multiple commenters request clarification of the data presented in Appendix N, including dates for which LHA were conducted. Commenters request that the data in section 3.7 and Appendix N be checked and revised for consistency.

OR 2/2

UT Commenters disagree on whether science has determined if livestock grazing damages GRSG habitat or affects wildfire frequency; commenters on both sides of the question offer references and citations, and/or claim there is no science supporting the opposing position. Multiple commenters call for a comprehensive peer-reviewed study to answer the question before BLM/FS implements any changes to grazing management.

Some commenters assert that properly managed grazing (controlled for time, location, and intensity) can protect GRSG habitat and reduce fire risks.

Several comments refer to the Duck Creek OHA ruling, in which the BLM's RH assessments and grazing management decisions were found to be legally insufficient.

Several commenters emphasize site-specific data: BLM should not average grazing utilization across pastures, ecosystems, and

ID-SW MT Multiple commenters asserted and presented citations supporting their position that grazing benefits GRSG and helps prevent fires. Commenters suggested that GRSG habitat could be improved by reducing cheatgrass. Other commenters presented citations supporting the position that grazing damages GRSG habitat and other environmental resources. Both sets of commenters claim that the EIS fails to adequately support its conclusions regarding the potential harm to GRSG habitat posed by grazing.

One commenter states that the DEIS failed to include analysis of impacts to ecological resources and economics.

Additionally, lack of ability to adapt to changing conditions was noted.

Several commenters requested more detailed information about current grazing management and habitat conditions in the planning area. Other commenters noted that ongoing collaboration between private ranchers and federal agencies has helped preserve GRSG habitat and should be acknowledged in the EIS.

NV-CA Commenters question the applicability of habitat objectives in Table 2.6. Multiple commenters requested that the EIS discuss the difference between permitted and actual AUM use, and explain that the failure to use all of one's permitted AUMs is often outside the control of a permittee. Several commenters disputed specific suggested habitat objectives, or recommended the use of the Nevada and California Rangeland Monitoring Handbook for monitoring guidelines and procedures. Several commenters disputed the economic data provided as a baseline for analysis. One commenter noted a discrepancy in the data in Tables 3.33 and 3.31 with regards to the acres meeting land health standards. Regarding the justification from the Increased Grazing Alternative, one commenter stated that "It is equally true that there are currently no science-based studies that demonstrate that decreased livestock grazing on public lands would enhance or restore GRSG habitat or maintain or increase GRSG abundance and distribution".

NWCO The BLM needs to consider the additional referenced information in the EIS.  
Reisner, M. D., J. B. Grace, D. A. Pyke, P. S. Doescher. 2013. Conditions favouring Bromus tectorum dominance of endangered sagebrush steppe ecosystems. Journal of Applied Ecology, available at <http://onlinelibrary.wiley.com/doi/10.1111/1365-2656.12097>

Lewisto Multiple commenters requested that the  
wn RMPA/DEIS be amended to include  
allotment-level rangeland health data,  
allotment-level analyses of standards and  
guidelines implementation, and detailed  
descriptions of current grazing and habitat  
conditions in the planning area.

Multiple commenters asserted that  
appropriately-managed grazing is beneficial  
to GRSG and GRSG habitat.

ND The DRMPA/DEIS provides conflicting information on the impacts to sage-grouse from fences versus other range improvements that maintain or improve rangeland health. The DRMPA/DEIS fails to adequately disclose existing livestock grazing use.

WY9

## Response

~~As noted in Section 4.4 of this report, before beginning the Oregon Greater Sage-Grouse RMPA/EIS and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the Oregon sub-regional planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad-scale analyses required for land use planning.~~

~~A land use planning level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM realizes that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan level decisions. Land use plan level analyses are typically broad and qualitative rather than quantitative or focused on site specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12—Land Management Planning). The BLM will conduct subsequent project specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, grazing permit renewals, range improvement projects, and wild horse and burro gathers. The subsequent NEPA analyses for project specific actions will tier to the land use planning analysis and evaluate project impacts at the appropriate site specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site specific actions.~~

~~The BLM has reviewed references provided in public comments and incorporated them as appropriate. [NOTE TO BLM: Review suggested references to determine if/where information in EIS needs to be updated]~~

Section 3.7, Livestock Grazing/Range Management, discusses the current level of grazing in the planning area and management systems in place. It has been updated to include a discussion on the process used to determine if an allotment is located within GRSG habitat, trend information recorded within rangeland health assessments, and that only a portion and not an entire allotment may not be meeting rangeland health standards. Impacts of current and historic grazing on other resource and resource uses are discussed under the appropriate resource and resource use headings (e.g., Section 3.2, Greater Sage-Grouse and Sage-Grouse Habitat).

[NOTE TO BLM: Update Section 3.7 to include language on GIS exercise to determine which allotments are in GRSG habitat, trends information from rangeland health assessments, and to clarify that only a portion of an allotment may not be Section 3.7 has been reviewed for consistency with Appendix N and updated as needed. Appendix N and Tables 3-24 and 3-25 identify the name and number of the allotments within GRSG habitat, authorized AUMs, acres within PGH and PPH, management categories, and ratings for each of the 5 rangeland health standards. Allotments that have not completed rangeland health assessment to date have been added to Appendix N. The information contain in these sections is appropriate for a land use planning amendment. Additional details for these allotments may be required at a project-level scale and will be assessed at that time. Section 2.10, Summary of Environmental Consequences, has also been updated to add clarification to impacts under Alternative A. [NOTE TO BLM: Review Chapter 3 data in comparison with Appendix N and update as needed for consistency. Update pg. N-1 to clarify between rangeland health standards that do not apply to that particular assessment from those assessments that have not been completed. Expand paragraph on pg. 2-110 starting with “Alternative A has a low probability...” to describe rationale for statement or remove paragraph.]

Section 2.4, Resulting Range of Alternatives, contains a definition of improper livestock grazing, and any allotment that fails to meet rangeland health standards would be considered to be improperly grazed. The livestock grazing objectives in the RMPA/EIS contains methods to correct improper grazing management.

[Note to EMPSi: Add to livestock grazing paragraph on pg. 2-21: “Where rangeland health standards are not being met due to livestock, the BLM could require changes in livestock grazing practices at the allotment level, including adjusting permits and other necessary actions to make progress towards meeting rangeland health standards.”]

[NOTE TO BLM: Need to consider if Appendix N will include dates for rangeland health assessments. If not, please provide reasoning for not including dates in this response and suggest including a footnote in table in Appendix N]

As noted in section 4.4 of this report, before beginning the Utah Greater Sage-Grouse DLUPA/DEIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. ~~The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The data provided in the DLUPA/DEIS is sufficient to support, at the general land use planning level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/DEIS. A land use planning level decision is broad in scope and, therefore, does not require an exhaustive gathering of data. Although the BLM and the Forest Service realize that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan level decisions. Land use plan level analyses are typically broad and qualitative rather than quantitative or focused on site specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12—Land Management Planning). The BLM and the Forest Service considered new information and revised the FEIS as necessary, including Sections XXXXX [NOTE TO BLM: Update this sentence if new information was added to FEIS, or delete if no new information was added.]~~

The Duck Creek OHA ruling is under continued litigation and **cannot be used as case law until the final decision has** ~~yet to~~ be made.

Before beginning the LUPA/EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the Idaho-Montana planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

The BLM and the Forest Service used the most recent and best information available that was relevant to a land-use planning-level analysis including the Baseline Environmental Report (BER; Manier et al. 2013). The BER assisted the BLM and the Forest Service in summarizing the effect of their planning efforts at a range-wide scale, particularly in the affected environment and cumulative impacts sections. The BER looked at each of the threats to greater sage-grouse identified in the Fish and Wildlife Service's "warranted but precluded" finding for the species. For these threats, the report summarized the current scientific understanding, as of report publication date (June 2013), of various impacts to greater sage-grouse populations and habitats. The report also quantitatively measured the location, magnitude, and extent of each threat. These data were used in the planning process to describe threats at other levels, such as the sub-regional boundary and WAFWA Management Zone scale, to facilitate comparison between sub-regions. The BER provided data and information to show how management under different alternatives may meet specific plans, goals, and objectives. The BLM and Forest Service have reviewed references provided in public comments and incorporated them as appropriate. [BLM and Forest Service need to review suggested references comment by comment to determine if/where info in EIS needs to be updated]

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM and the Forest Service realize that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The BLM and the Forest Service will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, grazing permit renewals, range improvement projects, and wild horse and burro gathers. The subsequent NEPA analyses for project-specific

The BLM and the Forest Service should have a variety of peer-reviewed publications to provide the best available science as the basis for management.

Application of grazing management actions in Table 2.7 result from implementation level analysis, not the broad scale approach of this LUPA.

Before beginning the LUPA/EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the Nevada-Northeast California planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

BLM added language referencing the Nevada and California Monitoring Handbook for monitoring guidelines and procedures in Table(s) 2.XX.

The BLM and the Forest Service used the most recent and best information available that was relevant to a land-use planning-level analysis including the Baseline Environmental Report (BER; Manier et al. 2013). The BER assisted the BLM and the Forest Service in summarizing the effect of their planning efforts at a range-wide scale, particularly in the affected environment and cumulative impacts sections. The BER looked at each of the threats to greater sage-grouse identified in the Fish and Wildlife Service's "warranted but precluded" finding for the species. For these threats, the report summarized the current scientific understanding, as of report publication date (June 2013), of various impacts to greater sage-grouse populations and habitats. The report also quantitatively measured the location, magnitude, and extent of each threat. These data were used in the planning process to describe threats at other levels, such as the sub-regional boundary and WAFWA Management Zone scale, to facilitate comparison between sub-regions. The BER provided data and information to show how management under different alternatives may meet specific plans, goals, and objectives.

Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service and [NDOW, CDFW]. Considerations included but were not limited to [list the types of data or GIS layers that were gathered/used. A few examples: threatened and endangered species and their habitats, water quality- limited (303d) streams, deer and elk herd management areas, invasive

The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in Chapter 3 and various appendices including [cite appendix(es)] in the Nevada and Northeastern California DLUPA/EIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM and the Forest Service realize that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The BLM and the Forest Service will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, grazing permit renewals, range improvement projects, and wild horse and burro gathers. The subsequent NEPA analyses for project-specific actions will tier to the land-use planning analysis and evaluate project impacts at the appropriate site-specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site-specific actions.

BLM staff have reviewed the suggested studies and revised both the affected environment section and the impacts analysis of grazing and livestock management to reflect new studies and provide a more balanced approach regarding the environmental impact of livestock grazing on public lands, wildfire management, and wildlife habitats.

The EIS/LUPA will be amended to explain in more detail about permitted versus actual AUMs.

As noted previously in Section 4.4, Best Available Information, the BLM and the Forest Service complied with CEQ regulations in describing the affected environment. Of the suggested studies and references put forth by the commenters, the BLM reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined that...

*[NOTE TO BLM: If the information is essentially the same, then state this. If there were references that you determined were truly new, then note that they were included in the FEIS and if possible, provide the specific locations where.*

*Currently under review by BLM.]*

As noted in section 4.4 of this report, a land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM realize that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan level decisions. Land use plan level analyses are typically broad and qualitative rather than quantitative or focused on site specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The BLM will conduct subsequent project specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, grazing conditions, etc. The subsequent NEPA analyses for project specific actions will tier to the land use planning analysis and evaluate project impacts at the appropriate site specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site specific actions.

Regarding statements that current grazing levels leading to land health issues: All grazing allotments within the planning area including those in GRS habitat that were determined to not be meeting land health standards due to livestock grazing have had management changes implemented, as demonstrated in Table 3-45 (Lewistown Field Office Planning Area – Land Health Assessment) and discussed in the DEIS pp 3-66. Previously completed site specific EAs to renew grazing authorizations are discussed in the DEIS pp 3-65. The FEIS has been updated to include additional information on existing site specific EAs and corresponding land health determinations for clarity. In addition DEIS Pp. 3-67 lists order for grazing permit renewals and Figure 3-7, Resource Activity Plans – Grazing Authorization Renewal Areas, in Appendix A shows renewal locations relative to GRS habitat.

[Change to FEIS-Need to update the text on pp 3-65 to include the following: All grazing allotments within the planning area including those in GRS habitat that were determined to not be meeting land health standards due to livestock grazing have had management changes implemented. Details of management changes can be viewed in site specific EAs and land health determinations, available at: [http://www.blm.gov/mt/st/en/fo/lewistown\\_field\\_office/Watershed\\_Plans.html](http://www.blm.gov/mt/st/en/fo/lewistown_field_office/Watershed_Plans.html)]

[Note to BLM- need to check on data from NRCS/SGI study near Round-up Mt to determine if should incorporate info response and/or FEIS]

Fences can have both beneficial and adverse impacts on GRSG depending on their location and distance from leks. As described in Table 2-3, Description of Alternatives A, B, C, and D, (pages 2-32 and 2-33 of the DEIS) fences can impact GRSG differently depending their proximity to a lek, the size of a lek, and the surrounding topography. However, fences can also be beneficial for range management. The BLM will evaluate all fences during permit renewals for their impacts to GRSG and make adjustments at this site-specific NEPA level.

~~The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in Chapter 3 is sufficient to support, at the general land use planning level of analysis, the environmental impact analysis resulting from management actions presented in the DRMPA/DEIS.~~

~~A land use planning level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM realizes that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan level decisions. Land use plan level analyses are typically broad and qualitative rather than quantitative or focused on site specific actions. The BLM will conduct subsequent project specific NEPA analyses for projects proposed for implementation under the land use plan amendment. These subsequent NEPA analyses will tier to the land use planning analysis and evaluate project impacts at the site specific level (see 40 CFR 1502.20 and 1508.28). Before beginning the land use plan amendment process and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan level. Much of the data in the DRMPA/DEIS is sufficient to support the gross scale analyses required for land use planning.~~

The existing condition within the 28 grazing allotments are discussed in Section 3.13.2, Conditions on BLM-administered

Appears that some of the issue statements don't have a response #2 sounds like opinion rather than a statement that BLM failed to consider it and should have.

Both issue statement and  
response sound as if written  
comment by comment. Please  
consolidate.

Add cross reference to section  
4.4 for general NEPA  
requirements (see other  
responses).

Plan	Issue Statement
OR	<p>Commenters stated that the impacts analysis did not fully account for the indirect changes related to loss of public AUMs, including related changes to private lands and overall reduction in ranch herd size.</p> <p>Other comments requested additional analysis of the impacts of current management on grazing to allow for more complete comparison between alternatives.</p> <p>One commenter notes that limitations on water developments can have impacts on grazing management and need to be clarified and analyzed in greater detail.</p>
UT	<p>Several commenters requested updated AMPs that incorporate specific objectives for GRSG and habitat; and requiring a GRI score of 0 or better for allotments meeting rangeland health standards.</p> <p>Some commenters want BLM to study beneficial impacts of grazing, because reducing grazing would disrupt use of the range, impede construction of range improvements, cause other administrative effects. DLUPA should address effects on management of checkerboarded land if</p>
ID-SW MT	<p>Multiple commenters noted that one possible impact of reducing grazing on public lands would be the increase of grazing on private lands, or the conversion of private range lands to other land uses because ranching is made uneconomical.</p> <p>Other comments detailed beneficial impacts of grazing, and the adverse impacts of grazing restrictions on livestock operations, Rangeland Fire Protection Associations, and the local economy.</p> <p>One commenter notes that limitations on water developments can have impacts on grazing management and need to be clarified and analyzed in greater detail.</p>

NV-CA vMultiple commenters noted that Alternative A has ongoing range management regulations that have adversely affected livestock grazing (both AUMs and economic benefits), and those impacts should be discussed in the EIS. Multiple commenters also stated that the conclusion that Alternatives B, D, and E would cause no further reduction in actual livestock use (and therefore no economic impact) is unsupported. Multiple commenters noted that the adverse economic impacts of Alternative C were not sufficiently developed, and/or were under-estimated. One commenter noted that the road closures associated with every alternative would interfere with grazing, and this should be discussed in the EIS. Two commenters pointed out that Alternative C would disturb GRSG habitat and would not prevent damage from wild horses and burros; multiple commenters noted that cattle, wild horses and burros, and other herbivores all have different impacts on GRSG habitat and those differences should be acknowledged in the

NWCO The BLM failed to provide adequate analysis of the impacts from the alternatives on livestock grazing, as well as the effects of livestock grazing on sage grouse and its habitat.

Lewisto wn Commenter suggests the DRMPA/DEIS be amended to include more detailed analysis on the following issues: grazing as a surface-disturbing activity and the difficulty of setting guidelines when grazing utilization is averaged across pastures, species, and seasons.

ND The BLM failed to explain how and why reduced grazing in the Big Gumbo area translates to meaningful biological benefits for sage-grouse under Alternative C compared to Alternatives B and D. The DRMPA/DEIS fails to include erosion on grazed lands compared to non-grazed lands in the analysis of erosion related to livestock management. The DRMPA/DEIS inaccurately states that livestock grazing is a 'diffuse' form of biotic disturbance that exerts repeated pressure over many years on a system.

WY9

## Response

Impacts on livestock grazing from current livestock grazing management are addressed in Section 4.7, Livestock Grazing/Range Management. Impacts on the social and economic aspect of livestock grazing are discussed in Section 4.19, Social and Economic Impacts (Including Environmental Justice). Cumulative impacts on livestock grazing are addressed in Section 5.1.8, Livestock Grazing/Range Management. All of these sections have been updated to include a more thorough discussion of impacts based on issues brought up by commenters.

[Note to BLM: Review comments 0093-151, 0093-77, and 0220-24 to make sure those issues are addressed.

Update paragraph on pg. 4-74 “Water developments...” to cover how managed livestock grazing, including developments, can maintain and improve rangeland health.]

As required by 40 CFR 1502.16, the RMPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man’s environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the

As required by 40 CFR 1502.16, the DLUPA/DEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man’s environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/DEIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/DEIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the

Impacts to livestock grazing from current livestock grazing management is addressed in section 4.9.4. Impacts to the socioeconomic aspect of livestock grazing is discussed in Section 4.19.

As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man’s environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The Final LUPA/EIS will provide sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS’s impact analysis relevant to grazing and indirect socioeconomic impacts and was found to need additional information and support for the conclusions/findings. The BLM and the Forest Service have updated this information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary information to make informed land use plan-level decisions. Specifically, [BLM/Forest Service-insert a summary of the information that was updated and include a

Impacts to livestock grazing from current livestock grazing management is addressed in section 4.9.4. Impacts to the socioeconomic aspect of livestock grazing is discussed in Section 4.19. • The Socioeconomic tables in the LUPA/DEIS analyze land use planning level changes under all alternatives to billed AUMs. While only alternatives C and F propose land use planning changes to AUMs all of the alternatives could potentially adjust AUMs through implementation level planning if range land health standards and Sage Grouse objectives are not being met. • No road closures have been proposed during this land use planning process, however, during travel management implementation planning road closures may be proposed and will be analyzed in subsequent analysis. • As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1. • Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions. • As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The Final

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The DRMPA/DEIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions. [NOTE TO BLM: use this response if no changes were made in FEIS.]

While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS's impact analysis relevant to grazing and water quality was found to need additional information and support for the conclusions/findings. The BLM has updated this information in the Proposed RMPA/FEIS to provide the NOTE TO BLM/EMPSi: recommend revising the COT Report Threats – Grazing and Range Management Structures section of Alternative C in the GRSG section of Chapter 4 of FEIS to provide more specific impacts to GRGS from reducing AUMs in Big Gumbo area.

The DRMPA/DEIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DRMPA/DEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DRMPA/DEIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1). The DRMPA/DEIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. ## Response

n/a

n/a

n/a

The BLM and the Forest Service thoroughly explained its consideration and analysis of cumulative effects in the DLUPA/EIS in Section XX.XX. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective. The BLM and the Forest Service have complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning. The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. Impacts from the wild horse and burros on livestock grazing are identified in Section 4.9. Site specific analysis of grazing use is conducted as part of the land health assessment process. However the BLM and the Forest Service have updated the information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary information to make informed land use plan-level decisions. Specifically, a more comprehensive list of cumulative projects, past and future, has been developed, and used to support a more detailed analysis of cumulative impacts.

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

The impacts from livestock grazing on sage grouse and its habitat are discussed in Section 4.4.2; impacts from the management actions and conservation measures on livestock grazing are discussed in Section 4.12. The socio-economic

n/a

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions.

District-specific adaptive management techniques or Rangeland Health Standards assessments would not be appropriate to include in the LUPA/EIS; these schedules, assessments, and monitoring protocols would be developed at the district level, in coordination with local stakeholders and permittees.

As noted previously in Section 4.6 of this Report, land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions.

Mitigation, adaptive management and a monitoring framework were developed by a Disturbance and Monitoring Team that focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM and the Forest Service worked with WAFWA to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate data-sets will be established so that data can easily be “rolled up” for reporting monitoring results across the range of greater sage-grouse, as defined by Schroeder et al. (2004); by populations and subpopulations as defined by Connelly et al. (2004); by LUP area; by the seven (WAFWA) Greater Sage-grouse Management Zones (Stiver et al. 2006), and by Priority Areas for Conservation (PACs) as defined in the greater sage-grouse Conservation Objectives Team (COT) Report (U.S. Fish and Wildlife Service 2013).

*[Refer to the Monitoring Framework in the appendix.]* To accomplish effective monitoring, the BLM and the Forest Service will analyze the monitoring data to characterize the relationship among disturbance, implementation actions, and habitat

Funding and scheduling of district-level assessment efforts is outside the scope of this planning-level NEPA process. Habitat assessments may be conducted on a schedule determined by the District Manager, depending on resource availability, and could include evaluations more frequently than once every ten years. However the imposition of new or modified standards and guidelines would necessarily be tied to grazing permit renewals, which come only at ten-year intervals, and thus assessing the success of the conditions more frequently than that would not add much value.

Rangeland health standards would be developed at the district level, based on the most current science (including Connelly and Hagen's sage grouse habitat standards), would be tailored to local conditions, and would be used to assess rangeland health of allotments prior to granting or renewing grazing permits. A toolbox of permit conditions and conservation measures such as RDFs and BMPs would be available to District Managers to choose from when granting or renewing grazing permits, as applicable for each individual allotment within priority habitat. Blanket, one-size-fits-all standards and objectives would not be imposed on permittees under the RMPA.

Regarding implementation of structural range improvements and fences, fences within ph and gh are currently being evaluated, mapped and marked with the priority for modification of fences with high and moderate collision risks as

## Response

~~The BLM has the authority to petition the Secretary of the Interior to withdraw federal mineral estate from entry under the 3809 regulations, whether the surface ownership is administered by the BLM or any other non-BLM entity per 43 CFR 2300.~~

For lands where the BLM administers the locatable mineral estate but not the overlying surface, except for those lands patented under the Stock Raising Homestead Act, operator must file a Plan of Operations or Notice for all proposed operations (43 CFR 3809.31(e)). The regulations at 43 CFR 3809 apply to those activities within lands being explored, mined, or used for placement of facilities that are reasonably incident to exploration, development, or mining. The regulations also apply to the access roads and facilities across split estate lands to and from the project area.

Where the mineral estate is private and the surface is administered by the BLM, the 3809 regulations do not apply because the non-Federal minerals are not subject to the 1872 Mining Law. The BLM is not proposing, under any alternative, to apply restrictions on this type of split-estate. Because the BLM still has an obligation under 43 USC 1732(b) to prevent unnecessary and undue degradation, the owner or operator must obtain a special use lease, permit, or easement under 43 CFR 2920 before using the public lands to develop the private mineral estate, and may be required to provide a financial guarantee before commencing surface-disturbing activities. The BLM will review each proposed authorization under the regulations at 43 CFR 2920 to ensure compliance with the unnecessary and undue degradation requirement as required by Section 302 of FLPMA (43 USC 1732(b)). The proponent is required to submit certain information concerning the proposed action (43 CFR 2920.2-4). This information requirement is similar to those required under 43 CFR 3809.301 and 3809.401. Appropriate NEPA analysis must be conducted on any special use lease, permit, or easement before it is granted.

~~The BLM has the authority to petition the Secretary of the Interior to withdraw federal mineral estate from entry under the 3809 regulations, whether the surface ownership is administered by the BLM or any other non-BLM entity per 43 CFR 2300.~~

As noted above in the response in Section 4.3, Range of Alternatives, Section 1.5 of the Draft EIS describes how the Utah GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives.

The DEIS considered a broad range of alternatives that considers variations in PPMA and PGMA as well as different restrictions on locatable mineral development.

n/a

The FEIS will include a mitigation appendix, which will outline the mitigation process.  
For lands remaining open to mineral entry under the Mining Law of 1872 would be allowed.

If an area were to be withdrawn from mineral location, new activities such as filing mining claims and producing locatable minerals would be prohibited, subject to valid existing rights.

FEIS needs a definition of effective mitigation. This is not a locatable mineral-specific issue as the term is used throughout the DEIS under multiple program areas.

See Section 5.2 for FLPMA response, which includes rights of mining claims and claimants.

The summary of impacts in Table 2-8 under Alternative D for locatable minerals is consistent with the management actions in Table 2-5.

n/a

Section 1.5 of the DRMPA/DEIS describes how the Lewistown District Office Greater Sage-Grouse RMPA/EIS planning team employed the BLM planning process to develop a reasonable range of alternatives for the RMPA. The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the district office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the district office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

[Habitat objectives provided in the Management Plan and Conservation Strategies for Sage-Grouse in Montana Plan \(2005\) will be incorporated into Standards and guidelines for rangeland health under Alternatives B and D. Whether or not standards are being met will be determined prior to renewing grazing authorizations. A toolbox of permit conditions and conservation measures such as RDFs and BMPs \(Appendix C and D\) would be available to Managers to choose from when granting or renewing grazing authorizations, as applicable for each individual allotment within priority habitat.](#)

During the development of the Final EIS, the BLM met with the USFWS to determine changes to the management actions and mitigation measures. The outcome from these meetings resulted in noted clarifications and edits to the alternatives and impacts analysis (see Sections XXX of the FEIS). [NOTE TO BLM: provide direction of how to respond if the alternatives for

## Response

As required by NEPA, the baseline information used in the DEIS, including mineral material data, is based on the best available regional information and follows an agency accepted process. Mineral documentation is based on observed trends. GRSG is a landscape level species accompanied by a programmatic EIS for all of Eastern Oregon. Specific detail about any one mine is not appropriate in this planning effort. Additionally, documentation of minerals is based on observed trends. More specific locations, mining potentials, and claims will be carried out as part of a subsequent implementation-level mineral mining process.

n/a

n/a

National direction was to not develop a mineral potential report [follow up on justification for not preparing one and add language here], which limited the amount of baseline geology information available for the DEIS. Areas of actual mineral development are determined by mineral occurrence and economics..

The plan area boundary is the only feasible area to use for analysis of impacts due to mining.

n/a

n/a

n/a

Incomplete responses. Suggest numbering responses to correlate to issues.

Plan	Issue Statement
------	-----------------

OR	The BLM does not have authority to manage mining operations on private lands where the surface owner is also the owner of the mineral estate or on split-estate lands where the surface is private and the underlying mineral estate is in federal ownership and administered by the BLM (i.e., federal mineral estate). The BLM should disclose the estimated probability the proposed withdrawals will actually take place under the action alternatives.
----	---

UT n/a

ID-SW  
MT The EIS fails to provide justification as to why “withdrawal from mineral entry” is necessary to protect GRSG and its habitat when the same objective can be achieved through avoidance, minimization of impacts, and mitigation of impacts within the designated areas. The current approach in the EIS does not meet FLPMA requirements for finding ways to remain flexible in balancing conservation and resource uses

NV-CA ~~This section needs to be split into 4 subsections:~~

1. The DEIS does not comply with general mining laws and other applicable agency policies related to mineral development, which allow for environmentally responsible mineral development with appropriate mitigation.
2. The DEIS does not address impacts from regulations limiting routes and ROWs, various restrictions placed on mineral activity, for each alternative, are not analyzed or compared, and additional analysis is needed to fully address the impacts of locatable minerals.
3. The DEIS should not close lands from mineral entry until after mineral development potential has been assessed.
4. The DEIS should require additional mitigation measures for locatable mineral development. (This sentence needs to be expanded to define what "additional mitigation measures" should be required.

WY9

## Response

As stated on Page 1-9 of the Draft RMPA/Draft EIS, “Although the entire planning area includes various land management entities, the management directions and actions outlined in this RMPA/EIS will apply only to BLM-administered surface lands in the planning area (Table 1-2) and BLM-administered federal mineral estate that may lie beneath other surface ownership, often referred to as split-estate lands. Table 1-4, BLM-Administered Mineral Split-Estate by RMP in the Planning Area, shows BLM-administered mineral split-estate beneath private, state, and other federally administered surface lands in the planning area. Because other federal and state surface land managers have management plans in place for their surface lands, the decisions resulting from this planning process will apply to only BLM-administered federal mineral split-estate beneath only private surface lands (2,639,000 acres in the planning area). The acreage of BLM-administered surface lands in the planning area and the acreage of BLM-administered federal mineral split-estate beneath private surface in the planning area are collectively referred to as the decision area.” In other words, the BLM is not proposing, under any alternative, to make decisions for private lands where the surface owner is also the owner of the mineral estate.

The BLM has the authority to petition the Secretary of the Interior to withdraw federal mineral estate from entry under the 3809 regulations, whether the surface ownership is administered by the BLM or any other non-BLM entity [need citation]. For lands where the BLM administers the locatable mineral estate but not the overlying surface, except for those lands patented under the Stock Raising Homestead Act, operator must file a Plan of Operations or Notice for all proposed operations (43 CFR 3809.31(e)). The regulations at 43 CFR 3809 apply to those activities within lands being explored, mined, or used for placement of facilities that are reasonably incident to exploration, development, or mining. The regulations also apply to the access roads and facilities across split estate lands to and from the project area.

Where the mineral estate is private and the surface is administered by the BLM, the 3809 regulations do not apply because the non-Federal minerals are not subject to the 1872 Mining Law. The BLM is not proposing, under any alternative, to apply restrictions on this type of split-estate. Because the BLM still has an obligation under 43 USC 1732(b) to prevent unnecessary and undue degradation, the owner or operator must obtain a special use lease, permit, or easement under 43 CFR 2920 before using the public lands to develop the private mineral estate, and may be required to provide a financial guarantee before commencing surface-disturbing activities. The BLM will review each proposed authorization under the regulations at 43 CFR 2920 to ensure compliance with the unnecessary and undue degradation requirement as required by Section 302 of FLPMA (43 USC 1732(b)). The proponent is required to submit certain information concerning the proposed

n/a

~~The facts that Sagebrush takes decades to re-establish and that disturbance from light and noise that accompany mineral development affect GRSG in a substantial way, meaning that avoidance, minimization of impacts and mitigation of impacts are not sufficient methods of protecting GRSG and sage brush habitat. Additionally, this concept was considered within the range of alternatives, as explained under Section 4.3, NEPA Range of Alternatives in this section. and Alternative D does not withdraw lands from mineral entry.~~ No change to the EIS has resulted from this comment. [NOTE TO BLM: Consider whether inserting text to this effect into the EIS is appropriate.]

The General Mining Law of 1872, as amended allows for access for environmentally responsible mineral development. There are standards in place that allow the BLM to regulate the nature of access and development. Impacts on locatable mineral development/access would vary and depend on site specific conditions. Projects would be analyzed on a case-by-case basis.

[Insert language from other issue regarding decision to not prepare a mineral potential report for this EIS]. Any recommendation submitted to Congress for mineral withdrawal must be accompanied by a mineral potential report covering the area proposed for withdrawal.

[See lands for language: mitigation measures will be included in the FEIS as an appendix]

WY9

## Response

n/a

n/a

n/a

The FEIS will include a final mitigation plan as an appendix and will include a definition of effective mitigation.

n/a

Locatable minerals are minerals for which the right to explore or develop the mineral resource on federal land is established by the location (or staking) of mining claims and is authorized under the General Mining Law of 1872. The BLM can only apply mitigation measures to prevent unnecessary or undue degradation means conditions, activities, or practices that (43 CFR 3809.5): (1) Fail to comply with one or more of the following: the performance standards in Section 3809.420, the terms and conditions of an approved Plan of Operations, operations described in a complete notice, and other federal and state laws related to environmental protection and protection of cultural resources; (2) Are not “reasonably incident” to prospecting, mining, or processing operations as defined in Section 3715. 0-5 of this chapter; or (3) Fail to attain a stated level of protection or reclamation required by specific laws in areas such as the California Desert Conservation Area, Wild and Scenic Rivers, BLM-administered portions of the National Wilderness System, and BLM-administered National Monuments and National Conservation Areas.

A plan of operations is not a BLM plan; rather it is submitted by the applicant wanting to develop the minerals. Appendix C and Appendix D of the Lewistown Field Office Greater Sage-Grouse DRMPA/DEIS contains best management practices (BMPs) that could be applied to locatable minerals. The BMPs are designed to protect GRSG habitat. Before exploration licenses and licenses to mine are approved, a project-specific environmental review document would be prepared to assess impacts. BMPs would be applied as COAs or mitigation measures to the authorizing document as determined by site specific project level NEPA analysis as to prevent undue and unnecessary environmental degradation.

### **[Consider using this national language on mitigation:**

Mitigation has been further defined as a Regional Mitigation Framework and is detailed in Appendix X. The Framework is incorporated in the [insert Proposed Plan/Proposed Plan Amendment] and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats.

ND	n/a
WY9	

## Response

n/a

n/a

n/a

n/a

The conflict arose from a typographic error in the Draft EIS. The referenced section should note that it refers to Alternative C, not Alternative D as Alternative C is the most restrictive of the alternatives analyzed in the EIS. This error has been corrected in the Final EIS, see *Section XX*.

n/a

n/a

Plan	Issue Statement
------	-----------------

OR	The BLM should consider using seasonal and temporal closures and/or noise regulations to reduce impacts of recreation on sage-grouse. Furthermore, the BLM should address the issue of hunting of sage-grouse. Travel management plans should be prioritized for GRSG.
----	--

UT	Commenters stated that various alternatives are inadequate to protect GRSG from the impacts of recreation (e.g., antler collection, camping, and OHV travel) and that more stringent measures should be put in place. Additional comments suggested changes to the noise restrictions included in the EIS as they affect recreational activities.
----	---

ID-SW MT In the EIS/LUPA, the BLM/FS should incorporate additional management actions (e.g. SRP/SUP stipulations, OHV noise regulations, seasonal restrictions on OHV events near leks, and rerouting of OHV events away from leks, and hunting) to limit the potential for impacts on Sage-Grouse from recreation activities. Any management actions limiting recreation activities in sage-grouse habitat should be based on the best available science with proven habitat conservation results.

NV-CA The BLM should consider using seasonal and temporal closures and/or noise regulations to reduce impacts of recreation on sage-grouse.

NWCO n/a

Lewisto wn The BLM needs to consider additional actions or clarifications to existing actions within the range of alternatives, including expanding protections /buffers beyond GRSG habitat.

ND WY9 n/a

## Response

During subsequent implementation-level travel management planning, new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including speed.

Seasonal and temporal closures have been proposed in Oregon for this planning effort (see proposed plan). Seasonal closures will diminish noise near leks.

For the Greater Sage-Grouse planning effort, travel management plan prioritization has been addressed in the Final EIS and is addressed in section XX.

Oregon Department of Fish and Wildlife manages hunting; therefore, hunting is not addressed in this planning effort because it is outside the scope of the EIS.

As noted above in the response in Section 4.3, Range of Alternatives, Section 1.5 of the Draft EIS describes how the Utah GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives.

The EIS considers an adequate range of alternatives to protect GRSG, including varying levels of restriction on recreational activities. The State of Utah regulates antler collection in the planning area, and the BLM does not allow cross-country motorized travel for collection of antlers in areas that are limited or closed to such travel. Under all action alternatives, GRSG habitat would be designated as at least limited to existing routes until route designation is completed. Noise restrictions in the EIS only apply to discretionary activities (e.g., SRPs for competitive events) and would not apply to

The EIS considers an adequate range of alternatives to protect GRSG, including varying levels of restriction on recreational activities and special recreation permits/special use permits. See recreation decision D-RC-1 and D-RC-3 in Table 2-18. During subsequent implementation-level travel management planning, new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including speed. New travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions during subsequent implementation level travel management planning. 43 CFR 8340 requires all OHVs to comply with state laws including noise and spark arrester requirements.

Contemporary hunting seasons in the Idaho and Southwest Montana Sub-region are very conservative with respect to their length and bag limits. The Idaho GRSG hunting season is determined annually according guidelines outlined in the 2006 Conservation Plan for the Greater Sage-grouse in Idaho (see table X below). Each year in August, IDFG evaluates population trends in 14 sage-grouse hunting zones and compares the data to the Conservation Plan guidelines. This information is then provided to the Commission. After considering population trend data, public input and local other issues, the commission, for each unit, either closes the season, or opens it at the restrictive level (7 day season with a 1 bird bag limit) or standard level (23 day season with 2 bird bag limit). This strategy allows for hunting opportunities in areas of healthy sage-grouse populations, while also closing areas to hunting where population numbers are low or have been impacted by large wildfires or other habitat issues. This past year, the sage-grouse hunting season was limited to seven days in 12 of the 14 hunting zones, with 2 zones being closed to hunting. Since implementing these guidelines, annual harvest has decreased significantly. In the past three years, harvest has averaged 2,900 sage-grouse per year, compared to 1985–1995 when an estimated 37,500 sage-grouse were harvested annually in Idaho.

In Montana, hunting seasons are... (Describe MT hunting season strategy).

In the past, sage-grouse harvest, like other upland game, was perceived to be a compensatory form of mortality (the proportion of the population that was harvested would have died from some other factor if hunting did not occur).

However, recent research has suggested that sage-grouse may be more susceptible to over-harvest than other upland game species because they have population characteristics that include relatively low reproductive rates, long lives, low annual turn-  
During subsequent implementation level travel management planning new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including noise levels and speed. Travel Management plans would not typically include noise levels.

The most recent and best available literature for establishing minimum noise level is research by Blickley (2012) and Patricelli (2012). Their research concluded that the current noise level restrictions applied by the BLM/FS for GRSG are already set too high and there are documented negative impacts to GRSG under these restrictions. The current noise restrictions are a minimal decibel level (dBA) of 10 over ambient noise levels which is equivalent to 39 dBA . The commenter (#0032-2) recommends a dBA of 96-101 based on the date that a vehicle was manufactured and is citing the CA State OHV Sound Law. This law was not established based on wildlife research or any minimum/maximum disturbance levels to wildlife. Based on research specific to noise impacts on GRSG, the BLM/FS will be applying maximum noise levels of less than 39 dBA (including ambient levels) on site-specific projects through Required Design Features and Best management Practices. These projects would undergo additional NEPA analysis at the project-level, which is outside the scope of this document. Need to see what the RDF states and revise based on new research. (Noise levels are likely to change based on Arlene's research.)

n/a

Section 1.5 of the DRMPA/DEIS describes how the Lewistown Field Office Greater Sage-Grouse RMPA/EIS planning team employed the BLM planning process to develop a reasonable range of alternatives for the RMPA. The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

Also as previously noted, the relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives.

Meaningful differences among the four alternatives are described in Table 2-3, Comparative Summary of Alternatives, in Section 2.10, Summary Comparison of Alternatives, of the Draft EIS. Specifically, impacts of Alternative B would be similar to Alternative D as both only allow neutral/beneficial SRPs on PH.

During the development of the Final EIS, the BLM met with the USFWS to determine changes to the management actions and mitigation measures. The outcome from these meetings resulted in noted clarifications and edits to the alternatives and n/a

## Response

In accordance with NEPA, the information presented in the DEIS is based upon the best scientific information available at the time the document was being written. [BLM: determine if additional references are needed to support the analysis as noted by the commenters].

The BLM uses the best data available based on the metrics they have developed.

Garfield County has not identified any specific instances in which this plan amendment conflicts with recreational decisions in local plans.

Section 3.16 of the DEIS recognizes that GRSG population areas overlapping Garfield County (i.e., Panguitch and Parker Mountain) contain a designated route network. Travel management plans completed for Kanab, Richfield, GSENM, and Dixie National Forest identified this network. The BLM and Forest Service are not proposing changes to this route network as part of this planning effort. Additional information has been added to Sections 3.16 and 4.16 of the FEIS discussing recreational opportunities in the Parker Mountain and Panguitch population areas. [EMPSi ACTION ITEM FOR FEIS: Add info on Bryce Canyon etc. Work with Dave Jessason at BLM]  
n/a

Cite general disturbance factors (human activity, predator perching) for recreation facilities .

NDOW cites Lyon and Anderson (2003) suggesting that light traffic disturbance (1-12 vehicles/day) during the breeding season might reduce nest-initiation rates and increase distances moved from leks during nest-site selection. NDOW also see acoustic impacts from machinery as a possible disruption in breeding activity (BSlickley and Patricelli 2012).

Additionally, recreation, including hiking, hunting and fishing, and OHV use in areas surrounding urban centers can negatively influence sage-grouse through habitat loss and fragmentation, facilitation of exotic plant spread, animal displacement or avoidance, establishment of population barriers, or increased human-wildlife encounters that increase wildlife mortality (Connelly and others, 2004). Recreation on lands managed by the BLM remains a significant land use with potential impacts to range conditions and sage-grouse populations (Connelly and others, 2004; also see Section III. A12. Other Land Uses). The cumulative nature of changes to the sagebrush biome as a result of human encroachment needs to be considered when managing sage-grouse. Mainer et al. 2013 pp 31.

Dispersed recreation activities (including but not limited to off-highway vehicles, camping, bicycling, and hunting), which utilize the extensive network of official and unofficial roads, have an extensive and difficult-to-measure impact on sagebrush and sage-grouse (also see Section III. A4. Infrastructure). Potential impacts include noise (Blickley and others, 2012), distribution of invasive plants, (With, 2004; Christen and Matlack, 2009; Bradley, 2010; Huebner, 2010), generation of fugitive dust (Gillies and others, 2005; Lee and others, 2007; Ouren and others, 2007; Padgett and others, 2008), and effects on predator and prey behavior (Gavin and Komers, 2006; Poulin and Villard, 2011; Whittington and others, 2011). Uninhabited areas within the Great Basin ecoregion (MZs III and V) decreased 90 percent (22.2 million acres [90,000 km<sup>2</sup>]) to less than 3 million acres (12,000 km<sup>2</sup>) with expansion driven by economic and recreation opportunities in the region (Knick and others, 2011); similarly, population densities have increased 19 percent in the Wyoming Basin region (MZ II) and 31 percent on the Colorado Plateau (MZ VII) since 1920 (Knick and others, 2011). With expanding populations comes greater human impacts (Leu and others, 2008), which is magnified by popular access to public lands (Hansen and others, 2005) and dispersed uses that expand the human footprint. Impacts of roads and motorized trails include mortality due to collisions, behavior modifications due to noise, activity and habitat loss, alteration of the physical environment, leaching of nutrients, erosion, spread of invasive plants, and increased use and noise due to accessibility (Knick and others, 2011). Closing unused and unnecessary roads in and around sagebrush habitats (for example, seasonal closure of specified sage-grouse habitats) may

## Response

n/a

n/a

n/a

Contemporary hunting seasons in the Nevada and Northeastern California Sub-region are generally very conservative due to their length and bag limits. The Nevada GRSG hunting season is limited to 10-15 days with a bag limit of 2 birds daily and 4 birds in possession. While California allows a 2 day season and a bag limit of 2 birds per permit. Where GRSG populations are considered rather small and/or isolated, hunting seasons have been closed. Five counties in Nevada and over 20 hunt units have been closed to GRSG hunting since 1997. In California, two hunt zones were closed in 2012 and 2013 due to large wildfires within the Buffalo Skedaddle Population Management Unit. These units will likely remain closed to GRSG hunting in future years until significant habitat and population recovery occurs.

The biological issue remains whether or not hunting GRSG is additive, and contributes to population declines, or compensatory with other sources of mortality (e.g. predation). Research conducted on GRSG hunting indicates that local circumstances, such as overall population size and connectedness, habitat condition and proximity to urban areas may play an important role as to whether mortality is additive or compensatory. In a long-term study conducted in Eureka County, Nevada, Blomberg et al. (2013) found that human harvest accounted for 2 percent of all mortality and did not adversely impact GRSG populations.

There are ancillary benefits to GRSG hunting. Even though few hunters purchase a hunting license specifically for GRSG hunting, hunting license dollars are used to match federal grants (Pittman-Robertson Act) to conduct monitoring work annually, conduct research projects and implement habitat enhancement and restoration projects. Additionally, wings from hunter harvested GRSG are analyzed annually to determine nest success, recruitment and overall population viability. Cessation of hunting would likely eliminate the usage of hunting license dollars as a match for federal aid grants and greatly reduce annual monitoring efforts, research and habitat restoration projects that are currently funded through this mechanism. (NDOW 2014). (Review Comments to the Nevada and Northeastern California Sub-Area Sage-grouse LUPA/DEIS)

For the FEIS, the BLM has considered allowing/creating trailheads if roads are closed to motorized use and non-motorized use is allowed. Develop criteria for development of trailheads/parking areas. Limit disturbance to minimum necessary to accommodate typical use such as parking/unloading/turning horse trailers. Any structures (signs, fencing, etc.) not provide

NWCO	n/a

Lewisto wn Commenters requested clarifications in the FEIS, including defining “public interest” when referring to “where disposal is deemed to be in the public interest” and if RDFs will be required for existing salable mineral operations. Commenters also requested that PH/GH be considered as such "key wildlife areas" in the selected alternative.

ND n/a  
WY9

## Response

[Waiting for direction from the national policy team.]

Closure of PGMA was considered in this planning effort and PPMA has been changed to include allowance of mineral material sites with concurrence from Oregon Department of Fish and Wildlife. Saleable minerals are discretionary. Locatables require notices of plan of operations.

n/a

n/a

Salable minerals is a discretionary action and authorizing the sale of permits would be in conformance with the final LUPA/EIS and existing regulations.

Action D-SAL 2 provides for reclamation of sites no longer in use.

n/a

Section 1.5 of the DRMPA/DEIS describes how the Lewistown Field Office Greater Sage-Grouse RMPA/EIS planning team employed the BLM planning process to develop a reasonable range of alternatives for the RMPA. The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

Also as previously noted, the relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives.

Meaningful differences among the four alternatives are described in Table 2-3, Comparative Summary of Alternatives, in Section 2.10, Summary Comparison of Alternatives, of the Draft EIS.

During the development of the Final EIS, the BLM met with the USFWS to determine changes to the management actions and mitigation measures. The outcome from these meetings resulted in noted clarifications and edits to the alternatives and impacts analysis (see Sections XXX of the FEIS). [NOTE TO BLM: provide direction of how to respond if the alternatives for saleable minerals were revised in the FEIS.]

As discussed in the DEIS (pp XX) Under Alternatives B, C, and D if an area is open to saleable minerals, mineral material sales or permits are analyzed on a case-by-case basis with site-specific NEPA. Based on this analysis, the field manager would issue sales or permits with RDFs or deny the proposal if impacts cannot be mitigated.

## Response

As stated on page 4-207 of the Draft RMPA/Draft EIS, "Management actions also apply to mineral material development on lands overlying federal mineral estate, which includes federal mineral estate underlying BLM-administered lands and lands not administered by the BLM." As such, operations on private land with federal mineral estate would be impacted in the same way as described in Section 4.13 of the Draft RMPA/Draft EIS. [Note to BLM: This section of the DEIS seems a little contradictory. The quoted statement is in the Assumptions section but on page 4-208, mineral split-estate is listed as a resource topic that wouldn't affect mineral materials. These two things seem to be at odds. Suggest checking Sections 4.11-4.14 to make sure the assumptions are accurate and are consistent with the list of resources that wouldn't affect the applicable topic.]

|----|---|
| OR | <p>Commentators recommend that the BLM Review the following data in the DEIS for accuracy and consider the recommended sources and data:</p> <p>typical impacts of BLM permit reduction at the ranch level</p> <ul style="list-style-type: none"><li>• mineral production employment estimates</li><li>• numbers for recreation/tourism employment</li><li>• Recreational visits</li><li>• Visitor spending by recreational visitors</li><li>• Income and Employment data and comparison areas</li><li>• Social and nonmarket values associated with ranching</li><li>• Environmental Justice</li></ul> |
|----|---|

In general, commenters stated that use of more specific, regional data would be more accurate.

Commenters question the use of data from 2010 stating that more recent data could be more accurate.

Commenters also question the accuracy of trends data from 2000-2010, stating that a

UT The DLUPA/DEIS fails to adequately describe the current socioeconomic conditions in the planning area. Economic data used in the analysis is from 2009, when communities were hard hit from the recession. Socioeconomic data in Chapter 4 is not consistent with data provided in Chapter 3. The DLUPA/DEIS fails to recognize the cultural values and uses of the land of the local population. Religious groups and the rural population may be considered minorities in comparison to national and statewide trends and the subjects of environmental justice. Analysis ignores other readily available data.

ID-SW n/a

MT

NV-CA BLM must revise the socioeconomic baseline analysis to include current economic data particularly related to livestock grazing, mining, tax revenues, and unemployment. Certain sectors and existing resources were inaccurately characterized including geothermal energy development in Churchill County, livestock grazing (generally and for Eureka Co and Modoc Co, specifically), and mining (Eureka Co and Elko Co). The relationship between billed and active AUMs is misleading – the BLM needs to better explain the factors that contribute to those differences. The discussion on interest groups and communities of place are confusing and hard to follow. BLM did not reference or evaluate several relevant existing studies (citations provided in comments). BLM did not disclose the

NWCO The BLM needs to use more current and site specific data, including new data from 2012 and analyze disadvantaged communities by place of residence, not just county of residence.

Lewisto n/a

## Response

Before beginning the RMPA/EIS and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The RMPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

As a result of these actions, the BLM and the Forest Service gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the DLUPA/EIS, and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives (Chapter 4). As a result, the BLM and the Forest Service have taken a “hard look,” as required by the NEPA, at the environmental consequences of the alternatives in the DLUPA/EIS to enable the decision maker to make an informed decision. Finally, the BLM has made a reasonable effort to collect and analyze all available data.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM and the Forest Service realize that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The BLM and the Forest Service will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, [etc.; list others as applicable]. The subsequent NEPA analyses for project-specific actions will tier to the land-use planning analysis and evaluate project impacts at the appropriate site-specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site-specific actions.

Of the suggested studies and references put forth by the commenters, the BLM reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined

The BLM and USFS used the best available data at the time of preparation of the DEIS. Most data are from 2010 and provide a snapshot of data at the time. The analysis of economic impacts of management alternatives through effects on the oil and gas industry is based on projected development over the 2014-2028 fifteen year period, not on the baseline data used. The baseline data serves as a reference for the relative magnitude of impacts and BLM and USFS do not expect the difference in impacts across alternatives to be meaningfully altered by updating the baseline. However, the BLM and USFS expanded and updated the baseline information for the FEIS, to the extent needed to support an expanded discussion of the geographic distribution of impacts and to avoid data that may not accurately reflect long term trends, due to the recession of 2008 and 2009.

The BLM and USFS followed CEQ guidance in the definition and identification of minority and low-income populations for the purpose of environmental justice analysis. However, in response to comments, the BLM and USFS expanded the discussion of cultural values and uses of public lands in the study area in the socioeconomics section, recognizing rural and religious characteristics of the population.

The BLM and Forest Service reviewed the suggested studies and references put forth by the commenters and incorporated to the extent that they presented new and high quality information that would need to be incorporated into the FEIS.

All agencies participating as cooperating agencies have been given opportunities to participate during various steps of the planning process, including regular briefings, requests for input on draft alternatives and the administrative draft EIS, and identification of issues and data during scoping and during the DEIS comment period, as required by 40 CFR 1503.2 and 40 CFR 1506.10. Based on the coordination efforts describe above, the BLM and Forest Service have met the legal and n/a

Next steps: ICF will, not limited to, complete the following: (1) Review comment summary and comment excerpts to ensure all issues have been sufficiently characterized. (2) Review the documents cited in the comments to determine if the information contained within conflicts with the current characterization of the social and economic conditions or if the information provides additional information that would alter the interpretation of impacts. ICF will revise the baseline to incorporate this information, if deemed appropriate. (3) ICF will review the data and characterization of the specific sectors that comments indicated were mischaracterized and make changes if needed. (4) ICF will add a discussion regarding factors that contribute to differences in billed and active AUMs [ICF will work with Josh Sidon and Mike Tietmeyer to develop language.]

Below is a partial and draft response for this theme and issues identified within:

BLM and USFS used the best available data at the time of elaboration of the DEIS. Most data are from 2010 and provide a snapshot of data at the time. BLM does not expect the difference in impacts across alternatives to be meaningfully altered by updating the baseline.

As noted previously in Section X.X, Best Available Information, the BLM and the Forest Service complied with CEQ 8 regulations in describing the affected environment. Of the suggested studies and references put forth by the commenters, the BLM reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined that...

BLM and USFS added information related to...[renewable energy in Churchill, mining in Eureka & Elko, livestock grazing...]

As noted previously in Section 4.4, Best Available Information, the BLM and the Forest Service complied with CEQ regulations in describing the affected environment. BLM and USFS used the best available data at the time of elaboration of the DEIS. Most data are from 2010 and provide a snapshot of data at the time. BLM does not expect the difference in impacts across alternatives to be meaningfully altered by updating the baseline.

BLM and USFS described the affected area at a geographic level that would support the analysis of potential socioeconomic and environmental justice impacts. However, BLM and USFS edited Section 3.24 to recognize the potential presence of minority and low-income communities at the sub-county level. Potential disproportionately high and adverse human health and environmental effects on these communities from implementation actions would be analyzed during assessment of site specific projects.

*[NOTE TO BLM: Double check available data to determine if 2012 data is applicable. Restate methodology for establishing baseline sources and explain if current data will be used to the site estimates. Restate appropriate level of analysis (county level) due to*

OR	<p>Commenters state that the DEIS does not include sufficient analysis on the impacts of management actions related to livestock, and suggest that analysis of the following be included in the FEIS:</p> <ul style="list-style-type: none"><li>• Cost of replacement pasture</li><li>• Cost of transport of livestock to replacement pasture</li><li>• Downsizing of herds and subsequent loss in income</li><li>• Cost of changes to water developments</li><li>• Cost of drought management changes to grazing</li><li>• Cost in changes to seasons and timing of grazing</li><li>• Cost of changes to kind of livestock</li><li>• Impacts to property value of ranches resulting from changes to grazing permits</li><li>• Impacts to full and part time employees of ranches and the impacts to the community</li><li>• Context and intensity of the loss of ranching jobs in small rural communities</li><li>• Social aspects of loss of lifeways, traditions, skills with reduction/elimination of grazing</li><li>• Changes in cost for wildfire and invasive weed treatment as a result in changes to</li></ul>

UT 1/2 The DEIS analysis

underestimates/understates the economic hardships that restrictive management actions would impose on planning area operators, communities, and services. The BLM's analysis was overly generalized and did not provide county specific impacts. No effort is made to identify the size or intensity of impacts listed in the document. County land use plans were not considered in the analysis. The authors failed to recognize the cultural impacts associated with the alternatives (some counties have designated grazing as an activity of historic and cultural significance). The analysis is biased in favor of non-market valuation methods based on questionable methodology.

With respect to socioeconomic impacts of management alternatives through effects on specific resources:

- The EIS does not adequately analyze the impacts of management alternatives on recreation, lands and realty and travel management;
- The EIS does not adequately analyze the

UT 2/2

ID-SW MT The socioeconomic analysis in the DEIS is overallly broad and does not provide sufficient analysis of impacts to individuals, local communities or counties. The DEIS should also expand analysis of the restrictive management actions on planning area operators, communitis and services including but not limited to grazing operators and mining. Finally, the analysis methodology is inadequate to provide a comprehensive analysis of direct, indirect, and cumulative analysis of the socioeconomic impacts on the planning area communities.

NV-CA Initial Language:

1/2 The BLM fails to disclose/include/evaluate/identify/consider/quantify the socioeconomic impact(s) of/on/to: Alternative C, local government tax revenues due to reduced locatable mineral exploration and development, proposed wildland fire and fuels management, designation of ACECs under Alternatives C and F, locatable-mineral development and exploration, mineral withdrawals on Tribal lands, new project mitigation requirements, Alternative A on all resources, land withdrawals and restrictions on mining and recreation, the net economic effect on recreational activity (OHV, hunting), acres closed to Leasable Minerals Management and to Salable Minerals, OHV area designation changes in PPMAs/PGMAs, loss of livestock grazing, loss of future mineral extraction, loss of mineral/oil/gas exploration and renewable energy potential, recognize ancillary economic components (residential, commercial and industrial development), loss of quality of life features (education, recreation, housing), loss to the property

NWCO The DEIS analysis

underestimates/understates the economic hardships that restrictive management actions would impose on planning area operators, communities, and services. The DEIS also does not disclose the indirect impacts to communities and services which had been raised in scoping, such as the effects of more restrictions resulting in less support emergency services, thereby resulting in harm to life & property. Also, the BLM's analysis was overly generalized and did not provide county specific impacts. The analysis methodology is inadequate to provide a comprehensive analysis of direct, indirect, and cumulative analysis of the socioeconomic impacts on the planning area communities. Finally, the DEIS is biased in

Lewisto wn The final EIS should address the local, regional, and national socioeconomic effects related to wind energy in the cumulative effects analysis. Commenters requested a thorough economic calculation in the FEIS of the value lost from negative environmental impacts.

ND WY9 n/a

## Response

[NOTE: Waiting for ICF input before editing response.]

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

[BLM provide input on why county level analysis was not completed]

Impacts were considered on numerous resources, resource uses, and socioeconomic conditions, which included [list noted issues]. See Section 4.22 of the Draft EIS.

The DLUPA/EIS describes the methodology and assumptions used for conducting the impact analysis (see Section 4.22.2 of the Draft EIS). The methodology and assumptions provide an adequate starting point for discussion of the environmental

As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS describes the methodology and assumptions used for conducting the impact analysis (see Section 4.22.2 and Appendix W of the Draft EIS). The methodology and assumptions provide a starting point for discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.24, the DLUPA/EIS identified methodologies used and made reference to the scientific and other sources relied upon for conclusions in the analysis. Based on these methodologies and assumptions, the DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Socioeconomic impacts assessed include impacts on output, employment, earnings and tax revenues in the affected area, non-market values, population and public services, specific groups and communities as well as environmental justice impacts. See Section 4.22 of the Draft EIS.

- A discussion of the potential socioeconomic impacts of management alternatives through mining of locatable and saleable minerals was included, as was a discussion of phosphate minerals;
- The oil and gas RFD was revised to recognize impacts of management alternatives on current leases;
- The discussion of potential impacts on wind energy was expanded;
- Information on the socioeconomic impact on school trust lands from making surrounding BLM and Forest Service-administered lands unavailable for various uses has been added;
- A discussion of the economic impacts of shifting development from Federal to private lands was added;
- A brief explanation of impacts on BLM administrative costs was included;
- The socioeconomic analysis was expanded to include a discussion of impacts cumulative with those of sage grouse habitat management alternatives being considered for other western states.
- BLM considers that several aspects commented on are appropriately addressed in the DEIS. In particular, the treatment of non-market values in this EIS is consistent with BLM guidance (see BLM IM 2013-131). Only those non-market values that

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

[BLM provide input on why county level analysis was not completed]

Impacts were considered on numerous resources, resource uses, and socioeconomic conditions, which included [list noted issues]. See Section 4.22 of the Draft EIS.

The DLUPA/EIS describes the methodology and assumptions used for conducting the impact analysis (see Section 4.22.2 of the Draft EIS). The methodology and assumptions provide an adequate starting point for discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.24, the

Next steps (general): ICF will review all comment excerpts to determine if the issues have been adequately summarized.

Scale (response – next steps): Consistent with the treatment of this comment in other subregions, ICF will investigate options and opportunities for disclosing information on impacts at a smaller geographic scale (county or place) for specific resource uses. If any of the impacts of specific resource uses, and the service centers that support them, are determined to be centralized in a subset of the planning area, ICF may run an additional IMPLAN analysis for the identified area.

Scale (draft/partial response): Although the discussion of impacts to counties and local communities was expanded to the extent possible, the distribution of estimated impacts to counties, cities and towns depends on the location of expenditures associated with economic activities. This location is often not known at the county, city or town level, based on the available data. In addition, In particular, because economic activity in one community or county typically has socioeconomic effects in other communities and counties with shared trade and commuter linkages, the impacts are often best assessed at the multi-county level.

ROW (response – next steps): Clarify with Dan Ryan the extent and nature of the proposed management action recommending burying “new and existing power lines” (including if it calls out transmission and/or distribution) and which alternative(s) it is proposed in. Consistent with the treatment of this comment in other subregions, ICF will add some information associated with potential realignment or burying of transmission/distribution lines. Information will likely include unit costs (i.e., per mile) of constructing (above ground) transmission/distribution lines in different terrains. ICF will seek out similar information for burying lines. The discussion will include how these costs are passed along to ratepayers. ICF will review the information in Leaming (2011) to determine if any information contained within is applicable to the impact analysis related to transmission lines.

Grazing (response – next steps): ICF will review comments and cited studies to determine if any information contained within contrasts with the methodology or conclusions of the econ impact analysis associated with grazing. If differences exist, ICF will determine if adjustments to the impact analysis should be made or provide rationale why it should not. ICF will add rationale why billed AUMs are the appropriate unit of analysis. ICF may need to coordinate with Josh Sidon and Mike Tietmeyer on any clarifying questions related to potential impacts to livestock grazing. ICF might explore options for expanding the discussion associated with impacts to interest groups by adding summaries or excerpts directly from comments associated with grazing.

Fiscal (response – next steps): ICF will identify options and opportunities to expand or clarify the section on “tax revenue and payments to states and counties.” In particular, an expanded discussion associated with potential impacts to tax revenues associated with locatable minerals (across alternatives) should be explored. A more substantive/meaningful discussion regarding how local tax revenues could be impacted should be explored.

EJ (response – next steps): Review comment. Initial evaluation by Sidon is that this issue was adequately addressed in the EJ impact section.

NMV (response – next steps): ICF will review cited literature to determine applicability and possible incorporation into the impact analysis associated with grazing.

Recreation (response – next steps): ICF will develop targeted and specific questions for the recreation/travel management specialists (Barbara Keleher and Leo Drumm) in order to clarify statements made in comments and to try to gain a better understanding (even at a qualitative level) of the potential impacts to recreation activity (especially OHV use) that might result in economic effects and how these impacts differ between alternatives. ICF will identify options and opportunities to expand or clarify the sections on economic impacts associated with minerals.

NOTE TO ICF: When developing formal responses please build off the suggested language and framework below. There are additional “national responses” – I’ll share that document with you.

The requisite level of information necessary to provide an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives is to provide the public and the decision maker with the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man’s environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented (40 CFR 1502.16). The impact analysis provided in [Chapter XX] in the [name of particular amendment] was found to be insufficient to aid in determining whether to proceed with the preferred alternative or to make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1. While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS’s impact analysis relevant to [speak to the specific topic or theme of the issue statement, e.g.,

As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man’s environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS describes the methodology and assumptions used for conducting the impact analysis (see Section 4.24.2 of the Draft EIS). The methodology and assumptions provide an adequate starting point for discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.24, the DLUPA/EIS identified methodologies used and made reference to the scientific and other sources relied upon for conclusions in the analysis. Based on these methodologies and assumptions, the DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level

The DRMPA/DEIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DRMPA/DEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DRMPA/DEIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The DRMPA/DEIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Impacts were considered on numerous resources, resource uses, and socioeconomic conditions, which included grazing and recreation. See Sections 4.21 and 5.21 of the DRMPA/DEIS.

The DRMPA/DEIS describes the methodology and assumptions used for conducting the impact analysis (see Section 4.21.1 and 5.1.1 of the DRMPA/DEIS). The methodology and assumptions provide an adequate starting point for discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.24, the DRMPA/DEIS identified methodologies used and made reference to the scientific and other sources relied upon for conclusions in the analysis. Based on these methodologies and assumptions, the DRMPA/DEIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice

n/a

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level

*[NOTE TO BLM: Provide a response]*

[BLM/Forest Service- review soils section to determine if references needed to support disucssion]

For stubble height triggers to be implemented, a determination has been made that rangeland health standards for riparian areas have not been met and that livestock, rather than wild horses or some reason, is the causal factor. In terms of applicability of stubble height requirements to various site conditions, consideration is provided for "site capability and potential" (Table 2.7, Pg. 356). We recognize use of stubble height criteria is not appropriate for all sites.

## Response

Biological soil crust information will be added to Chapter 3. Impacts on soil resources from livestock will be clarified in Chapter 4.

The DLUPA/DEIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/DEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/DEIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/DEIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

n/a

NOTE TO BLM: Review study and determine if the findings are essentially the same as you've already considered or if they provide new information that should be included in the EIS.

n/a

As noted in section 4.8 of this report, the DRMPA/DEIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DRMPA/DEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DRMPA/DEIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1. Land use plan level analyses are typically broad and qualitative rather than quantitative or focused on site specific actions (BLM Land Use Planning Handbook H-1601-1). The DRMPA/DEIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation level actions. The site-specific analyses will tier to the plan level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Chapter 4, Environmental Consequences, Section 4.16, Soil Resources, discusses the effects of livestock grazing on vegetation (ground cover) and the elevated potential for soil erosion. Also as, stated in Section 4.16 (Soil Resources, pp 4-134), achieving or maintaining Standards for Rangeland Health and Guidelines for Livestock Management generally is effective

CBD comment seems to be its own alternative rather than a substantive comment on the draft.

During subsequent implementation level travel management planning new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including noise levels and speed

n/a

n/a

n/a

If this is about alternatives for travel management actions, suggest moving it under 24.1.

Plan	Issue Statement
------	-----------------

OR	<p>Commenters expressed concern that proposed travel management actions in the DEIS would restrict administrative access to permitted activities such as livestock grazing and ROW development and inhibit the ongoing maintenance of existing infrastructure. Commenters noted that limitations on access should not override the need for timely and efficient responses to emergencies.</p>
----	--

Commenters were divided between advocating for more or less travel restrictions. Some noted that BLM should not close or restrict any access or travel throughout the planning area, while others suggest that more routes should be closed through important habitat areas pending BLM's inventory and subsequent travel and transportation analysis. Commenters also requested more clarification or provided input as to the types of management that would (or should) apply once routes are designated.

Commenters also had concerns regarding

UT Commenters questioned how this LUPA/EIS would apply to the pending Cedar City FO RMP revision. Commenters were divided on what changes would need to be made to alternatives. Some commenters requested more restrictive measures be added to the FEIS to protect GRSG; while some commenters felt the management actions in the DLUPA/DEIS were too restrictive to travel opportunities. Commenters emphasized the need for the BLM and Forest Service to prioritize implementation-level travel management planning. They also questioned how this implementation-level planning would occur and expressed dissatisfaction with the BLM and Forest Service's approach for moving to a limited-to-designated route system from the current OHV area designations. Commenters also noted the importance of allowing administrative access for valid existing rights.

ID-SW The Draft EIS/LUPA failed to consider a full  
MT suite of travel management-related management actions that would protect sage grouse habitat while allowing for continued administrative access, particularly for existing livestock grazing permittees. Commenters proposed that management actions should be included in the proposed plan to prohibit and reclaim/restore roads in GRSG habitat, limit motorized events, close PPHP to OHV use, apply additional seasonal travel restrictions, and apply a maximum route density within proximity of leks in PPH and PGH. Commenters also requested that proposed management actions preserve motorized access on existing routes per the 3-State OHV and National Route Designation decisions and maintain administrative access in grazing allotments.

NV-CA Commenters were divided between additional restrictions on route access, noting that BLM should not close or restrict any access or travel through areas, and suggesting that more routes should be closed through important habitat areas pending BLM's inventory and subsequent travel and transportation analysis.

Commenters also had concerns regarding management actions that would limit new road construction or hinder the ability to maintain existing routes because of the potential of upgrading the route from one category to another.

Commenters concern regarding access for permitted activities, maintenance of infrastructure, public health and safety.

NWCO The Draft EIS failed to provide changes to unrestricted motorized travel or open motorized routes to protect sage grouse which does not comply with the BLM's open road minimization requirements of the regulations. Also, BLM needs to consider additional measures under the alternatives.

Lewisto wn Commenters requested the FEIS clarify that ranching activities are amongst the authorized off-road uses. Commenters also recommended that a timeframe for travel management planning completion under Alternative D be specified and compensatory mitigation be included in Alternative D.

The BLM needs to consider additional actions or clarifications to existing actions within the range of alternatives, including:

- administrative off-road use being no less than 3% of total disturbance
- periodically evaluating the level of disturbance to PH from off-road use
- road density limitations
- specific road placement guidelines
- Limiting motorized travel to existing roads, primitive roads, and trails until travel management can be completed in PH, GH

ND The BLM should consider restricting new road construction to a minimum of 0.8 mile from leks, nesting habitat, and concentration areas in the alternatives. The BLM should also consider using jeep trails as for access and seasonal closures in nesting habitat and winter concentration areas.

WY9

## Response

### Permitted Uses:

The proposed LUPA would continue to allow access to valid existing rights within the planning area. Upon renewal of a livestock grazing permit, ROW authorization, or similar permitted use, the BLM would work with the permittee/ROW holder to adjust the appropriate level of access based on documented effects of that access on GRSG. [BLM: Consider adding language to include clarification regarding administrative access and the exceptions to OHV regulations found in 43 CFR 8340.0-5. Exceptions include: Any military, fire, emergency, or law enforcement vehicle while being used for emergency purposes; and any vehicle whose use is expressly authorized by the authorized officer, or otherwise officially approved.] Under SRP guidelines in the DEIS, as well as BLM regulation SRPs are discretionary with decisions made at the local line officer.

In terms of area closures, see alternatives considered but eliminated in the draft.

### Travel restrictions:

During subsequent implementation-level travel management planning, new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road restrictions or road additions, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including speed. In accordance with NEPA, subsequent travel management planning will include public involvement. In the proposed plan, all OHV allocations have been limited in PGMA. In addition, this is a planning document intended to conserve sage grouse and sage grouse habitat.

As noted on page I-6 of the DRMPA/DEIS, the purpose of the national GRSG planning effort is limited to making land use planning decisions specific to the conservation, enhancement, and/or restoration of GRSG habitat specifically by reducing, eliminating, or minimizing the threats to that habitat. No decisions related to the management of Wilderness, WSAs, or lands with wilderness characteristics will be made as part of this planning effort; therefore, management of Wilderness, WSAs, and lands with wilderness characteristics is considered outside the scope of this plan amendment process. Impacts on lands with wilderness characteristics from the alternatives being analyzed in this planning effort are presented in Chapter 4, Section 4.18, Lands with Wilderness Characteristics.

[BLM: Consider incorporating additional language to emphasize that the route selection process will be completed as subsequent implementation level planning using current TM policies and will include public and local agency involvement.]

As noted above in the response in Section 4.3, Range of Alternatives, Section 1.5 of the Draft EIS describes how the Utah GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

The GRSG management decisions being considered in this EIS will be incorporated into the Cedar City FO RMP revision. Cedar City's implementation-level travel management plans will be consistent with guidance included in the LUPs.

BLM has complied with its travel and transportation policy in identifying areas that are open, limited, and closed to motorized vehicle travel. All areas currently identified as open in GRSG habitat would be changed to limited to existing routes until route designations are complete. The BLM and Forest Service has established priorities for completing travel plans in GRSG habitat based on the amount of motorized vehicle use and the value of the habitat. The BLM and Forest Service have added decisions to the FEIS explaining the process that will be used in moving from a limited to existing routes category to a limited to designated routes category. The BLM has also added a decision that provides guidance to be taken into consideration when completing route designations. Finally, a preliminary route network has been identified and a map has been included in the FEIS showing known "existing" routes in areas that were previously open to cross-country travel. Decisions on seasonal closures, route purpose, and avoiding harassment and disruption of wildlife and their habitat will be addressed during the implementation-level travel planning process. Addressing these issues at the implementation level allows the BLM and Forest Service to take new information into account as it becomes available. [BLM ACTION ITEM FOR FEIS: Ensure that all these things have been added to the EIS.]

Section 1.4 of the Draft EIS describes how the Idaho Montana GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions. During subsequent implementation-level travel management planning new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including noise levels and speed. The route designation process will be completed as subsequent implementation level planning using current Travel Management policies and will include public and local agency involvement. Addressing these issues at the implementation level allows the BLM and Forest Service to take new information into account as it becomes available.

Needs for administrative access to valid existing rights, grandfathered uses, or permitted activities would taken into consideration during site-specific NEPA analysis. Restrictions applied to recreational OHV use may not apply to permitted administrative uses.

The BLM and Forest Service have not added a restriction that would limit road densities to less than 0.09 km per km squared (Wisdom et al. 2011) in GRSG habitat because the threshold established by Wisdom used coarse road data. When

#### Route selection:

During subsequent implementation level travel management planning new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including noise levels and speed. Implementation level travel management planning will include public involvement.

Consider additional language to emphasize that the route selection process will be completed as subsequent implementation level planning using current TM policies and will include public and local agency involvement.

#### New Road construction:

New road construction is addressed in Action D-LR-W 4: New ROW authorizations would be evaluated on a case-by-case basis. If new road construction is necessary, minimize impacts on GRS habitat through application of RDFs and other mitigation measures.

Temporary routes would be addressed during implementation level project evaluation. Temporary routes are generally not constructed during vegetation treatments.

#### Route Maintenance:

Routine maintenance of a primitive road would not upgrade the classification to a road.

Consider including the definition of Road, Primitive Road and Trail in DEIS.

Roads are linear routes managed for use by low clearance vehicles having four or more wheels, and are maintained for regular and continuous use.

Primitive Roads are linear routes managed for use by four-wheel drive or high-clearance vehicles. They do not normally meet any design standards.

Trails are linear routes managed for human-powered, stock, or OHV forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-clearance vehicles.

As discussed previously under Sections 4.3 and 7.5 of this report, the BLM and the Forest Service complied with CEQ regulations in developing the range of alternatives and the spectrum of actions considered all meet BLM and FS regulations, policy and guidance.

During the development of the Final EIS, the BLM and FS met with the USFWS to determine changes to the management actions and mitigation measures. The outcome from these meetings resulted in noted clarifications and edits to the alternatives and impacts analysis (see *Sections XXX of the FEIS*).

There are several management actions in the DEIS that do aim to minimize road construction and also would make open OHV areas in PPH limited to existing routes.

Under the NTT Action No. 1 Alternatives B, C and D all identify to limit motorized travel: "(PPH) Limit motorized travel to existing roads, primitive roads, and trails at a minimum." whereas Alternative A is the No Action/Current Management. Chapter 4, Environmental Consequences, Impacts from Travel Management on Travel Management (page 681) identifies that Alternatives B, C and D would change 574,100 acres from Open to Limited in PPH. Areas in PPH would become Limited in Alternatives B, C and D, and would not be open to unrestricted cross country motorized travel.

NTT Action No.3 identifies "(PPH) Complete activity level travel plans within 5 years of the ROD.....". Alternative A (Table 2.3 - page 52) identifies that Travel Management Route designation is being completed as a part of the RMP revision process for CRVFO, GJFO, and KFO. The LSFO RMP requires per Colorado State BLM policy that all areas in Limited Travel Management areas have completed Transportation Plans within 5 years of the RMP ROD. The Roan Plateau RMP identifies

As discussed previously under Sections 4.3 of this report, the BLM complied with CEQ regulations in developing the range of alternatives and the spectrum of actions considered all meet BLM regulations, policy and guidance.

During the development of the Final EIS, the BLM met with the USFWS to determine changes to the management actions and mitigation measures. The outcome from these meetings resulted in noted clarifications and edits to the alternatives and impacts analysis (see Sections XXX of the FEIS).

It should be noted that restrictions in place for travel have exclusions for administrative purposes; for example, cross-country OHV travel is prohibited and must remain on existing travel routes except for administrative purposes (see sections 1.8.7 ,Off-Highway Vehicle Record of Decision and Proposed Plan Amendment for Montana, North Dakota, and Portions of South Dakota, and 3.11.1 Comprehensive Travel And Transportation Management- Current Conditions)

[NOTE TO BLM: consider if timing stipulations of off-road uses for ranching activities would be needed. May need to update FEIS to clarify definition of administrative purposes and any exceptions for TM activities in the proposed plan]

[NOTE TO BLM: include a brief description of the changes and rationale for making the changes. This section of the response will need to be coordinated with the National group and may need to be reviewed higher up the chain.]

As discussed previously under Section 4.3 of this report, the BLM complied with CEQ regulations in developing the range of alternatives and the spectrum of actions considered all meet BLM regulations, policy and guidance.

The management actions in the DRMPA/DEIS (see Table 2-3) ~~fall within the provide an adequate~~ range of alternatives for protecting GRSG related to travel management, including travel limitations, seasonal closures, travel planning, valid existing rights, road maintenance, and road construction (e.g., Alternative C has a 4-mile buffer around leks to determine road route; Alternatives B and D 'limit route construction to realignments of existing designated routes if that realignment has a minimal impact on GRSG habitat, eliminates the need to construct a new road, or is necessary for motorist safety; and Alternative D allows new routes/realignments in PH and GH during site-specific travel planning if it improves GRSG habitat and resource conditions). In addition, the management actions (page 2-25) of the DRMPA/DEIS include evaluating the need for permanent

## Response

As required by NEPA, the baseline information used in the DEIS, including GIS-based route inventory data, is based on the best available regional information and follows an agency-accepted process. More specific route inventories and the designation of travel management for those routes will be carried out as part of a subsequent implementation-level travel management process, during which additional data, including ground-truthed inventories, will be gathered to further analyze future route designations. Additionally, the EIS includes a range of alternatives considering seasonal restrictions on roads within discrete areas. Action B-TM 3: In PPMA, travel management should evaluate the need for permanent or seasonal road or area closures.

[Note to BLM; Baker County should be included in Table 3-33]

Table 3-33 has been revised to include Baker County.

The BLM has considered information from completed BLM and Forest Service travel management plans in the planning area. With the exception of Alternative C, the BLM and Forest Service are not proposing any changes to those existing plans as part of this planning process. Under Alternative C, the BLM and Forest Service have identified potential closed areas. Within these areas, some existing or designated routes could be affected. Consistency with local plans is addressed in Section 1.7 of the DEIS.

[NOTE TO BLM: Add current CTTM area designation acres to Chapter 3.]

Consider additional language in Ch 3 (Sec 3.10 – Current Condition) to include the Northern California BLM Offices to the lands with current travel planning.

NDOW traffic and acoustic impact comments are from studies related to oil and gas exploration. These impacts would be considered during implementation level travel planning.

ND n/a

WY9

## Response

~~In accordance with NEPA, the impact analysis in the EIS is based on the best available information at the time of writing. Due to the large areas covered by the LUPA, scientific information and the nature and type of impacts is extrapolated for the entire planning area. Site specific studies will be conducted as part of subsequent implementation level project evaluation.~~

n/a

The mechanism being used to determine landscape level travel area designations (open/limited/closed) is 43 CFR 8340 which regulates OHV travel on public lands. BLM does not have a similar regulation for non-motorized travel. Non-motorized travel can be regulated through supplementary rules. Supplemental rules and site specific route designations will be addressed at the implementation level in the future.

New construction related to power line access would be exempted under 43 CFR 8340.05 (3).

While multiple studies on OHV use have been cited, BLM is using the BLM Travel Management Manual and Handbook (M-1626 & H-83421) to address travel planning in the EIS and will continue to use the same policy for future implementation and planning.

Cite general disturbance factors (human activity, predator perching) for recreation facilities.

NDOW cites Lyon and Anderson (2003) suggesting that light traffic disturbance (1-12 vehicles/day) during the breeding season might reduce nest-initiation rates and increase distances moved from leks during nest-site selection. NDOW also see acoustic impacts from machinery as a possible disruption in breeding activity (Slickley and Patricelli 2012). While these studies were conducted in oil and gas development areas, it is reasonable to assume that similar disturbance would have a similar impact.

The analysis is based on the no action alternative and the existing conditions. While future plans may restrict cross-country travel, "open to cross country travel" is the current condition. Table 4.9 correctly shows the differences between

n/a

## Response

Because the LUPA is a planning level document, it provides a mitigation framework but does not include a specific step-by-step mitigation implementation strategy. This strategy will be developed through a subsequent implementation-level process and will be consistent with the overarching framework contained in the land use plan.

n/a

Appendix C of the DEIS/LUPA includes required design features and best management practices, including those that are based on the best available science to prevent the spread and effects of non-native plant species. See RDF # 290.

[No response provided]

[NOTE TO BLM: this may be simple editorial clarification, or need more. If it truly relates to the mitigation/monitoring strategy, then can use this response:]

Mitigation, adaptive management and a monitoring framework were developed by a Disturbance and Monitoring Team that focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM and the Forest Service worked with WAFWA to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate data-sets will be established so that data can easily be “rolled up” for reporting monitoring results across the range of greater sage-grouse, as defined by Schroeder et al. (2004); by populations and subpopulations as defined by Connelly et al. (2004); by LUP area; by the seven (WAFWA) Greater Sage-grouse Management Zones (Stiver et al. 2006), and by Priority Areas for Conservation (PACs) as defined in the greater sage-grouse Conservation Objectives Team (COT) Report (U.S. Fish and Wildlife Service 2013).

[Refer to the Monitoring Framework in the appendix.] To accomplish effective monitoring, the BLM and the Forest Service will analyze the monitoring data to characterize the relationship among disturbance, implementation actions, and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife

## Response

n/a

As stated in Section 1.3.1, the planning area for the Utah Greater Sage-Grouse LUPA/EIS is the geographic area within which the BLM and Forest Service will make decisions during this planning effort. The planning area boundary includes all lands regardless of jurisdiction; however, the BLM and Forest Service only make decisions on lands that fall under their respective jurisdiction. Tribal surface estate with Tribal mineral estate is not considered part of the decision area. However, the cumulative effects analysis for all topics in the DLUPA/DEIS included an analysis of cumulative effects at the planning area level, including past, present, and reasonably foreseeable future actions on tribal lands. The BLM and the Forest Service have complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning

wn  
ND n/a  
WY9

## Response

[Note to BLM: Provide response.]

[NOTE TO BLM: provide direction if these EOs are to be added to Chapter 3 and Chapter 5 where tribal consultation is discussed.]

The BLM and Forest Service recognize their responsibility to ensure that meaningful consultation and coordination concerning GRSG planning is conducted with federally recognized tribes, including the Shoshone-Bannock Tribes, to consider tribal treaty rights and trust resources. [BLM-FS-include relevant legal citations. Note consultation efforts to date]

BLM provided tribes the opportunity to comment and participate in the development of the EIS through government-to-government consultation and as a cooperating agency. These efforts were detailed in Table 3-87 in the Draft EIS. Tribal concerns were specifically listed in Chapter 3 of the DEIS (pp. 3-241 and 3-242), to be brought forward in the analysis detailed in Chapter 4. For example, the Summit Lake Paiute Tribe noted that access to sage grouse strutting grounds during lekking in order to observe behaviors was critical to continuing tribal traditional practices. The DEIS, therefore, noted that those alternatives that would result in reductions of sage grouse numbers could decrease tribal opportunities to observe lekking behavior, and, conversely, those alternatives that would result in maintaining or increasing sage grouse numbers would either maintain or increase tribal opportunities to observe lekking behavior. These discussions were completed for each of the alternatives analyzed in the DEIS (see pages 4-278 to 4-287). In addition, the Wildlife Section of the FEIS contains a specific statement that the ROD does not preclude tribal observations of lekking behavior. Tribes that hold grazing permits were concerned that reductions in AUM's could harm tribes economically. Chapter 4 then noted that no reductions in AUM's were anticipated under alternatives A, B, D, E, and F, and thus no economic harm to tribes would be anticipated. Chapter 4 also noted that it was only under alternative C that AUM's may be reduced, thereby potentially causing economic harm to tribes that hold grazing permits (p. 4-281). All of these discussions have been retained in the FEIS.

## Response

The BLM has revised chapter 3 to state that Fort McDermitt Paiute and Shoshone Tribe of Nevada and Oregon and Burns Paiute have identified sage grouse as important to their culture. Management decisions related to fire, climate change, and drought are discussed in chapter 2. Land management on Tribal Reservations is not within the scope of the project. See Purpose and Need.

n/a

The BLM, Forest Service recognize their responsibility to consider potential impacts to Tribal resources.

Article 4 of the Fort Bridger Treaty, signed in 1868, retains the Eastern Band Shoshone and Bannock Tribes' rights to hunt, fish, gather natural resources, and provide other associative right necessary to effectuate these rights. Other treaties ensure similar rights for other tribes.

The BLM will analyze the impacts of the planning decisions in the FEIS on tribal interests [Note to BLM- is this analysis sufficient in the DEIS?]

The BLM would not require the ROW grant holder to retro-fit existing power lines until the ROW grant is up for renewal. BLM ROWs are issued on a term basis (10/20/30 year terms etc.). Once the term is up the BLM may renew the ROW and determine additional terms and conditions based on current policies and guidance. (43 CFR 2807)

Withdrawals of federal lands are authorized pursuant to FLPMA and are processed through an application process. Terms established for legislative withdrawals are made at the discretion of Congress.

New road construction is addressed in Action D-LR-W 4: New ROW authorizations would be evaluated on a case-by-case basis. If new road construction is necessary, approval would minimize impacts on GRS habitat through application of RFDs and other mitigation measures.

The DEIS stated (p. 4-275) that many of the "effects on tribal interests are general and unquantifiable in nature." These types of impacts were analyzed in Section 4.21.3, where it was noted, for example, that future fluid mineral leasing within PPH/PGH habitats could reduce sage grouse numbers and impact tribal observations of lekking behavior. Nevertheless, the alternatives analyzed in the DEIS were of various levels of complexity. Some alternatives, such as alternative A, were silent on a number of critical issues, and therefore the impacts of this alternative on tribal interests remains unknown for those issues. In contrast, the preferred alternative, alternative D, was not silent on a single critical issue analyzed in the DEIS, and therefore the preferred alternative contained the full suite of analysis on tribal interests. In addition, the Environmental Justice section of the DEIS specifically details the potential economic impact of each alternative on tribal grazing interests.

ND n/a

WY9

## Response

More detail about the rate of conifer encroachment will be added to Chapter 3. Juniper and sagebrush treatments in the Proposed Plan will be refined to be more lek-centric.

Use of Integrated Vegetation Management Handbook (H-1740-2) policies for conifer encroachment will incorporate BLM's best available science and management to design and maintain vegetation management projects, and entail the use of adaptive management to improve outcomes. Present trends toward conifer expansion do not indicate that future management will be unsuccessful in limiting expansion.

NCT Notes

Regional Team NOTES, EDITS, COMMENTS

Sounds more like affected  
environment issue/response.

Move to section 26.2

Plan	Issue Statement
------	-----------------

- OR Commenters proposed modifications to the alternatives and concerns about specific topics include:
1. Establishment of priorities for vegetation treatments to maximize GRSG benefit
  2. Limitations on vegetation treatments in sagebrush habitat, including avoiding use of fire and sagebrush removal in sensitive habitats or seasons
  3. More detail on proposed restoration activities including allowable treatment methods in GRSG habitat
  4. Increased juniper removal and prioritization for phase I and II woodlands, where success is more likely
  5. Testing restoration methods on a small scale
  6. Rest from grazing for two seasons following all vegetation treatments
  7. Improved consistency in recommendations on native plant materials for restoration
  8. Invasive spread prevention and more proactive invasive control methods
  9. Evaluation of use of fire for vegetation control in cheatgrass-prone areas
  10. Establishment of sagebrush reserves for

UT The DEIS failed to consider a full range of alternatives Commenters provided specific suggestions to meet the objectives related to the COT Report.

Commenters provided additional measures that should be considered in the alternatives, including,

- Pinyon-juniper restoration
- Specific objectives to measure success

ID- Commenters recommended that the  
SW preferred alternative include:  
MT

- Specific vegetation treatment acreage objectives
- Passive sagebrush restoration
- Limitations on vegetation treatments in sagebrush areas. To meet COT report objectives, include regulatory mechanisms to avoid sagebrush removal or manipulation in sage-grouse breeding or wintering habitats with minor exceptions.
- Establish Priorities for pinyon-juniper removal including reduced grazing in conjunction with pinyon-juniper treatment.
- Restore non-native seedings to increase GRSG habitat
- Apply additional restrictions for herbicide application in GRSG habitat
- Commit to a program to plan, fund, execute and monitor large scale integrated invasive species infestation and eradication projects in a measurable timeframe.
- Include specific objectives to measure success in invasive species eradication

NV- Issue 1: Multiple commentors were  
CA concerned with pinion-juniper expansion.

Issue 2: Sagebrush managment and cheatgrass control.

Issue 3: Multiple commentors are concerned with the source, level of detail, and ability of management actions in Chapter 2 to conserve sage grouse habitat.

Issue 4: Commenters noted that some of the alternatives presented in Chapter 2 did not adequately address the relationship between vegetation management and livestock grazing management.

In general, topics of concern included pinyon-juniper encroachment; impacts of grazing and fire; restoration; application of ecological site description and reference state concepts; and the effects of recreation.

Move comment 188-20 to NEPA range of alts  
- deals with burden of costs.

NW The Draft EIS should include additional  
CO conservation measures from the COT in one  
or more alternatives, including controls for  
preventing the spread of invasive, non-native  
plants.

Lewis The BLM should include additional measures  
town to target conifer encroachment and ensure  
no net conifer gain in the FEIS.

ND n/a  
WY9

Response	NCT Notes
<p>1. Establishment of priorities for vegetation treatments is in Proposed Plan. The Proposed Plan has lek-centric management with respect to weed treatments, junpier treatments, and sagebrush restoration. [BLM note: BLM to add to Proposed Plan]</p>	<p>It seems like this may be addressing comments on an individual basis. Consider revising issue statement and developing response around general themes.</p>
<p>2. The alternatives contain seasonal restrictions. Proposed Plan has modified seasonal restrictions. Fire has some benefits to sagebrush ecosystems. [BLM note: BLM to add to Proposed Plan]</p>	
<p>3. Priority areas and treatment methods are identified in Proposed Plan. [BLM note: BLM to add to Proposed Plan]</p>	
<p>4. Phase I and II was prioritized in Alternative D. Funding influences the ability to increase removal.</p>	
<p>5. Testing restoration methods is not a land use planning decision.</p>	
<p>6. BLM policy is to rest from grazing until treatment objectives are reached.</p>	
<p>7. Proposed Plan will address inconsistency and BLM handbooks will be added to Chapter I for native plant use and weed management.</p>	
<p>8. Proposed Plan targets invasives control around leks. [BLM note: BLM to add to Proposed Plan]</p>	
<p>9. It is BLM policy to evaluate areas for invasive plant invasion prior to fire treatment.</p>	
<p>10. Alternative F established 4 million acres of sage grouse ACECs.</p>	
<p>11. The BLM does not manage sagebrush on private lands.</p>	
<p>12. There is no data that identifies treatment quantities.</p>	
<p>13. Lek-centric management of junpier treatments will provide greater benefit to GRSG.</p>	
<p>14. Feasibility is based on prior experiences. 15. Literature supports active restoration. [BLM note: BLM to add paragraph to Ch 3 sections describing important and relevant handbooks/manuals/etc.]</p>	

As noted above in the response in Section 4.3, Range of Alternatives, Section 1.5 of the Draft EIS describes how the Utah GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

Also, as previously noted, the relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. The six alternatives are described in Table 2-1, Description of Alternatives A, B, C1, C2, D, E1, and E2, in Section 2.6, Detailed Comparison of Alternatives, of the Draft EIS.

Additionally, Sections 4.3 and 7.5 of this report discuss how the BLM and the Forest Service complied with CEQ regulations in developing the range of alternatives and the spectrum of actions considered all meet BLM and Forest Service regulations, policy and guidance.

The ID/SWMT LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. The BLM and the Forest Service complied with CEQ regulations in developing the range of alternatives and the spectrum of actions considered all meet BLM and Forest Service regulations, policy and guidance.

Some of the recommended components were addressed in the DEIS and additional info will be included in the FEIS as detailed below.

- Specific vegetation treatment acreage objectives [need National Policy team input- to decide how treatment objectives will be incorporated]
- Passive sagebrush restoration: In the DEIS Alternative C and management changes that allow progress towards standards and guidelines allow for passive sagebrush restoration. In some areas passive restoration may not be sufficient to improve GRS habitat and active restoration may be necessary (Davies et al. 2011) (see pp 4-54 DEIS [- check page]).
- Limiting vegetation treatments in sagebrush areas is covered under Alternative D ([provide pg reference]. To meet COT report objectives, include regulatory mechanisms to avoid sagebrush removal or manipulation in sage-grouse breeding or wintering habitats with minor exceptions. [include info from FEIS specific to meeting COT report objectives if appropriate])
- Establish Priorities for pinyon-juniper removal including reduced grazing in conjunction

Some of the commenter points sound like unsupported opinion directing BLM to a specific action. Suggest deleting those or revising the issue statement if there is some supporting rationale that indicates inadequate NEPA

Issue 1: [BLM to provide response]

Issue 2: [BLM to provide response]

Issue 3: The information presented in the range of alternatives is based on the best available science such as NTT report, COT report and other relative studies.

BLM will review studies in the DEIS and add additional analysis for the FEIS as necessary.

Issue 4: BLM will analyze the relationship between vegetation management and grazing management in the FEIS based on those actions brought forward for the proposed alternative.

Issue 3: This can be included in section 26.2. The question of best available information is more fully answered there.

[Note to BLM: BLM should read and consider all comments under this topic. Most reference a specific management action and suggest changes or clarifications.]

The Draft EIS contains an ~~entire~~ appendix (Appendix I) that articulates Required Design Features (RDFs), Preferred Design Features (PDFs) and Suggested Design Features (SDFs). While the list of PDFs/RDFs/SDFs in Appendix I is thorough, the list is not intended to be exhaustive; additional PDFs/RDFs/SDFs could be developed and implemented to help achieve resource objectives. PDFs/RDFs/SDFs include state-of-the-art measures applied on a site-specific basis to avoid, minimize, reduce, rectify, or compensate for adverse environmental or social impacts. They are applied to management actions to help achieve desired outcomes for safe, environmentally responsible resource development by preventing, minimizing, or mitigating adverse impacts and reducing conflicts. PDFs/RDFs/SDFs also can be proposed by project applicants for activities on public lands (e.g., for gas drilling). PDFs/RDFs/SDFs not incorporated into the permit application by the applicant may be considered and evaluated through the environmental review process and incorporated into the use authorization as conditions of approval or ROW stipulations. Standard conditions of approval and ROW stipulations from each LUP would apply to site-specific analysis. Additional PDFs/RDFs/SDFs, conditions of approval, and ROW stipulations could be developed to meet resource objectives based on local conditions and resource specific concerns.

As noted previously in Section 7.3 of this Report, all alternatives considered within this planning process are consistent with conservation measures and objectives outlined in the COT Report and follow the basic principles of: (1) avoiding the impact of an activity; (2) minimizing impacts by limiting the degree of activity; and (3) mitigating for an impact by improving or enhancing greater sage-grouse habitat. Each of the alternatives considers [NOTE TO BLM: No response provided until BLM determines which changes are needed. Response should explain which changes were made and where. If no change made, explain why the alternatives are sufficient].

[Change to FEIS: Consider adding an acreage range for conifer treatments for analysis. Provide a definition of old growth conifer stand to be added to the glossary]

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1). The DRMPA/DEIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific mechanical treatments come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the

n/a

Plan Issue Statement

OR The DEIS fails to provide adequate baseline information related to invasive species spread and juniper establishment. Commenters requested assumptions for the VDDT modeling, and references for statements regarding climate change and spread of invasive species.

More specific comments focused on:

1. Expansion rate of juniper needs to be identified.
2. Effects of mowing on bunchgrass.
3. How much would need to be treated to reach desired conditions.
4. Management of juniper stumps.

UT Commenters requested the FEIS be consistent with local GRSG management plans. The FEIS should use more accurate habitat mapping and scientific literature. The DEIS fails to provide adequate baseline information.

ID- The DEIS fails to provide adequate baseline  
SW information related to sagebrush vegetation.  
MT Commenters questioned the source of BLM  
data and requested the FEIS utilize additional  
baseline data on cheatgrass extent and  
evaluate effectiveness of continuing programs  
against weeds and juniper encroachment.  
Commenters provided additional literature to  
consider. Commenters also advocated an  
adaptive approach to vegetation management  
based on site-specific habitats.

NV- Issue 1: Additional literature or information is  
CA needed related to pinion-juniper expansion.

Issue 2: Additional information or literature is  
needed for sagebrush management and  
cheatgrass control.

Issue 3: BLM needs to consider additional  
literature in the EIS as a basis for the  
alternatives and analysis. BLM incorrectly  
interpreted the literature cited in the EIS.  
BLM needs to provide rationale and sources  
of information to support the alternatives,  
affected environment, and impacts analysis  
within the EIS (e.g. for ecological site and  
reference state concepts, VDDT modeling,  
and utilization levels).

Move comments related to use of stubble  
height as an indicator to riparian section.

town

ND The DRMPA/DEIS fails to take a hard look at  
I/I the history of agency seeding of nonnative  
species and the predictable but unmitigated  
outcomes when those species become  
invasive or out of control.

WY9

Before beginning the land use plan amendment process and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects proposed for implementation under the land use plan. The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in chapter 3 in the Draft EIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the Draft EIS. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions. The BLM used the most recent and best information available that was relevant to a land use planning-scale of analysis. During preparation of the LUPA/EIS, the BLM consulted with and used data from other agencies and sources, including but not limited to U.S. Geological Survey, Oregon state agencies, and the U.S. Fish and Wildlife Service. The BLM consulted on the analysis and the incorporation of available data into the EIS with its cooperating agencies and other agencies with jurisdiction or expertise.

1. [BLM note: BLM to provide expansion rate of juniper in Chapter 3]
2. [BLM note: BLM to add Chapter 3 info on bunchgrass mowing]
3. Proposed Plan vegetation treatment objectives address desired outcomes.

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in Chapter 3 and various appendixes in the Draft LUPA/EIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the Draft LUPA/EIS.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM realizes that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions. The BLM will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan amendment. These subsequent NEPA analyses will tier to the land use planning analysis and evaluate project impacts at the site-specific level (see 40 CFR 1502.20 and 1508.28). As part of the NEPA process, the public will be presented with the opportunity to participate in the environmental analysis process for these future implementation actions.

Before beginning the land use plan amendment process and throughout the planning effort, the BLM and FS considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level. The data needed to support broad-scale analysis of the 48,209,900 acre planning area are substantially different than the data needed to support site-specific analysis of projects proposed for implementation under the land use plan. Much of the data in the DLUPA/EIS is presented in qualitative and map form, and is sufficient to support the gross scale analyses required for land use planning.

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in chapter 3 in the Draft LUPA/EIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the Draft LUPA/EIS. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions.

The BLM used the most recent and best information available that was relevant to a land use planning-scale of analysis. During preparation of the LUPA/EIS, the BLM consulted with and used data from other agencies and sources, including but not limited to U.S. Geological Survey, Idaho state agencies, and the U.S. Fish and Wildlife Service. The BLM consulted on the analysis and the incorporation of available data into the LUPA/EIS with its cooperating agencies and other agencies with jurisdiction or expertise.

Before beginning the land use plan amendment process and throughout the planning effort, the BLM and FS considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects proposed for implementation under the land use plan. Much of the data in the DLUPA/EIS is presented in qualitative and map form, and is sufficient to support the gross scale analyses required for land use planning.

Adaptive management would be incorporated into vegetation treatment and restoration programs under Alternatives D and E. Adaptive management would allow BLM increased flexibility to adjust programs based on data collected during operation, to respond to changing conditions and improve effectiveness of vegetation management programs.

[BLM: provide direction if any change to analysis is necessary. Notes during cmt response

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in chapter 3 is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/DEIS.

It seems that the general idea of all three issues is that additional information or literature is needed. Suggest combining all three issues into one overall issue statement.

A land use planning-level decision is broad in scope, and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM and Forest Service realize that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions. Before beginning the Nevada and Northeastern California Greater Sage-Grouse DLUPA/DEIS process and throughout the planning effort, the BLM and Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level.

The BLM and Forest Service used the most recent and best information available that was relevant to a land use planning-scale of analysis. During preparation of the DLUPA/DEIS, the BLM and Forest Service consulted with and used data from other agencies and sources, including but not limited to [insert sources such as USFWS, NDOW, counties or conservation districts]. The BLM and Forest Service consulted on the analysis and the incorporation of available data into the DLUPA/DEIS with its cooperating agencies and other agencies with jurisdiction or expertise.

As a result of these actions, the BLM and Forest Service gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the DLUPA/DEIS. The BLM and Forest Service utilized the available data to provide an

As noted previously in Section 4.5 of this Report, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service and Colorado Parks and Wildlife [list others if needed]. The BLM reviewed the current research by CPW on the range of canopy cover preferred by sage grouse to determine if it presented new information that would need to be incorporated into the FEIS, was information already included in the draft EIS, or if it provided the same information as already used or described in the Draft EIS. The BLM determined that... [NOTE TO BLM: confirm that this is true. If it wasn't used in the draft, explain why, e.g., it wasn't yet available, etc. If this is new information that should be considered between Draft & Final, then note that you've reviewed it and make a brief statement to what your findings were (e.g., info was the same, info was n/a

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in chapter 3 is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DRMPA/DEIS. There has been extremely limited historic seeding of non-native species in association with ROWs, construction areas, etc. in the North Dakota Field Office. Additionally, there are no converted fields on BLM lands. Therefore, an exhaustive gathering and monitoring of baseline data related to BLM seeding practices is not required for the North Dakota Greater Sage-Grouse LUPA/EIS.

The North Dakota Field Office gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the DRMPA/DEIS. The BLM utilized the available data to provide an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives. Baseline data on noxious weeds and invasive plant species is included in Section 3.5 of the DRMPA/DEIS (p. 3-18 to 3-29). Specific reference is made to the presence of weeds, with waterways and transportation systems being the major vectors of spread. The impacts on the spread of weeds from these types of activities are more thoroughly described in the vegetation section of

Plan Issue Statement

OR Commenters request more detailed analysis of the objectives and impacts of vegetation treatment on GRSG, and parameters on allowable treatments to reduce impacts, including limits on allowable methods during lekking and nesting season, and buffers around nesting areas. Commenters state that juniper treatment and invasive weed control efforts have been ineffective and request further analysis.

More specific comments focused on:

1. The use of only native seeds.
2. Post planting evaluations.
3. Objective to treat approximately 30% of GRSG habitat over the next 10 years.

UT Commenters requested the BLM to analyze each contiguous block of occupied habitat and publish in the FEIS the percentage of sagebrush cover in that block. The scientific findings for impacts to GRSG from reduced juniper encroachment are contradictory to the impacts in the DEIS.

ID- Commenters express concern about  
SW unintended or undesirable impacts of  
MT vegetation management programs to control  
weeds or restore sagebrush habitat. The DEIS  
inadequately analyzes impacts from vegetation  
restoration

NV- BLM has failed to analyze or has incorrectly  
CA analyzed impacts on vegetation in the EIS,  
particularly related to the following issues:

Issue 1: Additional literature or information is needed related to pinion-juniper expansion to support impact analysis.

Issue 2: Additional information or literature is needed for sagebrush management and cheatgrass control to support impact analysis.

Issue 3: BLM needs to consider additional literature in the EIS as a basis for the alternatives and analysis. BLM incorrectly interpreted the literature cited in the EIS. BLM needs to provide rationale and sources of information to support impacts analysis within the EIS (e.g. for ecological site and reference state concepts, VDDT modeling, and utilization levels).

Re-code 91-66 to climate change, grazing, or water resources. Also re-review to determine if substantive.

OR	Commenters noted the treatment rate of 1% is inadequate.
UT	n/a
ID-SW	BLM's cumulative impacts analysis for
MT	vegetation failed to consider the impacts of limited resources on sage-grouse protection.

NV-CA BLM needs to substantiate the claim that a reduction in grazing would result in increased fuel loads and increase the frequency of wildfire on the landscape and should evaluate whether it is better to manage for higher levels of vegetation which would lead to higher fire probability or manage for less canopy spacing to reduce

NWCO n/a  
Lewisto n/a  
wn  
ND n/a  
WY9

## Response

The analysis shows a treatment rate of 1% is inadequate. Vegetation management objectives were revised while still taking into consideration GRSG.

n/a

[Unsure if we need to keep this national response]: Cumulative analysis for the DEIS was primarily qualitative in nature due to the time schedule of implementation of sage-grouse protection efforts. The FEIS will incorporate data from the BLM National Operations Center for the planning area and WAFWA management zone, to enable BLM to evaluate cumulative impacts quantitatively for each alternative.

The proposed plan habitat mapping combines the habitat maps from Alternatives D and E, including other refinements. The cumulative effects assessment for the proposed plan is included in the FEIS and captures the effects from the revised habitat map

Suggest BLM review the comment and determine whether a revision to the EIS is necessary. If revised, indicate what changes were made and where. If not, provide rationale as to why the current cumulative impact analysis is sufficient.

Response	NCT Notes
----------	-----------

Vegetation management and restoration projects will be targeted to benefit GRSG habitat. Vegetation treatment locations and activities are identified as specific project-level vegetation treatments are conducted.

The methodology that will be employed to determine effective mitigation is the monitoring framework developed by a Disturbance and Monitoring Team (see Appendix X in the FEIS) [NOTE TO BLM: EMPSi will complete appendix number once added to the FEIS.] that focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM and the Forest Service worked with WAFWA to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate data-sets were established so that data can easily be "rolled up" for reporting monitoring results across the range of greater sage-grouse, as defined by Schroeder et al. (2004); by populations and subpopulations as defined by Connelly et al. (2004); by LUP area; by the seven (WAFWA) Greater Sage-grouse Management Zones (Stiver et al. 2006), and by Priority Areas for Conservation (PACs) as defined in the greater sage-grouse Conservation Objectives Team (COT) Report (U.S. Fish and Wildlife Service 2013).

Incorporate information in current response and include at end of national response.

[Refer to the Monitoring Framework in the appendix.] To accomplish effective monitoring, the BLM and the Forest Service will analyze the monitoring data to characterize the relationship among disturbance, implementation actions, and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife agencies, effectiveness monitoring can be supplemented with population trend information, taking into consideration the lag effect response of populations to habitat changes.

[NOTE TO BLM (Alan): Provide a response that addresses what is a desirable seed.]

National/common language for Regional Mitigation

To accomplish effective monitoring, the BLM and the Forest Service will analyze mitigation and monitoring data to characterize the relationship among disturbance, implementation actions, and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife agencies, effectiveness monitoring can be supplemented with population trend information, taking into consideration the lag effect response of populations to habitat changes.

[Note to BLM/FS: Insert national monitoring response when available] Will develop an implementation plan to guide activities after the ROD.

#### National/common language for Regional Mitigation

Mitigation has been further defined as a Regional Mitigation Framework and is detailed in Appendix X. The Framework is incorporated in the [insert Proposed Plan/Proposed Plan Amendment] and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats.

If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures, then compensatory mitigation projects will be used to fully offset impacts to achieve conservation benefits. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.

Specific mitigation strategies, based on the Framework, will be developed by regional

Need a response to each of the statements above.

Here is some generic language regarding monitoring. Will probably need to include language about the revisions to the monitoring framework on a national level:

The methodology that will be employed to determine effective mitigation will be the monitoring framework developed by a Disturbance and Monitoring Team that focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM and the Forest Service worked with WAFWA to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate data-sets will be established so that data can easily be “rolled up” for reporting monitoring results across the range of greater sage-grouse, as defined by Schroeder et al. (2004); by populations and subpopulations as defined by Connelly et al. (2004); by LUP area; by the seven (WAFWA) Greater Sage-grouse Management Zones (Stiver et al. 2006), and by Priority Areas for Conservation (PACs) as defined in the greater sage-grouse Conservation Objectives Team (COT) Report (U.S. Fish and Wildlife Service 2013). Broad- and mid-scale monitoring will be conducted as funding allows.

Additional details regarding monitoring are presented in the Monitoring Framework, Appendix xx. To accomplish effective monitoring, the BLM and the Forest Service will analyze the monitoring data to characterize the relationship among disturbance, implementation actions, and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife agencies, effectiveness monitoring can be supplemented with population trend information, taking into consideration the lag effect response of populations to habitat

*[NOTE TO BLM: Some of the comments could be fixed is possible editorial clarifications in the FEIS. If this is the case, then a note of “In response to comments requesting clarification of certain mitigation language, the FEIS has been corrected in response to these comments.” For the monitoring aspect, suggest using language similar to what’s noted below:]*

In response to comments requesting clarification of certain mitigation language, the FEIS has been corrected in response to these comments. Additional information on mitigation can be found in Section XX of the FEIS.

The methodology that will be employed to determine effective mitigation will be the monitoring framework developed by a Disturbance and Monitoring Team that focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM and the Forest Service worked with WAFWA to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. n/a

n/a

Response 1 (subject to revision):Although not complete, ESDs are in the process of being developed for riparian areas and wetlands. In 2011, the NRCS issues draft guidelines for lotic areas (NRCS 2011, see discussion of this topic; section 4.5.5, Alternative B, Impacts from Riparian Areas and Wetland Management). Use of ESDs will result in more site specific and more appropriate objectives and management actions for riparian habitats.

Response 2: Meeting standards for rangeland health (Table 2-6) can be achieved through a variety of livestock grazing strategies including use of adaptive management techniques. Adaptive management consists of refinements to the management strategy based on annual analysis of monitoring information relative to short term events and indicators (Wyman et al. 2006). Where monitoring demonstrates standards are not being met and livestock are the causal factor, principles of adaptive management provide for adjustments in management strategies where appropriate. Annual indicators of livestock grazing impacts on riparian areas, including measurements of residual vegetation (stubble heights) and/or riparian plant utilization may indicate a need to employ rest or deferment from grazing. Once progress is being made towards meeting GRS habitat objectives, adaptive management and/or other site specific management strategies can continue to be

## Response

Tamarisk is invading tree-dominated areas. Tree-dominated areas are not associated with GRS habitat.

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives.

The ID/SWMT LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for riparian vegetation in the planning area that would meet the planning criteria, to address issues and comments from cooperating agencies and the public, and provide a reasonable range of alternatives. The BLM and the Forest Service complied with CEQ regulations in developing the range of alternatives and the spectrum of actions considered all meet BLM and Forest Service regulations, policy and guidance.

[BLM: provide direction if any change to analysis is necessary.]

For stubble height triggers to be implemented, a determination has been made that rangeland health standards for riparian areas have not been met and that livestock, rather than wild horses or some reason, is the causal factor. In terms of applicability of stubble height requirements to various site conditions, consideration is provided for "site capability and potential" (Table 2.7, Pg. 356). We recognize use of stubble height criteria is not appropriate for all sites.

Response 2: The Proper Functioning Condition (PFC) assessment protocol addresses the basic processes which sustain water tables and riparian plant communities. If a riparian area is not functioning properly, then it is likely the biological processes, such as creation of suitable habitat will be impaired. The PFC protocol is designed to help establish and prioritize management, monitoring and restoration activities and to provide a focused and effective foundation for determining resource goals and identified resource values (Prichard et al. 1998, Dickard et al. 2014). Use of this process optimizes management of GRS habitat through a sequential set of steps which include: determination of resource values; development and prioritization of goals and actions; collection of baseline data and establishment or modification of objectives; implementation of planned actions and effectiveness monitoring including updating PFC status; and, implementation of adaptive management actions (Dickard et al. 2014).

Response 3: All available data for condition of riparian areas across the planning area are summarized in Table 3.13. These data, which include riparian acreages, miles of stream and number of assessments are expressed as percent of lotic and lentic riparian areas meeting goals. Refer to section 3.4 section (Riparian Areas and Wetlands) for a discussion of these findings.

The original direction that initiated this planning process for the BLM can be found in BLM IM-2012-44. The BLM was tasked with analyzing the conservation in the NTT Report, "The conservation measures developed by the NTT and contained in Attachment I must be considered and analyzed, as appropriate, through the land use planning process by all BLM State and Field Offices that contain occupied Greater Sage-Grouse habitat."

As such, creation of new conservation measures that were not contained in the NTT report are out of scope for this planning process.

ID-SW  
MT

Commenter requests baseline data related to Proper Functioning Condition of riparian areas in sage-grouse habitat. Commenter questions whether PFC protects stability of riparian habitat for sage-grouse.

NV-CA

The BLM and Forest Service should incorporate additional literature to improve the impact analysis in the EIS. The BLM and Forest Service provided insufficient sources regarding riparian baseline information.

NWCO The BLM needs to expand on the information presented in the affected environment specifically for acreage of sage grouse habitat in riparian areas that is not meeting PFC and explaining what irrigated lands are on BLM and FS administered lands.

Lewisto n/a  
wn  
ND n/a  
WY9

## Response

BLM will review potential inconsistencies and available literature and incorporate into the EIS as necessary.

The CEQ regulations require an environmental impact statement to "succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration. The description shall be no longer than is necessary to understand the effects of the alternatives. Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Agencies shall avoid useless bulk in statements and shall concentrate effort and attention on important issues" (40 CFR 1502.15). Additionally, the Utah Greater Sage-Grouse LUPA is a programmatic NEPA effort to conserve greater sage-grouse and its habitat across a broad geographic area. As such, the BLM and the Forest Service described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions.

The BLM and the Forest Service complied with these regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The affected environment provided in Chapter 3 and various appendices including Appendices A, N, O, P, and Q in the Utah Greater Sage-Grouse LUPA is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS. For example, listing every water quality-impaired stream within the planning area by name would not provide useful information at this broad-scale analysis, particularly where the proposed plan alternatives did not vary the level of riparian protections to provide reduced levels for non-impaired streams. The riparian protections within each alternative were applied to all streams, whether or not they were water quality-impaired. However, understanding the miles of impaired BLM streams, as presented in the DLUPA/EIS at Section 3.6.1, is useful in establishing a baseline by which the BLM may analyze the relative effects of each alternative's broad-based approach.

As specific actions come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. Site-specific concerns and more detailed environmental Proper Functioning Condition of riparian systems according to BLM Manual 1737 includes stabilization of streambanks, maintenance of ponding, reduction in erosion, and other features beneficial to sage-grouse. Restrictions on grazing in riparian areas are considered in current BLM management to reduce trampling and overuse caused by livestock. Re: PFC data – not always available on a sub-regional level. Data have been included when available on a sub-regional level. [BLM: provide direction if any change to analysis is necessary.]

[Clean up this text: 36 CFR etc is a reference to the 2012 planning rule. These amendments are being promulgated under the transition provisions of the 2012 rule to use the 1982 rule which most of the ID/MT FS plans were developed under. Therefore, that CFR does not apply]

BLM: Include description of changes to EIS here or rationale for why no change is needed.

*[NOTE TO BLM: Assuming that the first part is extraneous information, see the response below. If it could be useful for analysis, then it may only need a quick explanation in qualitative text. The second part is likely editorial and could be addressed with text updates in the FEIS.]*

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in chapter 3 and various appendixes in the Draft LUPA/EIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the Draft LUPA/EIS.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM realizes that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions. The BLM will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan amendment. These subsequent NEPA analyses will tier to

ND The DRMPA/DEIS violates NEPA because it fails to consider the effects of livestock grazing on the sagebrush and the spread of cheatgrass adequately.

WY9

## Response

n/a

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/DEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/DEIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/DEIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA

n/a

BLM: Include description of changes to EIS here or rationale for why no change is needed.

n/a

n/a

The BLM has revised the description of cheatgrass existing conditions in the North Dakota Greater Sage-Grouse planning area with more recent data. Although cheatgrass is present in the planning area, it is not prevalent or listed as a threat to GRSG in the COT Report. Sections 3.X and 3.X have been revised accordingly in the FEIS.

This should be moved to  
Vegetation - Sagebrush,  
Section 26.

## Response

n/a

n/a

Proper Functioning Condition of riparian systems according to BLM Manual 1737 includes stabilization of streambanks, maintenance of ponding, reduction in erosion, and other features beneficial to sage-grouse.

Under the proposed plan, adaptive management would be incorporated into vegetation treatment and restoration programs, including riparian management. Adaptive management would allow BLM increased flexibility to adjust programs based on data collected during operation, to respond to changing conditions and improve effectiveness of vegetation management programs.

FRI M: provide direction if any change to analysis is necessary.

## Response

n/a

The BLM land use plans and amendments must be consistent with officially approved or adopted resource-related plans of local governments to the extent that these resource-related plans comport with FLPMA and other Federal laws and regulations (see 43 CFR 1610). The BLM has worked closely with local governments during preparation of the Draft LUPA/EIS. The BLM works to find a balance among uses and needs as reflected in these local government plans and has done so in the preparation of the LUPA/EIS; a list of these plans can be found in Section 1.8, Relationship to Other Policies, Plans, and Programs. While the BLM is not obligated to seek consistency, the agency is required to describe the inconsistencies between the proposed action and the other plans, policies, and/or controls within the FIS. This information has been

## Response

n/a

n/a

n/a

In the document the BLM must state that the policy will not threaten private water rights and will comply with water law. 130-5 Does this need to be discussed in the EIS? The BLM does not have the authority to make private water to be used for SG. The BLM does not have the jurisdiction.

0259-16 Need to reword 8th bullet on page A-17 to ensure it does not conflict with water rights.

393-5 BLM needs time to review section 4.16.2 to respond.

[NOTE TO BLM: Assuming that the list of watersheds wasn't included because of the relevant scope of the project, see the response below. If this is not the case, and it would be relevant to include, then we can modify the response and note that the information will be included in the FEIS. Including the watershed information would resolve the assumption issue. I'd suggest also revising the FEIS impact analysis to clarify statement on groundwater quality impacts.]

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in chapter 3 and various appendixes in the Draft LUPA/EIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the Draft LUPA/EIS.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM realizes that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions. The BLM will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan amendment. ND WY9 n/a

## Response

Specific text will be revised in terms of "probability of impacts".

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DI UPA/FIS that best addressed  
n/a

BLM not sure how to respond but believe these might be chapter 2 edits.

n/a

Section 1.5 of the DRMPA/DEIS describes how the Lewistown Field Office Greater Sage-Grouse RMPA/EIS planning team employed the BLM planning process to develop a reasonable range of alternatives for the RMPA. The BLM complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

The DRMPA/DEIS states that land health assessments and grazing permit renewals under agency preferred alternative (Alternative D), would be completed as they expire within watershed areas. Watershed areas in PH that contain expired or expiring grazing authorizations would be prioritized for renewal. Table 3-45, Lewistown Field Office Planning Area – Land Health Assessment, summarizes the BLM-administered acres in PPH and PGH not meeting land health standards because of livestock grazing management. Table 3-21, PFC Assessments within GRSG Habitat on BLM-Administered Lands, summarizes the stream and riparian conditions in PPH and PGH.

PFC it is the BLM-required protocol for assessment of streams and riparian-wetland areas, and it is the minimum standard for achievement of BLM land health standards. Alternative D in the DRMPA/DEIS, , goes beyond PFC by requiring that land health evaluations and determinations include (at a minimum) indicators and/or measurements of structure/condition/composition of vegetation specific to achieving GRSG habitat objectives. Management actions would be developed if land health determinations indicate that an allotment is not meeting standards due to current livestock grazing. Appendix B addresses mid-scale monitoring. State objectives would be used for fine scale analysis unless local objectives are developed at the field office level, in partnership with MFWP and USFWS. See Figure 2-7 (Appendix A).

Ecological site descriptions, riparian proper functioning condition (PFC) protocols, water quality data, and various types of appropriate vegetative, riparian, habitat, and any other applicable data would continue to be used as the basis in allotment

Water resource information and available literature will be reviewed.

As stated in Section 4.1.1, implementing actions from any of the LUPA alternatives would be in compliance with all valid existing rights, federal regulations, BLM and Forest Service policies, and other requirements [NOTE TO BLM: should language be added in FEIS pertaining to State laws?].

Utah's Standards for Rangeland Health and Guidelines for Grazing Management were developed in accordance with 43 CFR-4180 to provide for conformance with the Fundamentals of Rangeland Health. Through conformance and attainment of Utah's Standards and Guidelines, Utah BLM assures that the Fundamentals of Rangeland Health are met. It is beyond the scope of this EIS to revise existing guidelines for rangeland health or technical reports for riparian-wetland areas.

n/a

BLM needs to speak internally with GIS department about changes.

n/a

Allotments have been assessed for adherence to the Standards for Rangeland Health and Guidelines for Livestock Grazing Management for Public Lands Administered by the BLM for Montana and the Dakotas (Appendix F of the DRMPA/DEIS). An assessment of rangeland health standards and guidelines has been made on all allotments in the planning area. Table 3-45, Lewistown Field Office Planning Area – Land Health Assessment, summarizes the BLM-administered acres in PPH and PGH not meeting land health standards because of livestock grazing management. Under the agency preferred alternative (Alternative D), range management decisions, the DRMPA/DEIS states that land health assessments and grazing permit renewals would be completed as they expire within watershed areas. Watershed areas in PH that contain expired or expiring grazing

This seems like it might fit better with included in the livestock or vegetation rather than with water resources.

n/a

Plan Issue Statement

OR Commenters noted concerns about accuracy of impact analysis on water resources from livestock grazing and vehicle travel.

UT Commenters requested that the impacts on water from eroding soil and manure be analyzed for each alternative; supporting documentation that fluid mineral development can have an adverse impact on water quality; and a description of how Pinyon/Juniper encroachment affects water resources.

ID- The EIS fails to address impacts on the soil  
SW and watershed conditions resulting from  
MT grazing-sourced manure, soil erosion and  
pathogen contamination under each  
alternative and to provide appropriate  
mitigation measures. Such an analysis should  
include a list of impaired waters and the  
sources of contamination for those waters.  
The EIS also fails to address the negative  
impact on GRSG of restricting or removing  
water developments under Alternative D

NV- The BLM Needs to better analyze for impacts  
CA from minerals management.

NW n/a

CO

Lewis n/a

town

ND The DRMPA/DEIS does not provide detailed analysis of Proper Functioning Conditions in riparian areas. Include an analysis of how many acres/stream miles will be brought into Properly Functioning Condition, and how quickly, for each alternative.

WY9

Impact analysis on water resources from livestock grazing and vehicle travel will be clarified.

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

NOTE TO BLM: BLM should review impact discussions under soil and water resources under each alternative and consider mentioning any appropriate beneficial impacts on soils and watersheds that would result from grazing restrictions.

NOTE TO BLM: BLM should review impacts on GRSG from grazing under Alternative D and consider whether it is appropriate to identify adverse impacts on GRSG through the restriction or removal of grazing-related water developments.

[NOTE TO BLM: Discuss with biologists the impacts of the removal of water development on Sage Grouse.]

303d listed streams are discussed in Section 3.16.2.

BLM needs to review section to determine if permits are referenced in the document.

Need to find acres with mineral withdrawal.

Need to review new alternative E to see if comment is still relevant. If it is not relevant respond with changes to alternative E.

BLM needs to change/check the analysis to address comment 0188-41, 43,.

0344-42- Accept part of the changes (from mining to oil and gas) not accept other changes.

Soil erosion and water quality impacts from livestock grazing discussed in chapter 4.16.

n/a

n/a

**As noted in section 4.6, impact analysis, of this report** the DRMPA/DEIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. ~~As required by 40 CFR 1502.16, the DRMPA/DEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short term uses of man's environment and the maintenance and enhancement of long term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DRMPA/DEIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.~~

~~Land use plan level analyses are typically broad and qualitative rather than quantitative or focused on site specific actions (BLM Land Use Planning Handbook H-1601-1). The DRMPA/DEIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site specific project and implementation level actions. The site specific analyses will tier to the plan level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.~~

As indicated in Table 3-10 in Section 3.5.2, not all of the riparian areas in the planning area are currently in PFC. Many of the planning decisions, such as those related to grazing and riparian area management, are designed to move non-functioning areas towards PFC.

## **NEED TO BE CONSISTENT ON WHAT MANA**

Plan	Issue Statement
OR	<p>The BLM did not consider alternatives which adequately limited or managed wild horses in the planning area. The BLM should include greater justification for increasing or decreasing AUMs for wild horse. In addition, the BLM should provide details on how HAF will be utilized in management of WHB. The BLM should also provide information on current wild horse populations and clarify if populations exceed AML.</p>

UT The majority of the commenters were concerned about grouping livestock and wild horses and burros together in the plan and the 25% reduction in AML under Alternative C2 (and the basis for the reduction). The commenters wanted the 25% reduction evaluated again based on the fact that only 2% of the sage grouse habitat overlapped with HMAs.

Commenters also suggested the following edit/additions/clarifications to the preferred alternative:

- Outline a reduction, and if necessary elimination of livestock grazing, before any reduction of AUMs for wild horses and/or burros could occur.
- Add a commitment to consider drought conditions when establishing AMLs;
- Include a measure to develop scientific procedures that can be replicated to count horses so that proper management actions can be implemented when numbers exceed AMLs;
- Specifically identify the processes (i.e., HMAs, NEPA) through which management

ID-SW Commentors were concerned about  
MT grouping of livestock and wild horses  
together in management actions.  
Commentors were also concerned with the  
25% proposed reduction of AML under  
Alternative F and the basis for reduction;  
they requested reevaluation of reduction  
based on the fact that wild horse habitat  
overlaps a minimal percentage of GRSG  
habitat.  
Commentors also requested consideration  
of the following in the FEIS:  
Require that any land policy changes  
resulting from the sage grouse plan be in  
conformance with the National Academy of  
Sciences 2013 recommendations for reform  
of the federal wild horse management  
program.  
Provide flexibility to increase AML/AUM  
and/or open HAs if data becomes available  
demonstrating that genetic viability of wild  
horses and burros is threatened.  
Commentors also feel that the preferred  
alternative would give the BLM too much  
discretion to reduce AMLs or zero out  
HMAs which would violate the BLM's legal

NV-CA The DEIS fails to comply with the FLPMA and WFRHBA by restricting wild horses. One commenter was concerned that "Table 2.1 appears to suggest that feral horse and burro are not subject to reductions in population".

#### Summary for Range of Alternatives

The majority of the commenters were concerned about grouping livestock and wild horses and burros together in the plan and the equal reduction in forage under the Alternatives. The commenters wanted the reduction evaluated again based on the fact that only 12% of the sage grouse habitat overlapped with HMAs.

Commenters also suggested the following edit/additions/clarifications to the preferred alternative:

- Require that any land use policy changes resulting from the sage grouse plan be in conformance with the National Academy of Sciences' 2013 recommendations for reform of federal wild horse management program.

Commenters were also concerned about

NWCO The BLM should link the Colorado Monitoring Framework with the vegetation studies. Additionally, BLM should have considered AMLs for drought conditions in the range of alternatives.

## MANAGEMENT ACTIONS RELATING TO AMLS ARE AVAILABLE AND IN SCOPE FOR T

### Response

The BLM considered a reasonable range of alternatives during the Greater Sage-Grouse planning process in full compliance with the NEPA. See Section 4.3, NEPA Range of Alternatives, in this section for an expanded explanation on what constitutes a reasonable range of alternatives. The CEQ regulations (40 CFR 1502.1) require that the BLM consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage grouse in the planning area, the BLM fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives which best addressed the issues and concerns identified by the affected public.

The BLM protects, manages, and controls wild horses in accordance with the Wild Free-Roaming Horses and Burros Act of 1971 (Public Law 92-195, as amended), the purpose of which is to "manage wild horses and burros within herd management areas (HMAs) designated for their long-term maintenance, in a manner designed to achieve and maintain a thriving natural ecological balance (TNEB) and multiple use relationships." The FLPMA directs the BLM to manage wild horses and burros as one of numerous multiple uses including mining, recreation, domestic grazing, and fish and wildlife. It also required a current inventory of wild horses and burros. Additional guidance is found in 43 CFR 4700, Protection, Management, and Control of Wild Free-roaming Horses and Burros. The BLM does not manage for feral horses. Funding and priority for management and removal of wild horses and burros are determined by national level priorities and land health considerations.

Reducing AML does fall within the legal mandate of the BLM to protect WHB. Through the BLMs program of monitoring and analysis of data, AMLs have been established and will continue to be adjusted based on the analysis of data. AMLs can be adjusted based on the limitations and capability of the range, including the four habitat components, while managing for healthy populations of

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. See Section 4.3, NEPA Range of Alternatives, in this section for an expanded explanation on what constitutes a reasonable range of alternatives. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage grouse in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/DEIS that best addressed the issues and concerns identified by the affected public.

The BLM protects, manages, and controls wild horses in accordance with the Wild Free-Roaming Horses and Burros Act of 1971 (Public Law 92-195, as amended), the purpose of which is to "manage wild horses and burros within herd management areas (HMAs) designated for their long-term maintenance, in a manner designed to achieve and maintain a thriving natural ecological balance (TNEB) and multiple use relationships." The FLPMA directs the BLM to manage wild horses and burros as one of numerous multiple uses including mining, recreation, domestic grazing, and fish and wildlife. It also required a current inventory of wild horses and burros. Additional guidance is found in 43 CFR 4700, Protection, Management, and Control of Wild Free-roaming Horses and Burros.

Several comments were related to decision making that falls outside the scope of the Utah Greater Sage-Grouse LUPA/EIS. Reducing AML does fall within the legal mandate of the BLM to protect WHB. Through the BLMs program of monitoring and analysis of data, AMLs have been established and will continue to be adjusted based on the analysis of data. AMLs can be adjusted based on the limitations and capability of the range, including the four habitat components, while managing for

Through the BLMs program of monitoring and analysis of data, AMLs have been established and will continue to be adjusted based on the analysis of data. AMLs can be adjusted based on the limitations and capability of the range, including the four habitat components, while managing for healthy populations of WHBs in balance with other uses and resources (including sage grouse). Should the 25% reduction

The BLM protects, manages, and controls wild horses in accordance with the Wild Free-Roaming Horses and Burros Act of 1971 (Public Law 92-195, as amended), the purpose of which is to "manage wild horses and burros within herd management areas (HMAs) designated for their long-term maintenance, in a manner designed to achieve and maintain a thriving natural ecological balance (TNEB) and multiple use relationships." The FLPMA directs the BLM to manage wild horses and burros as one of numerous multiple uses and sustained yield including mining, recreation, domestic grazing, and fish and wildlife. It also required a current inventory of wild horses and burros. Additional guidance is found in 43 CFR 4700, Protection, Management, and Control of Wild Free-roaming Horses and Burros. **The BLM does not manage for feral horses and burros.**

Reducing AML does fall within the legal mandate of the BLM to protect WHB. Through the BLMs program of monitoring and analysis of data, AMLs have been established and will continue to be adjusted based on the analysis of data and the achievement of management goals and objectives including rangeland health standards and sage grouse habitat objectives. AMLs can be adjusted based on the limitations and capability of the range, including the four habitat components, while managing for healthy populations of WHBs in balance with other uses and resources (including sage grouse).

The current proportion of wild horse and burro AUMs compared to permitted livestock AUMs is fairly small across all HMAs. Many allotments reflect AMLs in which the AUMs are only a small percentage of the total AUMs allocated, however in some cases the AUM allocations for WH&B is equal to or exceed those allocated to domestic livestock. In addition, despite the fact that the wild horse and burro AUMs (AML) are lower than the livestock AUMs in most circumstances, actual use by wild horses has almost always exceeded the established AML on average. Additionally, livestock operators generally do not use all of the available AUMs on an annual basis.

The BLM established AML for each herd management unit in each of its relevant existing land use plans for the field offices in NW Colorado. Establishing new AML levels in the sage-grouse plan amendment is out of scope.

**Need to be consistent on how NAS report will be**

Plan	Issue Statement
------	-----------------

OR	The BLM should consider the findings and recommendations of the National Academy of Sciences (NAS) report.
----	--

UT Commenters request documentation of critical genetic data on each of the wild horse and burro herds in the planning area. This will provide BLM basis for identifying which HMAs would not be feasible to place AML reductions on while maintaining genetically viable herds.

Commenters did not feel that the NTT and COT report clearly identified the differences between livestock and wild horse and burros and their impacts on Sage Grouse. Therefore, by using these two reports and their approach, the BLM and Forest Service wrongly categorized livestock and wild horses together under the description of livestock.

Commenters were also concerned that the National Academy of Sciences' 2013 recommendations for reform of federal wild horse management program were not utilized in this LUPA/EIS.

ID-SW Commenters request documentation of  
MT critical genetic data on each of the wild  
horse and burro herds in the planning area.  
This will provide BLM basis for identifying  
which HMAs would not be feasible to place  
AML reductions on while maintaining  
genetically viable herds. Commentors also  
requested exact population data for all wild  
horse populations in HMAs and HAs and  
clearly defined maps of HMAs and HAs.

NV-CA Commenters are concerned of the lack of  
discussion of the detrimental influence of  
wild horses and burros on rangeland health.  
Commenters were also concerned that the  
National Academy of Sciences' 2013  
recommendations for reform of federal wild  
horse management program were not  
utilized in this LUPA/EIS.  
A specific comment identified that there  
were errors within the Chapter 3 WHB  
map, Specifically "T48N to T46N and R18E  
to R21E are and never have been feral horse  
range, nor are they HMA contrary to what  
your map shows. Please correct this in the  
final EIS".

Commenters are concerned the proposed  
EIS combines animal unit months for  
privately owned domestic livestock with wild

## e implemented or considered in the FEIS.

### Response

[Note to BLM: Have Bob check with national WHB team for national response on how the recommendations in the NAS report will be incorporated once the report is finalized.]

[Note to EMPSi: The NAS report is not finalized, and the report has been submitted and the BLM is in the process of completing a report on how they will implement the recommendations. National WHB team may have a standard response. The finalized NAS report and BLM implementation reports will be considered in the development of the FEIS and actions appropriate to the land management planning level included as appropriate. Many of these actions would be considered under a separate NEPA action 1

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in Chapter 3 and various appendixes in the Draft LUPA/DEIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the Draft LUPA/DEIS.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM realizes that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions. The BLM will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan amendment. These subsequent NEPA analyses will tier to the land use planning analysis and evaluate project impacts at the site-specific level (see 40 CFR 1502.20 and 1508.28). As part of the NEPA process, the public will be presented with the opportunity to participate in the environmental analysis process for these future implementation actions.

Before beginning the land use plan amendment process and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level. The data needed to support broad-scale analysis of the 48,209,900 acre planning area are substantially different than the data needed to support site-specific analysis of projects proposed for implementation under the land use plan. Much of the data in the DLUPA/DEIS is presented in qualitative and map form, and is sufficient to support the gross scale analyses required for land use planning.

The BLM used the most recent and best information available that was relevant to a land use planning-scale of analysis. During preparation of the LUPA/DEIS, the BLM consulted with and used data from other agencies and sources, including but not limited to U.S. Geological Survey, U.S. Fish and Wildlife Service, state of Utah, and counties. The BLM consulted on the analysis and the incorporation of available data into the LUPA/DEIS with its cooperating agencies and other agencies with jurisdiction or expertise.

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in chapter 3 and various appendixes in the Draft LUPA/DEIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the Draft LUPA/DEIS.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. Although the BLM realizes that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions.

Much of the data in the DLUPA/DEIS is presented in qualitative and map form, and is sufficient to support the gross scale analyses required for land use planning. The DEIS includes maps of HMAs and HAs. These maps will be reviewed for accuracy prior to inclusion in the FEIS.

BLM's use of the 2013 National Academy of Sciences (NAS) recommendations to use science to improve BLM's wild horse and burro management will occur primarily during the implementation phase of managing for protecting and improving GRSB habitat.

The USFWS did identify grazing as a threat in the NTT and COT reports but did not specifically delineate between domestic and wild horse and burro grazing. However within the DEIS, BLM did analyze impacts on WHB and domestic livestock grazing separately and also analyzed the impacts on GRSB from WHB and domestic livestock grazing separately. Impacts on GRSB from WHB and domestic livestock grazing are identified in section 4.3 of the LUPA/DEIS. Impacts on WHB from GRSB management strategies are identified in section 4.7 of the LUPA/DEIS.

A specific comment identified that there were errors within the Chapter 3 WHB map, specifically "T48N to T46N and R18E to R21E are and never have been feral horse range, nor are they HMA contrary to what your map shows. Please correct this in the final EIS". The WHB map has been thoroughly reviewed and the area covered by the identified Townships and Ranges are actually within a historic Need name Herd Area (HA) administered by the CA BLM.

Genetic documentation of WHB is an ongoing implementation level process used to monitor the genetic health of BLM's wild horse and burro populations. IM 2009-061.

----	-----

UT	<p>The majority of commenters were concerned that the alternatives do not adequately protect wild horses and burros per BLM mandate. They felt the genetic impacts of the proposed plan must be thoroughly examined including scientific data to justify the claim that any removal and upheaval would not negatively affect the genetic diversity of WHB and that any wild horses/burros allowed to remain would be adequate for the genetic viability and future survival of a self-sustaining population.</p>
----	--

They are also concerned that the analysis on GRSG from wild horses and burros are not distinguished from livestock which inaccurately increases the threat. Specifically, wild horse Herd Management Areas only impact 2% of the total Mapped GRSG Occupied Habitat in the planning area, while livestock grazing occurs in 55% of the Mapped GRSG Occupied Habitat. In addition, the BLM allows the equivalent of 253 wild horses vs. 75,769 cows (annual equivalent) in the mapped GRSG occupied areas. This means that there are 300 times

ID-SW  
MT

Commenters were concerned that the DEIS does not adequately protect wild horses and burros per BLM mandate. They are also concerned that the analysis on GRSG from wild horses and burros are not distinguished from livestock which inaccurately increases the threat. Specifically, wild horse Herd Management Areas only impact a small amount of the total Mapped GRSG Occupied Habitat in the planning area. Commenters identified contradictions in the document such as where the document states that "Under all alternatives, no direct change would occur to areas allocated as HMAs/WHBTs for wild horses and burros", then the report proceeds to summarize how every single alternative would restrict wild horse and burro usage in their own federally designated habitats.

NV-CA The BLM fails to analyze the impacts of reductions in forage allocations on Wild Horses.

The majority of commenters were concerned that the alternatives do not adequately protect wild horses and burros per BLM mandate. ~~They felt that the BLM failed to analyze the impacts of reductions in forage allocations on Wild Horses and Burros.~~

Commenters were also concerned that the analysis of impacts on GRSG from wild horses and burros was not distinguished from livestock which inaccurately skews the impacts.

Commenters also identified contradictions in the document such as where the document states that "Under all alternatives, no direct change would occur to areas allocated as HMAs/WHBTs for wild horses and burros", then the report proceeds to summarize how parts of alternative would restrict wild horse

Response

n/a

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

The BLM did analyze impacts on WHB and domestic livestock grazing separately and also analyzed the impacts on GRSG from WHB and domestic livestock grazing separately. Impacts on GRSG from WHB and domestic livestock grazing are identified in Section 4.2 of the DLUPA/DEIS. Impacts on WHB from GSRG management strategies are identified in Section 4.10 of the DLUPA/DEIS. BLM appropriately analyzed the impacts to WHB from actions not related to changes in AML.

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions. Proposed changes to HMAs would consider GRSG habitat and land health. Any changes in AML would require additional site specific NEPA analysis. The language in the FEIS related to the potential reduction of AMLs will be clarified as appropriate for the 25% reduction under Alternative F.[BLM –need to check language in FEIS]

The USFWS identified grazing as a threat in the NTT and COT report but did not specifically delineate between livestock and WHB grazing. However, within the DEIS, the BLM and Forest Service did analyze impacts on WHB and domestic livestock grazing separately and also analyzed the impacts on GRSG from WHB and domestic livestock grazing separately. Impacts on GRSG from WHB and domestic livestock grazing are identified in Section 4.X of the DLUPA/DEIS. Impacts on

The BLM protects, manages, and controls wild horses in accordance with the Wild Free-Roaming Horses and Burros Act of 1971 (Public Law 92-195, as amended), the purpose of which is to "manage wild horses and burros within herd management areas (HMAs) designated for their long-term maintenance, in a manner designed to achieve and maintain a thriving natural ecological balance (TNEB) and multiple use relationships." The FLPMA directs the BLM to manage wild horses and burros as one of numerous multiple uses including mining, recreation, domestic grazing, and fish and wildlife. It also required a current inventory of wild horses and burros. Additional guidance is found in 43 CFR 4700, Protection, Management, and Control of Wild Free-roaming Horses and Burros.

Reducing AML does fall within the legal mandate of the BLM to protect WHB. Through the BLMs program of monitoring and analysis of data, AMLs have been established and will continue to be adjusted based on the analysis of data and the achievement of management goals and objectives including rangeland health standards and sage grouse habitat objectives. AMLs can be adjusted based on the limitations and capability of the range, including the four habitat components, while managing for healthy populations of WHBs in balance with other uses and resources (including sage grouse).

In the development of the DEIS BLM did analyze impacts on WHB and domestic livestock grazing separately and also analyzed the impacts on GRSG from WHB and domestic livestock grazing separately. Impacts on GRSG from WHB and domestic livestock grazing are identified in section 4.3 of the LUPA/DEIS. Impacts on WHB from GSRG management strategies are identified in section 4.7 of the LUPA/DEIS.

Text in the WHB impact section will be reviewed and any contradictory statements will be taken out of the FEIS.

## Response

n/a

BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, requires the BLM to update and maintain a wilderness inventory consistent with BLM wilderness characteristics inventory guidance. It also directs the BLM to use the land use planning process to determine how to manage lands with wilderness characteristics as part of the BLM's multiple-use mandate. However, BLM Manual 6320 also states, "In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (As dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics."

Inventories for wilderness characteristics were conducted from 1979 to the present and reflect the most up-to-date lands with wilderness characteristics baseline information for this planning area. In addition to the inventories conducted for the purposes of land use planning, lands with wilderness characteristics inventories will be updated for site-specific project NEPA analyses that are conducted in the planning area to determine if a project will have impacts on lands with wilderness characteristics identified through previous or updated inventory efforts.

As noted on page I-4, the purpose of and need for the national GRSG planning effort is limited to making land use planning decisions specific to the conservation, enhancement, and/or restoration of GRSG habitat specifically by reducing, eliminating, or minimizing threats to that habitat. No decisions related to the management of lands with wilderness characteristics will be made as part of this planning effort; therefore, management of lands with wilderness characteristics is considered outside the scope of this plan amendment process. Impacts on lands with wilderness characteristics from the alternatives being analyzed for this planning effort are presented in Chapter 4, Section 4.14, Lands with Wilderness Characteristics.

n/a

Secretarial Order 3310 (issued in December of 2010) was never implemented, the Department of Defense and Full-Year Continuing Appropriations Act of 2011 (PLI 12-10) prohibited the use of funds to implement the Secretarial Order during fiscal year 2011. The primary direction under S.O. 3310 was the designation of "Wild Lands" that were to be derived from wilderness characteristics inventories. Since that time BLM has provided additional policy in 2012 in the form of Manuals 6310 and 6320 which excludes any designation of "Wild Lands" but continues to provide direction for the inventory of public lands for wilderness resources under FLPMA sections 201 and 202 which is considered appropriate under the

As noted on page 395, the purpose of and need for the national GRSG planning effort is limited to making land use planning decisions specific to the conservation of GRSG habitats. No decisions related to the management of lands with wilderness characteristics will be made as part of this planning effort; therefore, management of lands with wilderness characteristics is considered outside the scope of this plan amendment process. Impacts on lands with wilderness characteristics from the alternatives being analyzed for this planning effort are presented in Chapter 4, Section 4.20, Lands with Wilderness Characteristics.

As part of the original FLPMA Section 603-mandated inventories, inventories were conducted during past RMP revisions and amendment efforts, and through other various lands with wilderness characteristics inventory updates that have recently taken place. Inventories for wilderness characteristics were conducted for each field office, including some ongoing inventories and reflect the most up-to-date lands with wilderness characteristics baseline information for this planning area. For inventories that were conducted after 2011, findings were documented following guidance in BLM Instruction Memorandum 2011-154, Requirement to Conduct and Maintain Inventory Information for Wilderness Characteristics and to Consider Lands with Wilderness Characteristics in Land Use Plans, which is now encompassed in BLM Manuals 6310 and 6320. Lands with wilderness characteristics inventories will be updated for any site-specific project NEPA analyses that are

Response	NCT Notes
<p>As noted on page I-6 of the DRMPA/DEIS, the purpose of the national GRSG planning effort is limited to making land use planning decisions specific to the conservation, enhancement, and/or restoration of GRSG habitat specifically by reducing, eliminating, or minimizing the threats to that habitat. No decisions related to the management of Wilderness, WSAs, or lands with wilderness characteristics will be made as part of this planning effort; therefore, management of Wilderness, WSAs, and lands with wilderness characteristics is considered outside the scope of this plan amendment process. Impacts on lands with wilderness characteristics from the alternatives being analyzed in this planning effort are presented in Chapter 4, Section 4.18, Lands with Wilderness Characteristics.</p> <p>The BLM does recognize that wilderness inventories will need to be completed before an action takes place. However, this is done at the project-scale and impacts on lands with wilderness characteristics would be analyzed at that time. Similarly, actions such as native seed planting, removal of structures, and changes to recreation management are all viable management and restoration options within Wilderness, WSAs, or land with wilderness characteristics, but would be analyzed on a case-by-case basis, as necessary.</p>	<p>It is unclear which response corresponds to each issue. Suggest using bullets or numbering system to distinguish summary and response pairs.</p> <p>The second paragraph of this summary and corresponding response can be moved into section 31.0 of this report. Manual 6320 is already addressed there.</p>
<p>BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, requires the BLM to update and maintain a wilderness inventory consistent with BLM wilderness characteristics inventory guidance. It also directs the BLM to use the land use planning process to determine how to manage lands with wilderness characteristics as part of the BLM’s multiple-use mandate. However, BLM Manual 6320 also states, "In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (As dictated by the statement of purpose and need for the planning effort). For example, n/a</p> <p>Per BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, "In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (as dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics." Therefore, analysis in this planning document regarding LWCs will not be completed.</p> <p>Alternative C considers ACEC designation for Greater Sage Grouse habitat and species protection.</p>	<p>Consider using some language from the ACEC section (8) of this report to support last sentence of response.</p>

Wilderness management plans provide general guidance in the management of the designated area through compliance with the Wilderness Act and policies provided in BLM Manual 6340 – Management of Designated Wilderness. Direction for the management of Threatened and Endangered Species and Restoration –Vegetation Management is provided in Manual 6340; it is Wilderness Act policy on wilderness is that the wilderness resource is the priority. Other resource actions are subordinate to the preservation of wilderness and any actions proposed for other resources such as T & E species can be conducted but at minimum levels, enough to preserve the T & E Species but with minimal impact to wilderness characteristics.

BLM is required by policy through Manual 6320 to consider lands with wilderness characteristics for the management and protection/preservation of those characteristics during a land use plan revision. These lands are considered for the wilderness characteristics they contain, size, naturalness, outstanding opportunities for solitude and/or outstanding opportunities for primitive unconfined recreation. Threatened/endangered or sensitive plant/animal species are not wilderness characteristics, they are rather supplemental values which are not necessary for the determination of wilderness character. The decision to manage or not manage the

n/a

BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, states that, “In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (as dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics.” (BLM Manual 6320.06, Policy).

As noted on page I-14 of the Draft RMPA/EIS, the purpose of and need for the National GRSR Planning Strategy is limited to making land use planning decisions specific to the conservation of GRSR habitats. No decisions related to the management of lands with wilderness characteristics will be made as part of this planning effort; therefore, management of lands with wilderness characteristics is considered outside the scope of this plan amendment process.

As part of the original FLPMA Section 603-mandated inventories, inventories were conducted for the LFO in 1979. The intensive inventories published in the early 1980's resulted in the designation of two WSAs that are located outside of this planning area. No other inventories have been completed for lands with wilderness characteristics since then; however, inventories are currently underway as part of the RMP revision process, which began in 2013 and is scheduled to be complete in 2018. Lands with wilderness characteristics inventories will be updated for any site-specific project NEPA analyses that are conducted in the planning area to determine if a project will have impacts to lands

n/a

The response is confusing as currently written. It would help to switch the first and second paragraph. This way the question regarding manual 6320 is answered before elaborating on other policies which were followed. Also consider using some language from other subregions to help clarify.

n/a

BLM Upper Snake Field Office continues to evaluate lands with wilderness characteristics within the planning area. Decisions related to lands with wilderness characteristics will be addressed in the Upper Snake EIS/LUP.

Per BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, "In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (as dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics." Therefore, analysis in this planning document **related to LWCs** will not be completed.

The BLM is not making decisions on lands with wilderness characteristics in this planning effort. Doing so is outside the purpose and need and scope of this EIS.

The focus of management of wilderness characteristics is upon the protection/preservation of wilderness characteristics: size, naturalness, outstanding opportunities for solitude and/or outstanding opportunities for primitive unconfined recreation. The preservation of sage grouse habitat within lands with wilderness characteristics would be a secondary benefit not the primary benefit of any decision to manage wilderness characteristics. Management decisions on activities within lands with wilderness characteristics are not as stringent as those for WSAs or designated wilderness.

The primary direction under S.O. 3310 was the designation of "Wild Lands" that were to be derived from wilderness characteristics inventories. BLM Manuals 6310 and 6320 excludes any designation of "Wild Lands" but continues to provide direction for the inventory of public lands for wilderness resources under FLPMA sections 201 and 202 which is considered appropriate under the Appropriations Act of 2014.

## Response

n/a

n/a

n/a

n/a

As required by 40 CFR 1502.16, the Draft LUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects which cannot be avoided should the proposal be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources which would be involved in the proposal should it be implemented. The Draft LUPA/EIS presented the decision-maker with sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

The Draft LUPA/EIS assesses and discloses the environmental impacts associated with invasive and noxious weeds from proposed management actions of other resources and resource uses in Section 4.6, Vegetation (Forests, Rangelands, Riparian and Wetlands, and Noxious Weeds). A discussion of the impacts from noxious weeds on the grouse and its habitat can be found in Section 4.4.2. Greater Sage-Grouse.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The Draft LUPA/EIS contains only planning actions and does not include any implementation actions, such as a cohesive weed management program or plan. A more quantified or detailed and specific analysis would be required only if the scope of the decision included such actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions, which may include but are not

## Response

The BLM describes the effects of predation on sage-grouse in the Draft EIS; the information used here and in the affected environment was taken from the Baseline Environmental Report (the BER). The BLM has authority to manage the habitat and have provided analysis to describe how the numerous management actions across the range of alternatives could affect the habitat and indirectly the effects of predation. Altering the sagebrush habitat of the greater sage-grouse can create an influx of predators into an area and lead to a population decline. Roads, fences, power lines, trails and other disturbances may make access easier for potential predators and increase risks to the species. The Draft EIS calls for measures that will substantially reduce disturbances in the bird's habitat, thus reducing predation risk. The Draft EIS also calls for careful monitoring of grazing allotments within sage-grouse nesting habitat to ensure suitable grass and forb cover is reserved so we can minimize the associated predation risks.

While adding management actions specifically to manage predators is outside the scope of the amendment, the BLM has authority to manage the habitat and have provided numerous management actions across the range of alternatives. Altering the sagebrush habitat of the greater sage-grouse can create an influx of predators into an area and lead to a population decline. Roads, fences, power lines, trails and other disturbances may make access easier for potential predators and increase risks to the species. The Draft EIS calls for measures that will substantially reduce disturbances in the bird's habitat, thus reducing predation risk. The Draft EIS also calls for careful monitoring of grazing allotments within sage-grouse nesting habitat. As stated in Section 1.6.3, Issues Eliminated from Detailed Analysis, in the DRMPA/DEIS, predator control is outside the scope of RMPA. Predator control is allowed on BLM-administered and National Forest System lands and is regulated by state agencies; these comments therefore relate to state-regulated actions and are outside the scope of the plan amendment. The BLM and Forest Service will continue to work with agencies, to address current predation of GRSG. Federal lands in the planning area will remain open to predator control under state laws.

The BLM has authority to manage GRSG habitat and have provided analysis to describe how the numerous management actions across the range of alternatives could affect the habitat and indirectly the effects of predation. However, the DEIS did not explicitly connect the effects of infrastructure and altering sagebrush habitat with the effects this could have on predators and predation of GRSG. Structural range improvements such as fences represent potential predator perches, and altering the sagebrush habitat of the GRSG can create an influx of predators into an area and lead to a population decline. Roads, fences, power lines, trails and other disturbances may make access easier for potential predators and increase risks to the species. This information has been included in the Final EIS in Section XX to more clearly state the connection between the direct effects of habitat management and indirect effects of predation. [BLM ACTION ITEM FOR FEIS (Renee): add this impact analysis in GRSG chapter 4.]

The DEIS calls for measures that will substantially reduce disturbances in the bird's habitat, thus reducing predation risk. The

The BLM and the Forest Service describe the threat of predation and addressed the potential effects of predation on GRSG populations in the Draft EIS, [see Section XXX in the Draft EIS](#). The information used in the affected environment section was initially provided in the USFWS Baseline Environmental Report (the BER), Section III, Characterization of Important Threats and Issues. Regarding the threat of predation the BER notes the following:

“With this broad outlook, it is important to recognize that though over-utilization, disease and predation, and chemical poisoning are recognized as having direct effects (such as mortality) on sage-grouse populations—and the effects of these factors may be the principal cause of population declines in local areas during specific years, for example West Nile virus outbreaks—the impact of these factors on rangewide population sustainability are considered relatively small compared to indirect effects on populations via habitat degradation, policy limitations, and competing land uses. Habitat change (Factor A), which represents a suite of changes in both local conditions (implications for forage, cover and nest quality, for example) as well as regional landscape patterns (implications for habitat availability, connectivity, and isolation, for example), includes the bulk of factors identified in previous research and litigation as affecting sage-grouse populations.”

Similarly, While the state of Idaho identified predation as a threat to sage-grouse in the 2006 Conservation Plan for the Greater Sage-grouse in Idaho (Idaho Sage-grouse Advisory Committee 2006), the Plan acknowledges (page 4.104) the following: While some level of predation is always to be expected, the question of how much predation is acceptable before control actions are initiated is difficult to assess. Related to this question is the difficulty of understanding the complex interactions of multiple threats and landscape conditions, and how these factors collectively influence predation. While the FWS did not find predation to be a primary threat, threat of disease or predation is one of the 5 factors under section (4)(a)(1) of the Endangered Species Act that the service must evaluate when making a listing decision. The FWS notes the indirect impacts of land management changes on predation, and stating in their 2010 Warranted but Precluded finding (Federal Register Vol. 75, No. 55 / Tuesday, March 23, 2010, page 13973): “Except in localized areas where habitat is compromised, we found no evidence to suggest predation is limiting greater sage-grouse populations. However, landscape fragmentation is likely contributing to increased predation on this species.” FWS also noted (page 13972) “Reduction in patch size and diversity of sagebrush habitat, as well as the construction of fences, powerlines, and other infrastructure also are likely to encourage the presence of the common raven (Coates et al. 2008, p. 426; Bui 2009, p. 4).

The BLM and the Forest Service have authority to manage the habitat and have provided analysis to describe how the

In the USFWS Service 2010 Listing Decision (75 Federal Register. 13910), the USFWS stated “Based on the best scientific and commercial information available, we conclude that predation is not a significant threat to the species such that the species requires listing under the Act as threatened or endangered.” The USFWS acknowledged that increasing patterns of landscape fragmentation are likely contributing to increased predation on the species and identified two areas where predators may be limiting GRSB populations because of intense habitat alteration and fragmentation. One of the two areas identified is within the Nevada and Northeastern Sub-region in Northeastern Nevada.

The BLM and the Forest Service have authority to manage the habitat and have provided analysis to describe how the numerous management actions across the range of alternatives could affect the habitat and indirectly the effects of predation. Altering the sagebrush habitat of the greater sage-grouse can create an influx of predators into an area and lead to a population decline. Roads, fences, power lines, trails and other disturbances may make access easier for potential predators and increase risks to the species. The Draft EIS calls for measures that will substantially reduce disturbances in the bird’s habitat, thus reducing predation risk. The Draft EIS also calls for careful monitoring of grazing allotments within sage-grouse nesting habitat to ensure suitable grass and forb cover is reserved so we can minimize the associated predation risks. This information can be found in Section XX, page XX of the Draft EIS.

**[NOTE TO BLM: Delete from the response. This info is not needed here, but make sure this information is in the FEIS.]**

~~Greater GRSB are susceptible to predation from egg to adult, leading to the hypothesis that predator control would be an effective conservation tool for GRSB populations. Generally, GRSB nest success and adult survival are high, suggesting that on average predation is not a limiting factor to GRSB populations. GRSB face a suite of predators in sagebrush communities, however, none of the predators specialize in GRSB (Hagen 2011, p 95-100).~~

~~Predator management research has not provided sufficient evidence to support implementation of predator control to improve GRSB populations over broad geographic or temporal scales. The limited information available suggests predator management may provide short term relief for GRSB population sinks in the few cases where the situation has been documented (Hagen 2011, p95-100). Most GRSB research has failed to quantify predator community structure or predation rates in relation to habitat variables, let alone within the landscape contexts. Thus, it is not currently possible to understand relationships among habitat structure, demographic rates of GRSB, and the predator community of an area and to incorporate these into broad scale based predator management programs for GRSB. It is critical for future GRSB~~

n/a

As stated in Section 1.6.4, Issues Considered but Not Further Analyzed, in the DRMPA/DEIS, predator control is outside the scope of RMPA. The State of Montana possesses primary authority and responsibility for managing wildlife within the state. The BLM has authority to manage GRSB habitat and have provided analysis to describe how the numerous management actions across the range of alternatives could affect the habitat and indirectly the effects of predation. The DEIS calls for measures that will substantially reduce disturbances in the bird’s habitat, thus reducing predation risk. The DEIS also calls for careful monitoring of grazing allotments within sage-grouse nesting habitat to ensure suitable grass and forb cover is reserved so we can minimize the associated predation risks.

Predation is one of five specific ESA listing criteria; however the USFWS did not identify predation as a significant threat to sage-grouse populations in their 2010 decision to list the species as warranted for protection under the Endangered Species Act. The USFWS acknowledged that increasing patterns of landscape fragmentation are likely contributing to increased predation on the species and identified two areas, neither in Montana [North Dakota, South Dakota] (southwestern

## MPACTS ON GrSG, SUGGEST MOVING/ADDING THEM AS A SUBHEADER UNDER SECTION 7.10

### Response

BLM: Evaluate new information for potential inclusion in the Final EIS.

[NOTE TO BLM: Provide response to the summary.]

Blickley et al's research on noise and GRSG as since been published :

Blickley J.L, D. Blackwood, and G.L. Patricelli. 2012. Experimental evidence for the effects of chronic anthropogenic noise on abundance of greater sage-grouse at leks. Conservation Biology Vol 26. No 3. 461-471

This literature has been added to the noise section in the FEIS.

[Change to FEIS- add citation and data from this study in noise section. Consider addition of other data to support claims]

BLM to review Patricelli's and other studies referencing noise Ch 4.3.2 and make revisions as necessary.

As noted previously in Section X.X, Best Available Information, the BLM and the Forest Service complied with CEQ regulations in describing the affected environment.

[NOTE TO BLM: If the information is included, then state this. If references were not included, incorporate into FEIS and if possible, provide the specific locations.] Changes made- need to be added to FEIS:

Make changes to Chapter 4.3.2 pgs 14-15 (Locatable, Leasable, and Salable Minerals Management) as follows:

Amstrup and Phillips (1977) found that low-frequency mining noise in the study area was continuous across days and seasons and did not dissipate rapidly as it traveled from its source. The mechanism of how low-frequency noise affected the birds in the study was not known, but it is known that GRSG depend on acoustical signals to attract females to leks (Gibson and Bradbury 1985; Gratson 1993). Noise associated with oil and gas development may have played a factor in habitat selection and a decrease in lek attendance by GRSG (Holloran 2005). Noise from traffic has also been documented to negatively impact GRSG. Blickley et al. (2012a) found a 73% decline in male attendance at leks exposed to traffic noise as well as an increase in stress hormones levels (Blickley 2012b) and a disruption of strutting patterns on leks (Patricelli 2012).

Add the following citations:

Blickley et al. (2012a). Blickley, J. L., Blackwood, and G.L. Patricelli. 2012a. Experimental Evidence for the effects of chronic anthropogenic noise on abundance of greater sage-grouse at leks. Conservation Biology 26:461-471.

Blickley, J. L., K. R. Word, A. H. Krakauer, J. L. Phillips, S. N. Sells, J. C. Wingfield, and G. L. Patricelli. 2012b. Experimental chronic noise exposure is related to elevated fecal corticosteroid metabolites in lekking male greater sagegrouse (*Centrocercus urophasianus*). PLoS ONE 7:e50462.

n/a

Greater sage-grouse conservation measures in A Report on National Greater Sage-grouse Conservation Measures (NTT 2011) were used to form BLM management direction under at least one alternative [Alternative B], which is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044 (the BLM must consider all applicable conservation measures developed by the NTT in at least one alternative in the land use planning process). [NOTE TO BLM: provide a response as to why the dBAs in the RDFs Appendix were incorporated from NTT.]

The BLM does not have the authority to regulate the use of air space for military or other civilian aviation and therefore has not included additional information on low level flights and associated noise [Note- can either include this statement or move comment to out of scope]

## Response

The assessments in Appendix H will be analyzed in the FEIS in Chapters X and X. Site assessments and NEPA review will be conducted for specific projects and are out of scope for this planning level document. Appendix H, Greater Sage-Grouse Wildland Fire and Invasive Species Assessment, describes a minimal framework example and suggested approach for this assessment.

As stated in Section X.X of the DRMPA/DEIS, the BLM works cooperatively with other federal, state, and county agencies as well as private landowners to prevent and control the spread of noxious weeds. There are currently no cooperative weed agreements with ranchers in the Oregon GRSG sub-region. [BLM note: BLM to make sure Ch 3 describes the cooperative weed management areas between BLM and counties]

BLM will review available literature. the suggested literature and incorporate as needed into the FEIS.

~~The CEQ regulations require an environmental impact statement to "succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration. The description shall be no longer than is necessary to understand the effects of the alternatives. Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Agencies shall avoid useless bulk in statements and shall concentrate effort and attention on important issues" (40 CFR 1502.15). Additionally, the Utah Greater Sage-Grouse LUPA is a programmatic NEPA effort to conserve greater sage-grouse and its habitat across a broad geographic area. As such, the BLM and the Forest Service described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions.~~

~~As specific actions come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. Site-specific concerns and more detailed environmental descriptions will be addressed when project-level reviews are tiered to the analysis in this EIS (40 CFR 1502.20, 40 CFR 1508.28). In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for any site-specific actions.~~

The BLM's cumulative effects analysis has met the requirements set out by the CEQ regulations for adequacy and appropriate scope (see Section 4.6, Cumulative Effects for details on requirements).

The DEIS adequately described baseline conditions for cheatgrass infestations in the planning area; Section 3.2 describes cheatgrass infestations by GRSG populations while Section 3.7.1 (Invasives) describes the baseline invasive vegetation conditions in the planning area.

As stated in Section 3.7.1 of the DLUPA/DEIS, the BLM and Forest Service work cooperatively with other federal, state, and county agencies as well as private landowners to prevent and control the spread of noxious weeds.

As noted above in the response in Section 4.3, Range of Alternatives, Section 1.5 of the Draft EIS describes how the Utah GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in chapter 3 in the Draft LUPA/EIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the Draft LUPA/EIS. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions.

The BLM used the most recent and best information available that was relevant to a land use planning-scale of analysis. During preparation of the LUPA/EIS, the BLM consulted with and used data from other agencies and sources, including but not limited to U.S. Geological Survey, Idaho state agencies, and the U.S. Fish and Wildlife Service. The BLM consulted on the analysis and the incorporation of available data into the LUPA/EIS with its cooperating agencies and other agencies with jurisdiction or expertise.

Analysis of proposed weed treatment methods tiers off of analysis in the Final Vegetation Treatments Using Herbicides on Bureau of Land Management Lands in 17 Western States Programmatic Environmental Impact Statement (PEIS) [BLM 2007x] Potential occurrence of cheatgrass has been modeled (section 3.3.5). Acre of cheatgrass potential in GRSG habitat are shown

n/a

[NOTE TO BLM: provide a response to request for description of integrated vegetation management.]

As noted previously in Section 7.3 of this Report, all alternatives considered within this planning process are consistent with conservation measures and objectives outlined in the COT Report and follow the basic principles of: (1) avoiding the impact of an activity; (2) minimizing impacts by limiting the degree of activity; and (3) mitigating for an impact by improving or enhancing greater sage-grouse habitat. As stated in Table 2-4, Description of Alternatives A, B, C, and D, in the DRMPA/DEIS, all of the alternatives would include implementing integrated vegetation management to control, suppress, and eradicate, where possible, noxious and invasive species, in accordance with BLM Handbook H-1740-2.

The DRMPA/DEIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DRMPA/DEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DRMPA/DEIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1). The DRMPA/DEIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Since Virgil, Dustin, and Tom are coming into town on Wednesday, it would be good to know what reaction Jeff got from Virgil on the maps.

This will certainly be part of the discussion on Wed.

RE: Camas County Rangeland Management Plan

Dear Mr. Murphy and Mr. Ralston,

On July 14, 2014 the Camas County Board of Commissioners adopted by resolution the Camas County Rangeland Management Plan. The development of this Plans is to provide the format to guide all plans, policies, conservation measures and best management practices for the Greater Sage Grouse in Camas County. The Camas Conservation District was asked to assist in developing this plan.

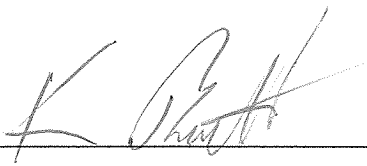

“The purpose of the Plan is to provide private and public land owners with land management principles, policies, incentives and best management practices, based on the best available science, that are tailored to fit Camas County’s unique landscape and habitat characteristics for the betterment of the species.”

The plan has been developed with considerable time and effort invested. We are incorporating resource inventory, mapping and logistics to ensure the habitat is well defined and we are working with NRCS to identify and incorporate BMP’s specifically suited to this area. By this letter, we specifically are notifying you that we have the Plan completed and are submitting it to you for incorporation within you Sage Grouse Environmental Impact Statement and for the integration of conservation measures from this Plan into your Resource Managements Plans as they apply in Camas County. A copy of the Camas County Rangeland Management Plan has been sent electronically to you at [tmurphy@blm.gov](mailto:tmurphy@blm.gov) and [bralston@blm.gov](mailto:bralston@blm.gov), respectively.

We are available to answer questions you may have about our Plan or its development and are providing you a copy. Following your review of the final product we can assist you with the incorporation of the Plan data into your NEPA analysis. We look forward to future Coordination meetings where we may discuss in greater detail the provisions of the Plan once you have had an opportunity to thoroughly review the contents.

Respectfully,

---

Ken Backstrom, Chairman  
Camas County Commissioners

The Office of the Governor

Executive Department  
State of Idaho

EXECUTIVE DEPARTMENT  
STATE OF IDAHO  
BOISE

State Capitol  
Boise

**EXECUTIVE ORDER NO. 2015-04**

**ADOPTING IDAHO'S SAGE-GROUSE MANAGEMENT PLAN**

WHEREAS, in December 2011, the U.S. Department of the Interior invited the eleven (11) western states impacted by a potential Endangered Species Act (ESA) listing of the greater sage-grouse to develop state-specific conservation plans that would conserve the species and its habitat while maintaining predictable levels of land use; and

WHEREAS, Governor Otter accepted the federal government's invitation, and by and through Executive Order 2012-02 established the Governor's Sage-grouse Task Force (Task Force) to collaboratively develop science-based recommendations for inclusion in Idaho's sage-grouse conservation plans; and

WHEREAS, in September 2012, and based on recommendations from the Task Force, I submitted the Federal Alternative of Governor C.L. "Butch" Otter for Greater Sage-grouse Management in Idaho (Governor's Alternative) as an alternative for inclusion in the National Greater Sage-grouse Land Use Planning Strategy. This national planning strategy amends some 68 U.S. Bureau of Land Management (BLM) planning units and 20 U.S. Forest Service (USFS) National Forest Plans by including objectives, habitat conditions and management actions for sage-grouse; and

WHEREAS, in February 2013, the U.S. Fish and Wildlife Service (FWS) published the Greater Sage-Grouse Conservation Objectives Team Final Report (COT Report). The purpose of the COT Report, which was developed in conjunction with state wildlife agencies, was to establish the ESA goals by identifying Primary Areas of Conservation (PAC) and the threats to the species throughout its range, as well as to develop conservation measures, based on the best available science, to address those threats. The COT Report provides the flexibility to create solutions that meet the needs of greater sage-grouse and the local ecological and socioeconomic conditions; and

WHEREAS, Governor Otter requested the FWS to evaluate the Governor's Alternative for consistency under the COT Report, and in April 2013, the FWS concluded that the foundational elements, and some individual components, within the Governor's Alternative were consistent with the COT Report. (App. 2); and

WHEREAS, based on the strength of FWS's recommendation, the BLM and USFS selected the Governor's Alternative as a co-preferred alternative within Idaho's portion of the national planning strategy (see Alternative E in the Idaho and Southwestern Montana Greater Sage-Grouse Draft Land Use Plan Amendments and Draft Environmental Impact Statement, 78 Fed. Reg. 65,703 (Nov. 1, 2013)); and

WHEREAS, the State has continued refining individual components of the Governor's Alternative, including but not limited to: (1) Idaho Code § 38-104B developing rangeland fire protection associations; (2) the State Board of Land Commissioners on April 21, 2015, adopting the Land Board's Greater Sage-grouse Conservation Plan (Land Board Plan) for State endowment lands complementary to the Governor's Alternative (App. 3); (3) the State Oil and Gas Conservation Commission on April 23, 2015, adopting portions of the Land Board Plan applicable to oil and gas programs (App. 3, p. 38); (4) working collaboratively with the local federal agencies' representatives and Task Force members to better clarify the Governor's Alternative; and (5) increasing state funding for enhanced lek monitoring, habitat restoration projects, and wildfire suppression; and

WHEREAS, it is vital to the interests of the State to continue these efforts as the listing of the species and/or overly restrictive federal land-use plan amendments would adversely impact Idaho's sovereign interest in managing its wildlife pursuant to Idaho Code § 36-103 and § 68-818, its customs, culture and way of life, and the State's ability to generate revenues from private property and endowment lands;

NOW, THEREFORE, I, C.L. "BUTCH" OTTER, Governor of the State of Idaho, by the authority vested in me under the Constitution and laws of the State of Idaho do hereby order the following:

That all executive agencies, to the extent consistent with existing state law, for relevant permits and policies, adopt the Governor's Alternative and all supporting documentation, incorporated in its entirety into this Executive Order by this reference, hereinafter known as "Idaho's Sage-grouse Management Plan," which includes:

**I. Application of the foundational elements of Idaho's Sage-grouse Management Plan (Idaho's Plan) to all landownerships.** These foundational elements are consistent with the COT Report and apply across all land ownerships.

- a. **Habitat Zones** – Idaho's Plan includes three distinct management zones: Core Habitat Zone (CHZ), Important Habitat Zone (IHZ), and General Habitat Zone (GHZ). The COT Report identified the most important habitat areas for maintaining sage-grouse representation, redundancy, and resiliency across the landscape. These areas (or PACs) closely align with CHZ and IHZ. The three management zones within the Sage-grouse Management Area (SGMA) represent a management continuum that includes, at one end, a relatively restrictive approach aimed at providing a high level of protection to the species within the CHZ, and on the other end, a relatively flexible approach for the GHZ allowing for more multiple-use activities. The zones are reflected in the attached map. (App. 1, p. 24).
  - i. **Core Habitat Zone (CHZ)** – The CHZ includes approximately sixty-five percent (65%) of the known active leks and is occupied by approximately seventy-three percent (73%) of sage-grouse males. CHZ supports the highest breeding densities of sage-grouse in Idaho, and maintenance of these populations ensures that Idaho has a viable and robust population of sage-grouse. Management in CHZ is the most restrictive to protect what local data shows as the "best of the best" habitat.
  - ii. **Important Habitat Zone (IHZ)** – The IHZ includes approximately twenty-five percent (25%) of the known active leks and is occupied by approximately twenty-two percent (22%) of sage-grouse males.
  - iii. **General Habitat Zone (GHZ)** – This management zone includes five percent (5%) of sage-grouse males, and generally includes few active leks and fragmented or marginal habitat.
- b. **Population Objectives** – In conjunction with the habitat zones, these population goals: (1) measure the efficacy of the State plan; and (2) ensure that there is an appropriately tailored response to significant fluctuations in habitat and populations.
  - i. **Objective 1** – Implement regulatory mechanisms that maintain and enhance sage-grouse habitats, populations, and connectivity within CHZ. Recognizing the impact of wildfire, the IHZ provides important management flexibility and a strategic conservation buffer.
  - ii. **Objective 2** – Stabilize sage-grouse habitats and populations by monitoring the effectiveness of the regulatory measures over time. A primary objective is to minimize habitat lost within CHZ, and to a lesser extent, IHZ.
- c. **Conservation Areas** – Idaho's Plan divided the SGMA into four Conservation Areas (CA) across the state: the Mountain Valleys, Desert, West Owyhee, and Southern. Each CA is divided into Core, Important, and General management zones. (App. 1, p. 8).
- d. **Adaptive Regulatory Triggers** – Given the unpredictability of wildfire, these triggers provide a regulatory backstop to manage loss within a CA. An adaptive trigger is

*employed when dramatic shifts in the population or habitat occurs based on an average over a three year period compared to the 2011 baseline.*

- i. *The adaptive triggers are based on the severity of habitat or population loss (i.e. a “soft trigger” or a “hard trigger”). (App. 1, pp. 11, 69-71).*
  - ii. *When monitoring information indicates that a soft trigger may be tripped, the Implementation Commission<sup>1</sup> – aided by technical expertise from Idaho Department of Fish and Game and other relevant State agencies – will assess the factor(s) leading to the decline and recommend potential management actions. (App. 1, p. 69).*
  - iii. *If the hard trigger becomes operative, management changes no longer are discretionary and will be implemented by the Implementation Task Force.*
- e. ***Rangeland Fire Protection Associations (RFPA)*** – *RPAs act as a regulatory mechanism across all landownerships ensuring quicker initial attack on wildfires in the CHZ and IHZ through the deployment of additional trained firefighters and resources located in rural parts of the SGMA.*
- i. *Idaho Code § 38-104B provides for the creation and funding of RPAs in Idaho.*
  - ii. *RFPA members work collaboratively with federal land management agencies and Idaho Department of Lands (IDL) to protect more than 2.9 million acres of federal and state rangeland and 675,000 acres of private land. These numbers are expected to grow as additional RPAs become operational in the near future.*
  - iii. *The success and effectiveness of RPAs in Idaho is considered a model by other western states.*

## **II. *Applicability of Idaho’s Plan to Lands Managed by the Federal Government (as more fully described in Alternative E of the Draft Environmental Impact Statement)***<sup>2</sup>

- a. ***Fire*** – *Idaho’s Plan for wildfire on federal lands focuses efforts on prevention, suppression, and restoration. The objective within Idaho’s Plan is to implement actions necessary to manage fire within the normal range of fire activity and maintain and restore healthy, native sage-steppe plant communities within CHZ and IHZ.*
- b. ***Invasive species*** – *In addition to the wildfire restoration efforts, Idaho’s Plan calls for the aggressive management of exotic undesirable plant species within the CHZ and IHZ.*
- c. ***Infrastructure*** – *Infrastructure means discrete, large-scale anthropogenic features, including but not limited to, highways, high voltage transmission lines, commercial wind projects, energy development (e.g. oil and gas development, geothermal wells), airports, mines, cell phone towers, landfills, residential and commercial subdivisions. (App. 1, p. 32).*
  - i. *Permitted activities in specific habitat designations*

---

<sup>1</sup> Should the BLM and USFS adopt the Governor’s Alternative, or an alternative consistent with the Governor’s Alternative, for incorporation into relevant Land and Resource Management Plans, the Governor shall execute a companion Executive Order establishing an Implementation Task Force as outlined in Appendix 1, pages 21, 67–71.

<sup>2</sup> Governor Otter encourages the adoption of Alternative E in the final EIS as it is consistent with the laws, programs, and policies of the State of Idaho. However, the Governor recognizes that the BLM and USFS may adopt a different alternative (or revised alternative) in the record of decision (ROD) and such action may necessitate a revision to this Executive Order.

- ii. *Infrastructure in CHZ – Infrastructure development in areas designated as CHZ is prohibited, except if conducted pursuant to a valid existing right, incremental upgrade and/or capacity increase of existing development, or if a project-level exemption is obtainable by meeting the criteria outlined in Appendix 1, including compensatory mitigation. (App. 1, pp. 35-36).*
  - 1. *Infrastructure in IHZ – Infrastructure development in areas designated as IHZ is permissible subject to meeting the criteria specified within Idaho’s Plan and approved by the BLM State Director. (App. 1, p. 42)*
- iii. *Best Management Practices (BMPs) for proposed infrastructure development within CHZ and IHZ.*
  - 1. *Infrastructure development should reflect unique localized conditions including soils, vegetation, development type, predation, climate, and other local realities and should utilize best management practices as described in Idaho’s Plan. (App. 1, pp. 43-45).*
  - 2. *A lek buffer of 1 km (0.6 miles) from occupied leks will be applied to essential public services, including but not limited to distribution lines, domestic water lines, and gas lines. This will enable development in a manner that maintains populations, habitats, and essential migration routes where possible. (App. 1, pp. 43-45).*
  - 3. *No Surface Occupancy (NSO) within 1 km of an occupied lek will be applied to oil and gas development. (App. 1, pp. 46-47)*
- d. *Nothing in Idaho’s Plan shall revoke, suspend, or modify any project or activity decision made prior to the effective date of the ROD.*
- e. ***Improper livestock grazing (secondary threat)*** –*This section of Idaho’s Plan requires that the Idaho Rangeland Health Standards (IRHS) be met and is consistent with the COT report. While no studies exist directly relating livestock grazing systems or stocking rates to sage-grouse abundance or productivity, Idaho’s Plan addresses improper livestock grazing within CHZ and IHZ through adaptive management according to the following process:*
  - i. *Sage-grouse habitat characteristics will be incorporated into relevant Resource Management Plans as desired conditions, recognizing that these desired conditions may not be achievable due to the existing ecological condition of an allotment, the ecological potential of the area, or causal events unrelated to livestock grazing. (App. 1, pp. 14-20).*
  - ii. *Based on these habitat characteristics, habitat assessments will be conducted to help inform grazing management in conjunction with scheduled term grazing permit renewals or if an adaptive regulatory trigger has been tripped. (App. 1, p. 73-75).*
  - iii. *In conjunction with scheduled term grazing permit renewals, livestock grazing will be assessed through the IRHS (primarily Standards 2, 4, and 8), as informed by the COT Report with respect to sage-grouse. (see Idaho Standards for Rangeland Health and Guidelines for Livestock Grazing Management (1997)).*
    - 1. *Assuming no adaptive regulatory trigger has been tripped, there is a rebuttable presumption that current grazing systems within a particular CA are adequate to maintain viable sage-grouse populations.*

2. *This does not preclude adaptive changes to grazing permits based on the other standards contained in the IRHS.*
- iv. *If an adaptive regulatory trigger has been tripped within a CA, and after a more thorough analysis of those allotments within a relevant CA determines that improper livestock grazing is a potential limiting factor, modifications to permits will be determined based on ecological site potential and will be selected from the suite of management options outlined in Idaho's Plan. (App. 1, pp. 48-50).*

**III. Applicability of Idaho's Plan on State and private lands**

- a. *In April 2015, the State Board of Land Commissioners and the Idaho Oil and Gas Conservation Commission contingently approved the Land Board Plan. (App. 3). The Land Board Plan, consistent with the constitutional mandate (IDAHO CONST. ART. IX, § 8), includes enforceable regulatory stipulations for inclusion into certain leases, permits, and easements on State endowment lands. Adoption and implementation of the Land Board Plan is contingent upon the incorporation of Idaho's Plan into the federal land-use plan amendments for sage-grouse.*
- b. *Certain permit holders on private lands can voluntarily agree to add BMPs into their permit, which would then become binding. However, private land comprises less than twenty percent (20%) of sage-grouse habitat in Idaho (and less than 6% of the CHZ).*
- c. *Existing land uses and landowner activities are vital to the State of Idaho. Idaho's Plan recognizes changes in sage-grouse populations and habitats on private lands could influence land management on public lands as adaptive triggers can become operative within a CA regardless of landownership. To offset any impacts, SGMAs have been designed to provide flexibility in order to allow for the continuation of land uses and valid existing rights. In addition, Idaho continues to encourage voluntary conservation efforts on private land for the conservation of sage-grouse.*

*IN WITNESS WHEREOF, I have hereunto set my hand and caused to be affixed the Great Seal of the State of Idaho at the Capitol in Boise on this 27<sup>th</sup> day of May, in the year of our Lord two thousand and fifteen, and of the independence of the United States of America the two hundred thirty-ninth and of the Statehood of Idaho the one hundred twenty-fifth.*

C.L. "BUTCH" OTTER  
GOVERNOR

LAWRENCE DENNEY  
SECRETARY OF STATE

In reply refer to:  
1610-5.G.1.4 (L00000)

IDMT\_PUB\_10760  
2.6

May 29, 2015

The Honorable John Hickenlooper  
Governor of Colorado  
136 State Capitol Bldg  
Denver, CO 80203

Dear Governor Hickenlooper:

The Bureau of Land Management (BLM) Northwest District Office has developed the Northwest Colorado Greater Sage-Grouse Proposed Land Use Plan Amendment/Final Environmental Impact Statement (Proposed LUP Amendment/Final EIS). The Proposed LUP Amendment/Final EIS is enclosed for your review.

The purpose of the Proposed LUP Amendment/Final EIS is to identify and incorporate appropriate Greater Sage-Grouse conservation measures into existing LUPs to help conserve, enhance, and/or restore Greater Sage-Grouse habitat by reducing, eliminating, or minimizing threats to that habitat. The need for this LUPA is to establish regulatory mechanisms in BLM LUPs to respond to the recent “warranted, but precluded” ESA listing petition decision from the US Fish and Wildlife Service (75 Federal Register 13910, March 23, 2010). In its finding on the petition to list the Greater Sage-Grouse, US Fish and Wildlife Service identified adequacy of regulatory mechanisms as a major threat. The US Fish and Wildlife Service also identified the principal regulatory mechanism for the BLM is conservation measures embedded in LUPs.

BLM Planning regulations in 43 CFR 1610.3-2(e) provide a state Governor 60 days to identify inconsistencies with approved state or local plans, policies, or programs and to provide written recommendations to the BLM State Director. If the BLM State Director does not accept the Governor's recommendations on plan consistency, the Governor may appeal to the BLM Director.

If no response is received by July 29, 2015, the BLM will assume the Proposed RMP/Final EIS is consistent with the State of Colorado's approved plans, policies, and programs.

If you or your staff has any questions about the Northwest Colorado Greater Sage-Grouse Proposed LUP Amendment/Final EIS or the Governor's Consistency Review process, please contact Erin Jones at (907) 244-3008.

Sincerely,

Ruth Welch  
State Director

C.L. "BUTCH" OTTER  
GOVERNOR

May 1, 2015

Dan Ashe, Director  
U.S. Fish and Wildlife Service  
U.S. Department of the Interior  
1849 C Street NW, Room 3331  
Washington, D.C. 20240-0001

Dear Dan,

The state of Idaho (State) reinforced its strategy to conserve greater sage-grouse (GRSG) and its habitat last month with the approval of additional conservation measures on State endowment trust lands and activities that fall under Idaho Department of Lands (IDL) regulatory and fire-related authorities.

The Idaho State Board of Land Commissioners (Land Board) approved the GRSG Conservation Plan (Land Board's Plan) on April 21, 2015. The Idaho Oil and Gas Conservation Commission (Commission) approved the Land Board's Plan on April 23, 2015. Included with this correspondence is a copy of the Land Board's Plan for your review.

The Land Board's Plan was developed with input from natural resource industry user groups, environmental organizations and relevant State and federal agencies. It is important to point out, however, that the implementation of the Land Board's Plan is contingent upon the incorporation of the foundational elements of the federal alternative (which is my plan) into the relevant Resource Management Plans (RMPs) in Idaho.

In addition to a landscape conservation approach for GRSG within the Land Board's Plan, the State of Idaho has backed up its commitment to GRSG conservation with a legislative appropriation of \$750,000 for additional conservation activities in Idaho. Some of this funding will be applied to projects on State endowment lands.

The State of Idaho has been proactive and collaborative in our efforts to conserve GRSG and its habitat in Idaho while maintaining working landscapes and the economic vitality of the State. These efforts demonstrate Idaho's commitment to the conservation of this iconic western species.

As always – Idaho, "Esto Perpetua"

A handwritten signature in black ink that reads "C.L. Butch Otter".

C.L. "Butch" Otter  
Governor of Idaho

Steve - attached is an outline for an event memo for the Otter meeting. I tried to make the GSG section match our conversation, but please review! For the Gateway section, can your team fill in Otter's expected concern and a suggested response? I am copying Zaina who is working on this for the briefing book. Thanks!

**BRIEFING MEMORANDUM FOR THE SECRETARY**

**MEETING WITH GOVERNOR OTTER**

DATE: June 9, 2014  
LOCATION: The Broadmoor Hotel, Colorado Springs, CO  
TIME: 10:30AM – 11:00AM  
FROM: Francisco Carrillo, Deputy Director of Intergovernmental Affairs, (202) 412-8846

**I. PURPOSE**

You are meeting with Idaho Governor Butch Otter prior to the WGA annual meeting. Gov. Otter would like to discuss Sage Grouse issues, particularly the impact that the National Policy Team guidance will have on the Idaho alternative. He would also like to discuss the Gateway West Transmission Line.

**II. PARTICIPANTS**

- Gov. Butch Otter (ID)
- Deputy Secretary Mike Connor

**III. HOT TOPICS**

**Gateway West Transmission Line (Idaho segments 8 & 9) \* Priority Project of Rapid Response Team for Transmission (RRTT)**

Next Milestone: Resource Advisory Council meeting June 5, 2014 (to be followed by BLM ROD based on existing FEIS or NOI initiating supplemental EIS)

Project Description: Sponsored by Idaho Power and Rocky Mountain Power, the Gateway West Transmission Project consists of nine 500 kV AC segments and one 230 kV AC segment spanning 990 miles across southern Wyoming and southern Idaho. The project will address load growth in Idaho, Oregon, Utah, and Wyoming, improve the reliability and efficiency of utility systems, and tap renewable energy resources in Idaho and Wyoming. A Record of Decision for project segments 1-7 and 10 was issued November 2013. BLM deferred a decision on segments 8 and 9 in Idaho to allow additional time to address unresolved siting challenges. BLM is the lead federal agency. The project sponsors estimate 1,100 to 1,200 jobs to be created.

Project Challenges:

- Routes proposed across the BLM administered Morley Nelson Snake River Birds of Prey NCA in southern Idaho
- Finalizing Greater Sage Grouse mitigation
- Finalizing Migratory Bird Conservation Plan

Gov Otter’s Concern:

### Sage Grouse

The Final Idaho State Plan was completed and incorporated as Alternative E into the Draft EIS. The State Plan only applies to Federal lands with the exception of the creation of the Rural Fire Protection Associations, which are currently being implemented and funded by the State. BLM has been working collectively with the State of Idaho and FWS to develop a 'Proposed Final Plan' that incorporates the State Plan, including additional changes the State wanted to include into their state strategy (e.g., Core Management Areas and Important Management Areas). These components have been agreed to and developed in collaboration with the State. All of the players (State, BLM, FS and FWS) look at these as components of the State plan although the State Plan has never been formally modified to include them.

The National Policy Team recently issued range-wide guidance that takes a different approach to management than the agreed to approach in the "Proposed Final Plan". That guidance set out an exception process for state directors to explain why an alternative approach is warranted. The Idaho BLM State Director has submitted information to the BLM Washington Office explaining why the Idaho approach achieves similar or better outcomes for Sage Grouse. That memo is under review.

Governor Otter's Concern: The Governor's office is especially concerned with the manner in which the general National Policy Team guidance requires General Habitat (versus Priority Habitat) be managed. In addition, Idaho has three tiers of lands (priority, important, and general habitat) and not two like other states.

Suggested Response:

- Governor Otter, I know that your team has worked very hard with ours to come up with a strong approach to sage grouse management in Idaho.
- The National Policy Team guidance was only guidance and invited State Directors to explain why alternative approaches can work given the specific facts at play in different states.
- We believe we need this step to ensure a strong record that supports deviation from the standards set out in the NTT and COT reports.
- My understanding is that the ID BLM director is working with our Washington Office on that record. The door is not shut to the Idaho approach and we look forward to continuing to work with you.

#### IV. TALKING POINTS

Formatted: Indent: Left: 0.5", No bullets or numbering

##### Sage Grouse

The Final Idaho State Plan was completed and incorporated as Alternative E into the Draft EIS. The State Plan currently only applies to Federal lands with the exception of the creation of the Rural Fire Protection Associations, which are currently being implemented and funded by the State. BLM has been working collectively with the State of Idaho and FWS to develop a 'Proposed Final Plan' that incorporates the State Plan, including additional changes the State wanted to include into their state strategy (e.g., Core Management Areas, and Important, and General Management ZonesAreas). These components have been agreed to and developed in collaboration with the State. All of the players (State, BLM, FS and FWS) look at these as components of the State plan although the State Plan has never been formally modified to include them.

The National Policy Team recently issued range-wide guidance that takes a different approach to management than the agreed to approach in the "Proposed Final Plan". That guidance set out an exception process for state directors to explain why an alternative approach is warranted. The Idaho BLM State Director has submitted information to the BLM Washington Office explaining why the Idaho approach achieves similar or better outcomes for Sage Grouse. That memo is under review.

Governor Otter's Concern: The Governor's office is especially concerned with the manner in which the general National Policy Team guidance requires General Habitat (versus Priority Habitat) be managed relative to the "no net unmitigated loss of sage grouse habitat." In addition, Idaho has three tiers of habitat and protections (priorityCore, Important, and General zoneshabitat) and not two like other states. Ninety five percent of breeding males are protected by the Core Zone (73% of breeding males) and Important Zone (22%), and the Important Zone is a fundamental component of the adaptive management strategy. This approach lays the foundation to potentially manage state and as appropriate, private lands, within this framework.

##### Suggested Response:

- Governor Otter, I know that your team has worked very hard with ours to come up with a strong approach to sage grouse management on public lands in Idaho.
- The National Policy Team guidance was only guidance not policy and invited State Directors to explain why alternative approaches can work given the specific facts at play in different states.
- We believe we need this step to ensure a strong record that supports similar or better outcomesdeviation from the standards set out in the NTT and COT reports.
- My understanding is that the ID BLM director is working with our Washington Office on that record. The door is not shut to the Idaho approach and we look forward to continuing to work with you.

## BRIEFING MEMORANDUM FOR THE SECRETARY

### MEETING WITH GOVERNOR OTTER

DATE: June 9, 2014  
LOCATION: The Broadmoor Hotel, Colorado Springs, CO  
TIME: 10:30AM – 11:00AM  
FROM: Francisco Carrillo, Deputy Director of Intergovernmental Affairs, (202) 412-8846

#### I. PURPOSE

You are meeting with Idaho Governor Butch Otter prior to the WGA annual meeting. Governor Otter would like to discuss Sage Grouse issues, particularly the impact that the National Policy Team guidance will have on the Idaho alternative. He would also like to discuss the Gateway West Transmission Line, particularly proposed segments 8 and 9.

#### II. PARTICIPANTS

- Governor Butch Otter (ID)
- Deputy Secretary Mike Connor

#### III. HOT TOPICS

##### **Gateway West Transmission Line (Idaho segments 8 & 9) \* Priority Project of Rapid Response Team for Transmission (RRT)**

Next Milestone: Boise District Resource Advisory Council (RAC) meeting June 5, 2014 (to be followed by BLM's re-initiation of public scoping and additional analysis under NEPA before a final decision is made).

Project Description: Proposed by Idaho Power and Rocky Mountain Power, the Gateway West Transmission Project consists of nine 500 kV AC segments and one 230 kV AC segment spanning 990 miles across southern Wyoming and southern Idaho. The project will address load growth in Idaho, Oregon, Utah, and Wyoming, improve the reliability and efficiency of utility systems, and tap renewable energy resources in Idaho and Wyoming. A Record of Decision for project segments 1-7 and 10 was issued November 2013. BLM deferred a decision on segments 8 and 9 in Idaho to allow additional time to address unresolved siting challenges centered primarily around the BLM's Snake River Birds of Prey National Conservation Area. The project sponsors estimate 1,100 to 1,200 jobs to be created.

##### Project Challenges for Segments 8 and 9

- Due to geographic constraints and existing military training ranges, all alternative routes cross at least a portion of the BLM administered Morley Nelson Snake River Birds of Prey NCA (NCA) in southern Idaho.
- To comply with the NCA's enabling legislation (PL 103-64) and BLM policies, the project must conserve, protect, and enhance the values for which the NCA was created.

- The BLM worked with the project proponents on a mitigation and enhancement strategy but this strategy was not submitted by the proponents in time to be included in the 2013 FEIS and the public has not had an opportunity to review and comment on the strategy. This will have to be analyzed in a future NEPA document.
- Finalizing Greater Sage Grouse mitigation.
- Finalizing Migratory Bird Conservation Plan

Governor Otter's Concern: The Governor is concerned that BLM's Preferred Alternative route for segments 8 and 9 in the 2013 FEIS was located primarily on neighboring private land and adjacent to communities, outside of the NCA. The Governor has maintained that a transmission line is inconsistent with city comprehensive plans. The Governor prefers to have the transmission line placed on public land within the NCA using or paralleling existing transmission line routes.

Suggested Response: BLM Idaho is working closely with the Boise District Resource RAC to identify optional routes and considerations for segments 8 and 9. We appreciate the Administrator of Idaho's Office of Energy Resources serving on the RAC subcommittee and contributing to this process. Based on the RAC report, BLM Idaho will determine what level of additional NEPA analysis is necessary. BLM Idaho will re-initiate public scoping and conduct further analysis prior to identifying a preferred alternative and reaching a final decision. BLM Idaho looks forward to close coordination with the Governor and his staff.

### **Sage Grouse**

The Final Idaho State Plan was completed and incorporated as Alternative E into the Draft EIS. The State Plan currently only applies to Federal lands with the exception of the creation of the Rural Fire Protection Associations, which are being implemented and funded by the State. BLM has been working collectively with the State of Idaho and FWS to develop a 'Proposed Final Plan' that incorporates the State Plan, including additional changes the State wanted to include into their state strategy (e.g., Core, Important, and General Management Zones). These components have been agreed to and developed in collaboration with the State.

The National Policy Team recently issued range-wide guidance that takes a different approach to management than the agreed to approach in the "Proposed Final Plan". That guidance set out an exception process for State Directors to explain why an alternative approach is warranted. The Idaho BLM State Director has submitted information to the BLM Washington Office explaining why the Idaho approach achieves similar or better outcomes for Sage Grouse. That memo is under review.

Governor Otter's Concern: The Governor's office is especially concerned with the manner in which the general National Policy Team guidance requires General Habitat (versus Priority Habitat) be managed relative to the "no net unmitigated loss of sage grouse habitat." In addition, Idaho has three tiers of habitat protection (Core, Important, and General management zones) and not two like other states. Ninety five percent of breeding males are protected by the Core Zone

(73% of breeding males) and Important Zone (22% of breeding males). This approach lays the foundation to potentially manage State and as appropriate, private lands, within this framework.

Suggested Response:

- Governor Otter, I know that your team has worked very hard with ours to come up with a strong approach to sage grouse management on public lands in Idaho.
- The National Policy Team guidance was only guidance not policy and invited State Directors to explain why alternative approaches can work given the specific facts at play in different states.
- We believe we need this step to ensure a strong record that supports similar or better outcomes from the standards set out in the NTT and COT reports.
- My understanding is that the ID BLM director is working with our Washington Office on that record. The door is not shut to the Idaho approach and we look forward to continuing to work with you.

BUREAU OF LAND MANAGEMENT  
Washington, DC 20240  
<http://www.blm.gov>

IDMT\_PUB\_2085

2.6

09/22/2015

SEP 16 2015

Honorable C.L. "Butch" Otter  
Governor of Idaho  
Boise, Idaho 83720

Dear Governor Otter:

This letter is in response to your appeal of the response provided by the Idaho State Director regarding your consistency review of the Idaho and Southwestern Montana Sub-regional Greater Sage-Grouse Proposed Land use Plan Amendment (referred to hereafter as the PRMPA or amendment). The Governor's consistency review process is a very important part of Bureau of Land Management's (BLM's) land use planning process, and we appreciate the significant time and attention that you and your staff have committed to this effort. The partnership that exists between the State of Idaho and the BLM is significant, and I believe our joint work to address the threats to Greater Sage-Grouse (GRSG) is an excellent example of what is possible when we work toward a common goal. Like you, I hope that these efforts will allow the U.S. Fish and Wildlife Service (FWS) to determine that the GRSG does not warrant listing under the Endangered Species Act (ESA).

As you know, the amendment is the result of an unprecedented west-wide effort to conserve GRSG and its habitat through detailed conservation measures and land use planning efforts at both the state and Federal levels. Because successful management of the western landscapes inhabited by the GRSG is dependent on the actions of multiple parties, the conservation measures contained in the BLM plans are built to complement the specific commitments to GRSG conservation that have been made at the local and state levels in the State of Idaho. Of note, the BLM plan includes a three-tier habitat mapping and management approach that works in conjunction with state-specific approaches to measuring disturbance, prioritizing management actions, and responding to rangeland fire. We are pleased to have developed the amendment in close coordination with your staff in the Office of Species Conservation, the Idaho Department of Fish and Game, the Western Governors Association Sage-Grouse Task Force, the United States Forest Service (USFS), the FWS, and a wide range of other interested stakeholders.

The purpose of the National GRSG Planning Strategy is to identify and implement measures to conserve, enhance and restore GRSG habitat by reducing, minimizing, or eliminating threats to that habitat. In order to avoid a potential listing and the effects it would have on every activity on millions of acres of public and private lands, the plans need to provide a high degree of regulatory certainty that those plans will be implemented and be effective. To help achieve that level of certainty, the BLM has included common elements across the range to address specific

threats to the species and its habitat. The purpose of these common elements is to provide for a net conservation gain for the GRSG. However, the plans also recognize that different circumstances exist across the range, which is why their development included state-based variations where different approaches or priorities were consistent with the overall conservation objectives.

The BLM was able to address some of the concerns outlined in your letter through a clarification of the management direction in the amendment, particularly with regard to prioritization of grazing management actions in Sagebrush Focal Areas (SFAs). These clarifications are reflected in the Record of Decision and/or the Approved Resource Management Plan Amendment (ARMPA) <http://www.blm.gov/wo/st/en/prog/more/sagegrouse.html>.

With the aforementioned context and goals in mind, the applicable regulations at 43 C.F.R. 1610.3-2(e), state that “[t]he Director shall accept the [consistency] recommendations of the Governor(s) if he/she determines that they provide for a reasonable balance between the state’s interest and the national interest.” As more fully described above and in the State Director’s response to your consistency review, there is a strong national interest in the implementation of an effective, range-wide GRSG strategy that reduces, minimizes or eliminates threats to GRSG habitat, including common range-wide elements that provide a high degree of certainty of effectiveness in order to potentially preclude a determination by the FWS that the species is warranted for listing under the ESA.

As you know, the PRMPA represents the culmination of an extensive planning process, involving significant time and resources from numerous partners including the State of Idaho. I believe this has led to the creation of a strong, range-wide approach for the conservation of GRSG habitat on BLM lands and, for the reasons set forth more fully below, I find that the recommendations in your letter do not meet the standard described above for granting your appeal.

In your appeal, you request reconsideration and acceptance of the recommendations that were identified in your July 28, 2015 Consistency Review letter. Specifically, you assert that the BLM has not met its consistency obligations under the Federal Land Policy and Management Act (FLPMA) and that Idaho’s recommendations provide for a reasonable balance between the state’s interest and the national interest. You request that the BLM adopt your recommendations, submit a Proposed Rule to the Office of Management and Budget (OMB), and remand the consistency review to the State Director. Below is my response to those issues and recommendations:

#### **Overall Consistency with Idaho State and Local Plans**

Your appeal letter states that the BLM responses to the Idaho Consistency Review letter failed to follow section 202(c)(9) of FLPMA, which states that land use plans be consistent with state and local plans to the maximum extent the Secretary of the Interior finds consistent with Federal law. As noted above, a cornerstone of the BLM’s sage grouse planning process has been coordination and collaboration with the affected states, as demonstrated by the detailed consideration and, in many cases, adoption of the strong GRSG conservation approaches put in place by or suggested by the states, including those put in place by or suggested by the State of

Idaho. However, in order to provide the necessary regulatory certainty, the BLM found it necessary to ensure that there are consistently strong approaches to the management of BLM-managed lands range-wide. The purpose of these common elements is to provide for a net conservation gain for the GRSG. However, the plans also recognize that different circumstances exist across the range, which is why the plans have allowed for flexibility where appropriate in the sub-regional plans, such as the three-tier mapping and management approach adopted as part of the Idaho plans. As such, I must respectfully disagree with your contention that the ARMPA is materially inconsistent with the Governor's Plan. The three-tier approach in the Governor's Plan is the basis of the Idaho/Southwest Montana ARMPA. The BLM has also worked with the State of Idaho to tailor many of the "range-wide" management actions in the Idaho ARMPA, such as the recent inclusion of prioritization actions for grazing management in SFAs. These actions demonstrate how the PRMPA has adopted the fundamental tenets of the State plan.

#### **Multiple Use in the Proposed Plan**

Your appeal letter states that the BLM erroneously relied on Manual 6840, Special Status Species Management, in the development of the PRMPA and the response to the Governor's Consistency Review letter. This statement does not identify an inconsistency with state or local resource related plans, policies, or programs, therefore, a response is not required under the Governor's consistency review process. The purpose of the amendment is the conservation of a special status species, the GRSG, and the management actions in the amendment are limited to those which will conserve, enhance, and restore GRSG and its habitat consistent with the agency's multiple-use and sustained yield mission. The management actions are consistent with all of the applicable BLM regulations and policies and allow for continued multiple-use of the lands. Most uses may still occur on the lands included in the amendment, with stipulations and conditions which conserve, enhance, and restore GRSG and its habitat. Allowable resource uses of the BLM lands which are not addressed in this amendment remain in the current land use plans. Therefore, I concur with the BLM Idaho State Director's statements about the applicable purposes, policies, programs, Federal laws, and regulations applicable to BLM-managed public lands, including BLM Manual 6840.

#### **Alleged Improper Delegation**

You also assert that the BLM has improperly delegated authority to the FWS by permitting that agency to effectively veto land management decisions for an unlisted species. This statement does not identify an inconsistency with state or local resource related plans, policies, or programs, therefore, a response is not required under the Governor's consistency review process.<sup>1</sup> That said, I would note that the BLM is not and has not delegated its authority. Rather, the BLM has focused on making its planning decisions based on input from local and national experts on these issues. For example, in order to provide the most protection to GRSG in Priority Habitat Management Areas (PHMA), the areas of highest importance for the species, decisions on allowing surface occupancy during fluid mineral development will be made with the Idaho Department of Fish and Game and the FWS, the local and national experts on GRSG, respectively. The BLM is not delegating authority, but ensuring that all experts evaluate

---

<sup>1</sup> Your letter claims, without explanation, that this is a "per se" imbalance. I find this to be insufficiently specific to constitute identification of an inconsistency under 43 C.F.R. 1610.3-2(e).

whether there would be direct, indirect, or cumulative effects on GRSG before allowing surface-disturbing fluid mineral development in areas of important habitat. While the BLM retains the final decision-making authority for decisions on the public lands, this input is critically important.

### **SFAs Exemption**

In your appeal letter, you request that I reconsider the request to exempt Idaho from SFAs. I have reviewed your prior comments on the development of the SFAs and I understand that your office is strongly opposed to them. While I understand these concerns, I uphold the determination of the BLM Idaho State Director that the SFAs are consistent with the BLM's range-wide GRSG conservation strategy. I also want to reiterate that the SFAs are a subset of PHMA, with limited additional management actions to ensure that the "best of the best" habitat receives the attention it deserves. In addition to the recommended mineral withdrawal and the fluid mineral no surface occupancy (NSO) stipulation without waivers, exceptions, or modifications, the ARMPA clarifies (in response to your Governor's consistency review letter) that these areas will be prioritized for a broader group of activities, including vegetation management, wild horse and burro management, habitat restoration, fire and fuels actions, as well as the review of livestock grazing permits and leases, consistent with the State of Idaho Plan.

You also assert in your appeal that in developing the SFAs the BLM has created Areas of Critical Environmental Concern (ACECs) without following the proper regulatory process. This concern does not identify an inconsistency with state or local resource or related plans, policies or programs, and therefore, a response is not required under the Governor's consistency review process. It should be noted that the SFAs are not ACECs – they are a subset of PHMAs with additional management protections, all of which were fully analyzed in the Draft and Final EISs for the Idaho plan. These additional measures include NSO without waiver, exception, or modification for fluid mineral development and a recommendation for mineral withdrawal from the 1872 Mining Law for solid minerals. These actions and recommendations do not constitute an ACEC designation under the applicable regulations. .

### **Disturbance Caps**

Both your consistency review and appeal letter requested the removal of the project level disturbance caps. The BLM included the project-level disturbance cap to ensure that disturbance is limited at both a local and landscape scale and to encourage co-location of disturbance. Based on best available science, when disturbance exceeds three percent at either scale, GRSG numbers are affected and tend to decline (derived from Holloran 2005, Walker et al. 2007, Doherty et al. 2008, Naugle et al. 2011). Disturbance caps at both the BSU and the project scale are necessary to account for the amount of existing disturbance at both scales. Calculating disturbance for each additional anthropogenic disturbance placed on the landscape is particularly important at the project scale to ensure that GRSG numbers and habitat acreages remain stable or increase. Further, calculations at both of these scales are intended to encourage clustering of disturbance and discouraging development in undisturbed habitat. This is a critically important aspect of the GRSG strategy, and therefore, I respectfully deny your appeal on this issue and uphold the State Director's determination that your recommendation is inconsistent with the goal of the BLM's range-wide GRSG conservation strategy.

It should be noted that based upon further review across the Great Basin region, the BLM is including an exception to the project-level disturbance cap for designated utility corridors, to ensure that these areas are used to the fullest extent possible as intended for utility lines and associated disturbance. This modification is consistent with BLM's goal of encouraging co-location of disturbance.

#### **Net Conservation Gain Standard**

Your appeal notes that the Governor's "... strategy is in many ways in and of itself a mitigation plan," and as a result, you expresses concern that the BLM mitigation standard of net conservation gain is in conflict with this. I respectfully disagree with this statement. Based on the way the ARPMA is structured, the Idaho State Plan, especially the three-tier approach, will serve as a key component of the BLM's mitigation strategy, and therefore the AMPRA is not in conflict or inconsistent with the state strategy. Additionally, as noted in the State Director's response, the mitigation standard in the amendment is consistent with numerous national policies, including Secretarial Order 3330 and BLM's Draft - Regional Mitigation Manual Section (MS)-1794. As a result, I deny your appeal on this issue and uphold the State Director's determination that your recommendation is inconsistent with the goal of the BLM's range-wide GRSG conservation strategy.

I would also note that going forward it will be critical for BLM and its partners to work together to develop and implement effective mitigation on the ground. This mitigation will be developed working with existing and developing mitigation approaches that are being utilized in individual states and west-wide. To do this, the BLM will utilize the expertise of state and Federal partners, through WAFWA Management Zone conservation teams, to develop mitigation strategies. Participation of your Office of Species Conservation and the Idaho Department of Fish and Game will be critical to this effort.

#### **Livestock Grazing**

You identified numerous concerns with the livestock grazing management actions in the amendment in your Consistency Review and appeal. As a result of the Governor's consistency review process, the BLM included a refinement of the prioritization strategy for livestock grazing management. The revised language states that:

"Management and conservation action prioritization will occur at the Conservation Area (CA) scale and be based on GRSG population and habitat trends: Focusing management and conservation actions first in SFAs followed by areas of PHMA outside SFA."

Under this refined language, vegetation management actions, including but not limited to the review of grazing permits, are prioritized in SFAs. In light of the agency's limited resources, we will focus our management actions first in SFAs, as these are the areas which hold the best contiguous habitat and populations. Specifically, our actions will focus on those allotments or permits not meeting land health standards in areas where the sage-grouse populations are in decline.

You also express concerns with the habitat objectives table, that the management direction associated with its use is vague and subjective. The use of the metrics in the table will be site-specific. Specifically, the habitat objectives table sets forth the desired habitat condition for permitted uses. The metrics in the table will be used, as appropriate, based on ecological site potential, in the development of land use authorizations, including but not limited to livestock grazing permits, and land health assessments. Please note, the BLM creates and uses habitat objectives for many special status species and includes them in land health assessments it prepares routinely across the west.

Finally, you expressed concern about the BLM's statement that "current grazing management will not change as a result of the SFA designation." Specifically, with respect to your statement that prioritization of grazing permit renewals in SFAs "...is really a subterfuge for elevating the activity [(i.e., grazing)] to primary threat status," I would like to clarify the intent of BLM's approach. The plans prioritize grazing permit renewals and field checks within SFAs because of the habitat quality in those areas, not because of some unstated concern about the level of threat posed by current grazing activities. As stated above, maintenance of habitat quality within SFAs is a key component of the BLM's plans. Moreover, it should be noted that the BLM, under current authority and plans, is responsible for ensuring that grazing is undertaken in an appropriate manner and that uses are meeting or moving towards meeting applicable land health standards. The amendment does not change this underlying obligation. They do however inform the applicable land health standards and place a higher focus on meeting or moving toward meeting land health standards and GRSB habitat objectives in SFAs.

Based on the foregoing, I respectfully deny your appeal on these grazing issues and uphold the State Director's determination that your recommendation is inconsistent with the goal of the BLM's range-wide GRSB conservation strategy range-wide.

### **Lek Buffers**

In your Consistency Review, you recommended that the BLM remove the uniform lek buffers from the plans. The BLM Idaho State Director's response explained that the buffers are not uniform and that local data and regulations can be considered in their application at the project development stage. The application of buffers also varies according to habitat type, with more exceptions provided in General Habitat Management Areas (GHMA) than in PHMA. Additionally, the use of the buffers identified in the Governor's Plan is allowed under the considerations put forth in the amendment, provided they provide the same level of protection for GRSB and its habitat in any particular circumstance. Again, the use of buffers will be determined on a site- and project-specific basis, during project development. Based on the foregoing, I respectfully deny your appeal on this issue and uphold the State Director's determination that your recommendation is inconsistent with the goal of the BLM's range-wide GRSB conservation strategy.

### **Required Design Features**

In your appeal, you request that I consider removing the Required Design Features (RDFs) which are not contained in the Governor's Plan. I agree with the Idaho State Director that the RDFs are an important aspect of the BLM strategy and respectfully deny your request. Similar to the buffers, there is flexibility in the application of the RDFs, such that if there is a Best

Management Practice in the Governor's Plan which provides equal protection for GRSG and its habitat, it may be used instead, and therefore the RDFs do not create an inconsistency with state or local resource related plans, policies, or programs.

Based on the foregoing, I find that the recommendations provided in your appeal letter do not meet the standard identified above for granting an appeal in accordance with 43 C.F.R. 1610.3-2(e). Therefore, I affirm the BLM Idaho State Director's response to your Finding of Inconsistency and respectfully deny your appeal, including your request to withdraw the proposed amendment and adopt the Governor's Plan in its entirety. As you are aware, through a strong partnership and significant engagement between our teams, many aspects of the Governor's Plan have been incorporated into the BLM's plan. The reasons outlined above for my decision on your appeal will also be published in the Federal Register pursuant to the applicable BLM regulations.

Despite occasional points where we have not agreed, the input that you and your staff have provided into this process has been sincerely received and enormously productive. You have shaped the ARMPA in significant ways, and the plan is stronger as a result. I look forward to our continued coordination as our teams work together to implement these plans.

Sincerely,

RE: Consistency Review Appeal to the Director of the Bureau of Land Management and Chief of the U.S. Forest Service regarding: Idaho and Southwestern Montana Sub-regional Greater Sage-Grouse Proposed Land Use Plan Amendment and Final Environmental Impact Statement (80 Fed. Reg. 30,711, May 29, 2015)

Dear Director Kornze and Chief Tidwell,

I write to appeal, under 43 CFR § 1610.3-2(e),<sup>1</sup> the Bureau of Land Management's ("BLM") August 6, 2015 response and rejection of the recommendations contained in the Governor's Consistency Review of the Idaho and Southwestern Montana Sub-regional Greater Sage-Grouse Proposed Land Use Plan Amendment and Final Environmental Impact Statement ("Proposed Plan"). See Governor Otter's Consistency Review (filed July 29, 2015) ("Consistency Review") (Attachment 1). Simply put, the Proposed Plan stands in stark contrast to the State of Idaho's laws, policies and programs, especially Idaho Executive Order 2015-04.

The State Director's cursory response in no way resolves the numerous and material inconsistencies outlined in the July 28, 2015 Consistency Review. See State Director's Response to Governor Otter's Consistency Review (August 6, 2015) ("BLM Response") (Attachment 2). Such rejection creates an "unreasonable" imbalance between

---

<sup>1</sup> As directed on page 10 of State Director Murphy's August 6, 2015 letter, "[p]lease note that you have the opportunity to appeal this response to the Director of the BLM pursuant to 43 CFR 1610.3-2(e). Such appeal must be filed within 30 days of your receipt of this letter, by September 8, 2015."

national interests and the State's interests and violates 42 U.S.C. § 1712(C)(9). *See* 43 CFR § 1610.3-2(e). I respectfully request the BLM Director and Chief Forester<sup>2</sup> to conclude that such an imbalance exists and return the Proposed Plan back to the State Director/Regional Forester with instructions to meaningfully resolve these inconsistencies, or in the alternative, adopt the recommendations outlined in the remedy section of this Consistency Review Appeal with the appropriate public participation. Failure to do so violates the BLM's consistency obligations pursuant to section 202 of the Federal Land Policy and Management Act ("FLPMA"), and the U.S. Forest Service's ("Forest Service") coordination obligations outlined in § 219.3(a) of the National Forest Management Act ("NFMA") Minimum Requirements Rule.

To briefly summarize our current status, for much of the past three years, my Administration, along with the tremendous local support of your agencies, were poised to deliver another significant natural resource milestone, similar to the Idaho Roadless Rule. That collaborative framework was abandoned in late 2014/early 2015 in favor of a top-down "uniform" solution to the sage-grouse issue. This national direction was highlighted by the internal and post-DEIS U.S. Fish and Wildlife Service ("FWS") memorandum ("Ashe Memo"), and based on this memorandum, the agencies' misguided decision to designate 3 million acres of Idaho as so-called Sagebrush Focal Areas ("SFAs"). My opposition to the SFA habitat zone and the many other overly restrictive and last minute management recommendations is no secret.

Yet, despite repeated attempts to reconcile these material inconsistencies (*See* June 18, 2015 letter to Secretary Jewell (Attachment 3)), the BLM has done little to meaningfully resolve these concerns to the "maximum extent" as required by § 202(c)(9) of FLPMA. Instead, we are advised that no flexibility exists, because modifying this new fourth SFA habitat zone along with the uniform lek buffers and the new "net conservation gain" mitigation standard will lead to a positive listing determination under the Endangered Species Act ("ESA"). Ironically, and as outlined in the Consistency Review, this push for "uniformity" by the FWS is incongruent with and ignores that agency's previous position largely endorsing the Governor's Plan as consistent with the Conservation Objectives Team Report. *See* U.S. Fish and Wildlife Serv., Greater Sage-Grouse (*Centrocercus urophasianus*) Conservation Objectives: Final Report (2013) ("COT Report").

---

<sup>2</sup> There is little doubt the Forest Service has been an integral part of the preparation of the Proposed Plan. As such, the agency must participate in a consistency review of the Proposed Plan. The Forest Service cannot have it both ways – namely, that it will receive the benefits from being a Cooperating Agency partner with the BLM and Idaho throughout this entire process only to abandon its consistency obligations in the capstone exercise to this unprecedented land-use planning effort. This is especially important because the FEIS is misleading, stating that "[c]hapter 2 separates the Forest Service Proposed Plan and the BLM Proposed Plan. This is because the Forest Service has different guidance for writing planning language; however, the actions are *basically the same* for both the BLM and FS under the Proposed Plan." FEIS 2-4. As the Consistency Review demonstrated, that statement is patently untrue; and is inequitable that the Forest Service should reap the benefits of the plan amendments without fulfilling its responsibility of conducting a comprehensive review of the Governor's Consistency Review. Governor Otter strongly urges Chief Tidwell to respond to the issues identified in both the Consistency Review and this Appeal.

As evidence of this now unilateral Federal process, I exercised my right under § 202 of FLPMA providing the BLM an 82-page Consistency Review, with multiple appendices, thoroughly detailing how each relevant portion of the Proposed Plan was and still is inconsistent with the “plans, policies, or programs” of the State of Idaho and local governments. The Consistency Review discussed in great detail how the Governor’s Plan<sup>3</sup> appropriately balances the BLM’s multiple-use mandate with the conservation needs of greater sage-grouse as outlined in the section titled, “*The Governor’s Plan, not the Proposed Plan, represents a balanced solution and is a perfect fit to meet the needs of the species in Idaho*”. Consistency Review at 65. Unfortunately, after the significant effort and resources expended to achieve a true planning partnership, the BLM provided – in just 6 business days – a 12-page form letter only somewhat tailored to Idaho’s concerns,<sup>4</sup> and summarily denying all of the Consistency Review’s recommendations.<sup>5</sup> This denial exacerbates the multiple legal issues in the Proposed Plan rendering it *per se imbalanced* and arbitrary and capricious.

The imbalance stems from the BLM’s contention that Idaho’s sage-grouse policy embodied in Executive Order 2015-04, without any analysis or explanation, does not comport with BLM’s legal obligations under the agency’s Special Status Species Manual 6840 (“Manual 6840”), and BLM’s Instruction Memorandum 2012-044 (“IM 2012-044”). BLM Response at 3. At no point in this process has the Bureau notified Idaho that the Governor’s Plan does not meet the provisions in Manual 6840. If that had been the case, the BLM would have rejected the Governor’s Plan, in the Draft Environmental Impact Statement (“DEIS”) as an “alternative considered but eliminated from detailed analysis” under the National Environmental Policy Act (“NEPA”). But rather than legitimately grapple with these difficult issues, this post-hoc rationalization only serves to paper over the agencies’ failure to analyze or explain (i.e., take the requisite “hard look” pursuant to NEPA) how the Proposed Plan better meets these legal obligations or the conservation needs of the species as compared to the Governor’s Plan. In short, the BLM’s Response is wholly inadequate under FLPMA.

At bottom, the agencies’ course of action over the past several months fail to honor Idaho’s rights pursuant to § 202(c)(9) of FLPMA and as a cooperating agency under NEPA, as well as the many commitments two Secretaries of Interior have promised my State. The underlying record demonstrates that the Governor’s Plan is consistent with the stated purpose of BLM’s planning effort, which is to “identify and incorporate appropriate conservation measures in LUPs to conserve, enhance and/or restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat.” BLM Response at 3. My sincere hope is the agencies will recognize it is in the long-term benefit of the species to correct the imbalance by diligently working with my Administration to resolve these issues through this appeal process.

---

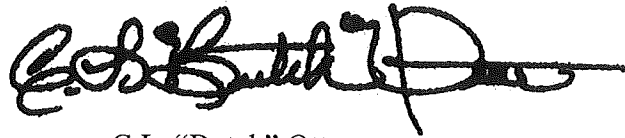

<sup>3</sup> The “Governor’s Plan” includes Idaho Exec. Ord. 2015-04 and the associated appendices.

<sup>4</sup> Identical language can be found in BLM’s Consistency Review responses to at least Governor Herbert (Utah) and Governor Sandoval (Nevada).

<sup>5</sup> In the letter from State Director Timothy Murphy to Governor Otter, dated August 6, 2015, Director Murphy did agree to “work with” the State of Idaho to refine BLM’s approach to prioritizing grazing permit renewals in Sagebrush Focal Areas.

Thank you in advance for your positive consideration of this Consistency Review Appeal. As you know, this process provides the final opportunity to achieve and preserve a meaningful state-federal partnership, contemplated by FLPMA, on this important issue. My Administration is fully prepared to resolve the identified inconsistencies with the BLM and Forest Service, as required by federal law and regulation. Please contact Cally Younger at 208-334-2100 with any questions or concerns.

As Always – Idaho, “Esto Perpetua”

## I. THE AGENCIES FAILED TO MEET THEIR CONSISTENCY OBLIGATIONS TO IDAHO UNDER FLPMA

Congress determined that federal land use planning is not the sole province of the United States. Section 202(c)(9) of FLPMA directs the Secretary of the Interior to coordinate the land use planning process with State and local governments and that the resulting federal land use management plans must substantially reflect this consultation and coordination. 43 U.S.C. § 1712(c)(9). The BLM Response fails to achieve the full planning partnership envisioned by Congress to protect the interests of state and local governments, especially those like Idaho, whose custom, culture and way of life are inextricably intertwined with decisions made on federally-managed lands. These obligations are not perfunctory in nature. *See American Motorcyclist Ass'n v. Watt*, 534 F. Supp. 923, *affirmed* 714 F. 2d 962 (9th Cir. 1983). The below sections identify the following errors with the State Director's response.

### A. BLM has failed to ensure that the LUPAs are consistent to the “maximum extent” with State direction.

As noted above, the BLM failed to follow section 202(c)(9) of FLPMA and its implementing regulations. Section 202(c)(9) requires consistency to the “maximum extent.” 43 U.S.C. § 1712(c)(9) (Land use plans of the Secretary under this section shall be consistent with State and local plans to the *maximum extent* he finds consistent with Federal law and the purposes of this Act) (emphasis added). Further, Congress directed the Secretary to “assure that consideration is given to those State, local, and tribal plans that are germane in the development of land use plans for public lands,” and “assist in resolving, to the extent practical, inconsistencies between Federal and non-Federal Government plans.” *See Consistency Review* at 8.

This direction is reaffirmed in BLM's regulations, which direct the Secretary to develop federal land use plans that are consistent with those State and local plans and satisfy the purpose of FLPMA and other federal laws:

Guidance and resource management plans and amendments to management framework plans shall be consistent with officially approved or adopted resource related plans, and the policies and programs contained therein, of other Federal agencies, State and local governments and Indian Tribes, so long as the guidance and resource management plans are also consistent with the purposes, policies and programs of Federal law and regulations applicable to public lands....

43 C.F.R. 1610.3-2(a). It is clear that Congress envisioned land use planning decisions to be made in concert with states, through consultation and collaboration, and not merely as an inconvenience for federal agencies that excludes meaningful input from states at critical junctures, as was the case here.

The BLM's interpretation of how to evaluate Land Use Plan Amendments (“LUPAs”) for consistency involves a two-step process: (1) determine if there is an actual inconsistency with an

officially approved state plan, policy or program; and (2) if such an inconsistency exists, whether a recommendation addresses that inconsistency and provides for a reasonable balance between the national interest and the State's interest. *See* Notice of BLM Director's Response to an Appeal from the Governor of New Mexico Regarding the Resource Management Plan Amendment for Federal Fluid Minerals Leasing and Development in Sierra and Otero Counties, 70 Fed. Reg. 3550, 3552 (January 25, 2005); *see also*, *New Mexico ex rel. Richardson v. BLM*, 565 F.3d 683 (10th Cir. 2009). This is the framework that Governor Otter expected, at a minimum, out of this Consistency Review process. However, the response Governor Otter received demonstrates that the Department of Interior is more concerned with meeting an arbitrary settlement deadline with environmental groups than complying with its statutory obligations to the state.

Specifically, several factual circumstances surrounding this Consistency Review indicate that FLPMA's maximum extent directive was not followed. For example, the amount of time that BLM took to respond to Governor Otter's Consistency Review was insufficient and lacked meaningful evaluation of the points raised in the document. Also, the BLM Response did not follow the general framework for Consistency Review responses, glossing over a vast majority of material inconsistencies identified by the Governor, and completely failing to address the second prong "balance of interests" analysis as outlined above.

In his response, the State Director states that, "the BLM generally only responded to issues that [Governor Otter] identified as being inconsistent with [his] State's (or other local and tribal) plans and not issues of disagreement [sic] with portions of the Proposed Land Use Plan Amendment/Final Environmental Impact Statement." BLM Response at 4. Importantly, Governor Otter's Consistency Review outlined multiple areas of inconsistency – not just disagreements – with his plan in the conspicuously titled section, "THE PROPOSED PLAN IS MATERIALLY INCONSISTENT WITH THE GOVERNOR'S PLAN." Consistency Review at 10. Throughout that section, the Consistency Review cited to specific portions of the Governor's Plan and the LUPAs. The BLM's failure to address the approximately fifty-one (51) pages of inconsistencies contained in this section, and selecting only a portion of the issues to address, simply does not meet its consistency obligations.

Moreover, the BLM did not accept *any* of the Governor's recommendations for resolution of the inconsistencies. The promise to "continue to work with the State to further refine our approach for prioritizing the review of grazing permits/leases and the processing of grazing permits/leases in SFAs to better reflect the prioritization approach adopted in the Idaho State Plan for CHZs," found in the State Director's response, hardly constitutes an acceptance of a recommendation contained in the Governor's Consistency Review and is of little solace to Idaho. *See* BLM Response at 9. Likewise the addition of language "to include state-implemented conservation measures or protections as an alternative to consider in the application of RDFs," is likewise not an acceptance of the Governor's recommendation. *Id.*

Based on these circumstances, it is clear the BLM failed to meet the "maximum extent" threshold for consistency reviews and reduced this important process to a check-the-box exercise for the agency. This Appeal represents the last opportunity for the Director to rectify this error, and accept the Governor's recommendations that are outlined below.

**B. BLM erroneously relied on Manual 6840 to avoid its responsibilities under NEPA and FLPMA.**

Where the State Director does address issues of inconsistency in the Proposed Plan, he begins with the faulty premise that the Governor's Plan is inconsistent with the purposes, policies, and programs of federal laws applicable to public lands. *Id.* at 3. The BLM Response attempts to justify this position by stating that the agency must "manage public lands for *multiple-use and sustained yield*, taking into account the long-long term needs of future generations for renewable and non-renewable resources – including fish and wildlife – and to seek achievement and maintenance in perpetuity of renewable resources." *Id.* (citations omitted). BLM goes on to describe Manual 6840, and IM 2012-044, initiating the BLM National Greater Sage-Grouse Land Use Planning Strategy.

Multiple-use is "a deceptively simple term that describes the enormously complicated task of striking a balance among the many competing uses to which land can be put, including but not limited to, recreation, range, timber, minerals, watershed, wildlife and fish, and uses serving natural scenic, scientific, and historical values." *Norton v. Southern Utah Wilderness Alliance*, 542 U.S. 55, 58 (2004) (citing 43 U.S.C. § 1702(c)) (internal quotations omitted). But multiple-use in this context does not mean that the agencies can subordinate all uses in favor of a single use and unlisted species (e.g. sage-grouse). *See The Lands Council v. McNair*, 537 F.3d 981, 990 (9th Cir. 2008) ("Congress has consistently acknowledged the Forest Service must balance competing demands in managing National Forest System lands. Indeed, since Congress' early regulation of the national forests, it has never been the case that the national forests were...to be set aside for *non-use*." ) (emphasis added).

This is precisely what BLM is recommending with this Proposed Plan pursuant to the direction contained in the self-described "new paradigm" of the National Technical Team (NTT) Report. And in fact, that is why the agency itself developed a modified-NTT alternative in the DEIS (Alternative D) because BLM recognized that implementing the full-blown NTT Report is "blatantly illegal" and materially inconsistent with its multiple-use mandate. *See Consistency Review* at 72-3 (noting that Governor Otter personally reviewed several NTT FOIA documents, he wrote the Secretary the following: "Even more shocking is the absence of anything in the scientific record warranting these draconian measures. In fact, one email reveals a career BLM employee expressing the following concern in the late stages of this process: '*But does the NTT really want to recommend something that is blatantly illegal?*'"). Yet despite this acknowledgment, the Proposed Plan stands at odds with the agencies' multiple-use mandate and exceeds their delegated authority from Congress.

Even more to the point, the State Director's interpretation of FLPMA implies that the BLM's policy on special status species trumps its multiple-use requirement. Several times in the BLM Response, the agency declines to adopt the Governor's Recommendation because "it is not consistent with the purposes, policies, and programs of federal laws and regulations applicable to public lands." *See e.g.*, BLM Response at 5 (BLM does not adopt Governor's recommendation on SFAs). In declining to adopt the Governor's recommendations, BLM fails to provide any reference to the specific laws, or any meaningful analysis, supporting its denial. They do,

however, cite on multiple occasions the BLM's Sage-Grouse Strategy, and the Special Status Species Policy as justification for not accepting the Governor's recommendation in the Consistency Review. *Id.* (in light of BLM's Sage-Grouse Strategy, its Special Status Species Policy, and its goal to provide regulatory certainty for the conservation of the GRSG and its habitat...). As mentioned above, this is the first instance where BLM notified the State that the Governor's Plan is not consistent with Manual 6840, and the underlying record and the NEPA process simply do not support this premise. Moreover, this implies that the Special Status Species policy and the NTT Report are in incompatible with the COT Report. As you are aware, the U.S. Fish and Wildlife Service affirmed that the Governor's Plan met the COT Report's objective of strategic conservation. *See* Consistency Review at 3; Consistency Review Appendix 4 (Letter from U.S. Fish and Wildlife Serv. to Governor C.L. "Butch" Otter (August 1, 2012)). At bottom, it is the Proposed Plan that is incompatible with the agencies' legal and policy obligations not the Governor's.

The net result of this pretense is that the public shielded from the opportunity to comment on the Governor's reasonable recommendations. This violates 43 C.F.R. §1610.3-2(e) which states, "[i]f the written recommendation(s) of the Governor(s) recommend changes in the proposed plan or amendment which were not raised during the public participation process on that plan or amendment, the State Director shall provide the public with an opportunity to comment on the recommendation(s)." At a minimum, the Director must correct the State Director's error and allow the public an opportunity to comment on the Governor's recommendations.

**C. The BLM failed to consider the unreasonable imbalance between Idaho and federal interests.**

The BLM regulations require the agency to accept the Governor's recommendations when they "provide for a reasonable balance between the national interest and the State's interest." 43 C.F.R § 1610.03-2(e). In the Governor's Consistency Review, a section titled "FAILURE TO ADOPT GOVERNOR OTTER'S PLAN WOULD CONSITUTE AN UNREASONABLE IMBALANCE BETWEEN NATIONAL AND STATE INTERESTS" was ignored by the State Director in his response, and must be addressed prior to executing the Record of Decision and the final LUPAs. *See Id.* at 64-81. This rejection creates an unreasonable imbalance by demonstrating: (1) the Governor's Plan, not the Proposed Plan, strikes the appropriate federalism balance and is the perfect fit to meet the needs of the species in Idaho; (2) the Proposed plan is legally infirm and by definition imbalanced; (3) the Proposed Plan rejects collaboration in favor of top-down management; and (4) the Proposed Plan overrides the state's sovereign authority over its wildlife. *Id.*

Idaho BLM did not address the Governor's contention that the Proposed Plan does not strike a reasonable federalism balance. Consistency Review at 64. The Governor's Plan meets the Purpose and Need statement, is based on the best available science, appropriately addresses the key threats in Idaho, and provides for achievable implementation. *Id.* at 65.

Nor does Idaho BLM deny, or respond to the fact that they have improperly delegated authority to the FWS by permitting that agency to effectively veto land use management

decisions for an unlisted species. At nearly every critical juncture in the Proposed Plan, BLM failed to fulfill its own independent legal obligations at the behest of the FWS. Namely, BLM created Areas of Critical Environmental Concern (ACECs) without the proper regulatory process by accepting the SFA recommendation (*see Id.* at 77-79), adopted an unnecessary project-level disturbance cap not based on sound science, and effectively gave FWS veto authority over exemptions in Idaho's CHZ. These legal flaws, among others, render the Proposed Plan *per se* imbalanced, and compel the Director to make that imbalanced finding and remand the Proposed Plan back to the State Director/Regional Forester to fulfill the agencies' legal obligations.

The Director/Chief Forester must respond to these concerns in his reply to this Consistency Review Appeal prior to the signing of the Record of Decision.

## **II. THE AGENCIES MUST RECONSIDER THE RECOMMENDATIONS THAT WERE REJECTED.**

### **A. Sagebrush Focal Areas (SFAs)**

In the BLM Response, the State Director denied Governor Otter's request to exempt Idaho from the SFAs and its draconian regulatory measures. As noted at the outset, the designation of 3 million acres of so-called SFAs is of particular concern to Idaho and is procedurally, scientifically, and substantively flawed. *See e.g., Id.* at 13-15. BLM's denial states that the agency "declines to adopt [the Governor's] recommendation because it is not consistent with the purposes, policies, and programs of federal laws and regulations applicable to public lands." BLM Response at 5. Rather than legitimately grapple with these concerns, BLM attempts to provide a timeline describing when the states were notified of the Ashe Memo and the other last minute national direction. Again, it is important to note that the BLM Response does not offer details of why the Governor's three-tiered habitat and management continuum approach is inconsistent with federal laws and policies. *Id.* at 5-6.

As to the timeline, the BLM Response claims the states were notified of the SFA designation through a November 2014 conference call. *Id.* at 5. However, this is only partially accurate and in no way satisfies the commitments made by two Secretaries of the Interior to Governor Otter.

While Idaho and the other states were made aware of the Ashe Memo in late October 2014, nothing in the memo or the attached maps put the State of Idaho on notice that this was a precursor to the agencies proposing a fourth habitat zone with its unnecessary management recommendations, such as a sweeping proposal for mineral withdrawal and no surface occupancy ("NSO") for fluid mineral development across approximately 3 million acres in Idaho. *See Ashe Memo* (identifying and recommending a subset of "strongholds" with the "strongest levels of protection," but making no mention of SFAs, withdrawals, NSO, or prioritization). In fact, at the time of the Ashe Memo's release, Idaho had no reason to believe that the Governor's Plan was inconsistent with a "best of the best" approach. This assumption was reinforced by the previous correspondence from FWS, and Idaho was confident that the Governor's Plan provided the "highest degree of protection" as recommended in the Ashe Memo

because of the conservation measures in the Core Habitat Zone. However, that reasoned assumption was undermined by subsequent actions by the agencies:

- In late October 2014, the states were notified by the Interior Department that FWS would like to designate priority areas within the Priority Areas for Conservation (PACs) identified in the COT. Interior officials referred to this designation as “superPACs.” *See* Email from Sarah Greenberger, Counselor to the Secretary, Office of the Secretary, Department of Interior, to Virgil Moore, Director of Idaho Department of Fish and Game, Dustin Miller, Administrator of the Office of Species Conservation, Executive Office of Governor C.L. “Butch” Otter, (“OSC”) Cally Younger, Associate Counsel to Governor C.L. “Butch” Otter, et al (October 28, 2014, 12:10 MDT) (Attachment 4).
- On October 30, 2014, Idaho received a subsequent email from Jim Lyons, Deputy Assistant Secretary for Land and Minerals Management, describing the similarity between these “super-PACs” and ACECs. In this email Jim Lyons stated that ACEC designations were “one of the approaches that the FWS has suggested for identifying and describing the management actions relevant to the ‘superPACs’.” *See* Email from Jim Lyons, Deputy Assistant Secretary, Lands and Minerals Management to Dustin Miller, Administrator, OSC (October 30, 2014 10:37 AM MDT) (Attachment 5) (stating that ACECs were one of the approaches that the FWS suggested for identifying and describing the management actions relevant to ‘superPACs’). Further, he stated that ACECs were not a substitute for wilderness but were “a means to identify and develop management direction for areas of special value and significance.” *Id*; *See* Governor’s Consistency Review at 77-79 (pointing out that SFAs are *de facto* ACECs that did not undergo the requisite analysis and process for such a designation). The email made no mention of the fact that BLM analyzed and rejected a large-scale ACEC designation in the DEIS.

Notwithstanding these emails, the State of Idaho was repeatedly told that the Ashe Memo was largely for other states, and that the Governor’s Core Habitat Zone was Idaho’s version of a superPAC. Again, this is consistent with FWS’s previous correspondence with the Governor, the selection of Alternative E as a co-Preferred Alternative, and at that point, the ongoing interagency and stakeholder refinement process.

- On November 6, 2014, there was a conference call between Interior and the states with members of the Governor’s staff attending in person. Following the conference call, there was also an Idaho specific meeting that same day to further discuss “superPACs.” Interior officials again discussed the idea of an ACEC designation and the State appropriately and emphatically rejected that approach. Interior stated that no management changes were necessary and the Core Habitat Zone in the Governor’s Plan simply needed a more descriptive name in their effort to identify areas of special value and significance to sage-grouse. The three staff members that attended that meeting have no recollection of discussing additional management criteria within superPACs at that meeting. *See* Letter

from Idaho Fish and Game Director Virgil Moore to Dustin Miller, Administrator, OSC (September 8, 2015) (Attachment 6).

- This lack of consultation and coordination is further evidenced by the fact that Interior officials downplayed SFA designations and new management criteria at the next several Secretary's Sage-Grouse Task Force Meetings. *See* Secretary's Sage-Grouse Task Force Meeting Notes for January 2015 (Attachment 7) and March 2015 (Attachment 8) (only discussing the NSO stipulations for new oil and gas leases in the January 2015 meeting, and in March 2015, addressing concerns from states about locatable mineral withdrawals, but never providing the full picture of the measures associated with SFA designations).
- It wasn't until late January/early-February that the BLM provided the full picture of SFAs and associated management actions to Idaho and began to discuss the State's significant issues with this top-down approach. *See* Email from Jonathan Beck, Greater Sage-Grouse Planning Lead for the Bureau of Land Management to Dustin Miller, Administrator, OSC (February 4, 2015 4:48 PM MST) (Attachment 9).

It was not until late January 2015 that Idaho became aware that "superPACs" were renamed "Sagebrush Focal Areas" and its associated ruleset. *See* Secretary's Sage-Grouse Task Force Meeting Notes, January 2015. Idaho and other states adamantly opposed this new designation, culminating in a meeting in Washington, D.C. in April 2015 with Interior officials<sup>1</sup> and governors' staff from Idaho, Utah, Nevada and Colorado. In this meeting, the states discussed their concerns with the new national direction and provided recommendations for resolving these issues. Notwithstanding these recommendations, the states were advised it was too late for any meaningful management changes and that FWS not only needed the agencies to propose mineral withdrawals, but that a "not warranted" decision would be based on the withdrawals actually occurring. This simply does not meet the agencies' obligations to consult and coordinate with the states as partners in this process.

In May 2015, Idaho was given a very brief (10 day) opportunity to provide comments on the administrative draft proposed plan (ADPP) with the State continuing, with no avail, to voice its opposition to SFAs and the other material inconsistencies created by the last minute national direction. *See* Letter from Dustin Miller, Administrator, OSC, to Jeff Foss, Interim Dir., Idaho BLM (May 13, 2015) (Attachment 10) (stating that the SFAs stand to "diminish the work completed by the Governor's [Task Force], the State of Idaho, and our local federal partners.").

The BLM Response clearly attempts to convey the notion that the State had ample opportunity to respond to this national direction, but that is no substitute for the consultation and coordination obligations owed to Idaho or the commitments from the Secretary to the Governor. As a cooperating agency, and consistent with § 202(c)(9) of FLPMA, SFAs should have been vetted not only through the Governor's Task Force but also subject to public scrutiny in a SEIS.

---

<sup>1</sup> From Interior, National BLM Director Neil Kornze, Deputy Asst. Secretary for Lands and Minerals Jim Lyons, Counsel to the Secretary Sarah Greenberger, Michael Bean, Ed Roberson, Steve Ellis, and Amy Luders

Instead, the State was notified of the SFAs with scant detail of the actual management implications until there was no meaningful opportunity or flexibility to make adjustments, or even consult with the state agency legally charged with managing the species. Now this fatally flawed problem will be further amplified as the Secretary has informed Idaho and the other states that the sweeping and unprecedented mineral withdrawal process under § 204 of FLPMA is imminent. Such an ill-advised decision is an unnecessary diversion of resources (also not addressed in the Consistency Review), will require Idaho to participate in another costly and time consuming process premised on a legally flawed document, and will pose an immediate and irreparable injury to Idaho and mining claimants across the region that will face certain forfeiture of those claims. This irretrievable commitment of resources and the cumulative impacts of such a proposal has not been analyzed or disclosed under NEPA. These issues do not even include the burdensome ESA listing process. Before the Secretary sets back collaborative collaboration across the West for decades, she should ask the Court or Congress for more time and develop a reasonable path forward.

## **B. Disturbance Caps:**

On page 20 of the Consistency Review, the Governor stated, “the recommendation for a uniform project-level [NTT-level] disturbance cap is not based on the best available science, and that his plan adequately addresses concerns about disturbance.” Again, BLM’s Response denying Governor Otter’s recommendation to eliminate the project level disturbance cap does not address the issue. As noted in the Consistency Review, the Governor’s Task Force was willing to accept a Conservation- Area level (or BSU-level) disturbance caps in the spirit of collaboration and interagency refinement. This was in addition to, Alternative E’s adoption of project level caps for fluid mineral development based on Wyoming’s DDCT strategy. *See* Consistency Review at 36 (The Governor’s Plan only adopts a project-level disturbance cap for fluid mineral development.).

For Idaho, the record is clear that a project level [NTT-level] cap was introduced for the first time in the Proposed Plan. Yet instead of analyzing the Governor’s specific concern, BLM treats all disturbance caps the same and bizarrely suggests it was the State’s idea to include a project-level cap in the Proposed Plan. “Through collaborations with the state of Idaho, BLM modified the disturbance cap concept using the best available science...to develop a disturbance cap strategy that would incorporate the Degradation of Threats presented in Appendix G of the FEIS.” BLM Response at 6. The Governor requests that the Director review the Governor’s Task Force recommendations of April 2014 where this collaborative group explains why the Conservation Area disturbance caps better meet the needs for sage-grouse than the NTT Report’s recommendation.

Consistent with the agency’s own direction in Appendix G, implementing and enforcing a project level disturbance cap is unnecessary in Idaho. Moreover, the formula for determining whether the cap has been exceeded is extremely confusing and unworkable. Further, the BLM Response offers no rebuttal to the fact that project level disturbance caps are based almost exclusively on BLM’s misapplication of one study by Dr. Steve Knick that never used the term. *See* Consistency Review at 20 (Dr. Knick’s study “has very little to do with disturbance caps and in fact, never uses that term”).

None of these concerns are addressed in Idaho BLM's response. In fact, Idaho BLM only provided three short paragraphs in response to Governor Otter's recommendation that project level disturbance caps be eliminated. There is no explanation for the necessity of a cap at such a fine scale in Idaho other than to suggest that FWS desired "uniformity". Thus, given the lack of response from Idaho BLM, the Director must reconsider Governor Otter's recommendation to remove project level disturbance caps from the Proposed Plan.

### **C. Net Conservation Gain Standard**

Beginning at page 21 of the Consistency Review, Idaho notes that the State's strategy "is in many ways in and of itself a mitigation plan." The zonal structure and management continuum encourage development outside of the CHZ, and to a lesser extent IHZ, to ensure a high level of conservation for the best habitat and the highest concentration of bids." Despite that approach – largely consistent with other states' approach to mitigation – the BLM without any real explanation or analysis shifted from a "no net loss" standard in the DEIS to a "net conservation gain" standard in the FEIS. Nor does BLM explain or analyze how this new standard meets or modifies the existing statutory standard for mitigation under § 1732(b) of FLPMA – the unnecessary or undue degradation standard. Without disclosing this information, BLM again exceeds its delegated statutory authority under FLPMA and likely violates the Administrative Procedure Act.

As reflective of all of the BLM's Response to Governor Otter's recommendations and concerns, the agency's discussion of this new standard is both confusing and unpersuasive. At every opportunity, Idaho questioned the "no net unmitigated loss" standard for vagueness. Rather than better defining this standard or analyzing any reasonable range of alternatives, the mitigation standard was changed without notice. BLM's Response offers no additional guidance on how this new standard will be implemented other than to simply throw up its hands and suggest that it will be fleshed out in the Regional Mitigation Strategy. This is an abdication of BLM's independent legal obligations under NEPA.

On page 6, the Response states, "...the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation." But that simply restates the LUPA language; it does not answer any of the concerns or inconsistencies raised in the Consistency Review (e.g. how this standard differs from the one analyzed in the DEIS). This confusion is further compounded by the BLM Wyoming's response to Governor Mead. On page 5, Wyoming BLM states its approach to this standard is somewhat different than Idaho BLM, "[f]urther, the BLM's standard for 'net conservation gain' for compensatory mitigation is *consistent* with the State of Wyoming's standard of maintaining a landscape scale result that is beneficial to sage-grouse. There is no specifically identified inconsistency between the State of Wyoming's mitigation standards, as outline in EO 2015-4 and BLM's net conservation gain standard." So which is it: a) the framework [state plan] itself works to achieve a net conservation gain; b) only the compensatory mitigation component is a new standard; or both? These are questions that should have been addressed and analyzed in the FEIS and not addressed in piecemeal fashion or on an ad-hoc basis.

To this end, BLM claims that the public was on notice of this directional shift based on FWS' 2014 GRSG Mitigation Framework to "be strategically designed to result in net overall positive outcomes for sage-grouse." Again, this mitigation framework was released after the DEIS, and BLM provided no notice that it would be adopting this approach. Reflective of BLM's last-minute changes, the agency simply shirked its own independent legal responsibility under NEPA because FWS desired more "certainty." Accordingly, BLM must analyze these issues in a SEIS.

#### **D. Livestock Grazing**

The BLM Response fails to address the numerous issues raised in the Consistency Review related to livestock grazing. *See* Consistency Review at 49-56. Again, the BLM Response relies heavily on *post hoc* rationalization (i.e. IM 2012-044 and Manual 6840) in their decision to disregard the Governor's recommendations. BLM Response at 7. Yet, the agency fails to describe how the Governor's Plan for livestock grazing is inconsistent with any of the BLM's statutory and regulatory obligations, especially in light of the fact that the 2010 "warranted but precluded" listing determination<sup>2</sup> ("2010 Finding") by FWS and the COT Report treat improper grazing as a secondary threat.

While Idaho is somewhat encouraged that the BLM is considering actions to place improper livestock grazing in the appropriate context as a secondary threat, this contemplated action cannot amount to a meaningful resolution of these important issues given the limited agency decision space between the FEIS and the ROD. *See id.* (stating the BLM will "make clear that appropriately-managed livestock grazing is not a threat and may continue under the plans."). Only a supplemental EIS can cure this defect. Below are three of the significant issues that were not addressed, or inadequately addressed, in the BLM Response related to livestock grazing. Again, the Governor's Consistency Review represents a complete and exhaustive analysis of the State's concerns with a list of appropriate recommendations that is incorporated here by reference.

First, the BLM continues to obfuscate and defend their decision to include livestock grazing in the SFA regime. As stated in the Consistency Review, this is not only inconsistent with the Governor's Plan, but also belies the notion that the BLM did not inappropriately elevate livestock grazing to primary threat status. *See* Consistency Review at 52. The federal agencies' elevation of livestock grazing in the SFA's is also arbitrary and capricious because, prior to the national direction, the FWS was very supportive of the Governor's livestock strategy. *See Id.* (quoting FWS letter that the livestock strategy is a "wise approach for regulating the appropriate conservation action for the secondary threat of improper grazing..."). The Governor's Plan, including its livestock strategy, adequately maintains "strong, durable, and meaningful protection" without the need for additional, and costly management actions. *See* BLM Response at 7.

---

<sup>2</sup> *See* Endangered and Threatened Wildlife and Plants; 12-Month Findings for the Petitions to List the Greater Sage Grouse as Threatened or Endangered, 75 Fed. Reg. 13,910 (proposed Mar. 23, 2010) (to be codified at 50 C.F.R. pt. 17)/

Second, the BLM Response does not adequately address the inconsistencies identified in the Proposed Plan's habitat standards. *See* FEIS at RM-17. The Proposed Plan includes vague and subjective language such as "specific management thresholds" and "one or more defined responses" that without clarification or adequate explanation will arbitrarily constrain agency discretion and result in unnecessary default responses, such as seven inch stubble height, without regard for localized conditions. *See* Consistency Review at 52. The Governor's Plan aligns with the COT report and its requirement for habitat objectives recognizing that the ecological site potential may alter these desired habitat conditions. *See Id.*; COT Report at 45. In short, the Proposed Plan undermines the fundamental premise in the Governor's Plan to incentivize *rather than punish* livestock producers for strong populations and quality habitat.

Third, another concerning aspect of the BLM Response is its specious assurance that "current grazing management will not change as a result of the SFA designation." BLM Response at 8. While Idaho and livestock operators indeed hope this to be true, the analysis in the Proposed Plan and the BLM Response provides little support for this statement. *See e.g., Id.* ("This approach provides the FWS with the *certainty* that the BLM will take prompt action when any range-use is not meeting or moving towards meeting, a GRSG habitat objective or land health standard.") (emphasis added). Moreover, the BLM's analysis validates the presumption that grazing will be reduced in the SFAs by unlawfully suggesting that an SEIS is unnecessary because a greatly reduced or no grazing alternatives were analyzed (and rejected) at the DEIS stage; thus, the impacts to grazing from the adoption of SFAs have been analyzed. FEIS at 2-2; *see also* FEIS 4-192 (describing no real additional impact from including grazing in the SFA regime). Notwithstanding the NEPA errors in this conclusion, BLM's position only serves to reinforce the notion that including grazing in the SFA regime is really a subterfuge for elevating the activity to primary threat status. In short, these declines were not adequately analyzed in the FEIS owing to the fact that they were an about-face from the agencies' previous positions. And if this presumed reduction in livestock grazing across sage-grouse habitat comes to fruition, the ensuing economic ripple-effect will be felt at the State and local government levels.

Again, the Governor's Strategy is wholly consistent with the Idaho Rangeland Health Standards, the COT Report, and the 2010 Finding; as well as Manual 6840 and IM 2012-044 and, as such, must be adopted. *See* 43 C.F.R. § 1610.3-2. The Proposed Plan's approach is imbalanced.

#### **E. Lek Buffers**

The justification in the BLM Response for rejecting the Governor's recommendation to remove all post-DEIS uniform lek buffers is two-fold. First, the agency contends that lek buffers will not be determined until a project level site-specific NEPA analysis is completed, which will make the Proposed Plan consistent with the Governor's Plan. BLM Response at 8. Second, the BLM again defaults to its obligations under Manual 6840, IM 2012-044, and the need to provide regulatory certainty for FWS. Again, there is no analysis or explanation as to why the Governor's Plan with its management continuum approach is inconsistent with this guidance or how it now suddenly fails to provide the requisite and appropriately-tailored regulatory certainty.

At the outset, it is important to note that the BLM Response does not respond to the Governor's claim that the USGS Report represents a significant change post-DEIS that should have been publicly disclosed and vetted through an SEIS. *See* Consistency Review at 10, 60. Until such time that the public has been afforded the opportunity to review and vet the USGS Report, it cannot stand as the best available science for lek buffers.

The agency's first claim that site specific NEPA is necessary before determining lek buffers does not obviate the agency's need under section 1610.3-2(e) to adopt the Governor's recommendation if it provides a "reasonable balance." The Governor's Plan recognizes the value and need for reasonable lek buffers within Core, and to a lesser extent Important, (PHMA and IHMA) Habitat Zones; however, the Governor's Plan eliminates land-use level uniform lek buffers in the General habitat. *Id.* at 58. The agencies' promise of variances from uniform lek buffers is simply illusory. *Id.* at 59. Also, the Governor's Plan's tiered management continuum places emphasis on providing greater protections where they are needed the most (*i.e.*, Core and Important Habitat), instead of the BLM's blanket standard that applies equally, regardless of habitat quality, in General Habitat (5% of the population) as it does in Core (Priority) Habitat (73% of the population). *See* Idaho Exec. Ord. 2015-04; Consistency Review at 59.

Secondly, as discussed, *supra*, the BLM Response claiming that the agency is obligated under their internal guidance to deny the Governor's recommendations does not pass muster. The Governor's Plan, which includes requirements for lek buffers, is inherently consistent with Manual 6840 because the Governor's Plan is *specifically* tailored to address the conservation needs of sage-grouse in Idaho based on actual on-the-ground information. Absent an analysis of how or why the Proposed Plan is even incrementally better for sage-grouse than the Governor's Plan, this argument cannot stand. Further, IM 2012-044 simply guides development of conservation plans for sage-grouse in this process. In fact, this IM actually encourages science-based collaboration with the states and is consistent with the Governor's Plan. The IM states:

"These goals and objectives are a guiding philosophy that should inform the goals and objectives developed for individual land use plans. However, it is anticipated that individual plans may develop goals and objectives that differ and are specific to individual planning areas." *See* IM 2012-044.

For these reasons, the Director must reconsider Governor Otter's recommendation to adopt the Governor's Plan and abandon the Proposed Plan's implementation of lek buffers.

#### **F. Required Design Features in all Habitat Types:**

In the "The Governor's Plan for Large-Scale Infrastructure is Commensurate with the Threat Level in Idaho and Provides an Adequate Regulatory Mechanism," section of the Consistency Review, Governor Otter points out that the required design features (RDFs), among other issues, contained in the Proposed Plan "blurs the distinction between habitat zones and renders the state's extensive mapping exercise effectively moot." *See* Consistency Review at 23-24. Specifically, "application of the net conservation gain standard, lek buffers, and RDFs in GHZ" renders GHZ as a *de facto* avoidance area. *Id.* Further, Governor Otter points out that

there are “significant differences between the [best management practices] required by the Governor’s Plan and the RDFs required in the agencies Proposed Plan,” and that “specific RDFs either in conflict directly with the Governor’s Plan or are inconsistent because they are not contained within the Governor’s Plan.” *Id.* at 26. In many instances, the Consistency Review provides a list of the RDFs contained in the Proposed Plan that are omitted from the Governor’s Plan. *See, e.g., Id.* at 27.

BLM’s Response denial of the Governor’s recommendation to remove the RDFs that are not contained in the Governor’s Plan is only a partial response to the issues raised in the Consistency Review. The first issue is that there are significant differences between the RDFs proposed on the various types of infrastructure in the Proposed Plan and the Governor’s best management practices (BMPs). The BLM argues that they have “flexibility inherent in the application of RDFs” making the inconsistency minimal between the two plans. BLM Response at 9. If the inconsistency is minimal as the BLM contends, then adopting the Governor’s BMPs as the RDF framework would meet the “maximum extent” requirement in FLPMA.
