

**Sage Grouse Schedule**

**Due Date**

**Days**

Direction to State Directors	1/23/2015	
Subregions revise Chapter 2 with ADPP	2/27/2015	35
<b>Sub-regions send ADPP data to the NOC, reflecting changes from FFM, discussions with the States, and from interagency leadership briefings</b>	2/20/2015	28
<b>NOC QA/QC and data to FWS</b>	2/27/2015	7
NOC completes WAFWA MZ Tier II CEA MZ tables	3/20/2015	21
EMPSi completes Tier II CEA MZ analysis and sends analysis to sub-regions	4/24/2015	35
Teams begin work on ROD template	4/24/2015	
Conduct Direct and Indirect Impact Analysis	4/3/2015	35
BLM/FS ID-teams review of direct and indirect impact analysis ( <i>for those planning efforts using contractors only</i> )	4/17/2015	14
BLM/FS ID-teams review CEA	5/1/2015	7
EMPSi revises CEA based on ID-teams comments	5/8/2015	7
BLM/Contractors compile, format, tech edit, and QA PLUPA/FEIS	5/1/2015	14
Consistency Review Strike Team Reviews all 14 Draft FEISs.	5/8/2015	7
BLM/FS ID-teams respond to potential issues from Consistency Review Strike Team.	5/15/2015	7
BLM/Contractors incorporate CEAs and make modifications for WO Review versions of the FEIS.	5/20/2015	5
<b>Submit briefing packet to WO/WO Review Kick-off Briefing</b>	5/20/2015	
WO Review (CONCURRENT COOPERATING AGENCY REVIEW)	6/3/2015	14
BLM Consolidate/filter all WO BLM/FS & SOL/OGC comments	6/5/2015	2
Sub-regions respond to WO review comments	6/12/2015	7
WO resolves any pending concerns that arise out of the WO Review	6/14/2015	2
BLM/Contractors make modifications in Public Review versions of the FEIS.	6/19/2015	5
<del>National Policy Team Briefing</del>		
<del>BLM Director's Briefing</del>		
Interagency Leadership Briefing	6/19/2015	
Secretaries of DOI and USDA Briefing - Approval to Print	6/19/2015	0
BLM/Contractors compile, format, tech edit, and QA PLUPA/FEIS	6/23/2015	4
Camera-ready copy to GPO/PDF for website	6/23/2015	
CD Distribution	6/30/2015	7
Printing and distribution by GPO	7/7/2015	14
<b>Publish Proposed Plan EISs (falls on a Friday per EPA requirements)</b>	6/26/2015	7
ID Teams begin work on Approved RMPs	6/26/2015	
Protest Period Ends (30 day mandatory protest period)	7/27/2015	31
Protest Resolution Process Ends	8/26/2015	30
Governor's Consistency Review Ends (60 day mandatory governor consistency review)	8/25/2015	60
<del>National Policy Team Briefing</del>		

<del>BLM Director's Briefing</del>		
Interagency Leadership Briefing	8/31/2015	6
Secretaries of DOI and USDA Briefing	9/1/2015	1
<b>RODs are signed</b>	9/2/2015	1
Formal Consultation for Utah, Wyoming and Montana revision	8/30/2015	135

## Notes

FWS wants this before March

6 weeks preferred

based on chapter 2

2 weeks - start compiling document - everything except for the CEA

1 week

1 week

2 weeks

1-2 weeks, with FS?

1 week

2-4 weeks; cooperating agencies get 2 weeks

2 days

1 week

2 days

1 week

Tied to Line 21

Assumes approval to print will be granted

1 week - are these duplications?

could send proof copies?

quicker than print

2 weeks - need to negotiate - want 4

One week from approval to print to get to EPA. 6/19/15 target - must be Friday

readable copy of RMPs

30 days

30 days

60 days

start discussions with FWS about this

	Step	Due Date	Days to complete	Notes	Included Steps
1	Direction to State Directors	1/23/2015			
2	ADPP Data to NOC	2/13/2015	21		The Pink and Blue steps are concurrent and develop in the Purple/Final EIS
3	Data to FWS	2/20/2015	7	The next steps are concurrent	
4	Subregions revise Chapter 2 with ADPP	2/20/2015	28	Subregions engage Cooperating Agencies	
5	NOC completes CEA tables	3/13/2015	21		
6	CEA Analysis Complete	4/17/2015	35		
7	Direct and Indirect Analysis Complete	3/27/2015	35		Revise Comment Report; Direct and Indirect Analysis Complete
8	BLM/FS ID Teams Review, Response and Modifications for D/I Analysis	4/3/2015	7		
9	BLM/Contractors compile, format, tech edit, and QA PLUPA/FEIS	4/10/2015	7	*Begin chapter 2 presentations to cooperators/WO in preparation for reviews	
10	Consistency, policy and initial legal review by IMT	4/17/2015	7	Key staff sequestered -Denver?	
11	Response and Modifications	4/21/2015	4	processing as available - Key staff sequestered	
12	CEA Analysis Review and Modifications	4/24/2015	7	*SOL can start reviewing, but will not have final/clean yet	BLM/FS CEA Coordinator Review; BLM/FS CEA Coordinator revises CEA based on ID-teams comments
13	DRAFT FEIS	4/25/2015	1	Key staff sequestered throughout next steps - M St 4th Floor - on call/responding	Draft Plans; BLM/Contracts compile, format, tech edit, and QA PLUPA/FEIS based on CEA review and IMT review
14	Concurrent WO/(Cooperating Agency Review in subregions)	5/9/2015	14		
15	Reviewed Plans to states for corrections/clean up	5/11/2015	2	key staff sequestered - processing as available	Reviewed Plans to states for corrections/clean up; States respond to Cooperating Agency comments
16	Final SOL Review of clean documents	5/18/2015	7		Final SOL Review; Subregional Teams make edits based on SOL Review
17	BLM/Contractors make modifications in Public Review versions of the FEIS	5/22/2015	4		
18	Interagency Leadership Briefing	5/22/2015			
19	Secretaries of DOI and USDA Briefing - Approval to Print	5/22/2015	0	7 days to printing	
20	Camera-ready copy to GPO/PDF for website	5/26/2015	4		
21	Printing and distribution by GPO	6/9/2015	14		
22	Publish Proposed Plan EISs (falls on a Friday per EPA requirements)	5/29/2015	7	Must be a Friday	
23	Begin work on RODS	5/29/2015			
24	ID Teams begin work on Approved RMPs	5/29/2015			
25	First Draft of RODs	6/26/2015	28		First Draft of RODs; WO Review of Approved RMPs/RODs; Subregional Teams make edits based on WO review
26	Protest Period Ends (30 day mandatory protest period)	6/29/2015	31		
27	SOL Review/Second Draft of RODs	7/10/2015	14		SOL Review/Second Draft of RODs; Subregional Teams make edits based on SOL review
28	Protest Resolution Process Ends	7/29/2015	30		
29	Governor's Consistency Review Ends (60 day mandatory governor consistency review)	7/28/2015	60		
30	Draft ROD for Sec. Review	7/24/2015	14		
31	Interagency Leadership Briefing	7/29/2015	1		Interagency Leadership Briefing; Respond to Governor's Consistency Review comments if any received
32	Secretaries of DOI and USDA Briefing	7/30/2015	1		
33	RODs are signed	7/31/2015	1		Steps not included: respond to Governors Consistency, print/publish RODs/ARMPS
	Formal Consultation for Utah, Wyoming and Montana revision	8/16/2015	135	BO/BA with FWS - 135 days

**Subject:** Schedule

Team GSG: Thank you for riding tall this week through much uncertainty regarding the CROmnibus and the sage grouse rider. Steve and Ed will both be back in the office Monday and we'll get a call set up. For now, though, you should know that our schedules and the urgency of the effort are unaffected by the rider. More on that Monday.

Our goal is to get you all the various information you need by mid/late next week for each of your plans so that you can march onward with your analysis. Nevada is going to lag behind (despite Amy's great efforts), but I believe we can get the others moving in a matter of days.

We're almost there! Have a nice weekend...you deserve it.

Neil

**National Greater Sage-Grouse Planning Strategy  
Idaho & Southwestern Montana Sub Region  
Greater Sage-Grouse Effort  
Idaho State Director Update  
August 13, 2012**

## **1. National/Regional Coordination**

### **a. State Director Decision Calls**

Last call was held on August 10<sup>th</sup>, discussing topics including: the process for State Plans to become BLM interim policy; detailed analysis of the no grazing alternative; required design features; and disturbance team recommendations.

On the previous call it was decided that each effort will analyze in detail in at least one alternative a no grazing alternative; the National Policy Team review and approval process was approved and funding for FWS staffing was approved pending final negotiations.

## **2. Contracting Work Efforts**

### **a. EMPSi Document/Process Development Contract**

Work continues on development of the EIS. EMPSi is involved with alternative development, coordination, note taking and administrative record support.

### **b. USGS Cumulative Effects Contract**

USGS is working on a baseline report using range wide data sources. Their initial draft report is expected in August (mid to late) with a final in September (late). An internal version is currently being reviewed by a select team.

### **c. ICF Social and Economic Contract**

ICF continues to work on the social and economic baseline.

### **d. Vegetation Accuracy Mapping**

Leona Svancara with University of Idaho & IDF&G has provided the initial crosswalks between macro groups and the base vegetation maps (LANDFIRE, ReGAP).

## **3. Idaho and Southwestern Montana Sub Regional Effort Coordination**

### **a. Forest Service**

Work continues with the Forest Service to coordinate development of alternatives.

### **b. Montana BLM**

Montana BLM is highly involved in helping to develop alternatives for the plan amendment. The existing Dillon RMP has already completed extensive coordination work with Montana Fish, Wildlife and Parks and much of this direction will be displayed as parts of the alternatives in the plan amendment.

c. Native American Tribes Consultation and Coordination

Coordination occurred through the Wings and Roots Campfire process and the Tribes posed several questions to BLM regarding Air Force activities and their potential to impact sage-grouse: sonic booms killing sage-grouse chicks in the egg prior to hatching and wildfire occurrence as a result of flares. BLM is working with the Air Force to compile relevant existing data to share with the Tribes in August or September.

d. Idaho Governor's Task Force

The Task Force commissioned by Governor Otter has developed a map specific to their proposal which delineates Core, Important and General areas to be addressed in management guidance that they are still working on. This plan has been released for public comment and has received significant interest. The State is working to incorporate comments and is expected to provide BLM a more complete version soon. The State has also requested USFWS's review of their approach. USFWS has responded and indicated that the approach is a good start and could benefit from some additional considerations.

e. Cooperating Agencies

BLM continues to work with local Cooperating Agencies and has approved MOUs with most of the agencies that have expressed interest.

A Cooperating Agency call was held on July 5<sup>th</sup> and another is scheduled for August 9<sup>th</sup>.

f. Resource Advisory Councils

Paul Makela presented PPH maps and process for the Twin Falls RAC group at a recent meeting.

g. Sage-Grouse Local Working Groups

h. Other Coordination

#### 4. EIS Development

a. Chapter 1 – Purpose and Need – Template complete for sub regional efforts.

b. Chapter 2 – Alternatives – Template for chapter in development.

i. ACECs

1. ID/swMT have received several ACEC nominations for consideration in the amendments process:

a. Greater Yellowstone Coalition

i. Dillon, MT Core Areas

ii. Eastern Idaho Uplands Local Working Group Area

iii. Upper Snake Local Working Group Area

b. Wild Earth Guardians

i. Range-wide Priority Habitat – all PPH minus oil and gas existing development; this translates into all PPH in Idaho

c. Western Watersheds Project

- i. Previously submitted Jarbidge Field Office sage-grouse ACEC nominations
      - ii. Previously submitted Bruneau Field Office sage-grouse ACEC nominations
    2. Each Field Office has assessed the potential identification of ACECs and have developed an internal BLM proposal.
    3. Sub-Regional coordination to determine and document Relevance and Importance
      - a. Meetings were held in Twin Falls, Idaho Falls and Boise Districts to discuss and evaluate proposals. Preliminary evaluations found that areas nominated for ACEC consideration met relevance and importance values if they were in areas that have been identified as having the highest conservation value to maintaining greater sage-grouse populations.
  - ii. ID/swMT Alternative
    1. Base Map
      - a. Discussion have been initiated regarding existing rights, leases, activities on BLM lands and potential approaches for addressing these in the EIS. Based on these discussions there will not be any need to adjust PPH/PGH boundaries or delineations from the existing map.
    2. Management Actions/Conservation Measures
      - a. Defining these measures is the next step in development process for the alternative. A series of subcommittees lead out of the State Office with input and support from the Field Offices will be used during initial development of these measures.
    3. Alternative Development
      - a. Several small teams were convened to draft initial guidance for this alternative. An alternative development workshop was held in Boise on July 24<sup>th</sup> to discuss and refine the approaches. As a result of this workshop each team was tasked with some additional refinements or augmentation to the direction which is due back to the State Office on August 8<sup>th</sup>.
- c. Chapter 3 – Affected Environment
  - i. Template developed, NOC is working on the cumulative effects baseline in coordination with USGS which will provide the foundation from which the existing environment will be developed. The ID Team will finish compiling this description by augmenting the baseline description to incorporate other pertinent sub regional information. A draft is being reviewed by a select group currently and the final baseline report is expected by the end of September.
- d. Chapter 4 – Environmental Consequences
  - i. Work on No Action ongoing, ID Teams working on GIS maps and acreage calculations.
  - ii. Reasonably Foreseeable Development Scenarios
    1. Oil and Gas
    2. Geothermal
    3. Renewable – Wind and Solar

## 5. Project Administration

### a. Administrative Support Proposal

There is a need for additional administrative support to assist with ePlanning implementation, administrative record compilation and various word processing/writer-editor duties. A proposal is currently being developed to address this need.

### b. ePlanning

Training has been held for SO users. The Idaho and southwestern Montana EIS project has been set up in ePlanning. EMPSi is currently working on the external website to display through ePlanning. Chapter 1 Template is uploaded and needs finalized with issue statements.

### c. Budget

### d. Sharepoint Sites

This site is finally up and reliable. Most everyone needing access has access.

### e. Website

Jessica is working with EMPSi to update website and information in the ePlanning framework.

### f. FBMS/Contract Administration

## 6. FOIA

## 7. Preliminary Priority Habitat Maps

## 8. Data Needs

- a. Several data needs calls have occurred in the last month and progress is moving forward.

## 9. Schedule

### a. Scoping – Ended March 23, 2012

- i. Scoping Report – Completed May 22, 2012

### b. Alternative Development

- i. ACEC Evaluations

- 1. *Initial Relevance and Importance Findings to be shared and approved with local line officer – August/September 2012.*

- 2. *Evaluation Report to be compiled – August/September 2012.*

- ii. ID/swMT Specific Alternative

- 1. *Management Actions and Conservation Measures have been identified and are currently being refined – August 2012.*

### c. Existing Environment

- i. *Sub Regional work awaiting completion of cumulative effects baseline – September 2012.*

Jon,

Yes, I've been thinking about this and want to bring in the Jarbidge and Elko Field Managers to discuss. I was going to talk to Bryan Fuell next week when I see him at training. There may be some description needed in the amendment FEIS, but I suspect most will occur in the ROD. Both amendment RODs should be on the same time schedule so the delay for Nevada plan is not a factor currently.

Date: Mon, Jun 2, 2014 at 3:13 PM  
Subject: Nevada section in the Jarbidge RMP planning area  
To: Jonathan Beck <[jmbeck@blm.gov](mailto:jmbeck@blm.gov)>, Codie Martin <[cjmartin@blm.gov](mailto:cjmartin@blm.gov)>

Jon:

Just wanted to bring this up because we haven't talked about it. We need to remember in the decision-making for the Jarbidge RMP the acres we have in Nevada. If we wait to do the Jarbidge RMP ROD until the ID/SW MT GRSG Amendment ROD is out, we will also have to wait for the NV/CA GRSG Amendment ROD as well. My understanding is that the section we have in the planning area in NV gets managed as per the NV/CA GRSG Amendment ROD.

The Nevada and Northeastern California Greater Sage-Grouse Draft Land Use Plan Amendment and Environmental Impact Statement states "There are approximately 77,800 acres of public lands in Elko County, Nevada, located north of the Humboldt-Toiyabe National Forest and south of the Idaho-Nevada state line, adjacent to the Bruneau and Jarbidge field offices in Idaho. Due to their remoteness from other BLM-administered lands in Nevada and because they are contiguous to major blocks of public lands in Idaho, a Memorandum of Understanding between the BLM Nevada and BLM Idaho State Offices transfers administration of those lands to the BLM Idaho State Office. For purposes of the GRSG LUPAs in Idaho and in Nevada, planning

for these lands will occur through the Nevada and Northeastern California Greater Sage-Grouse LUPA/EIS, and the regulatory measures/decisions that are put in place for the GRSG through the record of decision will be implemented and administered by the Jarbidge and Bruneau field offices in Idaho. Therefore, the mapped decision and analysis area for the Nevada and Northeastern California LUPAs/EIS will include lands administered by the Jarbidge Field Office in Nevada and end at the Nevada state line (see Table ES-1, Land Management within the Planning Area, and Figure ES-1, Nevada and Northeastern California Greater Sage-Grouse Sub-region Planning Area..."

**To:** Timothy Murphy; Jeffery Foss; Brent Ralston  
**Subject:** Re: Conference Call Prep--re: Response to NPT Guidance

Tim, I had a misstatement in the last line of my email to you all this morning. It should have said: After we discuss these questions and reconcile these issues, we can confirm that the data is ready to send to the NOC for the roll up.,

On Wed, Jun 4, 2014 at 8:35 AM, Roberson, Edwin <[eroberso@blm.gov](mailto:eroberso@blm.gov)> wrote:  
Tim,

In preparation for our discussion later today, I wanted to provide you with some of the concerns we would like to go over with you and your team regarding the info memo you sent us on 5/29/14. Hopefully you can provide us with some clarification/rationale on a few inconsistencies with the NPT allocation recommendations.

### For Priority Habitat (Core/Important):

What is your rationale for managing medial (important) habitat as a ROW avoidance area, instead of managing it as a ROW exclusion area for wind/solar?

Idaho is only closing areas to fluid mineral development that are low potential. What is the biological rationale for opening moderate and high potential areas for development? Are you applying NSO to any core (priority) areas?

Are core and important areas closed to non-energy leasables?

For mineral materials, what is the rationale for leaving medial (important) areas open? For existing sites, are they subject to the 3% disturbance cap and no net unmitigated loss?

### For General Habitat

What is your rationale for not managing general habitat as a ROW avoidance area for solar/wind?

What is your rationale for not managing general habitat as a ROW avoidance area for high-voltage transmission ROWs?

### Adaptive Management

Is BLM Idaho's adaptive management strategy consistent with the AM sideboards? How does the AM strategy apply to other allocation categories other than ROWs?

### Disturbance

What do you mean when you say that BLM Idaho is "inconsistent with specific biological units." The NPT guidance allowed the sub-regions to provide for their own unit, as long as information could be aggregated up to the PAC level. Also – you state that the cap is only subject to "seasonal habitats of highest concern" – does this mean that you are not applying the cap to all general and priority (core, important, and general)? Who makes the determination of what is of a "highest concern?"

Will the no net unmitigated loss be applied to core, important, and general habitat?

How much medial (important) habitat lies within the PAC boundaries?

### Cross-Jurisdictional Coordination

Are there any inconsistencies with how the Forest Service plans to manage their priority and general habitat areas?

Have you resolved all of the FWS stop-light matrix concerns (shifting reds to yellows or greens)?

I look forward to our discussion. After we discuss these questions and reconcile these issues, we can confirm that the data you sent to the NOC is ready for the roll-up or you can send any changes in data on to the NOC. Thank you. Ed

**Population Based Triggers**

	<b>SOFT TRIGGER</b>	<b>HARD TRIGGER</b>
<b>INDIVIDUAL LEKS</b>	>50% probability of a 10% change in an individual lek population for 3 years running, between the lek and the average for its lek cluster →	> 50% probability of 10% change in an individual lek population for 5 years running
<b>LEK CLUSTERS</b>	>50% probability of a 10% change in populations for 3 years running, between a lek cluster and its BSA moving average* →	>50% probability of a 10% change in populations for 5 years running, between a lek cluster and its BSA moving average*
<b>BSA (PAC)</b>	A declining moving average at the regional scale (not explained by climatic conditions) for 3 years running →	If the moving average continues its decline for 5 years running
<b>CATASTROPHIC EVENTS</b>	> 50% decline in population of a lek on any given year →	> 50% in the population of lek for 2 years running

\* Duration for the calculation of the moving averages need to be determined... 10 years? 8 years? 5 years?

**Habitat Based Triggers**

	<b>SOFT TRIGGER</b>	<b>HARD TRIGGER</b>
<b>LEK or LEK CLUSTERS</b>	=> 5% disturbance of any individual seasonal habitat type	=>10% disturbance of any individual seasonal habitat type
<b>BSA (PAC)</b>		
<b>25-65% landscape sagebrush cover</b>	=> 2% change in landscape sagebrush cover	=> 5% change in landscape sagebrush cover
<b>&gt; 65% landscape sagebrush cover</b>	=> 5% change in landscape sagebrush cover	=> 10% change in landscape sagebrush cover <b>OR</b> if landscape sagebrush cover falls below 70%

## Chapter 2: Adaptive Management

July 23, 2014

### Adaptive Management

Adaptive Management is a decision process that promotes flexible resource management decision making that can be adjusted in the face of uncertainties as outcomes from management actions and other events become better understood. Careful monitoring of these outcomes both advances scientific understanding and helps with adjusting resource management directions as part of an iterative learning process. Adaptive management also recognizes the importance of natural variability in contributing to ecological resilience and productivity. It is not a trial and error process, but rather emphasizes learning while doing. Adaptive management does not represent an end in itself, but rather a means to more effective decisions and enhanced benefits. On February 1, 2008, the Department of the Interior published its Adaptive Management Implementation Policy (522 DM 1). The adaptive management strategy presented within this EIS complies with this policy and direction.

In relation to the BLM and Forest Service's National Greater Sage-grouse Planning Strategy (2012), adaptive management will help identify if GRSG conservation measures presented in this EIS contain the needed level of certainty for effectiveness. Principles of adaptive management will be incorporated into the conservation measures in the plan to ameliorate threats to a species, thereby increasing the likelihood that the conservation measure and plan will be effective in reducing threats to GRSG. The following provides the adaptive management strategy for the Oregon Sub-region RMPA/EIS.

### Adaptive Management and Monitoring

This RMPA/EIS contains a monitoring framework (**Appendix G**, Greater Sage-Grouse Monitoring Framework), which includes an effectiveness monitoring component. The agencies intend to use the data collected from the effectiveness monitoring to identify any changes in habitat conditions related to the goals and objectives of the plan and other range-wide conservation strategies (DOI 2004; Stiver et al. 2006; USFWS 2013a). The information collected through the Monitoring Framework Plan outlined in **Appendix G** would be used by the BLM to determine when adaptive management hard and soft triggers (discussed below) are met.

An adaptive management working group will help BLM to identify the causal factor that may have tripped the adaptive management trigger. A causal factor is a threat that USFWS identified in its 2010 listing determination (USFWS 2010). While one or more causal factors can be linked to a habitat or population decline, this does not assume a cause-and-effect relationship. A plethora of factors has been suggested as affecting sage-grouse populations and habitats throughout the species' range. These factors can interact in a myriad of complex relationships that can be difficult to tease apart. It can be difficult to separate proximate factors from ultimate factors leading to population declines. For example, predation is the most commonly identified cause of mortality for GRSG. However, where

habitat is not limited and is of good quality, predation is not a threat to the persistence of the species. Thus, predation can be a proximate cause for a declining GRSG population, while habitat degradation, landscape fragmentation, and human populations may be the ultimate causal factor.

The adaptive management working group, in addition to assessing causal factors, will provide recommendations to the appropriate BLM authorizing official (decision maker) regarding the adaptive management responses to address the trigger. When organizing the adaptive management working group, the BLM will invite participation from USFWS and ODFW. If necessary, this group can reach out to the USFS, NRCS, and other Federal/state/tribal agencies for added information.

### **Adaptive Management Application Scale**

In Oregon, Core Area habitat encompasses approximately 90 percent of the breeding populations of GRSG on 38 percent of the species' range (Hagen 2011). Core Area and PPMA are equivalent to Priority Areas for Conservation (PACs) identified in the Conservation Objectives Team (COT) report developed by the US Fish and Wildlife Service (USFWS 2013). Retention of GRSG habitats within PACs is the COT's highest priority. However, "sage-grouse habitats outside of PACs may also be essential, by providing connectivity between PACs, habitat restoration and population expansion opportunities, and flexibility for managing habitat changes that may result from climate change" (USFWS 2013: page 36). While this adaptive management strategy is focused on PACs, the identification of lek complexes providing key connectivity habitat between PACs may identify additional areas where adaptive management triggers could be applied.

The ODFW in cooperation with the SageCon Partnership subdivided PACs in Oregon into 21 individual units and gave each unit a unique name. The BLM refers to these units as "Oregon PACs" and will monitor adaptive management triggers at this scale and, for the population trigger, at the finer scale of lek complex. Data from monitoring adaptive management triggers can be aggregated up to larger reporting units including GRSG population and WAFWA Management Zone.

### **Adaptive Management Triggers**

Adaptive management triggers are essential for identifying when potential management changes are needed in order to continue meeting sage-grouse conservation objectives. The BLM will use two types of triggers for specific populations and responses: soft triggers and hard triggers. These triggers are not specific to any particular project, but identify habitat and population thresholds.

#### *Soft Triggers*

Soft triggers represent an intermediate threshold indicating that management changes are needed at the implementation level to address habitat or population losses. If a soft trigger is tripped, the BLM will apply more conservative or restrictive implementation conservation measures to mitigate for the causal factor(s) in the decline of populations and/or habitats, with consideration of local knowledge and conditions. Soft trigger responses can come in the form of design features, BMPs, or site specific mitigation measures.

Examples of soft trigger responses could include (but are not limited to) the following for future BLM/FS implementation level actions:

- Extending seasonal restrictions for seasonal surface disturbing activities (provided as stipulations to a ROW grant or a Condition of Approval to an oil and gas lease),
- Reprioritizing wild horse and burro gathers;
- Applying sequential development after reclamation;
- Temporary area closures related to travel management (2-year maximum);
- Modifying seasons of use for livestock grazing through annual permit authorizations; and/or
- Applying additional restrictions on discretionary activities, or rejecting the application if mitigation criteria cannot be met.

#### *Hard Triggers*

Hard triggers represent a threshold indicating that immediate action is necessary to stop a severe deviation from GRSG conservation objectives set forth in the BLM plans. The response to a hard trigger is essentially “hard-wired”; that is, upon reaching the trigger, a more restrictive alternative, or an appropriate component of a more restrictive alternative will be implemented. After the hard-trigger is tripped, the BLM will determine the causal factor(s) and develop and implement a corrective strategy. In the event that new scientific information becomes available demonstrating that the hard wired response would be insufficient to stop a severe deviation from GRSG conservation objectives set forth in BLM plans, the BLM will immediately implement a formal directive, akin to BLM IM 2012-043, to protect GRSG and its habitat and to ensure that conservation options are not foreclosed. These actions could include one or more of the following (which may require subsequent NEPA):

- Temporary closures (as directed under BLM IM 2013-035)
- Immediate implementation of interim management policies and procedures through the BLM directives system
- Initiation of a new LUPA to consider changes to the existing LUP

#### **Population Trend Triggers**

Trend is measured by the change in the average number of males per active lek, the number of active leks, and the annual rate of change (percent change) in total numbers of males counted on leks between consecutive years. The ODFW used annual percentage change in estimating population size relative to the 2003 population to establish thresholds for management actions (Hagen 2011). Since 1980, statewide population size has fluctuated around an average of 99 percent of the 2003 benchmark. Therefore, habitat amounts and quality available in 2003 is assumed to be sufficient to sustain this population size and distribution into the future.

Population triggers for adaptive management are based on the 5-year moving window average of annual rates of population change. Analysis of long term trend data (between 10 and 40 years) from 22 Oregon leks that experienced a decline indicate a lek may average 4.1 years (SD = 2.6 years) of inactivity and rebound; most of the sample rebounded in a period of 7 years or less. Thus, leks may have no birds present for up to 7 years, but are defined as occupied.

Population trend data will be evaluated at two overlapping scales:

1. Lek Complex :
  - a. If a lek complex is 10 percent or more below the previous 5-year moving window average for the complex for 3 years, then the soft trigger is tripped. If the trend continues for an additional 2 years (for a total of 5 years) then the hard trigger is tripped.
  - b. If a lek complex has >50 percent attendance decline within the first year immediately following a known disturbance (e.g., fire, new authorized activity), then a soft trigger is hit. If it is sustained for a total of 2 years, then a hard trigger is hit.
  - c. The trigger response area would be the seasonal habitat and use locations associated with the lek that is specifically affected by the cause.
2. Oregon PAC. If the 5-year moving window average of annual rates of population change in the PAC indicates an annual population decline of  $\leq 7$  percent for three consecutive years then the soft trigger is tripped. If the population trend indicates an annual decline of  $> 7$  percent for three consecutive years, or a decline of  $< 7$  percent for five or more consecutive years, then the hard trigger is tripped.

### Habitat Trend Triggers

The trigger for habitat trend is the amount of the landscape in sagebrush cover measured at the scale of Oregon PAC. The vegetation management objective for sage-grouse habitat in this EIS is to provide a minimum of 70 percent of the area capable of supporting sagebrush plant communities. Capable habitat is defined as sagebrush cover  $\geq 5$  percent and tree cover  $< 5$  percent. The remaining approximately 30 percent includes areas of juniper encroachment, non-sagebrush shrubland, and grassland that should be managed to increase available habitat within GRSG range. The "70/30" goal is based on a habitat assessment described in BLM Technical Bulletin 417 (Karl and Sadowski 2005).

The habitat trigger will be evaluated at only one scale, Oregon PAC. Sagebrush availability, both existing and potential, will be measured using the procedures outlined in the GRSG Monitoring Framework (Appendix G). In 2005, the ODFW determined sagebrush cover on BLM Districts approximate the 70/30 goal (Hagen 2011). Using a different dataset (ILAP) and measuring capable habitat (i.e., sagebrush cover  $\geq 5\%$  and tree cover  $< 5\%$ ), the BLM found 2 PACs on Burns District and 3 PACs on Vale District had  $< 70$  percent sagebrush cover (range 59.6% to 68.4%; see Table 3-XX Percent Existing and Potential Sagebrush Cover). Understanding that there are natural fluctuations in sagebrush cover types, the 70/30 goal serves as an adaptive management strategy for sage-grouse habitat (Hagen 2011). Short-

term losses of sagebrush (e.g., fire or insect defoliation) are to be expected. However, sagebrush landscape cover  $\leq 25$  percent has a low probability of maintaining sage-grouse leks, while  $>65$  percent sagebrush cover has a high probability of sustaining sage-grouse populations (Aldridge et al. 2008; Wisdom et al. 2011; Knick et al. 2013; Chambers et al. *in press*). Increases in landscape cover of sagebrush have a constant positive relationship with sage-grouse lek probability at between about 25 percent and 65 percent landscape sagebrush cover (Knick et al. 2013). Thus, for purposes of habitat triggers, the categories of the percent landscape sagebrush cover that would apply are 25-65 percent and above 65 percent, as identified in the Matrix Based on Concepts of Resistance and Resiliency (Chambers et al. *in press*).

In Oregon PACs with 25-65 percent sagebrush cover, a soft trigger is tripped. A hard trigger is tripped in these areas if trend monitoring indicates a 5 percent or greater decline of sagebrush cover, or if sagebrush cover falls below 30 percent. In either case, the triggers remain tripped until the percent sagebrush is  $>65\%$ .

### Trigger Responses

When a soft trigger is hit, the causal factor will be identified and management actions would be adjusted to ameliorate the cause by application of project level adaptive management contained in the authorization and for future similar authorizations. Management would be adjusted based on the causal factors at the appropriate scale (lek complex and/or Oregon PAC). GRSG populations and habitat would continue to be monitored annually.

When a hard trigger is hit due to disturbance, more restrictive allocations and/or management actions would be implemented within the Oregon PAC. When a hard trigger is hit due to non-anthropogenic disturbance, pending and new development could continue within the affected Oregon PAC(s) if:

- a) As designed, the project would have no impact on the GRSG population, or
- b) The project has been modified so that it would not have impacts on the GRSG population.

If soft triggers are hit for **both population and for habitat**, this will result in a hard trigger response for the Oregon PAC.

Specific **hard trigger** responses in PPMA are:

Causal Factor (Threat)	Adaptive Management Response
Fire	No broadcast burning (pile burning allowed)
	No sagebrush removal for any reason
	Postpone new ROW authorizations
	Focus restoration effort toward the Oregon PAC

Causal Factor (Threat)	Adaptive Management Response
Invasive Grasses	Focus weed treatments in the Oregon PAC within 3 miles of occupied and pending leks
Energy Development	<i>see ROW/Infrastructure below</i>
Sagebrush Removal/Elimination	Do not allow sagebrush removal or manipulation in sage-grouse breeding or wintering habitats for any reason
Livestock Grazing	Sage-grouse habitat on active allotments within the Oregon PAC must be "suitable" per the BLM's GRSG Habitat Assessment Framework (Stiver et al. 2010) or discontinue grazing until a suitable rating is achieved
	Percent utilization of key herbaceous species cannot exceed 35% by volume (light grazing)
Wild Horse Management	Move horses to pasture outside the PAC
	Reduce AUMs
Juniper Encroachment	Prioritize juniper removal to focus on the Oregon PAC or lek complexes where the adaptive management trigger has been hit
Minerals & Associated infrastructure	Allow no new roads to be sited within 4 miles of the occupied or pending leks in the Oregon PAC or lek complex
Recreation	When an existing high traffic use route (defined as >8 vehicle trips per day) is closer than 2.0 miles to an occupied or pending lek implement a seasonal restriction on the route from March 1 to June 30, annually.
	When an existing road is found to have an effect on GRSG population trends, re-route or close road segments causing the effect.
	Where lek viewing has been documented by BLM and ODFW to be negatively impacting lek attendance by GRSG, close those areas to all uses (pedestrian, motorized, mechanized) from March 1 through June 31 annually.
	When SRMAs managed for high density use negatively affect GRSG populations or behavior modify season of use, location of use, or activities allowed in the SRMA.
Right-of-Ways/Infrastructure	Install perch and nesting deterrents on power poles and other tall features within 4 miles of occupied or pending leks
	Focus juniper removal in the PAC within 4 miles of occupied or

Causal Factor (Threat)	Adaptive Management Response
	pending leks
	Close and re-vegetate roads to reduce road density
	Postpone authorization for new high voltage transmission lines (greater than or equal to 100kv) and major pipelines (greater than or equal to 24 inch)

DRAFT

**Proposed Utah GRSG Adaptive Management Triggers – DRAFT  
August 1, 2014**

Population Soft Triggers (any of 1a, 1b, 1c, or 1d AND 2)

- 1a) 4 years of 10% or greater annual decline in average males/lek, based on “trend leks”;
- 1b)  $\geq$  6 years of declining average males/lek, based on “trend leks”; or
- 1c) 40% decline in any single year; or
- 1d)  $\geq$  50% decline in a 4 year period;

AND

- 2)  $\lambda < 1$  in 4 consecutive years, based on all leks in the population area.

Population Hard Triggers (any one of a-d)

*Short term decline*

- a) 4 years of 20% or greater annual decline in males per lek in each year, based on “trend leks”; or
- b) The average males per lek, on trend leks, drops 75% below the 10-year rolling average males per lek, in any given year; or

*Long term Decline*

- c)  $\lambda < 1$  in 6 of the last 6 years, or
- d)  $\lambda < 1$  in 8 of the last 10, based on all leks within the population area.

Habitat Soft Triggers:

- a) 10% loss of nesting (3 mile buffer around occupied leks) or modeled wintering habitat, within an population area; or
- b) 5% loss of modeled essential winter habitat, within an population area; or,
- c) 10% loss of total sage-grouse habitat within an population area; or,
- d) any one fire that burns 5% of habitat (new BLM proposal to address large catastrophic fires).

Habitat Hard Triggers:

- a) 20% loss of total suitable sage-grouse habitat within an population area; or small scale (b, c, d, or e)
- b) 20% loss of nesting (3 mile buffer around occupied leks) within an population area; or
- c) 20% loss of modeled brood-rearing within an population area; or
- d) 20% loss of modeled winter GRSG habitat within a population area; or
- e) 20% loss of modeled essential GRSG winter habitat within a population area.

Thanks Louisa,

I have added some additional Oregon VG and WFM goals, objectives and actions to Lauren's Use of FIAT Information comparison doc that are relevant to the FIAT Assessment process.

See the attached document.

Craig - Joan thought this would help for the FIAT call tomorrow.

Lauren - Joan asked me to work this up as the document sent out concerning the Use of FIAT Information in FEIS is missing nearly all the relevant actions for Oregon. This version of the proposed plan table should make it easier to spot goals, objectives, and actions that mesh with the FIAT paper. Note that this is still a work in progress as we continue to refine the language on the basis of comments from Districts and cooperating agencies.

Joan - as you requested. Down to only 22 pages in this format.

## Use of FIAT information in FEIS

### NEVADA

#### Vegetation Management

Action G-VEG 2: Utilize BLM and Forest Service GRSG habitat maps, habitat objectives (Table 2-6 for GRSG habitat objectives), and concepts of resistance and resilience (**Appendix F, Greater Sage-Grouse Wildfire and Invasive Annual Grasses Assessment and Concepts of Resistance and Resilience**) to prioritize habitat restoration projects to address the most limiting GRSG habitat components and to connect seasonal ranges.

Action G-VEG 4: Within PPMA and PGMA, prioritize and implement seeding and planting treatments **based on the concepts of resistance and resilience (Appendix F)**. To the extent feasible or available, use local seed collected from intact stands or greenhouse cultivation. To increase seeding success, consider the use of specialized seed drills or other proven and effective methods that may become available based on new science to ensure effective soil and seed contact.

Action G-VEG 9: For Wyoming, Mountain, and Basin Big Sage Communities in PPMA and PGMA:

- Prioritize treatments that focus on enhancing, reestablishing or maintaining the most limiting GRSG habitat component
- Reestablish sagebrush to meet GRSG habitat objectives (Table 2-6)
- Manage sagebrush communities to achieve age-class, structure, cover, and species composition objectives in GRSG habitat (Table 2-6)
- Restore herbaceous understory in brush dominated areas to meet GRSG habitat objectives (Table 2-6)
- Treat areas with cheatgrass and other invasive or noxious species to minimize competition and favor establishment of desired species (Table 2-6)
- **Treat disturbed areas based on the Greater Sage-Grouse Wildfire and Invasive Species Assessment (Appendix F)**

#### Vegetation Management-Invasive Species

Action G-VEG-ISM 2: Prioritize treatments to remove invasive annual grasses to provide the most benefit to GRSG **habitat conditions using Appendix F**.

Action G-VEG-ISM 3: Treat sites within PPMA and PGMA that contain invasive species infestations through an Integrated Pest Management (IPM) approach using fire, chemical,

mechanical, and biological (e.g., targeted grazing) methods based on site potential in accordance **with Fire and Invasive Assessment (FIAT) matrix.**

### **Wildland Fire Suppression**

Action G-WFM 3: Prioritize PPMA over PGMA for conservation and protection during fire operations and fuels management decision-making. When suppression resources are widely available, maximum efforts would be placed on limiting fire growth in PGMA as well. These priority areas would be further refined following completion of the **GRSG Wildland Fire and Invasive Species Assessment (Appendix F).**

Action G-WFM 3: Prioritize PPMA over PGMA for conservation and protection during fire operations and fuels management decision-making. When suppression resources are widely available, maximum efforts would be placed on limiting fire growth in PGMA as well. These priority areas would be further refined following completion of **the GRSG Wildland Fire and Invasive Species Assessment (Appendix F).**

Objective G-WFM-HFM 1: Apply fuels treatments on a landscape level to modify fire behavior characteristics, fire intensity, fire complexity (fire patchiness), fire size, and fire effects in which fire management efforts are enhanced. Apply fuels treatments over the landscape to restore, maintain and conserve ecological function and increase or maintain the ecological sites' **resistance to invasive species and resilience to disturbance (Appendix F).**

### **Fuels Management**

Action G-WFM-HFM 3: Fuels treatments would be designed through an interdisciplinary team process to expand, enhance, maintain, and protect GRSG habitat. Use green strips and fuel breaks, where appropriate, to protect seeding efforts from subsequent fire events.

**In coordination with USFWS and relevant state agencies, develop a fuels management strategy for the BLM and Forest Service with large blocks of GRSG habitat (using the assessment process described in Appendix F)** that considers an up-to-date fuels profile, land use plan direction, current and potential habitat fragmentation, sagebrush and GRSG ecological factors, and active vegetation management steps to provide critical breaks in fuel continuity where appropriate. When developing this strategy, consider the risk of increased habitat fragmentation from a proposed action versus the risk of large-scale fragmentation posed by wildfires if the action is not taken.

Action G-WFM-HFM 9: **In coordination with the USFWS and relevant state agencies, BLM/Forest Service planning units (Districts/Forests) will identify annual treatment needs for wildfire and invasive species management as identified in local unit level Landscape Wildfire and Invasive Species Assessments (Appendix F).** Annual treatment needs would be coordinated on state and regional scales and across jurisdictional boundaries for long-term conservation of GRSG.

Action G-WFM-HFM 10: Tier implementation actions to the local (District or Field Office/Forest) **GRSG Landscape Wildfire and Invasive Species Assessment (Appendix F), utilizing the best available science related to the conservation of GRSG.**

RDF G-WFM-HFM 7: Design vegetation treatments in areas of high fire frequency to facilitate firefighter safety, reduce the potential acres burned, and reduce the fire risk to GRSG habitat. Develop GRSG habitat maps that display existing fuels treatments that can be used to assist suppression activities. Give priority at the project level for implementing specific GRSG habitat restoration projects in annual grasslands, first to sites adjacent to or surrounded by PPMA or that reestablish continuity between GRSG habitats. Annual grasslands are a second priority for restoration when the sites are not adjacent to but within 2 miles of PPMA. The third priority for annual grassland habitat restoration projects are sites beyond 2 miles of PPMA. **The intent is to focus restoration outward from existing, intact GRSG habitat (Appendix F).**

Action G-WFM-PF 5: BLM and Forest Service planning units (Field Offices/Districts and Forests), in coordination with the USFWS and relevant State agencies, **would complete and continue to update GRSG Landscape Wildfire and Invasive Species Habitat Assessments in coordination with the USFWS and relevant state agencies to prioritize at-risk habitats, and identify fuels management, preparedness, suppression and post-fire treatment priorities** necessary to maintain sagebrush habitat to support interconnecting GRSG populations. These assessments and subsequent assessment updates would also be a coordinated effort with an interdisciplinary team to take into account other GRSG priorities identified in this plan. Appendix F describes a minimal framework example and suggested approach for this assessment

## **Adaptive Management**

### **Habitat Trend Triggers**

Triggers for habitat trends will be evaluated at the lek and BSA units. Lek trends incorporate the project boundary and adjoining GRSG seasonal habitats. Site level habitat trends will be based on changes in habitat components using the methodologies in the HAF. These changes would be compared to the GRSG habitat objectives in table 2-6. The BSA would be based on percent of sagebrush cover across the landscape. The categories of the percent landscape sagebrush cover that would apply are the 25-65 percent level and the above 65 percent level as identified in the **Matrix Based on Concepts of Resistance and Resiliency (Chambers et al. in press).**

## **IDAHO**

### **Greater Sage-Grouse Management Areas**

- 5.4 MA-4: Prioritize activities to protect, enhance and restore GRSG habitats (i.e. suppression activities, fuels management activities, vegetation treatments, invasive species treatments, etc.) first by Conservation Area, if appropriate (CA under adaptive management or at risk of engaging adaptive management), followed by

Core Management Zones, then Important Management Zones then General Management Zones within the Conservation Areas. Local priority areas within these zones will be further refined as a result of completing the GRSG Wildfire and Invasive Species Habitat Assessments as described in Appendix D. This could include projects outside GRSG habitat when those projects would provide a benefit to GRSG habitat.

### **Wildfire Preparedness/Prevention**

- 9.3 WFP-3: Annually incorporate into existing fire management plans results and updates from the Wildfire and Invasive Species Habitat Assessments described in Appendix D, to communicate/explain the resource value of GRSG habitat, including fire prevention messages and actions to reduce human-caused ignitions.
- 9.5 WFP-5: Continue annual coordination meetings held between cooperating agencies that have fire suppression responsibilities. Incorporate Rangeland Fire Protection Associations and other stakeholders into this coordination. Discuss priority suppression areas and distribute maps showing priority suppression areas at both the Conservation Area and the local office levels as based on the adaptive management strategy and Wildfire and Invasive Species Assessments.
- 9.7 WFP-7: As part of the Wildfire and Invasive Species Assessments, identify roads, trails, and recreational use areas with high frequency of human caused fires within or adjacent to the Core or Important Management Zones. Consider these areas during annual fire restriction evaluations, and as appropriate, through site specific management.
- 9.9 WFP-9: Implement activities identified within the Wildfire and Invasive Species Assessments.

### **Wildfire Suppression**

- 10.1 WFS-1: Complete Wildland Fire and Invasive Species Assessments as described within Appendix D within 1 year of the Record of Decision and incorporate results into appropriate Fire Management Plans as they are completed. Wildfire and Invasive Species Habitat Assessments are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of priority areas/treatment opportunities for fuels management, fire management, and restoration. These assessments identify priority areas and describe strategies for fuels management, suppression and restoration activities.
- 10.2 WFS-2: As part of the Wildfire and Invasive Species Assessments incorporate a wildfire response time analysis focusing on response time to identified priority areas within Core and Important Management Zones or on those fires that have the potential to impact Core and Important Management Zones. Incorporate findings into Unit Initial Attack program.
- 10.3 WFS-3: As part of the Wildfire and Invasive Species Assessment incorporate a water capacity analysis for suppression purposes, including potential private water

sources. Provide water availability to respond to fire in or threatening CMZ and IMZ during initial attack.

- 10.4 WFS-4: During high fire danger conditions, stage initial attack and secure additional resources closer to priority areas identified in the Wildfire and Invasive Species Assessments, based on anticipated fires and weather conditions, with particular consideration of the West Owyhee, Southern and Desert Conservation Areas to ensure quicker response times in or near GRSG habitat.

### **Fuels Management**

- 11.4 FM-4: Develop a fuels continuity and management strategy to expand, enhance, maintain and protect GRSG habitat informed by the Wildfire and Invasive Species Assessments completed as described in Appendix D.
- 11.5 FM-5: When developing the fuels management strategy as part of the Wildfire and Invasive Species Assessment described in Appendix D consider up-to-date fuels profiles; land use plan direction; current and potential habitat fragmentation; sagebrush and GRSG ecological factors; active vegetation management steps to provide critical breaks in fuel continuity where appropriate; incorporate a comparative risk analysis with regard to the risk of increased habitat fragmentation from a proposed action versus the risk of large scale fragmentation posed by wildfires if the action is not taken.

### **Wildfire Restoration/Rehabilitation – Emergency Stabilization and Rehabilitation**

- 12.1 ESR-1: Utilize the findings and Restoration/Rehabilitation Strategy developed as part of the Wildfire and Invasive Species Assessment process described in Appendix D to determine if rehabilitation actions are needed, based on ecological potential, and direct emergency stabilization and rehabilitation (ESR) (BLM) or Burned Area Emergency Restoration (BAER) (FS) actions after fire.
- 12.2 ESR-2: Incorporate GRSG Habitat Management Objectives into ESR/BAER plans based on site potential and in accordance with the Restoration/Rehabilitation Strategy developed as a result of the Wildfire and Invasive Species Assessments.

### **Habitat Restoration and Vegetation Management**

- 13.2 VEG-2: Implement vegetation rehabilitation or manipulation projects to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat based on Wildfire and Invasive Species Assessments, HAF assessments, other vegetative assessment data and local, site specific factors that indicate sagebrush canopy cover or herbaceous conditions do not meet habitat management objectives (i.e. is minimal or exceeds optimal characteristics). This may necessitate the use of prescribed fire as a site preparation technique to remove annual grass residual growth prior to the use of herbicides in the restoration of certain lower elevation sites (e.g., Wyoming big sagebrush) but

such efforts will be carefully planned and coordinated to minimize impacts to sage-grouse seasonal habitats.

### **Invasive Species**

- 14.1 Invasive Species (INV)-1: Incorporate results of the Wildfire and Invasive Species Assessments into projects and activities addressing invasive species.

### **Monitoring**

- 21.1 Monitoring (MON)-1: Annually complete a review of Wildfire and Invasive Species assessment implementation efforts within GRSG habitat with appropriate USFWS and state agency personnel.

## **Appendix D – Wildfire and Invasive Species Assessments/FIAT Team**

## **UTAH**

### **Wildland Fire Management**

BLM planning units, in collaboration with the USFWS and relevant state agencies, would complete and maintain **GRSG Landscape Wildfire & Invasive Species Habitat Assessments** to prioritize at risk habitats, and identify fuels management, preparedness, suppression and restoration priorities necessary to maintain sagebrush habitat to support interconnecting GRSG populations. These assessments and subsequent assessment updates would also be a collaborative effort with an interdisciplinary team to take into account other GRSG priorities identified in this plan. **Appendix M, Draft Greater Sage-Grouse Wildland Fire and Invasive Species Assessment**, describes a minimal framework example and suggested approach for this assessment.

Implementation actions will be tiered to the local **GRSG Landscape Wildfire & Invasive Species Assessment**, using best available science related to the conservation of GRSG.

In collaboration with USFWS and relevant state agencies, BLM planning units would identify annual treatment needs for wildfire and invasive species management as identified in local unit level **Landscape Wildfire and Invasive Species Assessments**. Annual treatment needs would be coordinated across state/regional scales and across jurisdictional boundaries for long-term conservation of GRSG.

Annually complete a review of **landscape assessment implementation** efforts with appropriate USFWS and state agency personnel.

### **Fuels Management**

In PPMA, fuel treatments will be designed through an interdisciplinary process to expand, enhance, maintain, or protect GRSG habitat.

- In collaboration with USFWS and relevant state agencies, BLM planning units with large blocks of GRSG habitat will develop, **using the assessment process described in Appendix M**, a fuels management strategy which considers an up-to-date fuels profile, LUP direction, current and potential habitat fragmentation, sagebrush and GRSG ecological factors, and active vegetation management steps to provide critical breaks in fuel continuity, where appropriate. When developing this strategy, planning units will consider the risk of increased habitat fragmentation from a proposed action versus the risk of large scale fragmentation posed by wildfires if the action is not taken.

Within GRSG habitat, PPMA are the highest priority for conservation and protection during fire operations and fuels management decision making. PPMA will be viewed as more valuable than PGMA when priorities are established. When suppression resources are widely available, maximum efforts will be placed on limiting fire growth in PGMA polygons as well. These priority areas will be further refined following completion of the **GRSG Landscape Wildfire & Invasive Species Habitat Assessments described in Appendix M**.

## **OREGON**

### Vegetation

Goal VG - 2: Increase the resistance of Greater Sage-grouse habitat to invasive annual grasses and the resiliency of Greater sage-grouse habitat to disturbances such as fire, and to climate change to reduce habitat loss and fragmentation.

Objective VG – X: Reduce juniper cover within 1 mile of all occupied and pending leks to zero within 10 years and to less than 5% within 4 miles of such leks within 20 years.

Objective VG - X: Reduce the area dominated by invasive annual grasses to no more than 5% within 4 miles of all occupied and pending leks within 20 years. Manage vegetation to retain resistance to invasion where invasive annual grasses dominate less than 5% of the area within 4 miles of such leks.

Objective VG - X: A minimum of 70% of the area capable of supporting sagebrush plant communities within each PAC has sagebrush cover of at least 5%. Use ecological site descriptions to determine which sites are capable of supporting sagebrush plant communities.

Objective VG - X: Coordinate vegetation management activities with adjoining landowners even where the boundary is greater than 4 miles from an occupied or pending lek.

Action VG - 1: Priority areas for GRSG habitat restoration and maintenance projects are:

- Sites with a higher probability of success.
- Seasonal habitats thought to be limiting to GRSG populations.

- Connectivity corridors between GRSG populations and subpopulations.
- Following stand-replacing events at least 100 acres in size.

\*Not in priority order\*

Action VG – X: Within 4 miles of occupied or pending leks, priority order for juniper treatment are:

1. Phase I and II juniper.
2. Phase III juniper with a grass-forb understory.

Action VG – X: In priority treatment areas for invasive annual grasses, apply early detection-rapid response principles on:

- New infestations.
- Satellite populations.
- Isolated populations.
- Where invasive annual grasses are still sub-dominant.
- Edges of large infestations
- Where sites are frequently or commonly used for temporary infrastructure such as incident base camps, spike camps, staging areas, and helispots.

\*Not in priority order\*

## Wildfire

Action WFM – X: Complete an interagency landscape-scale assessment (Appendix XX (H)) to prioritize at-risk habitats and identify fuels management, preparedness, suppression, and restoration priorities. Update these assessments ~~every 5 years or~~ as necessary or following a major disturbance event.

Action WFM - 29: Develop a system of fuel breaks to protect larger intact blocks of GRSG habitat. Locate these fuel breaks along existing roads and ROWs, where possible. **[Within GRSG habitat, prioritize suppression and fuels management activities based on an assessment of the quality of habitat at risk.]**

Action WFM - X: Develop annual treatment and fire management programs in coordination with interagency partners and across jurisdictional boundaries based on priorities identified in the local District Landscape Wildfire & Invasive Species Assessment.

Action WFM - X: Complete an annual review of landscape assessment implementation efforts with interagency partners.

Instruction Memorandum No. WO IM-2014-114  
Expires: 09/30/2015

To: All Field Office Officials

From: Deputy Director for Operations

Subject: Sage-Grouse Habitat and Wildland Fire Management

**Program Areas:** All Renewable Resource and Fire Management Programs**Purpose:** This Instruction Memorandum (IM) establishes Bureau of Land Management (BLM) guidance for management actions in renewable resource programs, fuels management, fire operations, and emergency stabilization and rehabilitation (ESR) related to habitat protection, conservation, and restoration for all species of sage-grouse (Gunnison and Greater Sage-grouse, including the Bi-State and Columbia Basin distinct population sub-groups).**Policy/Action:** This IM reinforces and enhances Washington Office (WO) IM No. 2013-128 (May 23, 2013), Fire and Aviation IM No. 2012-017 (May 14, 2012), and WO-IM No. 2012-043 (December 22, 2011). This direction is in addition to and does not replace more protective measures in existing land use plans (LUPs).

Firefighter and public safety has been, and continues to be, the BLM's highest fire management priority. The management of fire and hazardous fuels in protecting and enhancing sage-grouse habitat is one of the factors that will be considered by the U.S. Fish and Wildlife Service in making a decision regarding whether the Greater Sage-Grouse warrants protection under the Endangered Species Act. Over 50 percent of sage-grouse habitat is located on public lands managed by the BLM. Protecting, conserving, and restoring sage-grouse habitat is BLM fire management's highest natural resource objective.

Wildfire and invasive plants are range-wide threats to sage-grouse habitat and are the primary threats to the sage-grouse populations in the Great Basin. The BLM's management responsibilities include taking actions on public lands to control and manage wildfire and invasive plants in order to protect, conserve, and restore sage-grouse habitat. The BLM's goal is to limit acres burned and damaged within and adjacent to sage-grouse habitat. The BLM will meet this goal through the certain management actions, including those involving renewable resource authorizations, fuels management, fire operations, and emergency stabilization prioritization. Rapid restoration of sage-grouse habitat has proven difficult, requiring the BLM to focus on its pre-fire, fire suppression, and post fire efforts. The BLM will place a high priority on treatments that will aid fire suppression and reduce fire threats within and adjacent to sage-grouse habitat. The following provides guidance to convey leader's intent while recognizing that not all of these actions and activities apply to all affected offices and successful implementation may look different throughout the BLM.

Prior to, during, and following wildland fires, BLM field offices will:

- Protect, conserve, and restore sage-grouse habitat.
- Strive to maintain and enhance resilience of sage-grouse habitat.
- Foster existing relationships with partners and develop new cooperative relationships that will help bolster BLM capacity to protect sage grouse habitat.

With regard to fire operations in sage grouse habitat, BLM field offices will:

- Prioritize firefighter and public safety including following our "Standard Firefighting Orders", mitigate any "Watch-Out Situations", and apply the principles of Lookouts, Communications, Escape Routes, and Safety Zones on all fire assignments.
- Maintain a strong and proactive preparedness capability when conditions indicate potential for multiple ignitions and large fire growth.
- Maintain situational awareness during suppression resource drawdown levels under multiple ignition and large fire growth conditions.
- Boost suppression capability in critical sage grouse habitat when severe fire weather conditions are predicted.
- Generate interest in local residents and public land users becoming a trained and equipped fire response force to work in concert with existing partners.
- Expand the use of Rangeland Fire Protection Association (RFPA) or Volunteer Fire Department (VFD) suppression resources.
- Continue and expand efforts to train and use local, non-federal agency individuals as liaisons in wildland fire detection and suppression operations.

With regard to Renewable Resources Programs, Fuels, Healthy Lands Initiative (HLI), and Emergency Stabilization &amp; Rehabilitation (ES&amp;R), BLM field offices will:

- Consider establishing fuel breaks, such as mowing, tilling, green-stripping, and planting of fire resistant plant species in strategic locations to help protect areas with sagebrush cover.
- Coordinate with State/County/Municipal highway and road departments on road right-of-way maintenance programs to reduce fuel loads and the size and spread of wildfire.
- Coordinate with partners including state, federal and private landowners to design and implement fuels treatments that will minimize fire growth and size.
- Consider reducing the cover of pinyon pine and juniper where it is encroaching on sage-grouse habitat.
- Apply Integrated Vegetation Management (IVM) practices in addressing invasive and non-native species, including cheatgrass treatments and sagebrush management.
- Increase sagebrush, perennial grass and forb cover.

- Protect soil from erosion following disturbance through planting and seeding efforts.
  - § Strive to retain residual and functional post-fire plant species including early seral native perennial grasses.
  - § Favor fire-resistant native or non-native plant species when necessary as a first step toward habitat recovery.
  - § Use locally adapted native seed where available and probability of success and funding allow.
  - § Consider using minimum till drills and multiple seed boxes, where practical and available, to increase seeding success.
- Coordinate funding and planning within fuels, ESR, and renewable resources programs to plan and implement treatments that meet landscape objectives. This may include side-by-side treatments, and utilizing partner funds to cover additions to ESR seed mixes that will conserve and restore sage-grouse habitat.

The Fire Planning and Fuels Management Division (FA-600) hosts the webpage containing updated maps, instruction memoranda, conservation measures, best management practices, and spatial data pertaining to sage-grouse for the fire and fuels management functions. These resources can be accessed at: <http://web.blm.gov/internal/fire/fpfm/sg/index.html>. Using locally-developed data to supplement these resources is encouraged.

**Timeframe:** This IM is effective immediately.

**Budget Impact:** Costs will remain consistent with current budgets. States and offices without sage-grouse habitat may receive less than their usual allocation in some program areas to help achieve these objectives.

**Manual/Handbook Sections Affected:** This IM complements WO IM No. 2013-128, FA IM No. 2012-017, and WO IM No. 2012-043.

**Coordination:** This IM has been coordinated between Fire and Aviation (FA100) and Resources and Planning (WO200).

**Contact:** Questions may be directed to Ron Dunton, Acting Assistant Director, Office of Fire and Aviation, 208-387-5447, or Edwin Roberson, Assistant Director, Resources and Planning, 202-208-4896. Technical contacts are Stephen Small, Division Chief for Fish and Wildlife Conservation at (202) 912-7366 and Krista Gollnick-Waid, Fire Planning and Fuels Management Division at (208) 387-5165.

## Appendix A – Required Design Features and Best Management Practices

The following required design features (RDFs) and best management practices (BMPs) are included for consideration and use based upon review of current science and effects analysis (circa 2014) (Table A-1). These made be reviewed and updated through plan maintenance as new information and updated scientific findings become available.

The table is organized by program area grouping the RDFs and BMPs most relevant to that program; however, all relevant RDFs and BMPs, regardless of which program they are grouped under, should be considered during project evaluation and applicable RDFs and BMPs should be applied during implementation. The table identifies the specific measure (numbered) and its appropriate application – as an RDF – required all the time everywhere; as a BMP required when the applicable resources are present; and as a BMP when appropriate and application would reduce impacts and not conflict with other RDFs or BMPs. In some cases the BMPs may not all be appropriate based on local conditions and would be assessed in the appropriate site specific NEPA analysis, these all should be considered and were determined to be beneficial to achieving GRSG habitat objectives included as part of the site specific project. In other cases additional project design criteria or best management practices could be incorporated into project implementation to address site specific concerns not fully addressed by the RDFs or BMPs described here.

**Table A-1. Required Design Features and Best Management Practices**

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
<b>General</b>			
1. Solicit and consider expertise and ideas from local landowners, working groups, and other federal, state, county, and private organizations during development of projects.			X
<b>Wildfire Suppression</b>			
2. Compile district-level information into state-wide sage-grouse tool boxes. Tool boxes will contain maps, listing of resource advisors, contact information, local guidance, and other relevant information for each district, which will be aggregated into a state-wide document.	X		
3. Provide localized maps to dispatch offices and extended attack incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics. The Fire Planning and Fuels Management Division (FA-600) hosts a webpage containing up-to-date maps, instruction memoranda, conservation measures, BMPs, and spatial data specific to fire operations and fuels management/sage-grouse interactions. These resources can be accessed at: <a href="http://web.blm.gov/internal/fire/fpfm/sg/index.html">http://web.blm.gov/internal/fire/fpfm/sg/index.html</a> . Additional BLM sage-grouse information can be	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
found at: <a href="http://www.blm.gov/wo/st/en/prog/more/fish_wildlife_and/sage-grouse-conservation.html">http://www.blm.gov/wo/st/en/prog/more/fish_wildlife_and/sage-grouse-conservation.html</a> .			
4. Assign a resource advisor with sage-grouse expertise, or who has access to sage-grouse expertise, to all extended attack fires in or near sage-grouse habitat areas. Prior to the fire season, provide training to sage-grouse resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals. Involve state wildlife agency expertise in fire operations through: <ul style="list-style-type: none"> <li>• instructing resource advisors during preseason trainings;</li> <li>• qualification as resource advisors;</li> <li>• coordination with resource advisors during fire incidents;</li> <li>• contributing to incident planning with information such as habitat features or other key data useful in fire decision making</li> </ul>	X		
5. At the onset of an emerging wildland fire the Agency Administrators and Fire Management Officers will engage a local Resource Advisor to assess sage-grouse habitat that may be affected by the fire or suppression activities.	X		
6. If complexity of the wildland fire warrants the activation of an Incident Management Team, locally refined information regarding important sage-grouse habitat will be relayed during in brief and continually throughout the incident.		X	
7. On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas.		X	
8. As appropriate, utilize existing fuel breaks, such as roads or discrete changes in fuel type, as control lines in order to minimize fire spread.		X	
9. During periods of multiple fires, ensure line officers are involved in setting priorities.	X		
10. To the extent possible, locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas, heli-bases, etc.) in areas where physical disturbance to sage-grouse habitat can be minimized. These include disturbed areas, grasslands, near roads/trails or in other areas where there is existing disturbance or minimal sagebrush cover.	X		
11. Power-wash all firefighting vehicles, to the extent possible, including engines, water tenders, personnel vehicles, and all-terrain vehicles (ATV) prior to deploying in or near sage-grouse habitat areas to minimize noxious weed spread.	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
12. Minimize cross-country vehicle travel during fire operations in sage-grouse habitat.	X		
13. Minimize burnout operations in key sage-grouse habitat areas by constructing direct fireline whenever safe and practical to do so.	X		
14. Utilize retardant, mechanized equipment, and other available resources to minimize burned acreage during initial attack.	X		
15. As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.		X	
16. Adequately document fire operation activities in sage-grouse habitat for potential follow-up coordination activities.	X		
<b>Fuels Management</b> Unless otherwise specified as part of the land use plan consider the full array of fuels management treatment types (prescribed fire, mechanical, chemical and biological) when implementing the following RDFs and BMP's.			
17. Where applicable, design fuels treatment objectives to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit sage-grouse habitat.	X		
18. Provide training to fuels treatment personnel on sage-grouse biology, habitat requirements, and identification of areas utilized locally.	X		
19. Use burning prescriptions which minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of annual grass invasion).	X		
20. Ensure proposed sagebrush treatments are planned with full interdisciplinary input pursuant to NEPA and coordination with state fish and wildlife agencies, and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.	X		
21. Where appropriate, ensure that treatments are configured in a manner that promotes use by sage-grouse.	X		
22. Where applicable, incorporate roads and natural fuel breaks into fuel break design.		X	
23. Power-wash all vehicles and equipment involved in fuels management activities, prior to entering the area, to minimize the introduction of undesirable and/or invasive plant species.	X		
24. Design vegetation treatments in areas of high fire frequency which facilitate firefighter safety, reduce the potential acres burned, and reduce the fire risk to sage-grouse habitat. Additionally, develop maps for sage-grouse habitat which spatially display existing fuels treatments that can be used to assist suppression	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
activities.			
25. Give priority for implementing specific sage-grouse habitat restoration projects in annual grasslands, first to sites which are adjacent to or surrounded by Core Management Zones or that reestablish continuity between Core Management Zones. Annual grasslands are a second priority for restoration when the sites are not adjacent to Core Management Zones, but within Important Management Zones. The third priority for annual grassland habitat restoration projects are sites within General Management Zones. The intent is to focus restoration outward from existing, intact habitat.	X		
26. As funding and logistics permit, restore annual grasslands to a species composition characterized by perennial grasses, forbs, and shrubs or one of that referenced in land use planning documentation.	X		
27. Emphasize the use of native plant species, especially those from a warmer area of the species' current range, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.	X		
28. Remove standing and encroaching trees within at least 110 yards of occupied sage-grouse leks and other habitats (e.g., nesting, wintering and brood rearing) to reduce the availability of perch sites for avian predators, as resources permit.		X	
29. Protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas.		X	
30. Reduce the risk of vehicle- or human-caused wildfires and the spread of invasive species by installing fuel breaks and/or planting perennial vegetation (e.g., green-strips) paralleling road rights-of-way.			X
31. Strategically place and maintain pre-treated strips/areas (e.g., mowing, herbicide application, etc.) to aid in controlling wildfire, should wildfire occur near CMZ or priority restoration areas (such as where investments in restoration have already been made).	X		
32. Design treatments to provide a break in fuel continuity in large, at-risk, expanses of continuous sagebrush. Use local knowledge of fire occurrence, spread patterns, and habitat values at risk to determine the proper placement and size of the fuel break.	X		
33. Use existing agreements with local, county, and state road departments to improve and maintain existing fuel breaks during routine road maintenance. Examples include: blading, mowing, disking, grading, and spraying roadside vegetation.		X	
34. Form partnerships with linear right-of-way holders to		X	

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
maintain fuel breaks, which reduce fuel continuity and serve to protect at-risk landscapes.			
35. Use existing NEPA documentation and authorities, where possible, when conducting road right-of-way maintenance. In many instances, existing authorizations for roads or linear rights-of-way contain provisions for maintenance activities that could be implemented and incorporated into a vegetation and habitat protection strategy without requiring additional NEPA analysis. Document this with a Determination of NEPA Adequacy (DNA).			X
36. Enter into agreements with road departments which may help fund the construction and maintenance of fuel breaks adjacent to roads, as funding permits.		X	
37. Spatially depict the locations of existing and planned fuel breaks in a landscape fuel break map and label each vegetation polygon for reference. Offices will make these maps available to suppression resources for use in fire operations.	X		
<b>Vegetation Treatment</b>			
38. Utilize available plant species based on their adaptation to the site when developing seed mixes. (Lambert 2005; VegSpec).	X		
39. Utilizing the warmer component of a species' current range when selecting native species for restoration when available (Kramer and Havens 2009).		X	
40. Reduce annual grass densities and competition through herbicide, targeted grazing, tillage, prescribed fire, etc. (Pyke 2011).			X
41. Reduce density and competition of introduced perennial grasses using appropriate techniques to accomplish this reduction (Pellant and Lysne 2005).			X
42. Utilize techniques to introduce desired species to the site such as drill seeding, broadcast seeding followed by a seed coverage technique, such as harrowing, chaining or livestock trampling, and transplanting container or bare-root seedlings.			X
43. Assess existing on-site vegetation to ascertain if enough desirable perennial vegetation exists to consider techniques to increase on-site seed production to facilitate an increase in density of desired species.		X	
44. Use site preparation techniques that retain existing desirable vegetation.	X		
45. Use "mother plant" techniques or planting of satellite populations of desirable plants to serve as seed sources.		X	
46. Utilize post-treatment control of annual grass and other invasive species.	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
47. Utilize new tools and use of new science and research as it becomes available.	X		
48. Give higher priority to vegetation rehabilitation or manipulation projects that include: <ul style="list-style-type: none"> <li>• Sites where environmental variables contribute to improved chances for project success (Meinke et al. 2009).</li> <li>• Areas where seasonal habitat is limiting GRSG distribution and/or abundance (wintering areas, wet meadows and riparian areas, nesting areas, leks, etc.).</li> <li>• Re-establish sagebrush cover in otherwise suitable GRSG with consideration to local needs and conditions using the general priorities in the following order:                             <ul style="list-style-type: none"> <li>• Recently burned native areas</li> <li>• Native grassland with suitable forb component</li> <li>• Nonnative grassland with suitable forb component</li> <li>• Recently converted annual grass areas</li> <li>• Native grassland</li> <li>• Nonnative grassland</li> </ul> </li> <li>• Where desirable perennial bunchgrasses and/or forbs are deficient in existing sagebrush stands, use appropriate mechanical, aerial or other techniques to re-establish them. Examples include but are not limited to, use of a Lawson aerator with seeding, harrow or chain with seeding, drill seeding, hand planting plugs, aerial seeding or other appropriate technique.</li> <li>• Cooperative efforts that may improve GRSG habitat quality over multiple ownerships.</li> <li>• Projects that may provide connectivity between suitable habitats or expand existing good quality habitats.</li> <li>• Projects that address conifer encroachment into important GRSG habitats. In general the priority for treatment is 1) Phase 1 (<math>\leq 10\%</math> conifer cover), 2) Phase 2 (10-30%), and 3) Phase 3 (<math>&gt; 30\%</math>).</li> <li>• Replacing stands of annual grasses within otherwise good quality habitats with desirable perennial species. Other factors that contribute to the importance of the restoration project in maintaining or improving GRSG habitat.</li> </ul>	X		
Lands and Realty			

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
49. Where technically and financially feasible, bury distribution powerlines and communication lines within existing disturbance.		X	
50. Above-ground disturbance areas would be seeded with perennial vegetation as per vegetation management.	X		
51. Place infrastructure in already disturbed locations where the habitat has not been fully restored.		X	
52. Cluster disturbances, operations (fracturing stimulation, liquids gathering, etc.) and facilities as close as possible.		X	
53. Co-locate linear facilities within one mile of existing linear facilities.		X	
54. Micro-site linear facilities to reduce impacts to sage-grouse habitats.	X		
55. Locate staging areas outside the Core Management Zones to the extent possible.	X		
56. Consider collocating powerlines, flowlines and pipelines under or immediately adjacent to a road or adjacent to other pipelines first, before considering collocating with other ROW.			X
57. Restrict the construction of tall facilities and fences to the minimum number and amount needed.	X		
58. Use free standing structures where possible, to limit the use of guy wires. Where guy wires are necessary and appropriate bird collision diverters would be used, if doing so would not cause a human safety risk.	X		
59. Place new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors.		X	
60. Construction and development activities should conform to seasonal restrictions.	X		
<b>Fluid Mineral Leasing</b>			
61. Use directional drilling and/or multi well-pads to reduce surface disturbance.	X		
62. Apply a phased development approach with concurrent reclamation.	X		
63. Place liquid gathering facilities outside of CMZs. Have no tanks at well locations within CMZs to minimize truck traffic and perching and nesting sites for ravens and raptors.	X		
64. Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use (Lyon and Anderson 2003).			X
65. Site and/or minimize linear ROWs or SUAs to reduce disturbance to sagebrush habitats.	X		
66. Design or site permanent structures which create movement (e.g. pump jack) to minimize impacts to GRSG.	X		
67. Equip tanks and other above-ground facilities with		X	

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
structures or devices that discourage nesting of raptors and corvids.			
68. Control the spread and effects of non-native plant species (Gelbard and Belnap 2003, Bergquist et al. 2007, Evangelista et al. 2011). (E.g. by washing vehicles and equipment.)		X	
69. Restrict pit and impoundment construction to reduce or eliminate threats from West Nile virus (Doherty 2007).		X	
<p>70. Remove or re-inject produced water to reduce habitat for mosquitoes that vector West Nile virus. If surface disposal of produced water continues, use the following steps for reservoir design to limit favorable mosquito habitat:</p> <ul style="list-style-type: none"> <li>• Overbuild size of ponds for muddy and non-vegetated shorelines.</li> <li>• Build steep shorelines to decrease vegetation and increase wave actions.</li> <li>• Avoid flooding terrestrial vegetation in flat terrain or low lying areas.</li> <li>• Construct dams or impoundments that restrict down slope seepage or overflow.</li> <li>• Line the channel where discharge water flows into the pond with crushed rock.</li> <li>• Construct spillway with steep sides and line it with crushed rock.</li> <li>• Treat waters with larvicides to reduce mosquito production where water occurs on the surface</li> </ul>		X	
71. In CMZ, limit noise from discretionary activities to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before to 2 hours after sunrise and sunset during breeding season.	X		
72. Require noise shields when drilling during the lek, nesting, brood-rearing, or wintering season.			X
73. The BLM/Forest Service would work with proponents to limit project related noise where it would be expected to reduce functionality of habitats in Core and Important Management Zones.	X		
74. The BLM/Forest Service would evaluate the potential for limitation of new noise sources on a case-by-case basis as appropriate.	X		
75. Limit noise sources that would be expected to negatively impact populations in Core and Important Management Zones and continue to support the establishment of ambient baseline noise levels for occupied leks in Core Management Zones.	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
76. As additional research and information emerges, specific new limitations appropriate to the type of projects being considered would be evaluated and appropriate limitations would be implemented where necessary to minimize potential for noise impacts on sage-grouse core population behavioral cycles.	X		
77. As new research is completed, new specific limitations would be coordinated with the IDFG and MT FWP and partners.	X		
78. Fit transmission towers with anti-perch devices (Lammers and Collopy 2007).			X
79. Require sage-grouse-safe fences.			X
80. Locate new compressor stations outside Core Management Zones and design them to reduce noise that may be directed towards Core Management Zones.	X		
81. Clean up refuse (Bui et al. 2011).	X		
82. Locate man camps outside of priority sage-grouse habitats.	X		
83. Consider using oak (or other material) mats for drilling activities to reduce vegetation disturbance and for roads between closely spaced wells to reduce soil compaction and maintain soil structure to increase likelihood of vegetation reestablishment following drilling.			X
84. Use only closed-loop systems for drilling operations and no reserve pits.	X		
85. Cover (e.g., fine mesh netting or use other effective techniques) all drilling and production pits and tanks regardless of size to reduce sage-grouse mortality.	X		
<b>Roads</b>			
86. Utilize existing roads, or realignments of existing routes to the extent possible.	X		
87. Design roads to an appropriate standard no higher than necessary to accommodate their intended purpose.	X		
88. Do not issue ROWs or SUAs to counties on newly constructed energy or mineral development roads, unless for a temporary use consistent with all other terms and conditions included in this document.	X		
89. Establish speed limits on BLM and FS system roads to reduce vehicle/wildlife collisions or design roads to be driven at slower speeds.			X
90. Coordinate road construction and use among ROW or SUA holders.	X		
91. Construct road crossings at right angles to ephemeral drainages and stream crossings.			X
92. Use dust abatement on roads and pads.	X		
93. Close and reclaim duplicate roads by restoring original landform and establishing desired vegetation.		X	

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
<b>Roads Specific to Core and Important Management Zones</b>			
94. Locate roads to avoid priority areas and habitats as described in the Wildfire and Invasive Species Assessments.	X		
95. Establish trip restrictions (Lyon and Anderson 2003) or minimization through use of telemetry and remote well control (e.g., Supervisory Control and Data Acquisition).	X		
96. Restrict vehicle traffic to only authorized users on newly constructed routes (using signage, gates, etc.)	X		
<b>Reclamation Activities</b>			
97. Include objectives for ensuring habitat restoration to meet sage-grouse habitat needs in reclamation practices/sites (Pyke 2011).	X		
98. Address post reclamation management in reclamation plan such that goals and objectives are to protect and improve sage-grouse habitat needs.		X	
99. Maximize the area of interim reclamation on long-term access roads and well pads, including reshaping, topsoiling and revegetating cut-and-fill slopes.	X		
100. Restore disturbed areas at final reclamation to the pre-disturbance landforms and desired plant community.	X		
101. Irrigate interim reclamation if necessary for establishing seedlings more quickly.		X	
102. Utilize mulching techniques to expedite reclamation and to protect soils.		X	
<b>Grazing Required Design Features</b>			
103. Avoid building new wire fences within 2 km of occupied leks (Stevens 2011). If this is not feasible, ensure that high risk segments are marked with collision diverter devices or as latest science indicates.	X		
104. Place new, taller structures, including corrals, loading facilities, water storage tanks, windmills, out of line of sight or at least one kilometer (preferably 3 km) from occupied leks, where such structures would increase the risk of avian predation.	X		
105. Utilize temporary fencing (e.g., ESR, drop down fencing) where feasible and appropriate to meet management objectives.		X	
106. Fence wetlands (e.g., springs, seeps, wet meadows and/or riparian areas) where appropriate, to maintain or foster progress toward Proper Functioning Condition and to facilitate management of sage-grouse habitat objectives. Where constructing fences or exclosures to improve riparian and/or upland management, incorporate fence marking or other BMPs/RDFs as appropriate.		X	
107. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations)	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
and March 25-May 15 in higher elevations), livestock trailing will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6:00 p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse. Over-nighting, watering and sheep bedding locations on public lands must be at least 1 km from occupied leks during the lekking season to reduce disturbance from sheep, human activity and guard animals.			
108. Work with permittees in locating sheep over-nighting, watering and sheep bedding locations to minimize impacts to sage-grouse seasonal habitats.	X		
109. When trailing livestock during the lekking or nesting season, use roads or existing trails, to the extent possible to reduce disturbance to roosting, lekking or nesting sage-grouse.		X	
110. Design new spring developments in GRS habitat to maintain or enhance the free flowing characteristics of springs and wet meadows. Modify developed springs, seeps and associated pipelines to maintain the continuity of the predevelopment riparian area within priority GRS habitat where necessary.		X	
111. Install ramps in new and existing livestock troughs and open water storage tanks to facilitate the use of and escape from troughs by GRS and other wildlife.		X	
<b>West Nile Virus Required Design Features</b>			
112. Construct water return features and maintain functioning float valves to prohibit water from being spilled on the ground surrounding the trough and/or tank and return water to the original water source, to the extent practicable.	X		
113. Minimize the construction of new ponds or reservoirs except as needed to meet important resource management and/or restoration objectives.	X		
114. Develop and maintain non-pond/reservoir watering facilities, such as troughs and bottomless tanks, to provide livestock water.	X		
115. For most spring developments or wells, mosquito breeding habitat usually is not an issue. Flowing cold (less than 50° Fahrenheit) water and steep sides of the stock tanks are not conducive for egg laying or larvae production. If flows are low, the water is warm, or moss production is an issue in the tank, mosquito breeding habitat could exist in the tank.	X		
116. Maintenance of healthy wetlands at spring sources helps control mosquitoes and their larvae by providing habitat for natural predators such as birds, dragonflies and amphibians. Protecting the wetland at the spring source with a fence is an option to consider.			X

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
117. Clean and drain stock tanks before the season starts. If never cleaned or drained, many tanks will fill with silt or debris causing warmer water and heavy vegetation growth conducive to mosquito reproduction.		X	
118. Draining tanks after the period of use is completed, particularly in warmer weather, also reduces potential habitat by eliminating stagnant standing water.		X	
119. Maintain a properly functioning overflow to prevent water from flowing onto the pad and surrounding area, to eliminate or minimize pooling of water that is attractive to breeding mosquitoes.	X		
120. Clean or deepen overflow ponds to maintain colder temperatures to reduce mosquito habitat.		X	
121. Install and maintain float valves on stock tank fill pipes to minimize overflow	X		
122. Harden stock tank pads to reduce tracks that can potentially hold water where mosquitoes may breed.	X		
123. Build ponds with steep shorelines to reduce shallow water (>60 cm) and aquatic vegetation around the perimeter of impoundments to deter colonizing by mosquitos (Knight et al. 2003, cited in NTT report page 61).	X		
124. Consider removing and controlling trees and shrubs to reduce shade and wind barriers on pit and reservoir shorelines if not needed for wildlife, fish, or recreational values.			X
125. Impoundments that remain accessible to livestock and wildlife can cause tracking and nutrient enrichment from manure which can create favorable mosquito breeding habitat. Where this is a concern, it may be desirable to fence the reservoir and pipe the water to a tank.			X
126. Construct dams or impoundments that minimize down-slope seepage or overflow. Seepage and overflow results in down-grade accumulation of vegetated shallow water areas that support breeding mosquitoes.		X	
127. On ponds and reservoirs with enough depth and volume, introduce native fish species, which feed on mosquito larvae.			X
128. Line the overflow of a dam's spillway with crushed rock and constructing the spillway with steep sides to preclude the accumulation of shallow water and vegetation to reduce mosquito habitat.		X	
129. Where an existing reservoir has filled with silt, consider cleaning to reduce shallow water habitat conducive to mosquito reproduction.		X	
130. During confirmed West Nile virus outbreaks in sage-			X

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
grouse habitat, consider larvicide applications.			
<b>Travel Management Required Design Features</b>			
131. Designate or design routes to direct use away from priority areas identified in Wildfire and Invasive Species Assessments and still provide for high-quality and sustainable travel routes and administrative access, legislatively mandated requirements, and commercial needs	X		
<b>Recreation Required Design Features</b>			
132. Direct use away from GRSG priority areas as described in the Wildfire and Invasive Species Assessments.	X		
133. Eliminate or minimize external food sources for corvids.		X	

DRAFT

**Appendix B – Seasonal Timing Restriction**

During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6:00 p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse.

DRAFT

## Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary 06/16/2014 Draft

Compilers: Paul Makela, BLM; Jason Sutter, BLM; Chris Colt, USFS; Don Kemner, IDFG; Jason Pyron, FWS; Katie Powell FWS. BMPs, RDFs, Rationale reflect group consensus on 6/10/2014.

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
<b>Incidental disturbance to individual GRSB within all habitat types during all seasons</b>			
	Public or administrative activities that include incidental foot, aerial, horseback, or other similar travel.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Livestock grazing activities (except where specifically noted below).	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Public vehicle travel not otherwise restricted in Travel Management Plans; or administrative vehicle travel on existing routes for maintenance of existing infrastructure, facilities, or vegetation projects; or non-organized/non-permitted activities.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.

IDMT\_PUB\_12254  
 1.1  
 12/7/2015

Loss (i.e. death) of nests/eggs, chicks and/or adults that may occur within the nesting <sup>4</sup> habitat during the nesting season			
	Anthropogenic activities such as the use of heavy equipment <sup>2</sup> or targeted grazing in nesting habitat <sup>3</sup> for: 1) implementation of fuels/vegetation/habitat restoration management projects, 2) infrastructure construction or maintenance, 3) geophysical exploration activities; 4) organized motorized recreational events	BMP Core, Important, General: Avoid these activities within nesting habitat during the nesting <sup>3</sup> season.	Application of the seasonal nesting habitat restriction would avoid and minimize the loss of nests/chicks/hens. This is a BMP since the impact is loss of individual grouse and is small scale and not population-scale. Disallowing infrastructure maintenance or construction in nesting habitat outright may not be realistic as an RDF. Impacts may be able to be offset via appropriate mitigation.
	Bedding Sheep & Associated Camps	BMP: Core, Important, General: During the nesting season, locate bedding areas and camps outside of sagebrush areas <sup>3</sup> .	Application of the seasonal nesting habitat restriction would avoid/minimize the loss of nests/chicks by focusing bedding and camps in areas not meeting nest habitat characteristics for sagebrush cover (i.e., use areas less than 15% canopy cover).
	Fences	Existing Fences:  RDF: Core and Important; BMP for General- Where consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management, move, modify (e.g. lay down fences) or mark existing	Application of these measures would avoid/minimize the loss of birds to fence strikes.

**Comment [PM1]:** Marking fences in Wilderness, WSA, or certain VRM classes is problematic. I added caveat about "where consistent with...". Discussed with Robin F. 6/16/14.

		fences to reduce collision risk within areas that have a high probability of fence strikes (per Stevens et al. 2012 model or latest science).	
		New Fences:  RDF: Core and Important; BMP for General- Do not construct new fences within areas of high collision risk unless marked or modified, consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management .	
<b>Permanent functional or physical loss of a lek or declining attendance at lek<sup>4</sup></b>			
	Unleased fluid minerals	Stipulation: Core, Important, General: Do not allow wells, pads, facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek.  Stipulation: Core, Important, General: Limit average well pad density to no more than 1 per 640 acres within nesting <sup>3</sup> and winter <sup>3</sup> habitat.	This impact may have a population level effect and trip a population trigger therefore we recommended this be an RDF. Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended as far as 1.6 km from grouse leks. The 1/640 density per based on consideration of 1) Harju et al. (2010) who found pad density of 1.54 pad/sq km (1 pad/247 ac )

**Comment [PM2]:** Changed Fluid Mineral from RDF/BMP to Stipulation per fluid minerals terminology. Discussed with Karen Porter 6/16/14.

			had 13-74% lower attendance at leks and 2) Doherty (2008 page iii and 79) who noted potential impacts from oil and gas development were indiscernible at ~1 well/640 acres. IDswMT biology team recommended a more conservative approach to minimize risk of tripping a population trigger, hence the 1/640.
	Commercial solar development	<p>RDF: Core-No commercial solar development.</p> <p>RDF: Important- Do not allow new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek<sup>4</sup>.</p> <p>BMP-General: Avoid new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek<sup>4</sup>.</p>	No specific literature available relative to solar development. Recommended buffer is based on recent literature (Harju et al 2010) that 0.6 or 0.25 mile buffers are not. The 2 mile buffer is consistent with Connelly et al. 2000 regarding energy facilities (page 978).
	Roads	BMP: Core, Important, General: Do not construct new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of leks <sup>4</sup> .	Patricelli et al. 2012 (Recommendations for interim protections in WY) recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. We apply it here as a lek-centric BMP because we may need to construct a road near a lek (perhaps for fire operations/access or to allow

			<p>access to private lands or per ROW need). If we buffer roads in the Core or Important Zone via a large lek buffer, it may lead to disturbance of a much larger area of nesting habitat in the course of avoiding the lek and buffers. The BMP would at least allow for siting to avoid the lek, and reducing road noise near the lek, without compromising broader landscapes.</p>
	<p>Commercial/ industrial Pipelines (oil, gas, slurry, and similar)</p>	<p>BMP: Core, Important, General. minimize removal of sagebrush within 0.6 miles of leks<sup>4</sup>.</p>	<p>Application of this measure is designed to minimize loss of sagebrush in the vicinity of the lek. The main concern was with loss of sagebrush in vicinity of lek, that is used by GRSG for cover. The 0.6 mile buffer is based on rationale in the Colorado GRSG Conservation Plan as below:</p> <p>BACKGROUND INFORMATION: From Colorado GRSG Conservation Plan Appendix B: [Lek Habitat (March through mid-May) - The basis and rationale for the first radius, 0.6 miles from a lek (Fig. B-1), is developed by summarizing data from 5 separate studies of daytime movements of adult male sage-grouse during the breeding season (Carr 1967, Wallestad and Schladweiler 1974,</p>

			<p>Rothenmaier 1979, Emmons 1980, Schoenberg 1982), because daytime movements of adult male GRSG during the breeding season do not vary greatly. Wallestad and Schladweiler (1974) found daily movements of adult males ranged between 0.2 and 0.8 miles from leks, with a maximum cruising radius of 0.9 - 1.2 miles. Ellis et al. (1987) reported that dispersal flights of male GRSG (to day-use areas) ranged from 0.3 – 0.5 miles, with the longest flights ranging from 1.2 – 1.3 miles. Carr (1967) recorded a cruising radius for male GRSG that ranged from 0.9-1.1 miles. Rothenmaier (1979) found that 60-80% of male GRSG locations were within 0.6 - 0.7 miles of a lek. Emmons (1980) reported that male dispersal distances to day-use areas of 0.1 miles were common and that 67% of all use areas were greater than 0.3 miles from the lek. In addition, Schoenberg (1982) found that male daily movements averaged 0.6 miles, but ranged from 0.02 - 1.5 miles.</p> <p>Male GRSG activity patterns during the breeding season include strutting during the early morning hours, feeding and</p>
--	--	--	---

			<p>loafing during the day, and roosting on the lek during the night. Grouse attending the lek do not always roost on the exact location where the strutting occurs the next morning. Occasionally (this is lek-dependent), grouse roost in adjacent sagebrush cover. Ultimately, male GRSG require an open area for strutting, and sagebrush immediately adjacent for feeding and loafing. Sagebrush adjacent to the lek is also used as escape cover from predators or other types of disturbance. Female GRSG that attend the lek also use the area in this zone in the same fashion as do males (Patterson 1952, Barnett and Crawford 1994, Coggins 1998).]</p> <p>Study locations noted above: Carr-Colorado; Wallestad and Schladweiller- Montana; Emmons-Colorado; Schoenberg- Colorado; Rothenmaier –unable to locate Univ. WY Thesis but study area not defined.</p>
	<p>Miscellaneous anthropogenic structures/ activities (e.g., corrals, water windmills, apiaries, signs, informational kiosks, etc.)</p>	<p>BMP Core, Important, General: Avoid human activities or placement of new structures as noted within 2 miles (3.2 km) mi</p>	<p>This is a catch all to reduce impact of miscellaneous structures where possible (some are tall<sup>5</sup>, such as water windmill, some are small,</p>

		of a lek <sup>4</sup> or ensure they are out of the viewshed of the lek.	but have human activity- such as kiosks) or activities not otherwise addressed in this table. Based on biology team discussion and input, and Connelly et al. 2000 Guidelines that state, "avoid building powerlines and other tall structures that provide perch sites for raptors within 3 km of seasonal habitats" (page 977). Avoiding "seasonal habitats" entirely by 3 km would preclude any of these activities at all in Core, Important or General, but siting 2 miles + from leks as a BMP would nonetheless help protect leks from disturbance. Adding the "viewshed" caveat can help with siting in cases where topography or such screens view of the activity or structure.
	Campgrounds and other developed recreation facilities (trailheads etc.)	BMP: Core, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.	Biology team discussion. No literature specific to this issue. Aldrich (2012) mentions GRSG avoidance threshold 2.5 km from any single development at patch scale.
	OHV Play or Open Areas	RDF-Core and Important; BMP for General. No new Open or Play areas.	Rationale is to reduce risk for further noise, habitat loss, fire risk in the Core, Important and General zones.

	Solid Minerals		These measures for solid minerals are intended to reduce noise and human disturbance to lekking birds. Siting/ avoidance buffers not realistic due to the nature of mineral deposits.
		Locatables-BMP Core, Important, General: Access roads and associated infrastructure not on the mining claim-Avoid disturbance to leks <sup>4</sup> during the lekking season.	Regulations 43 CFR 3809.420 performance standards, speak to T/E, and habitat. As a BMP, it provides an opportunity to work with the developer where we can, such as routing access roads etc., siting of facilities/infrastructure etc., that are off the claim, that we have some discretion with.
		Salables- RDF: Core: Do not construct new salable development within 0.8 mile (1.3 km) of leks <sup>4</sup> .	<u>Salables</u> - No literature specific to salables but buffer distance is based on the noise literature for roads. See Patricelli et al. 2012 (WY recommendations for interim noise protections) that recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. Chose RDF for Core and BMP in Important and General habitat since new Salable pits (e.g., gravel) may be necessary to support road maintenance or improvement for access by fire operations or for other locally important factors.

		<p>Leasables-non-energy (e.g., phosphate)-</p> <p>RDF-Core and Important: New phosphate leasing is administratively unavailable.</p> <p>BMP-Core, Important, General- On existing leases avoid disturbance to leks<sup>4</sup> during the lekking season</p>	<p><u>Leasables:</u> None presently known in Core based on current mapping, but Core RDF included in case of a trigger trip and re-delineation of IDswMT subregional management zones.</p> <p>In "Important" there is only one such area with existing lease and Known Phosphate Lease Areas (KPLAs), just west of Bear. It is Federal mineral/private surface. No interest in surface mining but there is interest by a company in underground development. Company is proposing facilities on surface, but working with IDFG locally. Lek within .3 mile.</p> <p>BMP for lek disturbance for all Management Zones in case of trigger trip and IDswMT Management Zone re-delineation and since there are some KPLAs in the General Management Zone. Working with proponent to reduce lek disturbance is realistic and may take on different forms, such as road access, placement of</p>

			facilities, etc.. However, "exclusion" buffers are not realistic given the nature of the location of solid mineral deposits (i.e., cannot site elsewhere). For these, incorporation of appropriate mitigation, in addition to the lek BMP may need to be a primary focus.
	Wind development (commercial)	<p>RDF: Core-No commercial wind development .</p> <p>BMP: Important and General: Avoid wind development in nesting and/or winter habitat.</p>	<p><u>Wind</u>: Labeau et al. (2014) stated that erecting wind turbines at least 5 km from nesting and brood rearing habitat should reduce negative impacts, at least in the short term. However putting a 5 km (3 mile) buffer around leks in Important habitat, would create a defacto closure for the most part, inconsistent with the intent of the Important designation. Hence BMP to avoid placement in nesting or winter habitat.</p>
	Communication Towers	<p>RDF: Core -Do not allow communication tower construction within 3 miles (5 km) of a lek<sup>4</sup> unless needed to address public safety needs.</p> <p>BMP- Important and General-- Avoid communication tower construction within 3 miles (5 km) of a lek<sup>4</sup> unless needed to address public safety needs.</p>	<p>Johnson et al. (2011 pg. 427) noted "Analogously, across all management zones there was a steady downward pattern of trends of lek counts as the number of towers increased, either within 5 km (Fig. 21) or within 18 km (Fig. 22)."</p>

	Transmission Lines	<p>RDF: Core, Important, General: Do not allow transmission line construction within 600 m of a lek.</p> <p>BMP Core, Important, General: Avoid transmission line construction within 2 miles (3.2 km) of a lek.</p>	<p>A 600 m GRSG avoidance zone reported per Gillan et al. (2013). No other spatial buffer supported by literature. While 600 m is a citable buffer, a 2 mile zone as BMP for Transmission is recommended as well. Based on Connelly et al. 2000 Guidelines to avoid tall structures in important seasonal habitats.</p>
	Distribution Lines	<p>BMP: Core, Important and General-Avoid distribution line construction within 600 m of a lek or bury where possible</p>	<p>600 m, based on Gillan et al. BMP as this may not always be feasible.</p>
<b>Temporary functional loss of a lek<sup>4</sup>. SEASONAL RESTRICTION</b>			
	<p>Anthropogenic activities that result in noise or visual disturbance that may lead to sustained avoidance of the lek during a particular lekking season.</p>	<p>RDF: Core and Important- No repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season<sup>3</sup>.</p> <p>BMP-General: Avoid repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season<sup>3</sup>.</p>	<p>Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended as far as 1.6 km (~ 1 mile) from grouse leks. . IDswMT biology team recommended a more conservative approach to managing disturbance to minimize risk of disturbance.</p>

	Sheep Bedding & Sheep Camps	BMP Core, Important, General: Avoid bedding sheep and placing camps within 0.6 mi of a lek during the lekking season.	No literature. BMP based on biology team consensus.
	Organized Recreational Events	RDF Core and Important-Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.  BMP General- Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.	Biology team consensus. No specific literature relative to buffers for recreational events but can manage this through avoiding the appropriate season. This threat (organized recreational events) is a short term, typically one-day event, with temporary disruption from noise the main issue.
<b>Permanent functional or physical loss of nesting or winter habitat.</b>			
	Anthropogenic development or activities that result in loss of habitat or constant or repeated noise levels or objects on the landscape that result in permanent avoidance of the habitat.	Ensure > 80% of the landscape is functionally and physically meeting GRSG habitat objectives appropriate to the seasonal habitat <sup>3</sup> .	Impacts resulting from loss of habitat vary depending on the extent of the habitat lost. Minimal loss of habitat (e.g. removal of small amounts of sagebrush cover) would not likely result in any measurable impacts to GRSG individuals or the associated populations.  More extensive loss of habitat may result in increased probability of population level impacts, and trigger trips, through the increased probability that leks will no longer persist.

	Roads	BMP: Core, Important, General: Avoid construction of new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of nesting habitat.	See citations used for permanent loss of leks, above.
	Unleased Fluid Minerals	Stipulation: Core, Important, General: Limit average well pad density to no more than 1/640 acres within nesting <sup>3</sup> and winter <sup>3</sup> habitat.	See citations used for permanent loss of leks, above.
	Commercial Solar	RDF: Core-No commercial solar development.  RDF: Important: Do not allow facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .  BMP-Important: Avoid placing new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .	See citations used for permanent loss of leks, above.
	Campgrounds	BMP-Core, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.	See citations used for permanent loss of leks, above.
	OHV Play and Open areas	RDF-Core and Important. No new Open or Play areas. BMP-General: Avoid new Open or Play areas	See citations used for permanent loss of leks, above.

**Comment [PM3]:** Changed from RDF/BMP to Stipulation per fluid minerals. Discussed with Karen Porter 6/16/14.

	Wind Development (commercial)	RDF Core. No commercial wind development .  BMP: Important: Avoid wind development in nesting habitat	See citations used for permanent loss of leks, above.
<b>Temporary functional loss of winter habitat</b>			
	Anthropogenic activities that result in noise or visual disturbance that may lead to avoidance of a particular wintering area during a particular wintering season.	RDF: Core, Important- No repeated or sustained disturbance from construction activities in winter habitat during the wintering season.  BMP General: Avoid repeated or sustained disturbance from construction activities in winter habitat during the wintering season.	No known buffer. Biology team recommendation.

<sup>1</sup> Land use allocations or activities provided below are examples, but are not limited to those listed.

<sup>2</sup> Heavy equipment includes but is not limited to: tractors, discs, drills, mowers, Lawson aerators, large sprayers, masticators, dozers, graders, large trucks, excavators, backhoes cranes.

<sup>3</sup> As per Habitat Objectives table. Based on local GRSG seasonal use dates. Lekking ~ March 1-May 2<sup>5</sup> depending on elevation; Nesting /early brood ~April 1-June 30; Winter ~December 1-February 28. Source-Modified from ISAC 2006.

<sup>4</sup> Occupied lek as per IDFG definitions (active during at least one of past 5 years). Undetermined status leks will be evaluated on a case by case at the site specific scale during project-level NEPA.

<sup>5</sup> Definition of "tall structure": Any structure that has the potential to disrupt lekking or nesting GRSG and/or decrease the use of an area. This includes but is not limited to communication towers, meteorological towers, electrical transmission or distribution towers, etc.

## Appendix F – Idaho Key Habitat Map Update Process

As directed in IM ID-2013-010, Idaho BLM annually updates the Key Habitat map. The purpose of this Instruction Memorandum (IM) is to request updates to the Idaho Sage-grouse Habitat Planning Map. The update is needed to reflect habitat changes resulting from wildfire, succession, and vegetation treatments that occurred or were observed since the last update. This update is also intended to capture additional edits recommended by the field offices, sage-grouse Local Working Groups (LWG), or agency partners in sage-grouse conservation.

**Factors to Consider During Edits:** The following factors are applicable to land of any ownership status for which the Bureau of Land Management (BLM) data are available, or for which data or other information are provided by non-BLM partners. If such new data are unavailable, or not provided by partners, retain the existing spatial data in the dataset:

1. Wildfires that have occurred in the most recent calendar year fire season on land administered by the BLM and on land not administered by the BLM.
2. Vegetation management projects that have been completed within key habitat or potential restoration areas of sage-grouse planning areas. This includes activities such as burned area rehabilitation seeding projects, sagebrush thinning/reduction, conifer thinning/reduction, restoration of annual grasslands, new fuel breaks, etc. However, only consider those treatment areas completed and where a change in habitat classification has occurred (e.g., from annual grassland to perennial grassland; perennial grassland to key habitat, etc.). Areas planned for treatment or in the process of treatment (e.g., cheatgrass chemical treatment is completed, but seeding is pending) should not be included until an observed change in habitat category is achieved.
3. Changes in habitat status resulting from vegetation succession, such as perennial grasslands that have transitioned to key habitat due to increased sagebrush cover.
4. Habitat mapping errors or omissions that have been identified in the existing Idaho Sage-grouse Habitat Planning Map and other edits recommended by sage-grouse conservation partners, as appropriate. For this item, it is crucial that BLM field office biologists or an alternate staff specialist coordinate closely with their agency partners, especially the UFSFS and the Idaho Department of Fish and Game (IDFG), to actively solicit and resolve additional suggested edits that we may not be aware of. Those edits must also be incorporated into the respective BLM office's update submission. This is vital to ensure that the update is completed efficiently and as collaboratively as possible.
5. Since the Idaho Sage-grouse Habitat Planning Map is intended for use by all conservation partners in Idaho, it is important that we maintain a seamless coverage across land ownerships. In that regard, when editing, do not clip out BLM (or non-BLM land) on the basis of land ownership. Rather, make edits based on vegetation boundaries only, using the best available information and

professional judgment. If you have uncertainties about accuracies for certain areas, document that in the metadata as appropriate.

6. Based on discussions during map updates in recent years, we will again use a 10.0 acre minimum polygon size for wildfires since data are readily available to that scale. For vegetation treatments, we will also use a minimum area of 10 acres. For sagebrush or other vegetation patches (e.g., key habitat, perennial grassland, annual grassland, conifer encroachment), delineate habitat to the extent you have data, recognizing that some offices may have more recent, finer resolution data than others.
7. Areas that have recently burned, for which the field has little or no information as to habitat status, should be classified as “recent burn.” Efforts to document the general habitat status in these areas should be made the following field season if possible, in preparation for the next map update. The field may also attribute 2013 fires as perennial grassland or annual grassland, as appropriate.
8. Sage-grouse habitat polygon descriptions relevant to this IM include key habitat, perennial grassland, annual grassland, and conifer encroachment potential restoration areas.
  - o Key habitat includes areas of generally intact sagebrush that provide sage-grouse habitat during some portion of the year.
  - o Perennial grassland can be reclassified as key habitat once average sagebrush canopy cover is at least 10 percent.
  - o Annual grassland areas may be reclassified as perennial grassland once a restoration, fuels treatment or related project, such as an Emergency Stabilization and Rehabilitation (ES&R) seeding, is considered successful (i.e., seeded perennial species have successfully established).
  - o Conifer encroachment areas may be reclassified as key habitat following treatment of conifers if sagebrush cover is at least 10 percent and there is a perennial understory. They can also be reclassified as perennial grasslands if native perennial herbaceous species are dominant or if an associated restoration seeding is successful.
9. Field offices must ensure that original project-level data utilized in this update, including Global Positioning System data files, spatial, tabular and metadata associated with specific vegetation treatments, restoration projects, ES&R projects, etc., are archived at the field level and readily accessible in the event of future data calls.

## Appendix G

### Part I – Baseline Map and Description of Development

**Comment [BER1]:** Need to Develop the description and map.

### Part II - Adaptive Management - Soft Trigger Considerations and Implementation Actions

The Sage-Grouse Implementation Task Force would utilize monitoring information to assess when triggers have been tripped. When information indicates that the soft habitat or population trigger may have been tripped, a Sage-Grouse Implementation Task Force - aided by the technical expertise of IDF&G - will assess the factor(s) leading to the decline and identify potential management actions. The Sage-Grouse Implementation Task Force may consider possible changes in management to the CMA. As to the IMA, the Sage-Grouse Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state's ability to meet the overall management objective. It is anticipated IDF&G will collect data annually and will make recommendations to the Implementation Team by August 31st for population triggers and January 15th for habitat triggers.

Only where the monitoring information indicates the cause(s) of the decline is not a primary threat will the Sage-Grouse Implementation Task Force analyze the secondary threats to the species and determine whether further management actions are needed.

#### Potential Implementation Level Actions to Consider in the Event Soft Trigger Criteria are Met

- ✓ Increase monitoring and evaluation of sage-grouse populations in Core Management Area (area of concern).
- ✓ Implement Core Management Area management strategy in corresponding Important Management Area of the same Conservation Area.
- ✓ Implement Core Management Area RDFs in corresponding Important Management Area of the same Conservation Area.
- ✓ Not allow any new (large) infrastructure development within the Core Management Area (no exceptions allowed).
- ✓ Reallocate resources to focus on primary threats in the Core Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Core Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Apply Core Management Area criteria for all primary threats, and/or all secondary threats to the Important Management Area.
- ✓ Reallocate resources to focus on primary threats in the Important Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Important Management Area (e.g. direct resources from other parts of the state to the area of concern).

### Part III – Livestock Grazing Management Response

If Livestock Grazing is determined to be a Causal Factor Consider the Following Measures:

1. Employ grazing management systems that ensure adequate nesting and early brood rearing habitat within the breeding landscape.
2. When use-pattern mapping or monitoring demonstrates an opportunity to adjust livestock distribution to benefit occupied sage-grouse breeding habitat, include as appropriate herding, salting, and water-source management (e.g., turning troughs/pipelines on/off, extending pipelines/moving troughs) in grazing programs.
3. If available and feasible, utilize exotic perennial grass seedings and/or annual grasslands to avoid breeding season of use of occupied sage-grouse habitat.
4. Modify authorized seasons of use within grazing permits to provide greater flexibility in managing livestock for the benefit of sage-grouse.
5. Where appropriate, maintain residual herbaceous vegetation at the end of the growing/grazing season to contribute to nesting and brood-rearing habitat during the coming nesting season. Table 5.
6. Insure that permittees are informed of management and movement requirements related to avoidance of recent burns, rehabilitation seedings or other restoration sites.
7. Manage grazing of riparian areas, meadows, springs, and seeps in a manner that promotes vegetative structure and composition appropriate to the site. In some cases enclosure fencing may be a viable option. However, recognize the availability and quality of desired herbaceous species may be improved by periodic grazing use of the enclosure.
8. Implement management actions (grazing decisions, allotment management plan/conservation plan development, or other agreements) to modify grazing management to meet seasonal sage-grouse habitat requirements. Employ proper grazing management by providing flexibility in scheduling the intensity, timing, duration and frequency of grazing use over time that best promotes management objectives. During drought periods, prioritize evaluating effects of drought in the CMA relative to grouse needs for food and cover. Ensure that post-drought management allows for vegetation recovery that meets sage-grouse needs in priority sage-grouse habitat areas.
9. When using salt or mineral supplements: a) place them in existing disturbed sites, areas with reduced sagebrush cover—e.g., seedings or cheatgrass sites—to reduce impacts to sage-grouse breeding habitat, b) where feasible use salts or mineral supplements to improve management of livestock for the benefit of sage-grouse habitat.
10. In general, avoid constructing new fences within 2 km of occupied leks. Where feasible, place new, taller structures, such as corrals, loading facilities, water-storage tanks, windmills, etc., at least 2 km from occupied leks to reduce opportunities for perching raptors. Careful consideration, based on local conditions, should also be given to the placement of new fences or structures near other important seasonal habitats (winter-use areas, movement corridors etc.) to reduce potential impacts.
11. New spring developments in sage-grouse habitat should be designed to maintain or enhance the free-flowing characteristics of springs and wet meadows. Analyze developed springs, seeps and associated pipelines to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area within priority sage-grouse habitat. Make modifications where necessary, considering impacts to other water users when such considerations are neutral or beneficial to sage-grouse.
12. Ensure that new and existing livestock troughs and open water storage tanks are fitted with ramps to facilitate the use of and escape from troughs by sage-grouse and other wildlife. Do not use floating boards or similar objects, as these are too unstable and are ineffective. Use BMPs to mitigate potential impacts from West Nile virus.

13. When placing new water developments in sage-grouse breeding habitat, choose sites and designs that will provide the greatest enhancement for sage-grouse and sage-grouse habitat.
14. Avoid new water developments in higher quality native breeding/early brood habitats that have not had significant prior grazing use except in situations in which water developments may aid in better livestock distribution across the allotment and will not adversely impact the species.
15. Identify and when feasible, establish strategically located forage reserves focusing on areas unsuitable for sage-grouse habitat restoration or lower priority habitat restoration areas.
16. Monitor for, and treat invasive species associated with, existing range improvements.
17. Consider initiating vegetative manipulation projects where sagebrush canopy cover exceeds optimal characteristics to promote grass and forb understory growth. These projects should only be undertaken where it can be achieved without negatively impacting the species.

### Adaptive Grazing Management Response

BLM will individually analyze those allotments and pastures within the relevant Conservation Area. Given limited agency resources, prioritization will be given to areas that have the potential to provide the greatest benefit to sage-grouse. Allocation of resources should be concentrated on allotments within the CMA that have declining sage-grouse populations. Following those permits within the CMA, resources will be further prioritized to allotments within the IMA with breeding habitats that have decreasing lek counts. Sage-grouse populations that are stable or trending upward will be a lower priority for permit renewal and the adaptive assessment process. The assessment/determination process for sage-grouse pursuant to Standard 8 will consider published characteristics of sage-grouse habitat and the Ecological Site Descriptions, existing vegetation, habitat inventories/assessments (Stiver et al. 2010), and where available, state and transition models that describe vegetation and other physical attributes for sage-grouse. The related characteristics within the categories shown below will also be included. These characteristics indicate the ability of a given area to provide sage-grouse habitat.

Category 1: The grazing allotment (or any pasture/significant area therein) has the existing vegetation and existing ecological condition (seral state) to provide sage-grouse habitat

Category 2: The grazing allotment (or any pasture/significant area therein) has the ecological potential to provide sage-grouse habitat.

Where an allotment or pasture meets one of these Categories above, the GRSG Habitat Management Objectives will be incorporated into relevant resource management plans as the desired conditions with the understanding that these desired conditions may not be achievable:

- (a) due to the existing ecological condition, ecological potential or the existing vegetation; or
- (b) due to causal events unrelated to existing livestock grazing.

Allotments will only be managed for the primary seasonal habitat that it has the potential to support. Typically, summer habitats will be managed to provide the conditions described in Table 3; winter Table 4; and breeding habitats in Table 5. Based on these habitat characteristics, BLM will conduct fine and site scale-habitat assessments to help inform grazing management. Where necessary, a determination of factors causing any failure to achieve the habitat characteristics GRSG HMOs will be conducted at a resolution sufficient to document the habitat condition. This determination will include consideration of local spatial and inter-annual variability. A determination of issues

**Comment [BER2]:** This discussion describes the need to describe how ecological site potential is used to determine use of the habitat management objectives. Nika is working on some description of this which would replace this language.

**Comment [BER3]:** This assumes that any individual area only provides a unique seasonal habitat and does not account for the fact that grouse may use a specific area for several portions of their life history and would need a combination of habitat characteristics.

**Comment [BER4]:** See above comment

**Comment [BER5]:** This is what the HAF does – correct?

attributable to livestock grazing management shall not result from one year of data at a specific location within an allotment. If the process and conditions outlined above demonstrate that livestock grazing is limiting achievement of the habitat characteristics GRSG HMOs, renewed permits will include measures to achieve desired habitat conditions. These measures must be tailored to address the specific management issues associated with seasonal habitat limitations identified in the fine-scale assessments.

**Comment [BER6]:** Is this description consistent with determinations under our regulations?

DRAFT

## Appendix J – Mitigation

IDMT\_PUB\_12257

1.1

12/7/2015

### Part I – Regional Mitigation Strategy

The BLM/USFS will achieve no net unmitigated loss for authorized land uses within greater sage-grouse priority and general habitat. No net unmitigated loss means that impacts from authorized land uses will be fully offset to benefit the species. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to fully offset those residual impacts in order to achieve the no net unmitigated loss standard. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy to address impacts within that Zone. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

#### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy to address impacts within that Zone. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance

- Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
- Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- **Minimization**
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- **Compensation**
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - **Residual Impact and Compensatory Mitigation Project Valuation Guidance**
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects.
      - This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
      - For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure may require an upward adjustment of the valuation.
      - The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
    - **Compensatory Mitigation Options**
      - Options for implementing compensatory mitigation should be identified, such as:
        - Utilizing certified mitigation/conservation bank or credit exchanges.
        - Contributing to an existing mitigation/conservation fund.
        - Authorized-user conducted mitigation projects.
      - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
    - **Compensatory Mitigation Siting**
      - Sites should be in areas that have the potential to yield the greatest conservation benefit to the greater sage-grouse, regardless of land ownership.
      - Sites should be durable (see glossary).
      - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be

considered, if those sites have the potential to yield the greatest benefit to greater sage-grouse and are durable.

- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.
- **Compensatory Mitigation Reporting**
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- **Compensatory Mitigation Program Implementation Guidelines**
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into Land Use Authorization Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for authorized land uses that may impact greater sage-grouse or its habitat.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to achieve the greatest conservation benefit, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

## Glossary Terms

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** Specific, on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur.

**Durability (protective and ecological):** The administrative, legal, and financial assurances that secure and protect the conservation status of a compensatory mitigation site, and the ecological benefits of a compensatory mitigation project, for at least as long as the associated impacts persist. (BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts from an authorized land use that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The conservation benefits from compensatory mitigation accruing as early as possible or before impacts have begun. (BLM Manual Section 1794).

## **Part II – Idaho Mitigation Framework**

### **FRAMEWORK FOR MITIGATION OF IMPACTS FROM INFRASTRUCTURE PROJECTS ON SAGE-GROUSE AND THEIR HABITATS**

**Sage-Grouse Mitigation Subcommittee of the Idaho Sage-Grouse State Advisory Committee<sup>1</sup>  
December 6, 2010**

#### **INTRODUCTION**

The Conservation Plan for Greater Sage-grouse in Idaho (Idaho Sage-Grouse Advisory Committee 2006; as amended in 2009) calls for the development of a “proposal for a mitigation and crediting program for sagebrush steppe habitats in Idaho and recommendations for policy consideration” (Measure 6.2.4.). In early 2010, the Idaho Sage-grouse Advisory Committee (SAC) established the Mitigation Subcommittee to complete this task.<sup>1</sup> The Mitigation Subcommittee met several times from the late spring, through the fall of 2010 and found broad areas of agreement among its diverse participants.

This report presents the Mitigation Subcommittee’s consensus recommendations for the creation of an Idaho-based program to compensate for the impacts of infrastructure projects on sagegrouse and their habitats. This program – called the Mitigation Framework – would serve as a science-based “mitigation module” that project developers and government regulators could use to achieve compensatory mitigation objectives called for in project plans and permits. While compensatory mitigation may help offset certain impacts arising from infrastructure projects, mitigation should not be considered a substitute for first avoiding and then minimizing impacts.

In addition, it is important to recognize that federal and state regulatory or land-management agencies, and county or local governments may also require additional stipulations, conditions of approval or other requirements as well as on-site mitigation, in accordance with applicable law, regulation or policy.

This document proposes a general outline or “skeleton” of policies and procedures for such a program. The Mitigation Framework is designed to be transparent, inclusive, and accountable to defined objectives. The Subcommittee’s purpose is to describe the program in enough detail to foster a dialogue among SAC members, spot important issues and points of agreement, and assess the level of support for developing a functioning mitigation program for Idaho sagegrouse and their habitats.

---

<sup>1</sup> Subcommittee participants: John Robison and Lara Rozzelle, Idaho Conservation League; Brett Dumas, Idaho Power Company; Paul Makela and Tom Rinkes, BLM; Don Kemner, Idaho Department of Fish and Game; Will Whelan and Trish Klahr, The Nature Conservancy; Rich Rayhill, Ridgeline Energy, LLC; Lisa LaBolle and Kirsten Sikes, Idaho Office of Energy Resources; Nate Fisher, Idaho Office of Species Conservation; John Romero, Citizen at Large.

## **EXECUTIVE SUMMARY**

The state of Idaho is seeing an increasing number of infrastructure projects, such as transmission lines and wind energy facilities, proposed in the state's sagebrush steppe ecosystems. Where federal permits are required, the environmental review process for these projects will analyze how these projects affect sage-grouse and will consider a range of potential mitigation measures to avoid, minimize, or offset any impacts. It is likely that the environmental review process will lead at least some developers and agencies to implement compensatory mitigation.

Compensatory mitigation consists of compensating for residual project impacts that are not avoided or minimized by providing substitute resources or habitats, often at a different location than the project area. For sage-grouse, this would include, among other things, protecting and restoring sagebrush habitats to offset habitat losses and other effects of infrastructure projects.

This framework describes the general outline for a sage-grouse compensatory mitigation program in Idaho. This program would employ an "in-lieu fee" approach to compensatory mitigation through which a project developer would pay funds into an account managed by the mitigation program for performance of mitigation actions that provide measureable benefits for sage-grouse and their habitats within Idaho.

The Mitigation Framework does not alter the legal standards or procedures for review and approval of infrastructure projects. Rather, it offers an option that project developers and/or regulators may choose for implementing mitigation plans and agency permit conditions. It should be emphasized that this program would not relieve project developers and permitting agencies of their obligation to avoid and minimize environmental impacts through appropriate project siting, design and implementation.

Although the initial focus is on sage-grouse, the Mitigation Framework can be readily adapted to provide compensatory mitigation for other sagebrush obligate and associated species. The suitability of the Framework for other species and natural features has not been evaluated.

The objectives of the Mitigation Framework include:

- Provide a credible, efficient, transparent, and flexible mechanism to implement compensatory mitigation;
- Ensure that sage-grouse impacts are offset by actions that benefit the affected species and habitats;
- Provide increased certainty for developers and agencies;
- Involve private and public partners in crafting solutions;
- Provide developers the opportunity to offset the impacts of project development and operation on sage-grouse and sage-grouse habitat, and provide a consistent mechanism to offset impacts to the species that can be evaluated in future reviews of the species' status; and
- Evaluate issues based on best available scientific information, while acknowledging and responding to scientific uncertainty.

The Mitigation Framework would be established through a memorandum of agreement (MOA) among entities that have the capacity and commitment to assist in its implementation. Such parties

may include land and wildlife management agencies, counties, tribes, participating private infrastructure development companies, and non-governmental organizations. The MOA would define the specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based compensatory mitigation program.

The Mitigation Framework envisions a program with the following attributes: (1) a Mitigation Team and program administrator to steer the mitigation program and ensure strong oversight; (2) technically sound and transparent guidelines for estimating compensatory mitigation costs; (3) a science-based statewide strategy to guide the selection of mitigation actions that will receive funding; (4) provisions that the costs of operating the program will be borne by infrastructure developers that use the Mitigation Framework to deliver compensatory mitigation; (5) monitoring the implementation and effectiveness of mitigation actions funded by the Mitigation Framework program; (6) a system to track benefits provided by the Mitigation Framework to sage-grouse habitat in Idaho; and (7) periodic evaluation and adaptation of the Mitigation Framework program.

This framework provides only a general outline of a proposed Idaho-based compensatory mitigation program. It is intended to assess the level of support for crafting the agreements and completing the technical tasks needed to bring the Mitigation Framework into being.

## **DISCUSSION**

### **I. The Role of Compensatory Mitigation in Infrastructure Development and Sage-grouse Conservation**

#### **A. Mitigation Basics**

Broadly defined, “mitigation” refers to a wide range of measures that are taken to avoid, minimize, rectify, reduce, or compensate for the adverse impacts of actions affecting the environment. See 40 C.F.R. § 1508.20 (definition of “mitigation” in National Environmental Policy Act (NEPA) rules). In this general sense, mitigation should be an integral part of all phases of project planning and implementation.

The focus of this report is on compensatory mitigation – also known as “biodiversity offsets” or “offsite mitigation.” Compensatory mitigation consists of compensating for residual project impacts that are not avoided or minimized by providing substitute resources or habitats, often at a different location than the project area. For instance, a project developer may fund the restoration of a particular type of habitat in order to replace or “offset” similar habitat that is lost as a result of project construction.

This Framework adopts an “in-lieu fee” approach to compensatory mitigation. Under this approach, a project developer provides funding to a compensatory mitigation program administrator who then distributes the funds to the appropriate government agency, foundation or other organization for performance of mitigation actions. In an in-lieu fee program, the responsibility for actually delivering the compensatory mitigation is transferred from the developer to the program administrator once the developer provides the necessary funds to the in-lieu fee program. It is important to emphasize that compensatory mitigation does not relieve project developers and permitting agencies of their obligation to avoid and minimize environmental impacts. This Framework endorses the principle known as the

“mitigation hierarchy,” which holds that decision makers should consider the elements of environmental mitigation in the following order of priority:

1. Avoid environmental impacts through project siting and design;
2. Minimize the impacts during construction, operation, maintenance, and decommissioning by implementing appropriate conservation measures related to timing and conduct of project activities;
3. Restore areas that have been disturbed or otherwise rectify on-site project-related impacts to the greatest extent practicable; and
4. Compensate for residual impacts (direct and indirect effects that are not mitigated on-site) by providing replacement habitats or other benefits.

This means that compensatory mitigation is addressed only after efforts to avoid, minimize, and mitigate the impacts have been addressed. It also should be noted that significant impacts to habitat areas that support special functions and values for sage-grouse may simply not be replaceable through mitigation and therefore the best course may be to avoid those areas altogether.

### **B. Need for an Idaho Compensatory Mitigation Program**

In recent years, the state of Idaho has seen an increase in the number of major infrastructure projects proposed in the state’s sagebrush steppe ecosystems. Several current proposals involve high voltage transmission lines that would cross over hundreds of miles of sage-grouse habitat. Large scale energy infrastructure projects such as wind farms may also affect large areas of sagegrouse habitat. Where these projects are located at least partially on federally managed public lands they will be required by federal law to go through an extensive environmental review process under NEPA before relevant federal permits are issued. The NEPA process requires the permitting agencies to consider the projects’ environmental effects (both positive and negative), alternatives, and potential mitigation measures. Impacts on sage-grouse will be one of the topics analyzed in the NEPA process.

Even after efforts are taken to avoid and minimize impacts, it is possible that some of these infrastructure projects will degrade some sage-grouse habitat, cause direct sage-grouse mortality, or lead to indirect effects such as avoidance of previously occupied habitat. The extent to which project developers and regulators adopt compensatory mitigation as a means to offset these impacts is not fully known. However, it is likely that at least some developers and regulators will seek to implement compensatory mitigation to benefit sage-grouse and their habitats. Energy companies and other developers face daunting challenges in carrying out compensatory mitigation for sage-grouse habitat. Just identifying specific mitigation actions requires a major effort. Actually implementing sagebrush restoration and enhancement projects is even more difficult and expensive – typically involving years of effort and a significant risk of failure. Delivering this type of technically complex environmental mitigation may be well outside the core business of many infrastructure developers.

### **C. Advantages of the Mitigation Framework**

The Mitigation Framework proposes to respond to these challenges by creating a statewide program to deliver scientifically sound compensatory mitigation for multiple projects. Project developers and regulators would no longer have to design, fund and implement their own mitigation programs. Instead, they would have the option of contributing money to a central fund overseen by agencies with expertise in habitat management and non-governmental partners with similar experience. This approach to compensatory mitigation offers three major advantages. The first advantage stems from the increased efficiency of an Idaho-wide mitigation program compared with fragmented, project-by-project mitigation programs. Mitigation efforts require a significant investment in planning, administration, project oversight, and monitoring. The Mitigation Framework would consolidate these functions, thus avoiding needless duplication. The second advantage is that a state mitigation fund can be used for sage-grouse conservation more strategically and at a greater scale than project-by-project mitigation. As described in more detail below, the Mitigation Framework would fund sage-grouse habitat protection and restoration projects in accordance with a statewide strategy that uses landscape-scale analyses to identify the specific measures and habitats that will provide the greatest benefit for Idaho sagegrouse populations. This Idaho-based mitigation strategy will be integrated with other conservation strategies throughout the range of sage-grouse to ensure that actions taken in Idaho benefit the species as a whole. Third, this method can engage the capacity and competence of natural resources agencies, local governments, private companies, and non-governmental organizations. The Mitigation Framework proposes to enlist these entities in shaping Idaho's strategy, developing criteria for use of the fund, and proposing and implementing habitat protection and restoration projects. The benefits of the Mitigation Framework can be summarized as follows:

*Benefits for Project Developers:*

An efficient and reliable mechanism for meeting compensatory mitigation objectives and permit conditions; and Increased certainty regarding project costs.

*Benefits for Regulatory Agencies:*

Increased certainty that in-lieu fees will result in strategic "on-the-ground" mitigation actions that benefit sage-grouse.

*Benefits for Sage-Grouse:*

Increased certainty that scientifically sound mitigation actions that benefit sage-grouse and offset impacts and habitat losses associated with infrastructure development will be implemented.

#### **D. Ensuring Accountability**

In-lieu fee compensatory mitigation does pose one potentially significant drawback that must be acknowledged and addressed: a poorly designed program may lack accountability for delivering meaningful on-the-ground benefits for sage-grouse. Simply having a project developer contribute to an in-lieu fee mitigation account does not by itself compensate for the sage-grouse impacts caused by the project. Actual mitigation is possible only after well-conceived habitat protection and restoration projects are planned, funded, implemented,

monitored, and successful in achieving stated objectives. The Mitigation Framework seeks to ensure accountability by adopting a series of rigorous and transparent procedures. As described below, the Framework would: (1) ensure that program administration and monitoring functions are adequately funded; (2) provide technically sound guidelines for estimating the costs of delivering compensatory mitigation; (3) establish a sciencebased statewide strategy to guide the program; (4) develop project selection criteria and a request for proposals based on the strategy; (5) require monitoring of the implementation and effectiveness of mitigation actions funded by the program; (6) track benefits the Mitigation

Framework program provides to sage-grouse in Idaho; and (7) require periodic evaluation of the program. Taken together, these procedures provide a high degree of certainty that the Mitigation Framework will be able to turn in-lieu fee payments into tangible, lasting compensatory mitigation for sage-grouse. As described in greater detail in Section E, below, project developers that seek to use the Mitigation Framework will need to show two things. First, they will need to show that their projects' impacts on sage-grouse and their habitats have been evaluated using a scientifically sound process. Second, they will need to show that their contributions to the mitigation fund reflect the Mitigation Framework's compensation guidelines to ensure that funding will be adequate to offset project impacts. Having demonstrated those things, the project developers should then be able to rely on their in-lieu fee contribution to the mitigation account as satisfying their compensatory mitigation objectives or obligations.

## **II. Core Elements of Idaho Sage-Grouse Mitigation Program**

### **A. Program Objectives**

- Provide a credible, efficient, transparent, and flexible mechanism to implement compensatory mitigation;
- Ensure that sage-grouse impacts are offset by mitigation actions that benefit the sage-grouse and their habitats;
- Provide increased certainty for developers and agencies;
- Involve private and public partners in crafting solutions;
- Provide developers the opportunity to offset project impacts on sage-grouse and sage-grouse habitat, and provide a consistent mitigation mechanism that can be evaluated in future reviews of the species' status; and
- Evaluate issues based on best available scientific information while acknowledging and responding to scientific uncertainty.

### **B. Scope**

The Mitigation Framework proposes to mitigate for impacts to Idaho sage-grouse and their habitats in Idaho. The initial focus of the Mitigation Framework is on sage-grouse. However, this program can be readily adapted to provide compensatory mitigation for other sagebrush obligate and associate species, such as pygmy rabbits, if project developers and regulators call for such mitigation.

Whether this Framework is suited for mitigation of impacts to a broader suite of species or natural features has not been evaluated. It should be noted that some subcommittee members expect to advocate in other forums that compensatory mitigation should extend beyond sagegrouse. The Mitigation Framework focuses on infrastructure projects because this type of development is the most likely to give rise to compensatory mitigation under existing environmental policies. As used here, the term “infrastructure” refers to building structures that significantly disturb sage-grouse habitat, including but not limited to projects for electricity transmission, energy generation, pipeline conveyance, transportation, communications, and similar purposes. The Mitigation Framework is not intended to apply to existing projects that are not changing in scope or to the renewal of on-going activities, such as grazing permits. In addition, the Framework is not suited to projects with minor impacts because their contributions to the mitigation program would be too small to justify the effort needed to establish and administer inlieu fee payments.

### **C. Integration with Environmental Review Procedures**

The Mitigation Framework does not alter the legal standards or procedures for review and approval of infrastructure projects. Rather, the Framework offers an option that project developers and/or regulators may choose for implementing mitigation plans and agency permit conditions. The Mitigation Framework is intended to complement the environmental review process conducted pursuant to NEPA and other federal environmental laws as well as county land use planning authorities. Many energy and other infrastructure projects undergo review and approval at the county level. The issues examined and the level of environmental analysis varies widely among individual counties and individual developers. If a county or developer decides to address sage-grouse impacts, it will be able to use the Mitigation Framework as a mechanism for meeting compensatory mitigation objectives that may arise from the county permitting process.

### **D. Mitigation Strategy**

The next step focuses on the Mitigation Team’s task of developing a statewide, science-based strategy that will guide the use of the mitigation fund. The mitigation program strategy would establish priorities for the use of compensatory mitigation funding based on factors/risks identified in the U.S. Fish and Wildlife Service’s 12-Month Findings for Petitions to List Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered (USFWS 2010) and in the Conservation Plan for Greater Sage-grouse in Idaho (2006). The strategy sets mitigation priorities with a landscape view of sage-grouse needs and highlights mitigation opportunities in Idaho based on best available science. In setting priorities, the strategy considers species and community size, landscape condition, and regional context. The strategy is responsive to the threats and risks described in the sage-grouse 12-month findings. The strategy will also generally describe the types of mitigation actions, project specifications, and best practices that are likely to produce measureable benefits for sage-grouse habitat. Finally, the strategy addresses both implementation and effectiveness monitoring requirements for mitigation actions funded through the program. The Mitigation Framework’s strategy will draw heavily from the State of Idaho’s sage-grouse conservation plan but has a narrower focus. It is intended to provide the specific guidance on program priorities, accepted mitigation measures, and geographic areas of emphasis that potential mitigation project sponsors will need to know when they apply for funds. The strategy plays a crucial role in steering mitigation funding to those activities and places that can provide the most effective benefits for Idaho sage-grouse populations consistent

with strategies to increase the viability of the species throughout its range. To this end, the strategy will address one of the major policy questions that arise in the design of compensatory mitigation systems: how closely should the mitigation actions be linked to the type and location of the habitat that was originally affected by the infrastructure project. Stated in the alternative, does removal of the mitigation action from the area of impact improve the effectiveness of or benefit from the action. Some compensatory mitigation systems place a heavy emphasis on this link by favoring “in-kind” and “on-site” compensatory mitigation over “out-of-kind” and “off-site” compensatory mitigation. The subcommittee members generally favor an approach that allows funding to flow to the projects and locations within Idaho that will provide the greatest overall positive impact on sage-grouse populations. The Mitigation Framework calls for a monitoring program that would assess habitat gains provided by mitigation actions and compare them with the mitigation objectives of the participating infrastructure projects. The nature and purpose of this monitoring is described more fully in Mitigation Program Step 4, below.

Once the strategy is complete, the Mitigation Team will develop project ranking criteria and procedures that will guide the selection of the mitigation actions that will receive funding. The goal is to fund projects that provide high quality, lasting benefits based on landscape scale analyses that actually compensate for project impacts.

### **E. Compensation Guidelines**

The Mitigation Framework Program will develop guidelines that may be used by developers and/or regulators to determine the cost of meeting their compensatory mitigation objectives. These compensatory mitigation objectives determine the extent of compensatory mitigation for each project and are generally incorporated into project plans or permits. The compensation guidelines will provide transparent, technically sound principles for determining how much it costs to deliver habitat mitigation for sage-grouse. In other words, the guidelines will represent best estimates of the true cost of implementing the mitigation actions needed to meet each project’s compensatory mitigation objectives. The guidelines may be used by the project developer and the Mitigation Framework Program Administrator to establish the in-lieu fee that the developer will contribute to the mitigation fund. Specific valuation methods will be developed at a later time and will likely draw from compensatory mitigation systems used elsewhere in the West. Although the details have yet to be worked out, the following outline illustrates the core concepts and principles (shown in bold lettering) that are likely to be employed by the MOA parties in setting the Mitigation Framework’s in-lieu fee structure.

- A common unit of measurement would be established for describing and tracking both the project impacts and the benefits of any compensatory mitigation actions. This unit of measurement can be a physical unit such as “acres impacted” or more specifically “acres of summer brood rearing habitat impacted” or “habitat units” lost.
- While the “common unit of measurement” noted above addresses the area of habitat impacted and mitigated, habitat compensation ratios are used to address the quality of the habitat affected by the infrastructure project. These ratios could specify the number of acres of mitigation required per acre of impacted habitat based on the size, habitat quality/condition and function of the impacted habitat; for more critical or important habitat, more mitigation acres might be required. Thus, habitats with higher quality and importance could have higher compensation ratios.

- Several factors are taken into account in calculating how much it will cost to actually compensate for the acres or habitat units. The recommended approach is to evaluate on the costs of implementing a conceptual portfolio of potential mitigation actions or offset activities that provide benefits for sage-grouse. This portfolio of model projects would include a balanced mix of accepted habitat protection and restoration measures reflecting the types of projects expected to be funded by the mitigation program (in accordance with the strategy discussed above). Examples of projects in this portfolio may include such actions as restoring sagebrush canopy and a native understory on recently burned land, improving riparian areas and wet meadows in early brood-rearing habitat, conservation easements to prevent habitat loss, and land management practices that improve sage-grouse habitat. Project costs include the full range of expenses needed to complete all phases of the mitigation action, including administration and monitoring. The average costs of these model mitigation actions per acre or habitat unit is the foundation of the in-lieu fee calculation.
- In addition, the in-lieu fee should also be adjusted to take into consideration the issue of lag time –the time between when habitat is lost at the impacted site relative to when habitat functions are gained at the compensation site.
- The fee also needs to account for contingencies associated with delivering compensatory mitigation, including an estimate of the risk of failure (i.e., the probability that offsite mitigation will not result in any measureable conservation outcomes) for each mitigation site or project.
- In addition to the fee calculated above, costs for establishing and operating the program, including travel, technical consultation and monitoring of program effectiveness must be included. This overhead fee could range from 5-15% depending on the size and complexity of the proposed mitigation program.

## **F. Program Structure and Oversight**

The Mitigation Framework would be established through a memorandum of agreement (MOA) among the entities that would participate in its implementation. The MOA would define the specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based compensatory mitigation program. The MOA would serve as a joint powers agreement for state and local government parties. The MOA would establish the following administrative structure for the Mitigation Framework:

1. **Core Team:** A core group would oversee the Mitigation Framework program and provide policy-level guidance for the Science Team and Fund Administrator, described below. The Core Team would be composed of three to seven representatives of diverse perspectives among the MOA signatories.
2. **Science Team:** A team of experts drawn from MOA signatories and other targeted organizations will administer the science-based and technical aspects of the program. The Science Team would consist of several individuals with expertise in relevant areas such as habitat protection and restoration, landscape ecology/spatial analysis, wildlife biology, sage-grouse ecology, project development, and mitigation policy.

The Team would focus on developing the policies and statewide strategy that will guide the program, making requests for mitigation project proposals (RFPs), ranking mitigation proposals that will receive funding, tracking monitoring reports and project benefits, and evaluating program success.

3. Program Administrator: A program administrator will be responsible for fund management and administrative tasks. The program administrator will provide administrative support for the Mitigation Team, manage the mitigation account, and administer grants, contracts, and other agreements.

4. Advisory Committee: A broader advisory committee consisting of agencies, companies and organizations with the skills and commitment that will provide useful advice to the Core Team regarding the implementation of the Mitigation Framework. The specific make up of each of these groups will be determined at a later time. Potential participants in the Mitigation Framework include but are not limited to representatives of:

***State of Idaho:***

Department of Fish and Game Management  
Office of Energy Resources  
Office of Species Conservation  
Idaho Department of Lands Service

***United States:***

Bureau of Land  
U.S. Fish and Wildlife Service  
U.S. Forest Service  
Natural Resources Cons.

***Energy Companies:***

Idaho Power  
Ridgeline Energy  
Conservancy  
Idaho Tribes  
Idaho Sage-Grouse Advisory Committee  
Sage-Grouse Local Working Groups

***Non-Governmental Organizations:***

Idaho Conservation League  
The Nature  
Idaho Counties  
Public Land Users (e.g., grazing

interests)

**G. Funding the Mitigation Program**

The costs of administering the program will be sustained by the project developers that seek compensatory mitigation. Therefore, a portion of the in-lieu fee that project developers contribute to the mitigation account will be applied for program administration. As noted above, protecting and restoring sagebrush habitats are time consuming and expensive undertakings. Ensuring that these activities are conducted with strong oversight should be viewed as an exceptionally wise investment.

**III. Mitigation Program Steps**

The Mitigation Framework envisions a five-step process for developing, implementing, and monitoring compensatory mitigation.

### **A. Step 1 – Assessment of Project Impacts and Development of Mitigation Objectives**

Assessment of project impacts should be undertaken by the project developers proposing new infrastructure projects and the government agencies that conduct environmental reviews of those projects. Although the Mitigation Framework process is not responsible for this step, it is nevertheless crucial to the integrity of the mitigation program. Specifically, the Framework's success in achieving its goal of offsetting major infrastructure project impacts on sage-grouse depends on an accurate accounting of those impacts. For many projects, this analysis will be done as part of the environmental review procedures required by NEPA. As noted above, NEPA requires federal agencies to address the full range of direct, indirect and cumulative impacts of the proposed project, alternatives to the proposed action, and potential mitigation before they act on permit applications. Once impacts have been assessed and compensatory mitigation objectives set, the project developer is ready to engage the Mitigation Framework, starting with determining the developer's in-lieu fee contribution.

### **B. Step 2 – Determine the In-lieu Fee Contribution**

The goal of Step 2 is to use valuation techniques, such as the guidelines presented above, to convert the complex range of project impacts, including direct, indirect and cumulative impacts, into monetary terms that become the basis for the in-lieu fee payment. The accepted in-lieu fee compensatory mitigation plan could be a condition of the instrument approving the project (FONSI, ROD, right-of-way grant, conditional use permit, etc.) and thus legally requires the project developer comply with the approved mitigation plan.

### **C. Step 3 – Commitment of Mitigation Funds by Project Developer**

Infrastructure project developers can employ the Mitigation Framework by entering into an agreement with the program administrator with regard to a specific infrastructure project. This project agreement sets forth the parties' respective responsibilities, including the project developer's commitment to pay the in-lieu fee. Importantly, the agreement provides that the project developer's funds can only be used for the purposes set forth in the Mitigation Framework. The agreement may also include "conditions" as requested by regulatory agencies or project developers. For instance, the agreement might provide that the in lieu fee will be used to fund mitigation actions in specific geographic areas in order to meet permit requirements. The program administrator, based on consultation with the MOA parties, may decline to enter into an agreement that is inconsistent with the Mitigation Framework principles or includes conditions that are burdensome or unworkable. Once the agreement specifying the payment structure and schedule is signed, the project developer makes the required in-lieu fee deposits to an interest bearing account managed by the program administrator. After the completion of this step, the project developer is no longer engaged in the Mitigation Framework – unless it has decided to participate as a MOA party.

### **D. Step 4 – Issue Request for Proposals (RFP) and Select, Implement, and Monitor Mitigation Actions**

At least at annual intervals, the Mitigation Team will issue an RFP that invite private companies, non-governmental organizations, and agencies to submit proposals for sage-grouse habitat protection, restoration, and/or enhancement actions. The RFP will provide guidance to mitigation project sponsors on program priorities and criteria. These priorities and criteria will be drawn from the mitigation program strategy including identification of geographic areas where mitigation might provide the greatest benefits as well as identification of the threats that present the highest risk to the species or its core habitat. The Mitigation Team should also reach out to federal, state, and local agencies, non-governmental organizations and the general public in order to facilitate discussion, engage stakeholders, raise awareness of the program and generate responses to the RFP. The RFP will solicit project proposals that contain an operation or implementation plan and address at least the following elements:

- Geographic area;
- Threats addressed and how the mitigation action project will offset impacts resulting from those threats;
- An analysis of current sage-grouse conditions in the area;
- Resource goals and objectives the mitigation action project will seek to provide;
- A description of any coordination with federal, state, tribal and local resource management and regulatory authorities or other stakeholder involvement required to complete the mitigation action (e.g., requirement for NEPA compliance or county permit);
- A description of recent or proposed projects and events in the vicinity of the proposed project, if any, such as fire rehabilitation treatments, restoration or enhancement treatments or other activities that complement the effectiveness or intent of the proposed, mitigation action;
- A description of the long term protection, management, stewardship for the project being implemented, and the entity responsible for these activities; and
- A commitment to periodic evaluation and reporting on the progress of the project in meeting stated goals and objectives, including a process for adaptively redirecting the project if necessary.

When selecting projects, the Mitigation Team will estimate the biological benefits of the projects activities, the likely success of those activities, the duration of benefit expected and measure those benefits in relation to the strategy and RFP objectives. Mitigation Team and the program administrator will work together on continuing program administration and oversight including annual reporting of program activities, expenditures, and benefits. An annual program report will describe program activities, budget, and assessment of whether the mitigation strategy and associated projects are benefitting sage-grouse and at what level or scale. The Mitigation Team and/or Program Administrator should implement a monitoring program to measure and validate whether project-specific objectives have been met. Monitoring is required of all compensatory mitigation actions to determine if the project is meeting its performance standards and objectives. As mentioned above, at regular intervals, the total habitat and/or population gains provided by the programs will be compared with the habitat/population losses associated with the participating infrastructure projects. The purpose of this comparison is to evaluate the mitigation program and make

any necessary program adjustments – particularly if the monitoring shows that the mitigation benefits are not compensating for habitat losses. This comparison will not be a basis for imposing new, unexpected requirements on the infrastructure project developers.

## **CONCLUSION**

The framework of policies, principles and procedures outlined above are meant to start a dialogue among parties engaged in sage-grouse conservation and infrastructure development. If these parties agree with the Mitigation Subcommittee that there is great value in establishing an Idaho-based compensatory mitigation program, then this framework will mark the beginning of an inclusive effort to fill in the details and complete the tasks needed to bring such a program into being. We have confidence in our collective ability to create a compensatory mitigation program that will benefit infrastructure developers, agencies, conservation interests, and – not least – Idaho's sage-grouse.

DRAFT

**Part III –****IDAHO AND SOUTHWESTERN MONTANA SUBREGION-NO NET UNMITIGATED LOSS PROCESS****Introduction**

The No Net Unmitigated Loss strategy is a means of assuring that proposed anthropogenic activities, when approved and implemented will not result in long-term degradation of Greater Sage-Grouse habitat or population and will have a net conservation benefit to the species. The attached ‘flow chart’ identifies a screening process for review of proposed anthropogenic activities. The goal of the process is to provide a consistent approach regardless of the administrative location of the project and to ensure that authorization of these projects will not contribute to the decline of the species. Though the initial Steps (1-6) are done prior to initiating the NEPA process, the authorized officer must ensure that appropriate documentation regarding the rationale and conclusion for each is included in the administrative record.

The flow chart provides for a sequential screening of proposals. However, Steps 2-6 can be done concurrently. Steps 7-12 are related to project implementation.

**Step 1**

This screening process is initiated upon formal submittal of a proposal for authorization for use of federal lands (BLM or Forest Service). The actual documentation would include, at a minimum, a description of the location, scale of the project, and timing of the disturbance and would be consistent with existing protocol and procedures for the specific type of use. It is anticipated that the proposals would be submitted by a third party.

**Step 2**

This initial review would evaluate whether the proposal would be allowed as prescribed in the Greater-Sage-Grouse Land Use Plan Amendment. For example, certain activities are prohibited in suitable habitat, such as wind or solar energy development. If the proposal is an activity that is specific prohibited, the submitter would be informed that the proposal is being rejected since it would not be consistent with the Land Use Plan, regardless of the design of the project.

In addition to consistency with program allocations, the Land Use Plan identifies a limit on the amount of disturbance that is allowed within a ‘biological significant unit’ (BSU). If current disturbance within the affected unit exceeds this threshold, the project should be deferred until such time as the amount of disturbance within the area has been reduced, through restoration or other management actions.

**Step 3**

In reviewing a proposal, determine if the project will have a direct or indirect impact on population or habitat (PPH or PGH). This can be done by:

1. Reviewing Greater Sage-Grouse Habitat maps.
2. Reviewing the 'Base Line Environment Report' (USGS) which identifies the area of direct and indirect effects for various anthropogenic activities.
3. Consultation with agency, Fish and Wildlife Service, or State Agency wildlife biologist.
4. Reviewing the standard and guidelines in the plan amendments (such as buffer distances for the proposed activity).
5. Other methods

If the proposal will not have a direct or indirect impact on either the habitat or population, proceed with the appropriate process for review, decision, and implementation of the project.

#### **Step 4**

If the project could have a direct or indirect impact of sage-grouse habitat or population, evaluate whether the proposal can be relocated so as to not have the indirect or direct impact and still achieve the intent of the proposal. This Step does not consider redesign of the project as a means of not having direct or indirect impacts but rather authorization of the project in a physical location that will not impact Greater Sage-grouse. If the project can be relocated so as to not have an impact on sage-grouse and still achieve objectives of the proposal, inform applicant and proceed with the appropriate process for review, decision, and implementation of the relocated project.

#### **Step 5**

If the preliminary review of the proposal concludes that there may be impacts to sage-grouse habitat and/or population, and the project cannot be effectively relocated to eliminate these impacts; evaluate whether the agency has the authority to modified or deny the project. If the agency does NOT have the discretionary authority to modify or deny the proposal, proceed with the authorization process (NEPA) and include appropriate mitigation requirements that minimize impacts to sage-grouse habitat and populations. Mitigations could include a combination of actions such as timing of disturbance, design modifications of the proposal, site disturbance restoration, and compensatory mitigation actions.

#### **Step 6**

If the agency has the discretionary authority to deny the project and after careful screening of the proposal (Steps 1-4) has determined that direct and indirect cannot be eliminated, evaluate the proposal to determine if the adverse impacts can be mitigated. If the impacts cannot be effectively mitigated within the BSU, reject or defer the proposal. The criteria for determining this situation would include but not limited to:

- Natural disturbance within the BSU is significant and additional activities within the area would adversely impact the species.
- The current trend within the BSU is down and additional impacts, whether mitigated or not, could lead to further decline of the species or habitat.

- The proposed mitigation has proven to be ineffective or is unproven in terms of science based approach.
- The additional impacts, after applying effective mitigation, would exceed the disturbance threshold for the BSU.
- The project would impact habitat that has been determined, through monitoring, to be a limiting factor for species sustainability within the BSU.
- Other site specific criteria that determined the project would lead to a downward trend to the current species population or habitat with the BSU.

If the project can be mitigated to provide for a net conservation benefit to the species, proceed with the design of the mitigation plan and authorization (NEPA) of the Project. The authorization process could identify issues that may require additional mitigation or denial/deferring of the project based on site specific impacts to the Greater Sage-grouse.

**Comment [BER1]:** Needs to build this appendix. List of legal descriptions for lands parcels previously identified for disposal now located in Core (Important?) management zones and now longer available for disposal.

DRAFT

## Appendix L – Travel Management Planning Guidelines:

- Among other designation criteria from 43 CFR 8342.1(b), “areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention will be given to protect endangered or threatened species and their habitats.
- During subsequent travel management planning, all routes would undergo a route evaluation to determine its purpose and need and the potential resource and/or user conflicts from motorized travel. Where resource and/or user conflicts outweigh the purpose and need for the route, the route would be considered for closure or considered for relocation outside of sensitive GRSG habitat.
- During implementation-level travel planning, threats to GRSG and their habitat would be considered when evaluating route designations and/or closures.
- During subsequent travel management planning, routes that do not have a purpose or need would be considered for closure.
- During subsequent travel management planning, routes that are duplicative, parallel, or redundant would be considered for closure.
- During subsequent travel management planning, seasonal restrictions on OHV use would be considered in important seasonal habitats where OHV use is a threat.
- During subsequent travel management planning, OHV timing limitations would be considered in important seasonal habitats where OHV use is a threat.
- During subsequent travel management planning, consider limiting over snow vehicle (OSV) travel to designated routes, consider seasonal closures in GRSG wintering areas from November 1 through March 31 or define Designation Criteria (i.e. minimization criteria) to regulate over snow vehicle traffic.
- During subsequent travel management planning, routes not required for public access or recreation with a current administrative/agency purpose or need would be evaluated for administrative access only.
- During subsequent travel management planning, consider prioritizing restoration of routes not designated in a Travel Management Plan.
- During subsequent travel management planning, consider using seed mixes or transplant techniques that will maintain or enhance GRSG habitat when rehabilitating linear disturbances.
- During subsequent travel management planning, consider scheduling road maintenance to avoid disturbance during sensitive periods and times to the extent practicable. Consider using time of day limits (After 10:00 AM to 7:00 PM) to reduce impacts on GRSG during breeding and nesting periods.

**Comment [GJS1]:** Motorized only? What about mechanized?

**Comment [GJS2]:** Is this redundant with the first bullet above?

**Comment [BER3]:** Differs from national language

**Comment [BER4]:** Differs from national language

Over-snow vehicle – a motor vehicle that is designed for use over snow and that runs on a track or tracks and/or a ski or skis, while in use over snow.

## Idaho and Southwestern Montana Recommendation for Proposed Plan Amendment

### 1. Summary Description of Plan

- 1.1. Maintain and/or increase the abundance, distribution and connectivity of GRSG by conserving, enhancing and restoring GRSG habitat to maintain resilient populations by reducing, eliminating or minimizing threats to GRSG habitats.
- 1.2. Comply with existing laws, regulations and policies.
- 1.3. Recognize valid existing rights.
- 1.4. BLM and FS would coordinate with the States of Idaho and Montana, as appropriate, during implementation activities including the evaluation of disturbance threshold, adaptive management triggers and mitigation.
- 1.5. The Idaho and Southwestern Montana Sub-Region would be divided into 5 Conservation Areas over which the disturbance threshold and adaptive management triggers would apply. These areas are the West Owyhee, Desert, Mountain Valleys, Southern and Southwestern Montana (Map 1).
- 1.6. The Conservation Areas would be categorized into management zones – Core, Important and General, with the exception of the Southwestern Montana Conservation Area which does not contain Important Management Zones (Map 2).
- 1.7. Adaptive Management: Idaho: actions would engage when population decline by 10 percent or a combined 10 percent loss nesting and/or wintering habitat within Core or Important Management Zones within a Conservation Area is lost (Soft Trigger), and when 20 percent of the population or nesting and wintering habitat within Core or Important Management Zones within a Conservation Area is lost (Hard Trigger) Montana: Adaptive management in Montana is linked with the state evaluation framework.
- 1.8. Additional anthropogenic disturbance (AD-1) would be significantly limited in Core Management Zones with specific exceptions (AD-3 & AD-4); it would be limited unless consistent with specific criteria in Important Management Zones (AD-4) and would be avoided in General Management Zones.
- 1.9. Anthropogenic disturbance (AD-1) would be contained within a 3 percent total disturbance cap as applied to the biologically significant unit (the biologically significant unit (BSU) is defined as the nesting and wintering habitat within Core and Important Management Zones within a Conservation Area), including existing anthropogenic disturbance. In Montana surface disturbance will be calculated through the state surface disturbance analysis process on a project by project basis.
- 1.10. Mitigation would be required for all anthropogenic disturbance activities within GRSG habitat. Within Core Management Zones a standard of no net unmitigated loss would be required.
- 1.11. BLM and Forest Service would set up a Mitigation Board at the State level with state involvement to develop a Mitigation Strategy and oversee the application of mitigation at the site-specific level.
- 1.12. BLM and Forest Service would complete Wildfire and Invasive Species Assessments at the local level to identify priority areas of habitat, and wildfire and invasive species concern. These assessments would support and include the development of fuels, restoration and rehabilitation strategies to use during implementation level activities.

**Comment [BER1]:** Cally Younger – Need clear definition and identify what data layers will be used to calculate this; who is responsible for managing data, etc. Maybe this is in Appendix H.  
Response – the data sets are described in the anthropogenic disturbance section and a further description of those data sets is included in Appendix H.

**Comment [BER2]:** Cally Younger – Only applying disturbance within the BSU could significantly affect the functional 3% disturbance threshold. Task Force recommendations are 3% within nesting and wintering habitat of a CA.  
Response -

**Comment [BER3]:** Cally Younger – Are only impacts in BSU are counted towards the 3%?  
Response – Yes, only disturbance activities within the BSU are part of the 3% calculation, even though mitigation would be required for activities inside or outside the BSU.

**Comment [BER4]:** Cally Younger – How will BLM's new mitigation policy be coordinated with the state effort?  
Response -

**Comment [BER5]:** Cally Younger – What is local – BSU or CA?  
Response – Neither, for the purpose of developing Wildfire and Invasive Species Assessments the scale will be BLM Field Office.

**Comment [BER6]:** Don Kemner – Fuel breaks?  
Response -

### Idaho and Southwestern Montana GRSG EIS – Land Allocation Decisions Summary<sup>1</sup>

Solar/Wind/Nuclear/Hydropower		
Core	Important	General
Exclusion (LR-2)	Avoidance (LR-2)	Open (LR-2)
Commercial Service Airports		
Core	Important	General
Exclusion (LR-3)	Avoidance (LR-1)	Open (LR-1)
Landfills		
Core	Important	General
Exclusion (LR-4)	Avoidance (LR-1)	Open (LR-1)
Utility Corridors		
Core	Important	General
Existing designated corridors which are land use plan designations (and include Section 368 Corridors), will remain “open” (subject to the ongoing settlement agreement) and can provide an opportunity to be modified with mitigation. Any new disturbance within these corridors would count towards the disturbance cap. All new, modified, or deleted corridors will require a land use plan amendment. (LR-7)	Same as Core (LR-7)	Same as Core (LR-7)
High-Voltage Transmission and Major Pipeline ROWs		
Core	Important	General
Avoidance (LR-1)	Avoidance (LR-1)	Open (LR-1)
Other (Minor) Rights-of-Way and Land Use Authorizations/Permits		

<sup>1</sup> The Idaho and Southwestern Montana Subregion includes portions of Idaho, Montana and Utah. Where differences exist between direction for Idaho and Montana those are noted in the table and within the management action section. The lands within Utah are part of the Sawtooth National Forest and are managed as such; therefore direction for these lands in Utah is the same as that described for the Sawtooth National Forest in Idaho.

**Comment [BER7]:** Cally Younger – Does this category cover distribution lines? Communication sites?  
 Response – Yes, this includes both distribution lines and communication sites – the NPT guidance separated management of these while the Idaho plan does not make such a distinction, this was included here to aid in communication.

<b>Core</b>	<b>Important</b>	<b>General</b>

DRAFT

## 2. Goals and Objectives

- 2.1. GOAL-1: Maintain and/or increase the abundance, distribution and connectivity of GRSG by conserving, enhancing and restoring GRSG habitat to maintain resilient populations by reducing, eliminating or minimizing threats to GRSG habitats.
- 2.2. GOAL-2: Provide for the needs of GRSG and their habitat while also providing for resource uses in accordance with the agencies' direction for multiple use and sustained yield as described in FLPMA and the NFMA.
- 2.3. GOAL-3: Manage anthropogenic development and human disturbance to minimize the likelihood of adverse population level effects on GRSG.
- 2.4. GOAL-4: Reduce the risk of West Nile Virus or other disease outbreaks from BLM and USFS management actions.
- 2.5. Management Area (MA) - Objective (OBJ)-1: Maintain a resilient population of GRSG in Idaho and Southwestern Montana.
- 2.6. MA-OBJ-2: Designate GRSG management zones and associated management to maintain a resilient population and to designate strategically located adjacent zones to provide a buffer from unpredictable habitat loss such as wildfire to the resilient population areas.
- 2.7. MA-OBJ-3: Identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain GRSG population persistence.
- 2.8. Vegetation (VEG)-OBJ-1: Reconnect and expand areas of higher native plant community integrity/rangeland health to increase the extent of high quality habitat and, where possible, to accommodate the future effects of climate change.
- 2.9. VEG-OBJ-2: Increase the amount and functionality of seasonal habitats by:
  - a. Increasing canopy cover and average patch size of sagebrush in perennial grasslands.
  - b. Increasing the amount, condition and connectivity of seasonal habitats.
  - c. Protecting or improving GRSG migration/movement corridors.
  - d. Reducing conifer encroachment within GRSG seasonal habitats.
  - e. Improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats.
  - f. Reducing the extent of annual grasslands within and adjacent to Core and Important Management Zones.Decadal treatment objectives by population area are identified in Table 1.
- 2.10. Habitat Management (HM)-OBJ-1: Maintain or make progress toward 70% of lands within CMZs and IMZs capable of producing sagebrush at 10-30% canopy cover and less than 10% conifer canopy cover.
- 2.11. HM-OBJ-2: Incorporate GRSG Seasonal Habitat Objectives (Table 2) into the design of projects or activities, as appropriate, based on site conditions and ecological potential, unless achievement of fuels management objectives require additional reduction in sagebrush cover to meet strategic protection of GRSG habitat and conserve habitat quality for the species.
- 2.12. FUEL-OBJ-1: Design fuel treatments to restore, enhance, or maintain GRSG habitat.
- 2.13. WHB-OBJ-1: Manage wild horse and burro population levels within the established AML ranges to maintain or enhance GRSG habitat.
- 2.14. WHB-OBJ-2: Prioritize gathers and population growth suppression techniques in HMAs in GRSG habitat, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Additional prioritization would

**Comment [BER8]:** Cally Younger – In a specific CA or should 'in' be deleted?  
Response – 'in' was deleted.

**Comment [BER9]:** Cally Younger – within and adjacent to...  
Response – change made.

**Comment [BER10]:** Tie this value to what is in the table. Paul and Rob to finish table.  
Response – Table has been updated.

**Comment [BER11]:** Use FS language regarding fuels objectives – get from Rob.  
Response – language has been included.

**Comment [BER12]:** Need to incorporate FIAT results.  
Response – these are incorporated into the various applicable sections.

be given for HMAs that are near AML or where a reduction would serve the most beneficial purpose.

DRAFT

**Table 1. Acres of Treatment within a 10-Year Period to Achieve Vegetation Objectives<sup>2</sup>**

Population Area	Mechanical Conifer Treatment	Prescribed Fire	Annual Grass Treatment
SW Idaho	15000-16000	600-700	30000-32000
S Central Idaho	10000-11000	100-200	16000-17000
Mountain Valleys	1500-1600	500-600	0
N Snake River	0	4000-4500	20000-21000
Bear Lake Plateau	100-150	0	100-200
Montana	300-400	10000-12000	0

**Comment [BER13]:** From Paul - The figures in this table look more like what we would need to treat annually. Treating 15000 acres of juniper a decade in SW Idaho won't make a dent, nor will 500 acres of RX fire in mountain valleys (that is far less than one typical RX fire project acreage.). Double check model outputs with Robb. In comment review meeting NV/CA mentioned they are reporting this info for 50 year timeframe....Should we. Discuss.  
Response -

**Table 2. Seasonal Habitat Desired Conditions for Greater Sage-Grouse**

ATTRIBUTE	INDICATOR	DESIRED CONDITON
Lek Habitat	Proximity of trees <sup>9,16</sup>	<Trees (e.g. juniper) none to uncommon within 3 km of occupied leks
	Proximity of sagebrush to leks <sup>16</sup>	Adjacent protective sagebrush cover within 100 m of an occupied lek <sup>16</sup>
Nesting Habitat	Apply indicators to areas within 10 km of occupied leks, that have the ecological capability to provide sagebrush cover.	
	Seasonal habitat needed <sup>10</sup>	>80% of the landscape in sagebrush cover
	Sagebrush canopy cover <sup>2,10,11,13</sup>	15-25%
	Sagebrush height <sup>10</sup>	
	Arid sites <sup>3</sup>	12-31 inches (30-80cm)
	Mesic sites <sup>4</sup>	16-31 inches (40-80cm)
	Predominant sagebrush shape <sup>16</sup>	>50% in spreading shape <sup>5</sup>
	Perennial grass cover <sup>2,10</sup>	
	Arid sites <sup>3</sup>	≥10%
Mesic sites <sup>4</sup>	≥15%	
Perennial grass height <sup>10,11,13,16</sup>	≥7 inches <sup>10</sup>	
Perennial forb canopy cover <sup>2,10</sup>		
Arid sites <sup>3</sup>	≥5%	
Mesic sites <sup>4</sup>	≥10%	
<b>BROOD-REARING/SUMMER<sup>1</sup> (July-October)<sup>1</sup> (Apply to all habitat outside of nesting/breeding and winter)</b>		
Cover	Seasonal habitat needed <sup>10</sup>	>40% of the landscape in sagebrush cover
	Sagebrush canopy cover <sup>2,10</sup>	10-25%
	Sagebrush height <sup>10</sup>	40-80cm
	Perennial grass canopy cover <sup>2,10</sup>	>15%
	Upland and riparian perennial forb availability <sup>2,16</sup>	Preferred forbs are common with several preferred species present <sup>7,8</sup>

**Comment [LD14]:** Should "tree" be defined? I am just thinking of areas with mountain mahogany or old-growth juniper in limited patches that we would want to preserve, vs. seral juniper. Maybe there is a way to differentiate by saying "as appropriate for existing soils/ecological sites"??

<sup>2</sup> These acreage figures represent and objective for treatment over a ten-year (decadal) timeframe to support achievement or progress toward vegetation and habitat objectives. This accounts for variations in yearly funding availability and does not reflect a maximum acreage for treatment should funding and site specific conditions allow for more or less treatment than described in order to meet vegetation and habitat objectives.

	Riparian meadow habitat function	>80% relative composition <sup>a</sup> of riparian herbaceous species <sup>9</sup>
<b>WINTER<sup>1</sup> November-March<sup>1</sup> (Apply to areas of low snow accumulation)</b>		
Cover and Food	Seasonal habitat needed <sup>10</sup>	>80%
	Sagebrush canopy cover above snow <sup>2,10</sup>	>10%
	Sagebrush height above snow <sup>10</sup>	>25cm

**Comment [LD15]:** Function is kind of a confusing term to use here. That makes me think of PFC, which doesn't look at spp. Composition. Not a deal breaker, just thought I'd mention it

<sup>1</sup> Seasonal dates can be adjusted by local unit according to geographic region.  
<sup>2</sup> Absolute cover is the actual recorded cover and can exceed 100% when recorded across all species and all layers. It is not relative cover, which is the proportions of each species, and equals 100%. Note that cover is reported for only those species (e.g., sagebrush, preferred forbs) that are sampled to determine suitability of habitat for sage-grouse. Overall cover at the site will be greater than that sampled for sage-grouse habitat, due to other species present.  
<sup>3</sup> 10 – 12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush sub-species for this type site (HAF 2014).  
<sup>4</sup> ≥12 inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site (HAF 2014).  
<sup>5</sup> Sagebrush plants that are more tree or columnar-shaped do not provide the protective cover of sagebrush with a spreading shape (HAF 2014).  
<sup>7</sup> Preferred forbs are listed in HAF Table III-2 (HAF 2014). Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred in Table III-2.  
<sup>8</sup> Cover may be higher according to local riparian classifications.

**Maximum Allowable Use Levels for GRSG Habitat**

Seasonal Habitat	Allowable Use of Key Species
Nesting/Breeding <sup>1</sup>	Residual perennial grass height: Grazing post nesting/breeding season: 4 in. <sup>15,16</sup> Grazing during nesting/breeding season <sup>a</sup> : 7 in. <sup>10,15,16</sup>
	<sup>a</sup> Average, assuming current vegetation composition has the capability.
Brood-Rearing /Summer	≤35% shrub species
	≤40% herbaceous species <sup>17</sup>
	≤35% woody species
	Average stubble height 4 inches (depending on site capability and potential) for herbaceous riparian vegetation <sup>17</sup>
Winter	≤35% shrub species

1-Grass heights only apply in nesting habitats with sufficient sagebrush cover (15-25%) to support nesting.

**Comment [PM16]:** This is FS language that will be required. Need to discuss BLM's use of these.

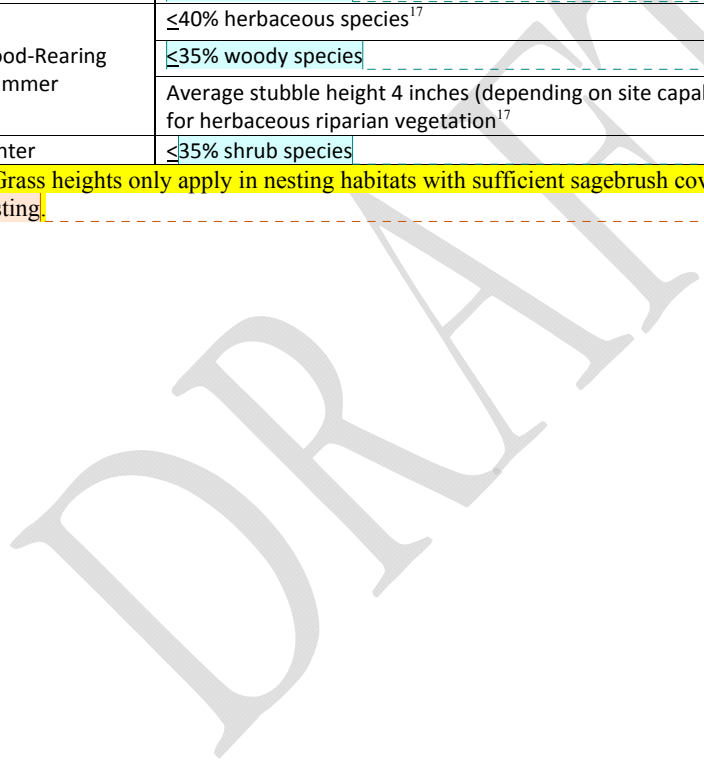

**Comment [LD17]:** Allowable Use is fine for BLM too

**Comment [PM18]:** This is from FS Draft. Assumes we will be monitoring shrub utilization in spring. Need to discuss.

**Comment [PM19]:** This is from FS Draft. Assumes we will be monitoring shrub utilization in summer. Need to discuss.

**Comment [PM20]:** This is from FS Draft. Assumes we will be monitoring shrub utilization in winter. Need to discuss.

**Comment [LD21]:** In the grazing section, we have language about considering ESDs and current site potential as well, so that unrealistic objectives aren't put in place for areas that can't produce 7" every year. May need to spell out how this works if POSE doesn't count towards cover requirements, but it is the main perennial grass out there...

### 3. General Direction (GD)

- 3.1. GD-1: Comply with state and federal laws, regulations, policies, and standards, including FLPMA multiple use mandates and NFMA regulations.
- 3.2. GD-2: Implement actions (day-to-day management, monitoring, and administrative functions) that stem directly from regulations, policy, and law, which are considered in conformance with the LUPA that are not specifically addressed in the plan amendment.
- 3.3. GD-3: Preserve and recognize valid existing rights, which include any leases, claims, or other use authorizations established before a new or modified authorization, change in land designation, or new or modified regulation is approved. Activities on existing mineral leases are managed through terms, conditions and stipulations on the leases, and through specific operating conditions included in operating plan approvals for the duration of the lease.
- 3.4. GD-4: Allowable uses and management actions from the existing LUPs that remain valid and do not require amending are carried forward.
- 3.5. GD-5: Sustain habitat in sufficient quantities and quality for resilient plant and wildlife populations.
- 3.6. GD-6: Provide for human safety and property protection from wildfire.
- 3.7. GD-7: Ensure that existing utility corridors would remain unchanged.
- 3.8. GD-8: Limit all Forest Service-administered lands to designated routes.
- 3.9. GD-9: Existing requirements regarding site-specific environmental analysis, public involvement, consultation with tribes and other agencies, or compliance with applicable laws without waiver are maintained.
- 3.10. GD-10: Appropriate, site-specific analysis as described in NEPA and any requisite site specific decision making (i.e., 43 CFR Subpart 4160, or 36 CFR Part 251) would be conducted prior to approving proposed management actions.
- 3.11. GD-11: Impacts analysis on other sagebrush steppe species and impacts on state endowment trust lands managed by the Idaho Department of Lands would be analyzed during site-specific project NEPA review.
- 3.12. GD-12: Activities not specifically addressed by the plan amendment would still be subject to the allowances and restrictions of the applicable land use plans.
- 3.13. GD-13: Information in the Management Plan and Conservation Strategies for Sage-Grouse in Montana would be considered when designing projects that may affect sensitive species or federally listed species in Montana.
- 3.14. GD-14: Any oil and gas leasing decisions would be consistent with the BLM and Forest Service requirements for leasing decisions as found in 43 CFR Part 3101 and 36 CFR 228.102, respectively.
- 3.15. GD-15: In conjunction with plan evaluation, re-evaluate management zones, required design features and other protective stipulations as new science, information and data regarding the habitats and behavior of the species is obtained. Incorporate these findings as part of plan maintenance.
- 3.16. GD-16: Incorporate required design features (RDFs) as described in Appendix A in the development of project or proposal implementation, reauthorizations or new authorizations and suppression activities.
- 3.17. GD-17: Incorporate best management practices as described in Appendix A, as applicable and appropriate in the design and development of implementation activities and projects.
- 3.18. GD-18: Conduct implementation and project activities consistent with seasonal habitat restrictions described in Appendix B.

**Comment [BER22]:** Paul is compiling.

- 3.19. GD-19: Incorporate appropriate buffers into implementation and project design to avoid and minimize impacts to GRSG described in Appendix C.
- 3.20. GD-20: Consistent with regulations, require a full reclamation bond specific to the site when surface disturbing activities are proposed. Ensure reclamation bonds are sufficient to cover costs that would result in full rehabilitation to restore lost GRSG habitat. Base the reclamation costs on the assumption that contractors for the BLM will perform the work.

DRAFT

#### **4. Coordination**

- 4.1. CC-1: Collaborate, coordinate and utilize cooperative planning efforts to implement and monitor activities to achieve desired conditions and to maximize the utilization of available funding opportunities. Coordination efforts could include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups and non-governmental organizations.
- 4.2. CC-2: Develop a cooperative MOU between the BLM, Forest Service and State of Idaho to establish the State of Idaho as a cooperating agency during implementation of the final decision. The MOU would identify responsibilities, role and interaction of the BLM, FS and Task Team. Montana BLM will participate as appropriate on Montana's Sage-grouse Oversight Team to facilitate coordinated and implementation of BLM's final decision and Montana's forthcoming sage-grouse conservation strategy.
- 4.3. CC-3: The BLM and Forest Service would consider any recommendations from the Governor of Idaho as a result of evaluation completed by the Sage-Grouse Implementation Task Force.
- 4.4. CC-4: The BLM and Forest Service would coordinate with the State of Idaho and Montana and the Idaho Sage-Grouse Implementation Task Force and Montana Sage-grouse Oversight Team regarding proposed management changes, the implementation of conservation measures, mitigation, and site-specific monitoring, related to adaptive management and livestock grazing (Appendix O).
- 4.5. CC-5: At the state level, BLM and Forest Service would consider recommendations from the Governor in the decision process recognizing that the BLM and Forest Service have the final decision making authority and responsibility on federal lands under their appropriate jurisdiction.
- 4.6. CC-6: At the state level, BLM and Forest Service would coordinate with IDFG, MFWP, USFWS, and other conservation partners in collaborative efforts with adjacent states (Oregon, Nevada, Utah, Montana, Wyoming) in GRSG MZs IV and II to evaluate GRSG habitat and population status and trends within the broader USFWS PACs and make appropriate recommendations for GRSG conservation at broader scales.
- 4.7. CC-7: At the state level, BLM and Forest Service would coordinate with appropriate WAFWA Sage-grouse Technical Committee to develop consistent population and habitat monitoring approaches that facilitate GRSG conservation at the MZ scale.
- 4.8. CC-8: All prescribed burning would be coordinated with state and local air quality agencies to ensure that local air quality is not significantly impacted by BLM and Forest Service activities.

## 5. Greater Sage-Grouse Management Areas

- 5.1. Management Area (MA)-1: Designate five GRSG Conservation Areas within the sub-region to form the geographic basis for achieving population objectives; evaluating the disturbance density and adaptive regulatory triggers; and tailor adaptive management responses. These conservation areas are depicted in Map 1. These areas are referred to as Mountain Valleys, Desert, West Owyhee, Southern and Southwestern Montana Conservation Areas.

### Conservation Area Description:

Mountain Valleys Conservation Area – generally located north of the Snake River Plain, and includes habitat in west-central population area. It extends west from Rexburg, north and west of Highway 33 to Howe, north and west of Highway 33/22 to Arco, north and west of Highway 26/20/93 to Carey, north and west of Highway 20 west to Hill City, north and west of Highway 20 to the Dylan Karaus Road, west to Canyon Creek. Canyon Creek to the confluence with the Snake River form the western boundary.

Desert Conservation Area – located north of the Snake River and south of the Mountain Valleys Conservation Area. It extends from the confluence of Canyon Creek and the Snake River, eastward to Idaho Falls. The Snake River and Henry’s Fork form the eastern boundary.

West Owyhee Conservation Area – located south of the Snake River and west of the Bruneau River.

Southern Conservation Area – located south of the Snake River and east of the Bruneau River, including East Idaho uplands and Bear Lake Plateau, and the Utah portion of the Sawtooth National Forest in Box Elder County.

Southwestern Montana – located in southwestern Montana - encompassing the Dillon and Butte BLM Field Office boundaries.

Additionally, sage-grouse habitats in the Desert and West Owyhee CAs are relatively contiguous, while those in the Mountain Valleys and Southern CAs tend to be more fragmented due to topography, elevational and land use differences.

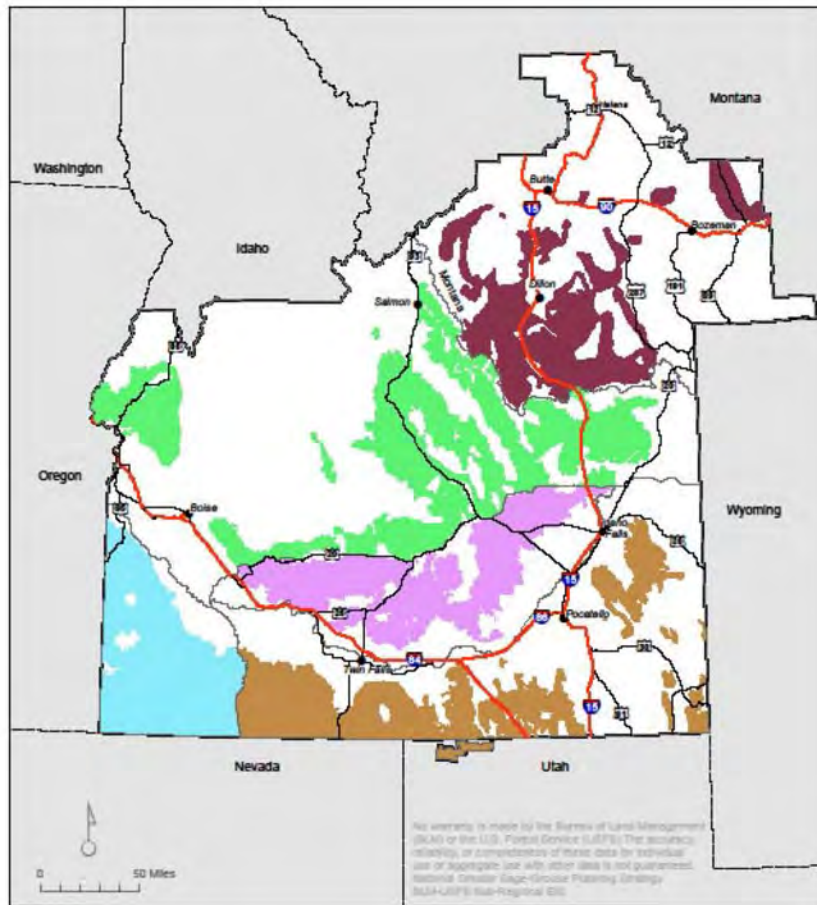

- 5.2. MA-2: Within each Conservation Area (CA) designate GRSG Management Zones: Core, Important and General Management Zones (Map 2). **Core Management Zones (CMZs)** focus on conserving the two key meta-populations in the sub-region. These meta-populations consist of a large aggregation of interconnected breeding subpopulations of GRSG that have the highest likelihood of long-term persistence. The CMZ encompasses areas with the highest conservation value to GRSG, based on the presence of larger leks, habitat extent, important movement and connectivity corridors and winter habitat. Core Management Zones include adequate area to accommodate continuation of existing land uses and landowner activities. **Important Management Zones (IMZs)** contain additional high value habitat and populations that provide a management buffer for the CMZ, connect patches of CMZ. The IMZ encompasses areas of generally moderate to high conservation value habitat and/or populations and in some CAs includes areas beyond those identified by USFWS as necessary to maintain redundant, representative and resilient populations

(Priority Areas for Conservation (PACs)). The IMZs are typically adjacent to CMZs but generally reflect somewhat lower GRSG population status and/or reduced habitat value due to disturbance, habitat fragmentation or other factors. There are no IMZs designated within the Southwestern Montana CA. **General Management Zones (GMZs)** encompass habitat that is outside of CMZs or IMZs. It is generally characterized by more marginal habitat and few, if any, occupied leks or other important seasonal use areas.

- 5.3. MA-3: Annually prioritize Conservation Areas at the state scale considering results of the annual adaptive regulatory trigger evaluations relative to implementation of restoration and mitigation activities.
- 5.4. MA-4: Prioritize activities to protect, enhance and restore GRSG habitats (i.e. suppression activities, fuels management activities, vegetation treatments, invasive species treatments, etc.) first by Conservation Area, if appropriate (CA under adaptive management or at risk of engaging adaptive management), followed by Core Management Zones, then Important Management Zones then General Management Zones within the Conservation Areas. Local priority areas within these zones will be further refined as a result of completing the GRSG Wildfire and Invasive Species Habitat Assessments as described in Appendix D. This could include projects outside GRSG habitat when those projects would provide a benefit to GRSG habitat.
- 5.5. MA-5: The management zone map and biologically significant unit baseline map would be re-evaluated in conjunction with plan evaluation processes (i.e. approximately every 5 years). This re-evaluation could indicate the need to adjust Core, Important or General Management Zones or the habitat baseline. These adjustments could occur upon completion of the appropriate analysis (plan amendment) to review the allocation decisions based on the map.
- 5.6. MA-6: The appropriateness of specific project proposals or management activities within the management zone designations (Core, Important, General) would be assessed individually during project-level NEPA analysis. This evaluation is necessary since designations of Core, Important and General Management Zones were derived at a broad scale with additional refinements relative to boundaries and management consideration; locally GRSG habitat suitability and vegetation characteristics vary.

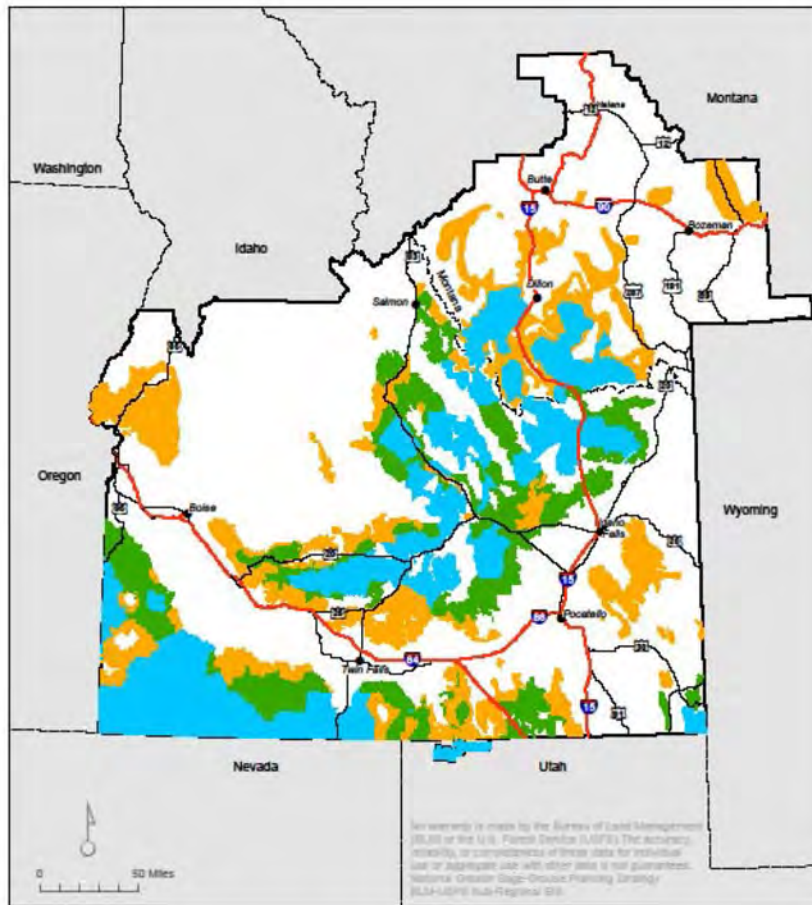

**Comment [BER23]:** From Paul - newly identified habitat use areas that are agreed upon between BLM/FS and IDFG that are outside the boundaries of the FEIS C//G zones, could be managed as "General" during the interim 5 year time frame between map updates?. [This would necessitate a rule set based on telemetry or other verified info showing the area is indeed a seasonal use area and not just a random observation.]

Map 1. Conservation Areas within Idaho and Southwestern Montana Subregion

- |   |                            |
|---|----------------------------|
| <b>Conservation Area with Management Zone</b> | Conservation Area Boundary |
| Idaho Desert Conservation Area                | Analysis Boundary          |
| Idaho Mountain Valleys Conservation Area      |                            |
| Idaho Southern Conservation Area              |                            |
| Idaho West Owyhee Conservation Area           |                            |
| SW Montana Conservation Area                  |                            |

  - Analysis Boundary

## 6. Adaptive Management

- 6.1. Adaptive Management (AM)-1: Idaho: Use hard and soft population and habitat triggers, evaluated within a Conservation Area, to determine an appropriate management response.
- 6.2. AM-2: Utilize monitoring information collected through the Monitoring Framework Plan (Appendix E) to determine when adaptive regulatory triggers have been met.
- 6.3. AM-3: Idaho: BLM and Forest Service would maintain GRSG habitat information, through use of the Key Habitat map or latest sagebrush/vegetation map, which would be used to track and identify habitat changes to assess the habitat trigger in the adaptive management approach. Key habitat map updates are made each winter by BLM in coordination with the FS and Idaho Department of Fish and Game (IDFG), using the process described in Appendix F.
- 6.4. AM-4: BLM and Forest Service would utilize population information collected and maintained by the Idaho Department of Fish and Game to track and identify population changes to assess the population trigger in the adaptive management approach...
- 6.5. AM-5: Twice each year the applicable monitoring information would be reviewed to determine if any adaptive management criteria have been met.
- 6.6. AM-6: Adaptive regulatory triggers would be individually calculated across all ownerships within the biologically significant units (BSU). The BSU is defined as the nesting and wintering habitat within Core and Important Management Zones within a Conservation Area.
- 6.7. AM-7: Adaptive Regulatory Criteria for Hard Habitat Triggers are defined as:  
A 20 percent combined loss of nesting and/or wintering habitat within CMZ within a CA compared to the 2011 biologically significant unit (BSU) baseline (Map 3) (The BSU is defined as the nesting and wintering habitat within Core and Important Management Zones within a Conservation Area, inclusive of all ownerships and is used in the evaluation of the adaptive regulatory triggers and the anthropogenic disturbance threshold); or  
A 20 percent combined loss of nesting and/or wintering habitat within IMZ within a CA compared to the 2011 BSU baseline.
- 6.8. AM-8: Adaptive Regulatory Criteria for Soft Habitat Triggers are defined as:  
A 10 percent combined loss of nesting and/or wintering habitat within CMZ within a CA compared to the 2011 BSU baseline; or  
A 10 percent combined loss of nesting and/or wintering habitat within IMZ within a CA compared to the 2011 BSU baseline.
- 6.9. AM-9: Adaptive Regulatory Criteria for Hard Population Triggers are defined as:  
A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within CMZ within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline; or  
A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within IMZ within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline.
- 6.10. AM-10: Adaptive Regulatory Criteria for Soft Population Triggers are defined as:  
A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within CMZ within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011; or

**Comment [BER24]:** Describe Project Level Adjustments.

**Comment [BER25]:** From Paul - Confirm if this should read "average maximum" (avg max no. per lek) or is it the total max number of birds. Important distinction.

A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within IMZ within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011.

- 6.11. AM-11: When any of the Adaptive Regulatory Criteria for Soft Triggers have been met then the Implementation Team would engage to identify implementation level actions that may be appropriate to consider.
- 6.12. AM-12: When any of the Adaptive Regulatory Criteria for Soft Triggers have been met the Implementation Team would evaluate causal factors and recommend additional potential implementation level activities Appendix G.
- 6.13. AM-13: When any of the Adaptive Regulatory Criteria for Hard Triggers have been met due to loss of habitat then CMZ management actions would be applied to the IMZ within that CA.
- 6.14. AM-14: If an adaptive regulatory trigger is tripped and livestock grazing is identified as a probable limiting factor then adjustments would follow the Adaptive Grazing Management Response described in Appendix G.
- 6.15. AM-15: Remove any adaptive management response when the habitat or population information shows a return to or an exceedance of baseline values within the associated CA.
- 6.16. **Montana Adaptive Management:**

**Comment [BER26]:** John Carlson to provide template of language.

DRAFT

## 7. Anthropogenic Disturbance

- 7.1. Anthropogenic Disturbance (AD)-1: Limit anthropogenic disturbance to 3 percent as calculated within the biologically significant unit (BSU) (Map 3). The BSU is defined as the nesting and wintering habitat within Core and Important Management Zones within a Conservation Area, inclusive of all ownerships. Anthropogenic disturbance excludes habitat disturbance from wildfire and includes activities described in Table X. For Idaho this disturbance is measured by direct footprint or by ROW width for linear features. For Montana this disturbance is measured utilizing the Disturbance Density Calculation Tool process described in Appendix I.
- 7.2. AD-2: New anthropogenic disturbances within winter and nesting habitat within Core or Important management zones within a CA where the disturbance threshold is already exceeded from any source or where the proposed development would result in the threshold being exceeded would not be allowed until enough habitat has been restored to maintain the area under this threshold (subject to valid existing rights).
- 7.3. AD-3: Core Management Zone: Anthropogenic Disturbance Exception Criteria – in addition to the Core and Important Management Zone Anthropogenic Disturbance Development Criteria (AD-4), the following criteria must all be met in the screening and assessment process:
  - a. The population trend for the GRSG within the associated Conservation Area is stable or increasing over a three-year period and the population levels are not currently engaging the adaptive management triggers (this applies strictly to new authorizations; renewals and amendments of existing authorizations would not be subject to this criteria when it can be shown that long-term impacts from those renewals or amendments would be substantially the same as the existing development);
  - b. The development with associated mitigation would not result in a net loss of GRSG habitat and would provide a net conservation benefit of the respective Core Management Zone;
  - c. The project would not likely result in a net loss of GRSG habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA;
  - d. The project is developed pursuant to a valid existing authorization;
  - e. The project is an incremental upgrade/capacity increase of existing development;
  - f. Cannot be reasonably accomplished outside of the Core Management Zone;
  - g. Can be co-located within the footprint of existing infrastructure (proposed actions would not increase the 2011 authorized footprint and associated impacts more than fifty percent (50%), depending on industry practice.
  - h. Development would follow the required design features (RDF) and best management practices (BMPs) as described in Appendix A;
  - i. The project would not exceed the disturbance threshold (AD-1).
  - j. The project has been reviewed by the State Implementation Team and recommended for consideration by the Idaho Governor.
- 7.4. AD-4: Core and Important Management Zone: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:
  - a. The project cannot reasonably be achieved, technically or economically, outside of this management zone; and

- b. The project is co-located within the footprint for existing infrastructure, to the extent practicable. In the event co-location is not practicable, the siting should best reduce cumulative impacts and/or impacts on other high value natural, cultural, or societal resources; and
- c. The project does not result in a net loss of GRSG habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA; and
- d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
- e. The project complies with the applicable RDFs and BMPs as described in Appendix A.
- f. The project would not exceed the disturbance threshold (AD-1).

**7.5. AD-5: Co-locating new infrastructure within existing ROWs and maintaining and upgrading ROWs is preferred over the creation of new ROWs or the construction of new facilities in all management zones. Colocation for various activities is defined as:**

Communication Sites – The installation of new equipment/facilities on or within or adjacent to existing authorized equipment/facilities or within a communication site boundary as designated in the Communication Site Plan.

Electrical Lines – Installation of new rights-of-way (ROWs) adjacent to current ROWs boundaries, not necessarily placed on the same power poles.

Other Rights-of-Way – The installation of new rights-of-way (ROWs) within the existing footprint of an approved ROW boundary or adjacent to an approved ROW boundary.

Designated Corridors – The installation of new rights-of-way within the existing corridor or adjacent to the existing corridor.

**7.6. AD-6: Construction activities and other short-term anthropogenic disturbances would be carried out subject to seasonal and timing restrictions Appendix B.**

Table X

Datasets as Described in the Monitoring Framework <sup>3</sup>	Additional Local Datasets (need definitions)
Oil and Gas Wells and Development Facilities	Underground Pipelines
Coal Mines	Coal Bed Methane Ponds
Wind Towers	Meteorological Towers
Solar Fields	Nuclear Energy Facilities
Geothermal Development Facilities	Airports
Active Locatable, Leasable and Saleable Developments	Military Ranges (ground based?)
Roads	Hydropower plants
Railroads	Recreation Areas
Powerlines	

<sup>3</sup> As described in the Monitoring Framework

Communication Towers	
Other Vertical Structures	
Other Developed Rights-of-way	

DRAFT

## **8. Mitigation**

- 8.1.** Mitigation (MIT)-1: BLM and USFS would establish an inter-agency GRSG Conservation Board at the state level (both Idaho and Montana) to oversee GRSG Conservation.
- 8.2.** MIT-2: The BLM and USFS, in coordination with the GRSG Conservation Board would develop a State Mitigation Strategy. In Idaho this strategy would be consistent with the Idaho Mitigation Framework (Appendix J).
- 8.3.** MIT-3: Mitigate impacts from anthropogenic developments (Appendix H) to GRSG habitats by first avoidance of impacts, minimizing impacts and then compensating for impacts.
- 8.4.** MIT-4: Mitigate anthropogenic development (Appendix H) impacts to CMZs to a no net loss standard (Appendix K) through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix L), referred to as no unmitigated loss.
- 8.5.** MIT-5: Mitigate anthropogenic development (Appendix H) impacts to GRSG habitat through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix L).

## **9. Wildfire Preparedness/Prevention**

- 9.1. Wildfire Preparedness (WFP)-1: Support development and implementation of Rangeland Fire Protection Associations (RFPAs) in coordination with the State of Idaho.
- 9.2. WFP-2: Develop a consistent approach to fire restrictions within GRSG habitat through the existing coordinated inter-agency approach to fire restrictions based upon National Fire Danger Rating System thresholds (fuel conditions, drought conditions, and predicted weather patterns).
- 9.3. WFP-3: Annually incorporate into existing fire management plans results and updates from the Wildfire and Invasive Species Habitat Assessments (FIAT Assessments) described in Appendix D, to communicate/explain the resource value of GRSG habitat, including fire prevention messages and actions to reduce human-caused ignitions.
- 9.4. WFP-4: Continue to participate with the Wildland Fire Leadership Council, a cooperative, interagency organization dedicated to achieving consistent implementation of the goals, actions, and policies in the National Fire Plan and the Federal Wildland Fire Management Policy.
- 9.5. WFP-5: Continue annual coordination meetings held between cooperating agencies that have fire suppression responsibilities. Incorporate Rangeland Fire Protection Associations and other stakeholders into this coordination. Discuss priority suppression areas and distribute maps showing priority suppression areas at both the Conservation Area and the local office levels as based on the adaptive management strategy and FIAT Assessments.
- 9.6. WFP-6: Ensure firefighter personnel receive annual orientation regarding GRSG habitat and sagebrush management issues as related to wildfire suppression.
- 9.7. WFP-7: As part of the FIAT Assessments, identify roads, trails, and recreational use areas with high frequency of human caused fires within or adjacent to the Core or Important Management Zones. Consider these areas during annual fire restriction evaluations, and as appropriate, through site specific management.
- 9.8. WFP-8: Coordinate with Federal, State and local jurisdictions on fire and litter prevention programs to reduce human caused ignitions.
- 9.9. WFP-9: Implement activities identified within the FIAT Assessments.

## **10. Wildfire Suppression**

- 10.1.** WFS-1: Complete Wildland Fire and Invasive Species Assessments (FIAT Assessments) as described within Appendix D and incorporate results into appropriate Fire Management Plans as they are completed. FIAT Assessments are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of priority areas/treatment opportunities for fuels management, fire management, and restoration. These FIAT Assessments identify priority areas and describe strategies for fuels management, suppression and restoration activities.
- 10.2.** WFS-2: As part of the FIAT Assessments incorporate a wildfire response time analysis focusing on response time to identified priority areas within Core and Important Management Zones or on those fires that have the potential to impact Core and Important Management Zones. Incorporate findings into Unit Initial Attack program
- 10.3.** WFS-3: As part of the FIAT Assessment incorporate a water capacity analysis for suppression purposes, including potential private water sources. Provide water availability to respond to fire in or threatening CMZ and IMZ during initial attack.
- 10.4.** WFS-4: During high fire danger conditions, stage initial attack and secure additional resources closer to priority areas identified in the FIAT Assessments, based on anticipated fires and weather conditions, with particular consideration of the West Owyhee, Southern and Desert Conservation Areas to ensure quicker response times in or near GRSG habitat.
- 10.5.** WFS-5: Utilize a full range of fire management strategies and tactics through strategic wildfire suppression planning consistent with appropriate management response and within acceptable risk levels, to achieve resource objectives for GRSG habitat consistent with land use plan direction. Utilizing both direct and indirect attack as appropriate to limit the overall amount of GRSG habitat burned. This could include suppressing fires in intact sagebrush habitats; limiting fire growth in General Management Zones when suppression resources are available or managing wildfire for resource benefit in areas of conifer (juniper) encroachment.
- 10.6.** WFS-6: Suppression priorities: Firefighter and public safety followed by property are the highest priority for protection during suppression activities. Maintaining GRSG habitat will be prioritized immediately after human life and property, commensurate with threatened and endangered species habitat or other critical habitats to be protected.
- 10.7.** WFS-7: Ensure close coordination with federal and state firefighters including the Rangeland Fire Protection Associations during suppression activities.

## **11. Fuels Management**

- 11.1.** FM-1: Design and implement fuels treatments that would reduce the potential start and spread of unwanted wildfires and provide anchor points or control lines for the containment of wildfires during suppression activities with an emphasis on maintaining, protecting, and expanding sagebrush ecosystems and successfully rehabilitated areas and strategically and effectively reduce wildfire threats in the greatest area.
- 11.2.** FM-2: Enhance (or maintain/retain) sagebrush canopy cover and community structure to match expected potential for the ecological site and consistent with GRSG habitat objectives unless fuels management objectives requires additional reduction in sagebrush cover to meet strategic protection of GRSG habitat. Closely evaluate the benefits of the fuel management treatments against the additional loss of sagebrush cover on the local landscape in the NEPA process.
- 11.3.** FM-3: Apply appropriate seasonal restrictions for implementing fuels management treatments according to the type of seasonal habitats present. Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality. Ensure chemical applications are utilized where they would assist in success of fuels treatments. Strategically place treatments on a landscape scale to prevent fire from spreading into Core Management Zones or WUI.
- 11.4.** FM-4: Develop a fuels continuity and management strategy to expand, enhance, maintain and protect GRSG habitat informed by the FIAT Assessments completed as described in Appendix D.
- 11.5.** FM-5: When developing the fuels management strategy as part of the FIAT Assessment described in Appendix D consider up-to-date fuels profiles; land use plan direction; current and potential habitat fragmentation; sagebrush and GRSG ecological factors; active vegetation management steps to provide critical breaks in fuel continuity where appropriate; incorporate a comparative risk analysis with regard to the risk of increased habitat fragmentation from a proposed action versus the risk of large scale fragmentation posed by wildfires if the action is not taken.
- 11.6.** FM-6: Fuel treatments will be designed though an interdisciplinary process to expand, enhance, maintain, and protect GRSG habitat which considers a full range of fuel reduction techniques, including: grazing, targeted grazing, prescribed fire, chemical, biological and mechanical treatments.
- 11.7.** FM-7: Existing and proposed linear ROWs could be considered for use and maintenance as vegetated fuel breaks in appropriate areas.
- 11.8.** FM-8: Fuel breaks would incorporate existing vegetation treatments (seedings) or be located adjacent to existing linear disturbance areas where appropriate. Fuel breaks should be placed in areas with the greatest likelihood of compartmentalizing a fire and/or to foster suppression options to protect existing intact habitat.
- 11.9.** FM-9: Strategically pre-treat areas to reduce fine fuels.
- 11.10.** FM-10: Protect seeding efforts from subsequent fire events.
- 11.11.** FM-11: Targeted grazing as a fuels treatment to adjust the vegetation conditions to reduce the potential start and spread of unwanted wildfires may be implemented within existing grazing authorizations if feasible such as through temporary non-renewable authorizations, or through contracts, agreements or other appropriate means separate from existing grazing authorizations and permits.

- 11.12. FM-12: Targeted grazing to achieve fuels management objectives should conform to the following criteria:
- Targeted grazing should be implemented strategically on the landscape, and directly involve the minimum footprint and grazing intensity required to meet fuels management objectives.
  - Allow conformance to the applicable Standards for Rangeland Health and Guidelines for Livestock Grazing Management (Idaho or Montana) at the assessment scale.
  - Where feasible and applicable coordinate with the grazing permittee to strategically reduce fuels through livestock management within the Mandatory Terms and Conditions of the applicable grazing authorizations
- 11.13. FM-13: Prioritize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low or non-economical, nonnative seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime. When reseeding, use fire resistant native and nonnative species, as appropriate, to provide for fuel breaks.
- 11.14. FM-14: Maintain effectiveness of fuels projects to ensure long-term success, including persistence of seeded species and/or other treatment components while maintaining the integrity of adjacent vegetation.

**12. Wildfire Restoration/Rehabilitation – Emergency Stabilization and Rehabilitation**

- 12.1. ESR-1: Utilize the findings and Restoration/Rehabilitation Strategy developed as part of the FIAT Assessment process described in Appendix D to determine if rehabilitation actions are needed, based on ecological potential, and direct emergency stabilization and rehabilitation (ESR) (BLM) or Burned Area Emergency Restoration (BAER) (FS) actions after fire.
- 12.2. ESR-2: Incorporate GRSG Habitat Management Objectives into ESR/BAER plans based on site potential and in accordance with the Restoration/Rehabilitation Strategy developed as a result of the FIAT Assessments.
- 12.3. ESR-3: Adjust management activities, as appropriate to ensure successful establishment of vegetation from ESR and rehabilitation informed through the evaluation of measurable groundcover and vegetation objectives such as plant vigor, seed production and growing season conditions.
- 12.4. ESR-4: Adjust, as appropriate, livestock management on adjacent unburned areas to mitigate the effect of the burn on local GRSG populations.

### 13. Habitat Restoration and Vegetation Management

- 13.1. VEG-1: Implement habitat rehabilitation or restoration projects in areas that have potential to improve GRSG habitat using a full array of treatment activities as appropriate, including chemical, mechanical and seeding treatments.
- 13.2. VEG-2: Implement vegetation rehabilitation or manipulation projects to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat based on FIAT Assessments, HAF assessments, other vegetative assessment data and local, site specific factors that indicate sagebrush canopy cover or herbaceous conditions do not meet habitat management objectives (i.e. is minimal or exceeds optimal characteristics). This may necessitate the use of prescribed fire as a site preparation technique to remove annual grass residual growth prior to the use of herbicides in the restoration of certain lower elevation sites (e.g., Wyoming big sagebrush) but such efforts will be carefully planned and coordinated to minimize impacts to sage-grouse seasonal habitats.
- 13.3. VEG-3: Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success (Richards et al. 1998). Non-native seeds may be used as long as they support GRSG habitat objectives (Pyke 2011) to increase probability of success, when adapted seed availability is low or to compete with invasive species especially on harsher sites.
- 13.4. VEG-4: Implement management changes in restoration and rehabilitation areas, as necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat and to ensure long-term persistence of improved GRSG habitat (Eiswerth and Shonkwiler 2006). Management changes could be considered during livestock grazing permit renewals, travel management planning, and renewal or reauthorization of rights-of-way.
- 13.5. VEG-5: Consider establishing seed harvest areas that are managed for seed production (Armstrong 2007) to provide a reliable source of locally adapted seed to use during rehabilitation and restoration activities.
- 13.6. VEG-6: Allocate use of native seed to GRSG or ESA listed species habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from ESR (BLM) and/or BAER (Forest Service) projects outside of Core or Important Management Zones to those inside it. Where probability of success or native seed availability is low, nonnative seeds may be used as long as they meet GRSG habitat conservation objectives (Pyke 2011). Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the highest priority for rehabilitation efforts.
- 13.7. VEG-7: During land health assessments evaluate the compatibility of existing nonnative seedings for GRSG habitat to keep as a component of a grazing system, development of a forage reserve, or to be used as a fuelbreak (Davies et al. 2011) or during restoration development. If nonnative seedings do not contribute to a grazing system, are not suitable for a forage reserve, and are not suitable fuelbreaks, evaluate the nonnative seedings in and adjacent to CMZ to determine if they should be diversified with or converted to native grasses, forbs, and shrubs, including sagebrush.
- 13.8. VEG-8: Utilize conifer (juniper) removal treatments to reduce the extent of conifer encroachment areas. Refrain from using prescribed fire and conducting removal

projects in old-growth juniper stands. Old-growth juniper trees are characterized by rounded tops and spreading canopies, often containing dead limbs and/or spike tops, large branches near the base of the tree, as well as furrowed, fibrous bark, and are typically host to arboreal lichens. Leader growth in the upper quarter of the tree is usually less than one inch. These trees are generally distributed on rock outcrop or rubble land soils, or other soils with coarse fragments in the soil-surface and/or slopes over 12-25%, where juniper vegetation type is the climax plant community (IDFG 2000; Miller et al 2005; USDI and USGS 2007).

DRAFT

## **14. Invasive Species**

- 14.1. Invasive Species (INV)-1: Incorporate results of the FIAT Assessments into projects and activities addressing invasive species.
- 14.2. INV-2: Implement noxious weed and invasive species control using integrated weed management actions per national guidance and local weed management plans for Cooperative Weed Management Areas in cooperation with State and Federal agencies, affected counties, and adjoining private lands owners.
- 14.3. INV-3: Conduct integrated weed management actions for noxious and invasive weed populations that are impacting or threatening GRSG habitat quality using a variety of eradication and control techniques including chemical, mechanical and other appropriate means.
- 14.4. INV-4: Require project proponent to ensure that treatments of noxious weeds and invasive species on disturbed project construction areas are completed for at least 3 years.

## **15. Lands and Realty / Infrastructure**

- 15.1.** Lands and Realty (LR)-1: Core: Designate and manage Core Management Zones as ROW avoidance areas subject to RDFs, BMPs, buffers and seasonal timing restrictions (Appendix A, B & C). Important: Designate and manage Important Management Zones as ROW avoidance areas subject to RDFs, BMPs, buffers and seasonal timing restrictions. General: Designate and manage General Management Zones as open with proposals subject to RDFs, BMPs, buffers and seasonal timing restrictions.
- 15.2.** LR-2: Core: Designate and manage Core Management Zones as exclusion areas for utility scale (20 MW) Wind and Solar testing and development, nuclear and hydropower energy development. Important: Designate and manage Important Management Zones as avoidance areas for Wind and Solar testing and development, nuclear and hydropower development. General: Designate and manage General Management Zones as open for Wind and Solar testing and development and nuclear and hydropower development subject to RDFs, BMPs, buffers and seasonal timing restrictions.
- 15.3.** LR-3: Core: Development of commercial service airports and facilities (as defined by FAA 2014 – publically owned airports that have at least 2,500 passenger boardings each calendar year and receive scheduled passenger service) would not be allowed within Core Management Zones. Important and General Management Zones are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 15.4.** LR-4: Core: Development of new landfills would not be allowed within Core Management Zones. Important and General Management Zones are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 15.5.** LR-5: Core Management Zones: Rights-of-way for development of new or amended ROWs and land use authorizations, not excluded, would only be considered when consistent with the Anthropogenic Disturbance Exception Criteria (AD-3). Important: Rights-of-way for development of new or amended ROWs and land use authorizations, not excluded, could be considered consistent with the Important Management Zones Anthropogenic Disturbance Development Criteria. (AD-4). General: New ROW and land use authorizations could be considered.
- 15.6.** LR-6: If the project is an incremental upgrade/capacity increase of existing development - the existing transmission line must be removed within a specified amount of time after the new line is installed and energized.
- 15.7.** LR-7: Existing designated corridors, including Section 368 Corridors, will remain Open (subject to the ongoing settlement agreement).
- 15.8.** LR-8: Process unauthorized use. If the use is subsequently authorized, it would be authorized consistent with direction for the Management Zones within which it is located and the RDFs, BMPs, buffers and seasonal timing restrictions. If the use is not subsequently authorized the site would be reclaimed by removing these features and restoring the habitat.
- 15.9.** LR-9: Land use authorizations that are temporary in nature would be subject to seasonal or timing restrictions and mitigation requirements regarding habitat loss as needed.
- 15.10.** LR-10: New ROW applications for water facilities (ditches, canals, pipelines), or amendments to existing water facilities which include additional structures to improve fish passage or benefits to fisheries (new diversions, fish screens) would be

- allowed on a case-by-case bases subject to RDFs and BMPs to reduce impacts to GRSG habitat and mitigation requirements regarding GRSG habitat loss as needed.
- 15.11. LR-11: When a ROW grant expires, is relinquished, or terminated, the lease holder would be required to reclaim the site by removing overhead lines and other infrastructure and to eliminate avian predator nesting opportunities provided by anthropogenic development on public lands associated with the now void ROW grant (e.g., remove powerline and communication facilities no longer in service).
- 15.12. LR-12: Work with ROW holders to retrofit existing towers with perch deterrents or other anti-perching devices, where appropriate, to limit GRSG predation.
- 15.13. LR-13: Land tenure adjustments would be subject to the following disposal, exchange, and acquisition criteria, which include retaining lands with GRSG habitat. Retention of areas with GRSG would reduce the likelihood of habitat conversion to agriculture, urbanization, or other uses that would remove sagebrush habitat and potentially impact sensitive plants. Criteria:
- a. Lands within Core and Important Management Zones would not be available for disposal (Appendix M).
  - b. Acquire habitat within Core and Important Management Zones, when possible (i.e. willing landowner), and retain ownership of habitat within all Zones, except if a land exchange would allow for additional or more contiguous federal ownership patterns.
  - c. Lands within Core and Important Management Zones would be retained unless exchange of those lands would increase the extent or provide for connectivity of Core or Important Management Zones.
  - d. Evaluate potential land exchanges containing historically low-quality GRSG habitat that may be too costly to restore in exchange for lands of higher quality habitat, lands that connect seasonal GRSG habitats or lands providing for threatened and endangered species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of Core Management Zones. Higher priority will be given to exchanges for those in-tact areas of sagebrush that will contribute to the expansion of sagebrush areas within Core Management Zones currently in public ownership. Lower priority would be given to other lands that would promote enhancement in the Core and Important Management Zones.
  - e. Identify lands for acquisition that increase the extent of or provide for connectivity of Core Management Zones.

## 16. Minerals

### 16.1. Fluid Minerals

- 16.1.1.** Fluid Minerals (FLM)-1: Idaho: Areas within Core Management Zones with no or low potential for fluid mineral development (oil and gas or geothermal) would be closed. Areas within Core Management Zones with moderate to high potential for development and Important Management Zones would be open to mineral leasing and development subject to no surface occupancy, in accordance with the Anthropogenic Disturbance Exceptions (Core – AD-3) and the Anthropogenic Disturbance Development Criteria (Important – AD-4) subject to RDFs, BMPs, buffers, timing restrictions and standard stipulations. General Management Zones would be open to mineral leasing and development subject to CSU which includes RDFs, BMPs, buffers, seasonal timing restrictions and standard stipulations. Montana: Areas within Core Management Zones would be open to leasing subject to no surface occupancy. No waivers, exceptions or modifications would be allowed unless approved by the State Director. General Management Zones would be open to leasing subject to CSU which includes RDFs, BMPs, buffers, seasonal timing restrictions and standard stipulations.
- 16.1.2.** FLM-2: Core Management Zones: Waivers, exemptions or modifications to the NSO stipulation could be considered upon recommendation from the Governor through the Implementation Task Force during the federal site-specific NEPA analysis based on Core Management Zone Anthropogenic Disturbance Exception Criteria (AD-3). Important Management Zones: Waivers, exceptions or modifications to the NSO stipulation could be considered upon recommendation from the Governor through the Implementation Task Force during the federal site-specific NEPA analysis based on the Important Management Zone Anthropogenic Disturbance Development Criteria (AD-4). In the event a waiver, exception or modification were allowed development would still be subject to CSU which includes RDFs, BMPs, buffers, seasonal timing restrictions and standard stipulations.

#### **Waivers, Exceptions and Modifications (WEMs)** (Source IM-2008-032)

A waiver is a permanent exemption from a lease stipulation, the stipulation would no longer apply anywhere within the lease. Waivers require a 30-day public review and are approved and signed by the State Director.

An exception is a one-time exemption for a particular site within the lease; exceptions are determined on a case-by-case basis; the stipulation continues to apply to all other sites within the lease. An exception is a limited type of waiver.

A modification is a change to the provisions of a lease stipulation, either temporarily or for the term of the lease. Depending on the specific modification, the stipulation may or may not apply to all sites within the lease to which the restrictive criteria are applied.

- 16.1.3.** FLM-3: Incorporate required design features, best management practices appropriate to the management area, buffers and seasonal timing restrictions as conditions of approval into any post-lease activities.
- 16.1.4.** FLM-4: Complete a Master Development Plan on leases where a producing field is proposed to be developed.
- 16.1.5.** FLM-5: Encourage unitization when deemed necessary for proper development and operation of an area (with strong oversight and monitoring). The unitization must be

designed in a manner to minimize adverse impacts on GRSG according to the Federal Lease Form, 3100-11, Sections 4 and 6.

**16.2. Unleased Fluid Minerals**

- 16.2.1. FLM-6: Allow temporary geophysical exploration, subject to site-specific RDFs, BMPs, buffers, seasonal restrictions, and daily timing restrictions.
- 16.2.2. FLM-7: Parcels nominated for lease in Core or Important Management Zones would be evaluated to determine whether they meet the Anthropogenic Disturbance Exception (AD-3 for CMZ) or Anthropogenic Disturbance Development Criteria (AD-4) for IMZ, prior to lease offering. Parcels which do not meet the criteria would not be offered for lease.

**Comment [BER27]:** Does this apply to Core, Important or General? Is it closed to this type of use when it is closed to the development?

**16.3. Locatable Minerals**

- 16.3.1. Locatable Minerals (LOC)-1: Lands would remain open to locatable mineral entry in all management zones.
- 16.3.2. LOC-2: Apply reasonable and appropriate Conditions of Approval to prevent unnecessary or undue degradation of GRSG habitat when a Plan of Operations is submitted for BLM or FS approval, in accordance with 43 CFR 3809.411(d)(2) (or 36 CFR 228.5(a)(3) on National Forest System lands).

**16.4. Salable Minerals**

- 16.4.1. Salable Minerals (SAL)-1: Core: No new site authorizations would be approved. Important: New site authorizations could be considered consistent with the Anthropogenic Disturbance Development Criteria (AD-4) subject to RDFs, BMPs, buffers and seasonal timing restrictions. Sales from existing community pits within CMZ and IMZ would be subject to seasonal timing restrictions. General: Open to new site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing sites Open to new sales subject to seasonal timing restrictions.
- 16.4.2. SAL-2: Restore salable mineral pits no longer in use to meet GRSG habitat management objectives.
- 16.4.3. SAL-3: Require reclamation bonding that would require restoration of GRSG habitat on new site authorizations for mineral material pits in IMZ (this would not apply to free use permits issued to a government entity such as a county road district, but would apply to non-profit entities).

**Comment [BER28]:** From Paul - But what if we can show minimal issue such as far from leks, can moderate disturbance in lek/nest season etc. with seasonal or timing restrictions? See buffer table ideas.

**16.5. Non-Energy Solid Mineral Leasable Minerals**

- 16.5.1. Non Energy Leasables (NEL)-1: Core and Important Management Zones: Areas within Know Phosphate Leasing Areas (KPLAs) will remain open to leasing. CMZ areas outside KPLAs are closed to leasing and prospecting. IMZ areas outside of KPLAs are open to leasing in accordance to the Anthropogenic Disturbance Development Criteria (AD-4) subject to the anthropogenic disturbance cap (AD-1), RDFs, BMPs, buffers and seasonal timing restrictions. Exceptions may be made for lease modifications and fringe leases where valid existing rights may be affected. General Management Zones: Lands are available for leasing, exploration activities and initial mine development subject to RDFs, BMPs, buffers, timing restrictions (seasonal and daily) and standard stipulations.
- 16.5.2. NEL-2: Require seasonal and daily timing restrictions in undeveloped non-energy mineral leases when exploration activities or initial mine development is proposed, as appropriate.
- 16.5.3. NEL-3: Include RDFs as conditions of approval to mine plans in undeveloped non-energy mineral leases.

**Comment [BER29]:** From Paul - Verify use of "administratively unavailable" for Important, per Buffer table and discussion with Karen Porter in May.

**16.6. Mineral Split Estate**

- 16.6.1.** Mineral Split Estate (MSE)-1: In coordination with surface land owner, apply stipulations, conservation measures, and design features consistent with those applied to BLM- and Forest Service-administered lands in the management zone where the federal government owns the mineral estate and the surface is non-federal ownership.
- 16.6.2.** MSE-2: Recommend to the state regulatory entity to apply a timing restriction stipulation, COAs, and buffer restricts around occupied leks, when concurring to the approval of authorizations for mineral-related surface disturbance on lands in GRSG habitat where the federal government owns the surface and the mineral estate is in non-federal ownership.
- 16.6.3.** In PPMA, where the federal government owns the mineral estate and the surface is in non-federal ownership, apply the conservation measures applied on public lands.
- 16.6.4.** Same as Alternative D.
- 16.6.5.** In PPMA, where the federal government owns the surface, and the mineral estate is in non-federal ownership, the RDFs identified in Appendix J would be applied to surface developments, unless at least one of the following can be demonstrated in the NEPA analyses associated with the specific project:
- 16.6.6.** • A specific design feature is documented to not be applicable to the site-specific conditions of the project/activity;
  - 16.6.7.** • A proposed design feature or BMP is determined to provide equal or better protection for GRSG or its habitat;
  - 16.6.8.** • Analyses conclude that following a specific feature will provide no more protection to GRSG or its habitat than not following it, for the specific project being proposed.

## 17. Range Management/Livestock Grazing

- 17.1. Range Management (RM)-1: Continue to make GRSG habitat available for livestock grazing. Active AUMs for livestock grazing would remain the same, though the number of AUMs available on an allotment may be adjusted based on site-specific conditions to meet management objectives during term permit renewals, AMP development, or other appropriate implementation planning. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, season of use in accordance with applicable regulations.
- 17.2. RM-2: Prioritize BLM land health assessments and processing of BLM grazing permits consistent with management zone prioritization (MA-4), unless other higher priority considerations exist such as threatened, endangered and proposed species habitat that livestock grazing could affect. Where possible, conduct land health assessments at the watershed, or other meaningful landscape-scale.
- 17.3. RM-3: Where opportunities exist, coordinate with other land managers to encourage livestock operations that utilize mixed federal, private and/or state land to be managed at the landscape scale to benefit GRSG and their habitat across land ownerships.
- 17.4. RM-4: CMZ & IMZ: During the land health assessment process, identify the type(s) of seasonal habitat the assessed areas are capable of supporting. Utilize the habitat assessment framework, (Stiver et al. 2014 as amended/replaced) or other BLM or Forest Service approved methodology, in accordance with current policy and guidance to determine whether vegetation structure, condition and composition are meeting GRSG habitat objectives including riparian and lentic areas (HM-OBJ-2; Table 2). Use appropriate Ecological Site Descriptions, reference sheets and state and transition models to inform desired habitat conditions and expected responses to management changes for the land unit being assessed.
- 17.5. RM-5: When modifying grazing management, analyze indirect effects to habitat, including changes in fuel loading and wildfire behavior.
- 17.6. RM-6: When livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives following consultation, cooperating and coordination with permittees and interested publics, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential modifications include, but are not limited to, changes in:
- 1) Season or timing of use;
  - 2) Numbers of livestock;
  - 3) Distribution of livestock use;
  - 4) Duration and/or level of use;
  - 5) Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011);
  - 6) Voluntary measures such as temporary non-use; and
  - 7) Grazing schedules (including rest or deferment).
- 17.7. RM-7: Where opportunities exist, establish forage reserves to facilitate restoration and rehabilitation efforts in sage-grouse habitat areas.
- 17.8. RM-8: CMZ & IMZ - When an allotment becomes vacant or grazing preference is relinquished, consider voluntary retirement of the allotment or grazing preference in whole or in part, or converting the area to a forage reserve/buffer when doing so would maintain or enhance sage-grouse habitat. GMZ - When an allotment

- becomes vacant or grazing preference is relinquished, consider converting it to a forage reserve/buffer to use during fire rehabilitation or restoration efforts elsewhere, when such actions would result in a net benefit to GRSG habitat and other priority resources.
- 17.9. RM-9: CMZ & IMZ - Where practical, design pasture rotations to utilize exotic perennial grass seedings and/or annual grasslands, during GRSG nesting season annually or periodically.
- 17.10. RM-10: Evaluate the locations where salt/supplements are placed. In coordination with the permittee, have salt/supplements placed in areas which would reduce impacts to GRSG habitat (e.g., existing disturbed areas).
- 17.11. RM-11: Incorporate RDFs into Terms and Conditions for crossing permits to limit disturbance of occupied leks when trailing livestock across BLM- and Forest Service-administered lands in the spring. Work with permittees in locating over-nighting, watering and bedding locations to minimize impacts to seasonal habitats.
- 17.12. RM-12: Design any new structural range improvements, following cooperation, consultation and coordination with permittees, to minimize and/or mitigate effects to GRSG habitat. Any new structural range improvements are subject to RDFs (Appendix A). Structural range improvement in this context, include, but are not limited to: fences, enclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments.
- 17.13. RM-13: During the land health assessment and grazing permit renewal process, evaluate existing livestock management range improvements with respect to their effect on GRSG habitat. Consider removal of projects that are not needed for effective livestock management, are no longer in working condition, and/or negatively affect GRSG habitat, with the exception of functional projects needed for management of habitat for other threatened, endangered or proposed species or other sensitive resources.
- 17.14. RM-14: Prioritize removal, modification or marking of fences or other structures in areas of high collision risk following cooperation, consultation and coordination with permittees to reduce the incidence of GRSG mortality due to fence strikes (Stevens et al. 2012).

**Comment [BER30]:** From Paul – See revised buffer table.

## **18. Wild Horses and Burros**

- 18.1. Wild Horse and Burro (WHB)-1: Develop or amend BLM Herd Management Area Plans and Forest Service Wild Horse Territory Plans to incorporate GRSG habitat objectives and management considerations for all BLM HMAs) and Forest Service Wild Horse Territories.
- 18.2. WHB-2: When evaluating AML on HMAs within CMZ, evaluate indicators that address structure/condition/composition of vegetation and measurements specific to achieving GRSG habitat objectives.
- 18.3. WHB-3: Utilize interdisciplinary land health assessments in HMAs containing GRSG habitat to determine whether vegetation characteristics are meeting appropriate seasonal habitat objectives.
- 18.4. WHB-4: CMZ: Do not expand HMAs. IMZ: Analysis of proposed additions to existing HMA boundaries should consider the direct, indirect and cumulative impacts on GRSG habitat, including the need for additional infrastructure such as boundary fencing, and consider alternative areas outside of CMZ and IMZ.

## 19. Travel Management

- 19.1. Travel Management (TM) -1: Limit motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails. This excludes areas previously designated as open through an affirmative land use plan decision or currently under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices. The initial designation would be “limited to existing roads, primitive roads and trails”; this designation would change to “limited to designated roads, primitive roads and trails”, in areas where travel management plans are completed.
- 19.2. TM-2: Temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use).

Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.

- 19.3. TM-3: Develop Travel Management Plans for each Field Office as described in the BLM Travel Management Handbook 8342.1 and according to the travel management planning guidelines (Appendix N).
- 19.4. TM-4: During subsequent travel management planning design and designate a travel system to minimize adverse effects on GRSG. Locate areas and trails to minimize harassment of wildlife or significant disruption of wildlife habitats. Give special attention to protect endangered or threatened species and their habitats. Allow for route upgrade, closure of existing routes, and creation of new routes to help protect habitat and meet user group needs, thereby reducing the potential for pioneering unauthorized routes. The emphasis of the comprehensive travel and transportation planning within Core Management Zones would be placed on having a neutral or positive effect on GRSG habitat.
- 19.5. TM-5: Conduct road maintenance activities to avoid disturbance during specific times at different seasons – see seasonal and timing restrictions section.

## **20. Recreation**

- 20.1.** REC-1: Manage existing recreation uses and sites to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, BMPs, buffers and seasonal restrictions.
- 20.2.** REC-2: Do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) within CMZs and IMZs unless the development would have a neutral effect or be beneficial to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.); or the new construction replaces existing facilities and reduces impacts from the existing facilities as in TM-4, or unless the development is required for visitor safety or resource protection.

DRAFT

## **21. Monitoring**

- 21.1. Monitoring (MON)-1: Annually complete a review of FIAT Assessment implementation efforts within GRSG habitat with appropriate USFWS and state agency personnel.
- 21.2. MON-2: Annually monitor the effectiveness of fuels treatment projects.
- 21.3. MON-3: Monitor invasive vegetation post vegetation management treatment
- 21.4. MON-4: Monitor project construction areas for noxious weed and invasive species for at least 3 years, unless control is achieved earlier.
- 21.5. MON-5: Use lek, nesting and winter habitat maps and key habitat map (updates) to annually assess GRSG population and habitat status in the context of the adaptive management triggers.
- 21.6. MON-6: Continue to support updates to the Key Habitat map to track vegetation changes in relation to GRSG habitat on a yearly basis, until such a time this process is replaced. The process used to update the Key Habitat Map is described in Appendix F.
- 21.7. MON-7: Monitor GRSG habitat as described in the monitoring framework plan (Appendix E) in coordination with IDFG and MT FWP.

\$æ ~ 1 ,æ ~ 1-#

### General Greater Sage-grouse

**GRSG-Gen-DC-001-Desired Condition** – The landscape for greater sage-grouse encompasses large contiguous areas, approximately 6 to 62 square miles in area, to provide for multiple aspects of species life requirements. Within these landscapes, a variety of sagebrush-community compositions exist, with variations in subspecies composition, co-dominant vegetation, shrub cover, herbaceous cover, and stand structure, to meet seasonal requirements for food, cover, and nesting for greater sage-grouse.

**GRSG-Gen-DC-002-Desired Condition** – Anthropogenic development is focused in non-habitat areas outside of priority and general management areas. Disturbance in general management areas is limited, and there is little to no disturbance in priority management areas except for valid existing rights and where benefits to greater sage-grouse are greater compared to other available alternatives.

**GRSG-Gen-DC-003-Desired Condition** – In greater sage-grouse management areas, including all seasonal habitats, 70% of lands capable of producing sagebrush have 10 to 30% sagebrush canopy cover and less than 10% conifer canopy cover. In addition, within breeding and nesting habitat, sufficient herbaceous vegetation structure and height provides overhead and lateral concealment for nesting and early brood rearing life stages. Within brood rearing habitat, wet meadows and riparian areas sustain a component of perennial forbs with a rich diversity of forb species relative to site potential. Within winter habitat, sufficient sagebrush height and density provides food and cover for greater sage-grouse during this seasonal period. Greater sage-grouse generally use the following seasonal habitats during the following periods: breeding and nesting, March 1 – June 15<sup>4</sup>; brood rearing and summer, June 16 – October 31<sup>1</sup>; winter, November 1 – February 28<sup>1</sup>. Specific desired conditions for greater sage-grouse based on seasonal habitat requirements are in table 1.

<sup>4</sup> Seasonal dates can be adjusted; that is, start and end dates may be shifted either earlier or later, but the amount of days cannot be shortened or lengthened by the local unit.

## Appendix H – Anthropogenic Disturbance

### Disturbance Density Calculation

#### GRSG Local/Site Disturbance Calculation

- **All sub-regions:** Agreed to use the same types of disturbances for fine/site scale monitoring as were used for broad and mid-scale analysis. Would use local data and/or more current satellite imagery if available. Recognize that site specific data, where available, provide a more accurate measure of land cover, disturbance and conifer encroachment than Landfire. In the long-term, ensure fine/site scale monitoring provides results that can be used across the GRSG range and “rolled up” for reporting purposes. In the short term (<5 years), locally derived vegetation data may not be available or easily rolled up, so use of seamless land cover data such as Sagestitch is recommended.

Great Basin sub-regions agreed to use the same type of data sets as used for broad and mid-scale to monitor local/site level conditions. Supplement with local data where available and/or more accurate. The following data layers or local surrogate would be used.

1. Energy (oil and gas wells and development facilities) Based on local info, actual footprint; see NOC language for certain exceptions.
2. Energy (coal mines) Actual footprint
3. Energy (wind towers) Based on local info, actual footprint
4. Energy (solar fields) Based on local info, actual footprint
5. Energy (geothermal) Based on local info, actual footprint
6. Mining (active developments; locatable, leasable, saleable) Based on local info, actual footprint
7. Infrastructure (roads) actual footprint; see road attachment for specific guidance
8. Infrastructure (railroads) abandoned railroads are NOT a disturbance
9. Infrastructure (power lines) Using NOC guidance, apply these widths:
  - <100 kV: use ROW width
  - 100-199kV: 100 ft
  - 200-399kV: 150 ft
  - 400-699kV: 200 ft
  - 700-799kV: 250 ft
10. Infrastructure (communication towers, fire lookouts, met towers) Based on local info, actual footprint
11. Other developed rights-of-ways

**Comment [GJS1]:** Do we need to provide a more specific reference?

**Comment [GJS2]:** Do we need to provide a more specific reference?

The National Monitoring Framework lists the data sets by threat. These are:

<b>FWS Listing Decision Threat</b>	<b>Sagebrush Habitat Availability</b>	<b>Habitat Degradation (Human Activities)</b>	<b>Density of Energy and Mining Facilities</b>
Agriculture	X		
Urbanization	X		
Wildfire	X		
Conifer encroachment	X		
Treatments	X*		
Invasive Species	X*		
Energy (oil and gas wells and development facilities)		X	X
Energy (coal mines)		X	X
Energy (wind towers)		X	X
Energy (solar fields)		X	X
Energy (geothermal)		X	X
Mining (active locatable, leasable, and salable developments)		X	X
Infrastructure (roads)		X	
Infrastructure (railroads)		X	
Infrastructure (power lines)		X	
Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights of ways		X*	

The following data sets would *not* be used to calculate anthropogenic disturbance, but would be used in the habitat baseline to estimate habitat availability or the amount of sagebrush on the landscape within biologically significant units. Use best available data, where Landfire or Sagestitch could be used for biophysical setting (bps), compared to existing vegetation type.

1. Habitat treatments
2. Wildfire
3. Invasive plants
4. Conifer encroachment
5. Agriculture
6. Urbanization, Ex-urban and rural development

**Biologically Significant Unit:**

- Idaho proposes use of Priority (Core) and Important management areas that generally match PACs, but also anticipates assessing disturbance at other scales including nesting and winter habitat, 5 km lek neighborhood, Conservation Areas and/or at the project-scale, depending on need.
- For all subregions, data from these units would be rolled up to the PAC and WAFWA Management Zone, to meet FWS needs. In addition, units must be edge matched/aligned with neighboring states. All sub-regions acknowledge there may be locally important biologically significant units smaller than PACs which may or may not be rolled up to PAC level. The Subregions also acknowledge that assessing disturbance at larger scales such as certain PACs, or via rollup of data, provides a baseline metric for future comparison, but dilution may likely mask disturbance concerns occurring at more local scales.

**Comment [GJS3]:** Kelly Bocking had a paragraph highlighted in the literature that talks about disturbance which specifically warns against calculating disturbance over large areas, small/landscape scale.

***Travel and Transportation Disturbance in Sage-Grouse Habitat***

The following would count as disturbance:

- Linear transportation features identified as roads that have a maintenance intensity of 3 or 5
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a functional classification and a maintenance intensity of level 3 or 5

**Non-Disturbance**

The following items would not count as disturbance:

- Linear transportation features identified as trails.
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a maintenance intensity of either level 0 or 1.

Linear transportation features identified as primitive routes.  
Linear disturbances.

DRAFT

*Travel and Transportation Management Definitions*

**Roads** are linear routes managed for use by low clearance vehicles having four or more wheels, and are maintained for regular and continuous use.

**Primitive Roads** are linear routes managed for use by four-wheel drive or high-clearance vehicles. They do not normally meet any design standards.

**Trails** are linear routes managed for human-powered, stock, or OHV forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-clearance vehicles.

**Linear Disturbances** are human-made linear features that are not part of the designated transportation network are identified as "Transportation Linear Disturbances." These may include engineered (planned) as well as unplanned single and two-track linear features that are not part of the BLM's transportation system.

**Primitive Routes** are any transportation linear feature located within a WSA or lands with wilderness characteristics designated for protection by a land use plan and not meeting the wilderness inventory road definition.

**Temporary routes** are short-term overland roads, primitive roads or trails which are authorized or acquired for the development, construction or staging of a project or event that has a finite lifespan. Temporary routes are not intended to be part of the permanent or designated transportation network and must be reclaimed when their intended purpose(s) has been fulfilled. Temporary routes should be constructed to minimum standards necessary to accommodate the intended use; the intent is that the project proponent (or their representative) will reclaim the route once the original project purpose or need has been completed. Temporary routes are considered emergency, single use or permitted activity access. Unless they are specifically intended to accommodate public use, they should not be made available for that use. A temporary route will be authorized or acquired for the specific time period and duration specified in the written authorization (permit, ROW, lease, contract etc.) and will be scheduled and budgeted for reclamation to prevent further vehicle use and soil erosion from occurring by providing adequate drainage and re-vegetation.

**Administrative routes** are those that are limited to authorized users (typically motorized access). These are existing routes that lead to developments that have an administrative purpose, where the agency or permitted user must have access for regular maintenance or operation. These authorized developments could include such items as power lines, cabins, weather stations, communication sites, spring

**Comment [GJS4]:** This could get confusing. Why have a new definition to confuse between Primitive Road and Primitive Route when we could simply qualify these Primitive Roads when appropriate as within WSA or Wilderness? Also not sure if we designate lands with wilderness characteristics in land use plans any more. We may manage for these characteristics through the use of VRM designations, NSO, etc. but does that then mean that all of the Primitive Roads within these various different surrogate designated areas now need to be reclassified as Primitive Routes?

**Comment [GJS5]:** Same argument. These are still Primitive Roads that may only exist temporarily. I think it is hard enough to get people used to Road and Primitive Road and do not feel that adding new terms for these rare and unique circumstances will help them or us.

**Comment [GJS6]:** Same argument as GJS57 (comment above). Administrative use is a restriction on Roads or Primitive Roads and is again, rare and unique enough that it should be dealt with as a use restriction rather than justification for a new term that will confuse the public.

*Maintenance Intensities*

**Level 0**

Maintenance Description:

Existing routes that will no longer be maintained and no longer be declared a route. Routes identified as Level 0 are identified for removal from the Transportation System entirely.

Maintenance Objectives:

- No planned annual maintenance.
- Meet identified environmental needs.
- No preventative maintenance or planned annual maintenance activities.

### **Level 1**

#### Maintenance Description:

Routes where minimum (low intensity) maintenance is required to protect adjacent lands and resource values. These roads may be impassable for extended periods of time.

#### Maintenance Objectives:

- Low (Minimal) maintenance intensity.
- Emphasis is given to maintaining drainage and runoff patterns as needed to protect adjacent lands. Grading, brushing, or slide removal is not performed unless route bed drainage is being adversely affected, causing erosion.
- Meet identified resource management objectives.
- Perform maintenance as necessary to protect adjacent lands and resource values.
- No preventative maintenance.
- Planned maintenance activities limited to environmental and resource protection.
- Route surface and other physical features are not maintained for regular traffic.

### **Level 3**

#### Maintenance Description:

Routes requiring moderate maintenance due to low volume use (for example, seasonally or year-round for commercial, recreational, or administrative access). Maintenance Intensities may not provide year-round access but are intended to generally provide resources appropriate to keep the route in use for the majority of the year.

#### Maintenance Objectives:

- Medium (Moderate) maintenance intensity.
- Drainage structures will be maintained as needed. Surface maintenance will be conducted to provide a reasonable level of riding comfort at prudent speeds for the route conditions and intended use. Brushing is conducted as needed to improve sight distance when appropriate for management uses. Landslides adversely affecting drainage receive high priority for removal; otherwise, they will be removed on a scheduled basis.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

### **Level 5**

#### Maintenance Description:

Route for high (maximum) maintenance due to year-round needs, high volume of traffic, or significant use. Also may include route identified through management objectives as requiring high intensities of maintenance or to be maintained open on a year-round basis.

Maintenance Objectives:

- High (Maximum) maintenance intensity.
- The entire route will be maintained at least annually. Problems will be repaired as discovered. These routes may be closed or have limited access due to weather conditions but are generally intended for year-round use.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

Lauren, we did not send the draft to SHPO seeking comment. Therefore, we did not receive any comments. We only send the 106 documents for their review and concurrence. Idaho SHPO does not care to see nepa docs. Jon

Jon,

In the ADPP there was a question on pg.45 about Appendix L. Functioning of boards.

I have discussed this with Pat Fosse and we have decided that it might be best to just remove this.

Originally I think it was a place holder to describe how the BLM would coordinate mitigation measures with other agencies and the "MT sage grouse oversight committee" however, since that has not been defined as of yet, we should just remove it. We feel there is enough already in the document explaining that we will coordinate with other agencies.

## Linking conservation actions to demography: grass height explains variation in greater sage-grouse nest survival

Kevin E. Doherty, David E. Naugle, Jason D. Tack, Brett L. Walker, Jon M. Graham and Jeffrey L. Beck

K. E. Doherty ([kevin\\_doherty@fws.gov](mailto:kevin_doherty@fws.gov)), US Fish and Wildlife Service, Lakewood, CO 80228, USA. – D. E. Naugle and B. L. Walker, Wildlife Biology Program, Univ. of Montana, Missoula, MT 59812, USA. DEN also at: USDA Sage Grouse Initiative, Missoula, MT 59812, USA. – J. D. Beck, Dept of Ecosystem Science and Management, Univ. of Wyoming, Laramie, WY 82071, USA

Conservation success often hinges on our ability to link demography with implementable management actions to influence population growth ( $\lambda$ ). Nest success is demonstrated to be important to  $\lambda$  in greater sage-grouse *Centrocercus urophasianus*, an imperiled species in the North American sagebrush-steppe. Enhancing this vital rate through management represents an opportunity to increase bird numbers inside population strongholds. We identified management for grass height as an action that can improve nest success in an analysis of sage-grouse nests ( $n = 529$ ) from a long-term study (2003–2007) in the Powder River Basin, southeast Montana and northeast Wyoming, USA. Average grass height by study area and year varied (11.4–29.2 cm) but its positive effects on nest survival were consistent among study years and study areas that differed in absolute rates of nest success. We tested the predictive ability of models by grouping output from log-link analyses (2004–2006) into two bins with nest success probabilities  $< 0.45$  and  $> 0.55$ , and validated the relationship with additional data from 2003 and 2007. Nests with probabilities  $> 0.55$  were 1.64 (2004–2006) to 3.11 (2007) times more likely to hatch than those  $< 0.45$ , except in 2003 when an early wet spring resulted in universally high grass height at nest sites (29.2 cm) and high predicted nest success (64%). The high predictive power of grass height illustrates its utility as a management tool to increase nest success within priority landscapes. Relationships suggest that managing grass height during drought may benefit sage-grouse populations.

Achieving desired conservation outcomes requires planning at scales that match the biological needs of wide-ranging focal species (Nicholson et al. 2013). Inherent in conservation success is our ability to link demography to implementable management actions that influence population growth ( $\lambda$ ; Mills 2012). Implementing locally beneficial conservation practices inside intact ecosystems maximally benefits species for which landscape context matters (Wilson et al. 2007, Schultz 2010). Advances in spatial ecology make landscape prioritization more feasible (Millsbaugh and Thompson 2009), but identifying intact targets is only a first step (Knight et al. 2008). Still missing in most plans is a demographic link between a conservation action and its ability to influence demographic traits influencing  $\lambda$  (Wisdom et al. 2000, Caswell 2001).

Greater sage-grouse *Centrocercus urophasianus* (hereafter sage-grouse) are native only to western arid and semiarid sagebrush *Artemisia* spp. landscapes (Schroeder et al. 1999), and extirpated from half their range (Schroeder et al. 2004), the species is a candidate for listing under the federal Endangered Species Act (US Fish and Wildlife Service 2010). Major fragmenting threats include energy development (Naugle 2012), wildfire (Bukowski and Baker 2013, Murphy et al.

2013), cultivation for row crop production (Foley et al. 2011) and others (Knick et al. 2013). The current sage-grouse distribution encompasses 76 million hectares, yet population densities are highly clumped across their range (Doherty et al. 2010a). In efforts to focus conservation actions, the US Fish and Wildlife Service identified “Priority Areas for Conservation” (PACs; US Fish and Wildlife Service 2013) by consulting US states to incorporate the best available population and habitat data into site delineation. Research has focused on reducing threats to populations within PACs (Baruch-Mordo et al. 2013, Copeland et al. 2013), yet management actions that aim to bolster populations within priority areas will be critical for a species with declining distribution.

The purpose of our paper is to increase conservation effectiveness by exploring linkages between demography and implementable actions to benefit populations. Nest success is demonstrably important to  $\lambda$ , and enhancing this vital rate through management may benefit populations (Taylor et al. 2012). Variation in nest survival may in part be explained by grass height (DeLong et al. 1995), a feature influenced by grazing (Rickard et al. 1975), and a preeminent landuse in sagebrush systems. We used generalized linear models to

estimate the influence of vegetation and nest characteristics on sage-grouse nest survival within a landscape context (Dinsmore et al. 2002, Rotella et al. 2004). Findings will help guide the US Dept of Agriculture's Sage Grouse Initiative (SGI) in implementing rotational grazing systems designed to increase hiding cover for nesting grouse inside PACs on 847 000 ha of privately-owned rangelands (<www.sagegrouseinitiative.com/our-work/proactive-conservation/> under Grazing Systems).

## Material and methods

### Study area

We sampled sage-grouse in two distinct study areas in Johnson and Sheridan Counties in northeast Wyoming (southern region), and Bighorn, Rosebud, and Powder River Counties in southeast Montana (northern region), USA. Northern study areas were dominated by sagebrush, with conifer encroachment in more rugged landscapes and overall larger grassland areas. Southern study areas were also dominated by sagebrush, but had no conifers and exhibited smaller grassland areas. Shrub-steppe habitats were dominated by Wyoming big sagebrush *A. tridentata wyomingensis* with an understory of native and non-native grasses. Land use in both study areas was dominated by cattle ranching and land tenure was a mix of federal, state and private. Doherty et al. (2008) provides detailed descriptions of study areas. Because of the differences in landscape context, study area was included as a categorical blocking variable.

### Capture, radio-tracking and predictor variables

We captured sage-grouse in rocket-nets and walk-in traps (Giesen et al. 1982) and by spotlighting (Wakkinen et al. 1992) March–April and July–October in 2003–2007. We aged females, fitted them with necklace style VHF radio collars, and relocated sage-grouse to monitor nests by ground based radio-tracking throughout the breeding season. We used established protocols (Connelly et al. 2003) to quantify local vegetative features known to influence habitat selection within  $\leq 15$  m of nests (Connelly et al. 2000, Hagen et al. 2007; Table 1). Doherty et al. (2010b) provides a full description of nest monitoring.

### Statistical analyses and model selection

We used generalized linear models with a binomial likelihood and a log-link to estimate the influence nest age, study area and grass height on the daily survival rates (DSR) of nests (Dinsmore et al. 2002, Rotella et al. 2004). We derived nest survival rates by multiplying DSR together over the 28 day predicted incubation time for sage-grouse. We divided samples into nests used to build the model ( $n = 383$  nests in 2004–2006) and those used to test model stability and predictive capability ( $n = 146$  in 2003 and 2007).

We followed an iterative system for model selection. We first included a variable that controlled for the known effect of a spring snow storm in 2005 on DSR in all variable screenings and final model selection (Walker 2008).

Table 1. List of variables used in model selection explaining sage-grouse nest survival, Powder River Basin, Montana and Wyoming, USA, 2004–2006.

Candidate variables	Description
Local scale habitat variables	
Shrub canopy cover	using the line-intercept method along two 30 m perpendicular transects centered at nest or random locations (Canfield 1941)
Shrub density	all shrubs > 15 cm within 1 m of transect line were counted, total /120 m <sup>2</sup>
Quadratic shrub canopy cover	shrub canopy cover + (shrub canopy cover × shrub canopy cover)
Nearest shrub height	height of nearest shrub to Daubenmire quadrant location. There were 10 Daubenmire quads on each of the two 30 m transects for a total of 20 Daubenmire quads. They were spaced 3 m apart and started at 0 m
Visual obstruction at nest	height density readings at 0, 1, 3 and 5 m from nest or available shrub in each cardinal direction (Robel et al. 1970)
Nearest grass height	average of the vegetative droop height for the nearest grass from the 20 Daubenmire quadrants
Tallest grass height	average of the vegetative droop height for the tallest grass from the 20 Daubenmire quadrants
Average grass height	(nearest grass height + tallest grass height)/2
Nest characteristic variables	
Hen age	yearling or adult (Walker 2008)
Nest age	(nest age in days + nest age in days <sup>2</sup> ) (Walker 2008)
Snowstormmarker	grouped 7 nests that were abandoned following major snow event in May 2005
Abiotic site variables	
Study area	north or south Powder River Basin
Year	year of observation

We assigned predictor variables into 1 of 3 model categories: 1) habitat, 2) nest characteristic, and 3) site variables (Table 1). We first examined univariate selection for study area and the 8 habitat variables, and removed variables if 95% confidence intervals overlapped zero. If predictor variables were highly correlated ( $r \geq |0.7|$ ), only the variable with the greatest biological merit was included in the model (Chatfield 1995). When variables were moderately correlated (i.e.  $|0.3| \leq r < |0.7|$ ), we checked for stability and consistency of parameter estimates as predictor variables were added.

We allowed each variable that made it past variable screening to compete with all other combinations of variables to identify the most parsimonious model for habitat and study area. If variables made it past screening we determined if their addition improved model fit via Akaike's information criterion with a small sample size correction factor ( $AIC_c$ ; Burnham and Anderson 2002). After obtaining the best habitat model using  $AIC_c$  values, we then tested if inclusion of nest characteristic variables (Table 1) and an additional abiotic site variable (year effect) documented in Walker (2008) were still important predictor variables when included with

habitat covariates. We followed the exact variable screening and AIC methods described above to test if these variables improved model fit.

We tested the predictive strength of the final habitat model by grouping predicted nest survival probability from log-link analyses (2004–2006) into two bins with probabilities of nest survival,  $< 0.45$  and  $> 0.55$ , generically representing low and high nest survival probabilities, respectively. We then compared observed nest success from independent data sets (2003 and 2007) between low and high validation bins, and calculated the ratio of observed nest success between the high and low bins. We reasoned that observed nest success should be higher in the top validation bin if the final model predicted nest success well across years, demonstrated by a ratio of observed nest success  $> 1$  between bins. We further evaluated the predictive model by comparing predicted nest success from our top model to observed nest success by year. Average grass height around nesting sage-grouse in a given year (Table 1) was the only continuous predictor variable included in our top model, thus we evaluated how well one variable served as an indicator of nest success. Statistical analyses were performed in program SAS ver. 8.0 (SAS Inst. <http://v8doc.sascom/sashtml/>).

We performed a bootstrap analysis to quantify precision and the effect size of grass height on nest survival, using beta coefficients from the best approximating model (Burnham and Anderson 2002). We used the logistic exposure equation (Rotella et al. 2004) to generate the predicted probability of successfully hatching a nest for each bootstrap dataset ( $n = 5000$ ) by systematically varying grass height within the observed range of variation. We computed at each percentage the probability of successfully hatching a nest for each of 5000 simulations. We ordered these probabilities and used a rankit adjustment (Chambers et al. 1983) to estimate upper and lower 95% confidence intervals.

## Results

Nearest, tallest and average grass height were the only variables with significant coefficients when tested univariately. Nearest, tallest and average grass height were all positively associated with nest success, but were highly correlated and could not be included in the same model. Average and nearest grass height had virtually identical univariate coefficient estimates, however average grass height showed less variation around the estimate (average grass height  $\beta = 0.034$ ,  $SE = 0.013$ ,  $95\% CI = 0.008–0.060$  vs nearest grass height  $\beta = 0.039$ ,  $SE = 0.019$ ,  $95\% CI = 0.001–0.076$ ). Further, average grass height outcompeted nearest and tallest grass measures based on  $AIC_c$  values, thus it was retained for additional modeling.

The addition of study area increased model fit, while hen age and year effects were removed from the model because they explained no additional variation in nest survival when included with habitat variables and confidence intervals around effect estimates overlapped zero. The inclusion of nest age increased model fit ( $w_i = 0.974$ ; Table 2). Our final model included average grass height, nest age, study area and the variable that controlled for the known effect of a spring snow storm in 2005 on DSR.

Table 2. Comparisons of grass height, study area and nest age variables to identify the  $AIC_c$  best model explaining sage-grouse nest survival, Powder River Basin, Montana and Wyoming, 2004–2006<sup>a</sup>.

Model	K	$AIC_c$	$\Delta AIC_c$	$w_i$
Average grass height + study area + nest age	6	834.418	0.000	0.974
Average grass height + study area	4	841.634	7.216	0.026
Average grass height	3	866.099	31.681	0.000
Study area	3	927.881	93.463	0.000

<sup>a</sup>all models included a categorical blocking variable which controlled for nests abandoned in a heavy spring storm in 2005 (Walker 2008).

Estimates of average grass height tracked annual trends in nest success (Fig. 1; northern region 2003–2007, beta estimate = 0.036,  $p = 0.023$ ; southern region 2004–2007, beta estimate = 0.079,  $p = 0.001$ ). Bootstrap analyses showed the positive relationship between average grass height and nest success (Fig. 2). Our final model including grass height and study area demonstrated large effect sizes (Fig. 2). Nests with probabilities  $> 0.55$  were 1.64 (2004–2006) to 3.11 (2007) times more likely to hatch than those  $< 0.45$  (Table 3), except in 2003 when average grass height (29.2 cm) and apparent nest success reached their highest recorded levels (68%, Fig. 1).

## Discussion

High predictive power of grass height illustrates its utility as a management tool to benefit sage-grouse populations. Findings show grass height is a strong predictor of nest survival inside intact landscapes, and increasing hiding cover can increase nest success, a demographic rate that explains a

Figure 1. Apparent and predicted annual nest survival by year for sage-grouse in the Powder River Basin, Montana and Wyoming, US, 2003–2007. The final model included the effects of grass height, nest age, study area, and 2005 spring snow storm. Grass height measurements were averaged across nests within years to make annual predictions.

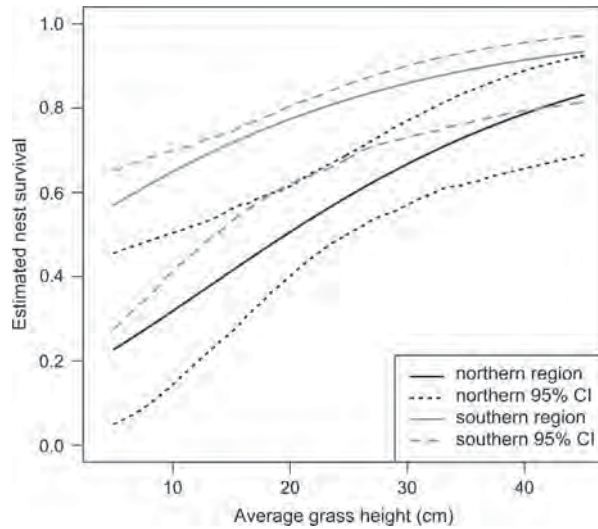

Figure 2. Relationship between average grass height and sage-grouse nest survival, Powder River Basin, Montana and Wyoming, USA, 2004–2006. Estimates of nest survival (95% confidence intervals [CIs]) in both study areas are based on 5000 bootstrap samples.

third of variation in  $\lambda$  (Taylor et al. 2012). Moreover, grass height is a reliable management tool because it explained variation (Fig. 2) despite variability in absolute rates of nest success between study areas. Positive effects of grass height should be evaluated on other important demographic rates including adult female and chick survival (Taylor et al. 2012) to see if benefits extend beyond what is now known.

Managing grass height in large and intact landscapes with grazing is a tool that may benefit populations in eastern Montana and northeast Wyoming. Positive effects of grass height in our study areas explained variation in nest success between years with large and precise effect sizes. Differing intercepts prohibit extrapolating of results to novel sagebrush systems because absolute effects likely depend upon regional conditions that influence grass and shrub composition. South and west of our study areas where sagebrush rather than grass provides most hiding cover, grass height had only a weak effect on nest success, and nest fates were dominated by year and site effects (Holloran et al. 2005). Grass height is positively related to nest success for other prairie grouse species

Table 3. Validation of grass height as a predictor for sage-grouse nest success, Powder River Basin, Montana and Wyoming, 2003–2007. We tested the AICc best model (Table 2) by calculating the predicted probability of hatching for each nest by applying grass height and region coefficients from log-link analysis (2004–2006) to observed grass heights at nests. We used the predicted probability ( $n$  is number of nests in each category) of hatching to group nests with probabilities of  $<0.45$  and  $>0.55$  and then compared apparent nest success ratios. We also validated the relationship with independent data sets (2003 and 2007). Nest age was excluded because we exponentiated daily survival rate for nests across the 28-day incubation period.

Predicted probability	Observed nest success		
	2003	2004–2006	2007
$p < 0.45$ (low)	0.714 ( $n = 7$ )	0.486 ( $n = 70$ )	0.200 ( $n = 5$ )
$p > 0.55$ (high)	0.667 ( $n = 30$ )	0.796 ( $n = 184$ )	0.623 ( $n = 52$ )
Ratio (high/low)	0.93	1.64	3.11

and subspecies (Attwater's prairie-chickens *Tympanuchus cupido attwateri*, Lehmann 1941; plains sharp-tailed grouse *T. phasianellus jamesi*, Hillman and Jackson 1973; greater prairie-chicken *T. cupido pinnatus*, McKee et al. 1998).

Findings suggest that maintaining grass height during drought may provide the greatest benefits to populations. Average grass height and predicted nest success in this study is within the range of published literature (Schroeder et al. 1999, Connelly et al. 2000). Benefits may be negligible in years resembling 2003 when spring rains provided abundant grass and the correspondingly highest predicted nest success for the northern study area. High variation in pooled grass height by study area and years (11.4–29.2 cm) also suggested that modifying grazing practices to maintain nesting cover could improve a habitat feature that otherwise limits  $\lambda$ . We have identified a strong corollary of nest success in the Powder River Basin (PRB). If this relationship is validated in new study areas across different parts of the sage-grouse range, and if the relationship between grass height and nest success can be calibrated within these new areas, grass height may be useful as a surrogate to monitor nest success.

Findings emphasize the importance of an indirect effect of grazing on sage-grouse nest success. Results have broad implications because livestock grazing is the most widespread land use in the world (Holechek et al. 2003), affecting 70% of land area in the western US (Fleischner 1994). Effects of grazing on sage-grouse habitat may be wide-ranging depending upon current and historic timing and intensity of grazing, soil conditions, precipitation, plant communities and habitat features under consideration (Beck and Mitchell 2000, Connelly et al. 2000, 2004, Crawford et al. 2004). However, adjustments to duration and timing of grazing also may increase residual cover with the added benefit of increasing long-term rangeland health on which birds depend. For example, reducing the short-term stocking rate of sheep increased black grouse *Tetrao tetrix* numbers by 6% annually in Europe by increasing residual cover (Calladine et al. 2002). Replicated experiments to document sage-grouse response to different grazing systems are needed to help guide land managers to practices that are beneficial to sage-grouse and economically viable to producers (Krausman et al. 2011).

Habitat management within a PAC-based conservation strategy may benefit populations, but sage-grouse are a wildland species, and grass height is of little consequence if sagebrush systems continue to be replaced by anthropogenic land uses (Knick et al. 2013). Viability of ranching as a predominant land use may in part determine the future of sage-grouse conservation in the West. The SGI has increased by four-fold their implementation of rotational grazing systems by resting for up to 17 months the pastures used by nesting sage-grouse within 488 000 ha inside Montana's PACs (J. Siddoway pers. comm.). Our findings suggest that these types of grazing systems that promote nest success may provide one mechanism to offset population losses by increasing bird numbers.

MT Disturbance Transition Language.docx  
14K

*If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) or if anthropogenic disturbance and habitat loss associated with conversion to agricultural tillage or fire exceed 5% within a project analysis area, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.) will be permitted by BLM within a project analysis area until the disturbance has been reduced to less than the cap. If the BLM determines that the State of Montana has adopted a GRSG Habitat Conservation Program that contains comparable components to those found in the State of Wyoming's Core Area Strategy including an all lands approach for calculating anthropogenic disturbances, a clear methodology for measuring the density of operations, and a fully operational Density Disturbance Calculation Tool, the 3% disturbance cap will be converted to a 5% cap for all sources of habitat alteration within a project analysis area.*

Beck, Jonathan &lt;jmbeck@blm.gov&gt;

I really hope these are the last updates (though i know there will be a grass bank definition to come next week). Please see these two attachments, one for grazing which includes changes for buffers and one for adaptive management. I have highlighted the changed language in the grazing document to make it easier to pick out. Please let me know if you have any questions.

And thank you all. Everyone involved in this planning effort got major props from the Department today, when I said we were on target to meet the May 29th publication date!

## Drop In Language For the Plans:

### **Vegetation Objectives**

The ADPPs will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be developed using current local and regional GRSG habitat research and data and used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP.

These habitat objectives in Table XX summarize the characteristics that research has found represent the seasonal habitat needs for Greater Sage-Grouse. The specific seasonal components identified in the Table were adjusted based on local science and monitoring data to define the range of characteristics used in this subregion. Thus, the habitat objectives provide the broad vegetative conditions we strive to obtain across the landscape that indicate the seasonal habitats used by sage-grouse. These habitat indicators are consistent with the rangeland health indicators used by the BLM.

The habitat objectives will be part of the sage-grouse habitat assessment to be used during land health evaluations (see Monitoring Framework, Appendix X). These habitat objectives are not obtainable on every acre within the designated GRSG habitat management areas. Therefore, the determination on whether the objectives have been met will be based on the specific site's ecological ability to meet the desired condition identified in the table.

All BLM use authorizations will contain terms and conditions regarding the actions needed to meet or progress toward meeting the habitat objectives. If monitoring data show the habitat objectives have not been met nor progress being made towards meeting them, there will be an evaluation and a determination made as to the cause. If it is determined that the authorized use is a cause, the use will be adjusted by the response specified in the instrument that authorized the use.

The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

- *In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with*

10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in *Interpreting Indicators of Rangeland Health* (BLM Tech Ref 1734-6).

### **Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of ADPPs.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*
- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds, based on **GRSG Habitat Objectives Table, Land Health Standards (43 CFR 4180.2) and ecological site potential, and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis.***
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, **such as grass banks or fire breaks.***

### **Lek Buffers**

**Issue:**

**Application of Lek Buffers**

**Direction:**

The ADPPs will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA and PHMA (see Attachment V) through this drop-in Chapter 2 language:

*“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review ([Open File Report 2014-1239](#)) in accordance with Appendix X.”*

### Attachment V

#### **Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*  
Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the

BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

- linear features (roads) within 3.1 miles of leks
- infrastructure related to energy development within 3.1 miles of leks.
- tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
- low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
- surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
- noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in GHMA that are within the applicable lek buffer distance identified above only if:

- Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater level of protection to GRS and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or
- The BLM determines that impacts to GRS and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and

- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).
- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- Range improvements which do not impact GRSG, or, range improvements which provide a conservation benefit to GRSG such as fences for protecting important seasonal habitats, meet the lek buffer requirement.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

Add to all plans, in the adaptive management section:

*In making amendments to this plan, the BLM will coordinate with the FWS as BLM continues to meet its objective of conserving, enhancing and restoring GRS habitat by reducing, minimizing or eliminating threats to that habitat.*

Idaho Preconsistency.docx  
16K

Comment	Response
Section 2.1—Please remove “substantial” from section title. This is a change to the template.	
p.2-40 to p.2-42: Somewhere in the fluid minerals section, please reiterate that SFAs are NSO without waiver, exception, or modification.	
AD-1: Make following edit to be internally consistent with applying disturbance cap in IHMA: “...will be permitted by BLM within GRSG PHMAs and IHMAs in any given Biologically Significant Unit until the disturbance...”	
HM-OBJ-2/Table 2-3: Please add reference column to Table 2-3, and shown in 1/30 guidance. Please add reference for each desired condition.	
p. 2-43: Mineral Materials drop in language needs to apply to Idaho also.	
<p>LR-13: Please make following change to drop in language. This was a mistake in the guidance. Apologies. Please replace last sentence of LR-13 with:</p> <p>“The BLM is analyzing GRSG mitigation measures through the projects’ NEPA review process.”</p>	
LR-1: Please add language stating that GHMA (Montana) is open to minor ROWs. I don’t think I saw this captured in LR-1 or LR-2.	
FM-15: Please replace with new prescribed fire drop in language sent on March 4 <sup>th</sup> . Sorry for the late change.	
Mitigation Appendix: Please revise Part III of the mitigation appendix to remove the concept of “no net unmitigated loss”. This concept/standard has been replaced with “net conservation gain”. Is it possible to rephrase this Part III as the “Idaho and Southwestern Montana Subregion Net Conservation Gain Process” while keeping the rest of the content the same?	
Please indicate where the hard trigger responses are in the document. Not readily apparent in Chap 2 or the Appendix.	

Beck, Jonathan &lt;jmbeck@blm.gov&gt;

As you may have heard, we are changing the drop in language referencing grass banks as an example. Please use the below language instead in the grazing section:

- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fire breaks.*

A reserve common allotment is an area which is designated in the land use plan as available for livestock grazing but reserved as an area available for use as an alternative to grazing in another allotment in order to facilitate rangeland restoration treatments and recovery from natural disturbances such as drought or wildfire. The reserve common allotment would provide needed flexibility that would help the agency apply temporary rest from grazing where vegetation treatments and/or management would be most effective.

Dear BLM,

Please fully consider the paper at the link below in any efforts to lethally "control" ravens on public lands.

BLM must take a more active role analyzing the adverse environmental impacts of various predator killing schemes conducted on public lands.

They imbalance ecosystems, and serve to distract from greatly needed habitat changes.

Better habitat is key, not poisoning native corvids.

<http://onlinelibrary.wiley.com/doi/10.1111/ibi.12223/pdf>

Madden et al. 2014.

Please fully consider this in the sage-grouse EIS process, as well as the 2015 iteration of a Wildlife Services EA to impose poison across broad swaths of Idaho public lands. In that process, only non-lethal "control" and habitat improvement measures can be considered viable corvid "control" alternatives.

Who is now in charge of the EIS process in Idaho? I understand Brandon Knapton is now working on the appalling effort to impose livestock facilities and continued high levels of overstocking and harmful periods of livestock use on the Garat allotment sage-grouse habitats.

Who is now in charge of the ID-NW MT GRSG EIS process?

Thank you,

Katie Fite

Dear BLM,

I now just noticed as one continues on down the BLM eplanning page that there are MORE very harmful reservoir and other water "maintenance" projects under mere CEs.

This is alarming - as these projects are the basis for severe depletion, degradation and weed invasions of GRSG habitats. These cesspools of cow waste promote diseases and toxic algae, disrupt watershed processes and drainage networks, and further reduce, alter and destroy sage-grouse spring and meadow/drainage bottom/brood rearing habitats. Many of these are dug into springs or meadow areas.

Further, increasing the capacity of these harmful livestock developments to hold water only results in even more severe impacts to the surrounding landscape - as cows remain grazing in large numbers exploiting the surrounding lands. This severely depletes a wider and wider area. Impacts may become even worse during drought.

See: RIDDLE Reservoir maintenance. Isn't this part of a series of segmented, piecemeal projects in the Riddle

allotment? Why is this under a separate CE from the EA (which needs to be an EIS)?

<https://www.blm.gov/epl-front-office/eplanning/projectSummary.do?methodName=renderDefaultProjectSummary&projectId=40153>

Then this for SIMPLOT in the Northwest allotment:

<https://www.blm.gov/epl-front-office/eplanning/projectSummary.do?methodName=renderDefaultProjectSummary&projectId=39893>

#### Project Description:

Maintenance would involve removing accumulated sediment from reservoir bottoms, particularly the deepest storage areas by use of heavy equipment such as a bulldozer. Maintenance of the water gap involves repair or extension of the side panels and associated cables and use of an excavator to reduce the grade down into the water from the west approach. Disposal of some removed material within the adjacent water gap may be necessary. Spoil material could be sediment collected behind the embankment or bottoms of the deepest storage areas. Reservoir pit floors could be lined with a layer of clay bentonite if necessary to reestablish the seal after work is completed; but the work would be conducted in a manner intended to avoid damage to the seal. All earthwork and material staging would occur in areas previously affected by impoundment construction or inundation. The following maintenance stipulations would be in effect, per the original Cooperative Agreements, CXs, and EAs: 1. Stay within original area of disturbance 2. Disposal of sediment may be added to embankment for dam or reservoir berm if that is the most feasible action 3. Disturbed areas will be dressed so as to improve visual appearance 4. Cross country travel will be restricted to periods when the soil is dry and firm enough to support vehicles without creating ruts 5. No new roads or blading will be allowed in moving equipment to the various reservoir sites

#### Project Location:

T11S, R02E, Sec 9, 20 and T11S R03E Sec 24, 30, 35

An EIS is required for all of these, too.

There is also a project in the Battle Creek allotment for Simplot at Hutch Springs:

We have seen NO Scoping info. Please immediately provide me with all information on all of these projects, as well.

We are increasingly dismayed at the current path of the Boise District BLM.

In the Owyhee FO, following ALJ Holt's rancher-biased decision (with ALJ Holt never even addressing WWP's Appeal and claims), BLM released a Jackson permittee Garat EA that essentially had TWO rancher alternatives. At the same time, BLM has never even responded to WWP's request to meet to discuss a viable conservation alternative. Owyhee BLM is going in the dead opposite direction that all sage-grouse conservation science shows is necessary.

Now in the Bruneau for a Jackson permittee and others, BLM is proposing a raft of exceedingly harmful piecemeal water development intensification/expansion projects - ignoring the need to conserve, enhance and restore sage-grouse habitats by removing and reducing livestock facilities like these livestock water developments, and undertaking large-scale cuts in livestock use and numbers.

There needs to be new management that cares about sage-grouse, and not placating ranchers by intensifying cattle grazing use and killing every juniper in the County based on false Ecosite models and general anti-tree hysteria that the agency has embraced since it serves to distract from taking better care of the sagebrush habitats..

Here is what is happening to what is the largest block of somewhat intact sage remaining in the northern Great Basin GRSG population:

It is being trampled and grazed to a weedland. For example, the cows grazing right now in the Owyhee Stateline allotment are causing - in real time - the expansion of medusa head in one of the best remaining sage pockets left in the nearly destroyed Owyhee ID-OR border habitats. Medusahead, cheat and bulbous bluegrass are

exploding and will soon dominate nearly all the grossly trampled grazed lands in the ID-OR border north of the North Fork Owyhee. To the west, cheatgrass is increasing in Garat and Riddle, and now medusahead invasion looms. Plus bulbous bluegrass and cheatgrass (soon to be followed by medusahead) are sweeping the cow-trashed uplands in the Big Springs allotment and similar areas.

A bleak, bleak picture. Yet the agency response is to double down and do MORE of what has caused the problem in the first place.

I have attached a recent Doherty et al. 2014 paper showing the need to maximize grass height.

Please review the Attached paper - ALL of these damaging projects in the Bruneau, plus the Garat PEA - that are so heavily weighted toward the rancher's desires, show that the Boise District is abjectly failing to properly regulate livestock grazing impacts in the heart of the most important remaining habitats for sage-grouse in the West.

Please also enter this e-mail, and the preceding one of concern about the several Riddle allotment reservoir projects into the Project Record for the ID-E MT GRSG EIS.

Thank you.

On Dec 8, 2014, at 2:24 PM, Katie Fite wrote:

Dear BLM,

I was dismayed to see the following projects in the Riddle allotment posted on the Bruneau BLM's Website (Hoof Butte, Little Shoofly, Yatahoney):

Hoof Butte Wetland Construction – Project would change one to two acres of mesic meadow and silver sagebrush habitat into ephemeral wetland. Construction would require heavy equipment (i.e., tracked bull dozer and excavator). The wetland would be constructed to dry out each year but would hold approximately 12 – 24 inches of water over an area of one to two acres for a period of at least 9 months (November– July) each year. Wetland construction would be accomplished by constructing a ground water dam and reshaping the land behind the dam. Expanded project description available.

Little Shoofly Reservoir Improvement - This reservoir improvement project repair the breached earthen dam by using fill material from the adjacent borrow area. The increased water holding capacity of the reservoir depends on the amount of material removed from the adjacent borrow area. Grading the borrow area from its current level to that of the existing reservoir pit floor, for example may increase capacity by anywhere from 50 to 100 percent, by estimation. Leaving the grade higher would dampen this effect. Vegetation taken from the borrow area would be scattered below the earthen dam along the existing channel. Expanded project description available.

Yatahoney #1 Reservoir Improvement – This reservoir improvement project would re-design the feature by constructing a new earthen dam, lengthening the reservoir's shape, and constructing a new inlet channel. The existing earthen dam would continue to function as the impoundment structure. A new point of diversion

would be created by constructing a new channel. Material from new feature construction would be used onsite to construct a new earthen dam placed to divert water from ephemeral drainages upslope into the new channel and reservoir. The existing short channel would become a spillway, allowing effluent to flow back into the natural drainage after the feature fills. Expanded project description available.

BLM has long delayed conducting the necessary integrated environmental analysis to control the destructive, cheatgrass-spreading hoofprint of permittee Jackson grazing across these crucial sage-grouse, pygmy rabbit, migratory songbird, raptor, and big game and wild lands habitats.

The public was promised an evaluation by Mgr. Signe Sather Blair in the 1990s. BLM wasted tens or maybe even hundreds - of thousands of dollars - in collecting FRH and baseline data in the late 1990s and early 2000s - and never followed through.

Please review and provide me with all FRH, assessment, riparian, upland, wildlife and other information collected for this allotment over the past 20 years.

Due to the political power of the rancher, the process was aborted, funds wasted, and the land and crucial sage-grouse habitats including drying meadows left to become degraded, desertified and sage-grouse habitats invaded by weeds like cheatgrass and white top.

Moreover, we are very concerned that this is linked to the large-scale effort by the Jackson permittee to impose a massive damaging livestock facility footprint in the adjacent Garat allotment.

An EIS must be prepared to assess all of the impacts of the huge burden of livestock facilities in these Jackson allotments on sage-grouse and other wildlife in the local area and the region.

BLM must fully assess a wide range of alternative actions, including determining the capability and suitability of these lands to suffer continued livestock grazing disturbance.

How does expanding stinking, manure-choked waters and West Nile mosquito habitats harm public land and water health and native biota?

We are also concerned that BLM may be trying to placate the permittee - as the agency seeks to acquire a small parcel of land in the Owyhee wilderness that is held in private ownership.

Further, BLM has never adequately addressed our concerns about the very damaging footprint of livestock facilities across this allotment already such as communicated to you following a spring 2014 site visit.

For example, we request that you fully consider REMOVAL of the very harmful spring depleting spring development and livestock water pipeline in the Riddle allotment reported to you in the Attached e-mail.

It is time for a full and integrated hard look at conditions in Riddle, and major reductions and changes in livestock grazing impacts.

What is the current status and trend in sage-grouse habitats and leks? Where is cheatgrass currently present? Where are lands vulnerable to flammable cheatgrass expansion with continued grazing disturbance?

What has the actual use been in all pastures/units and the allotment over the past 20 years?

We are very concerned that use may be shifted and intensified in these areas of the Riddle allotment in order to please the permittee, or minimize cuts that must be made in Garat.

Please enter these concerns into the Garat process, and the Owyhee land trade process as well.

Please be sure to send to me all information on this harmful project if you go forward with it.

We request a site visit.

Sincerely,

/kf

## Linking conservation actions to demography: grass height explains variation in greater sage-grouse nest survival

Kevin E. Doherty, David E. Naugle, Jason D. Tack, Brett L. Walker, Jon M. Graham and Jeffrey L. Beck

K. E. Doherty ([kevin\\_doherty@fws.gov](mailto:kevin_doherty@fws.gov)), US Fish and Wildlife Service, Lakewood, CO 80228, USA. – D. E. Naugle and B. L. Walker, Wildlife Biology Program, Univ. of Montana, Missoula, MT 59812, USA. DEN also at: USDA Sage Grouse Initiative, Missoula, MT 59812, USA. – J. D. Tack, Fish, Wildlife and Conservation Biology, Colorado State Univ., Fort Collins, CO 80523, USA. – J. M. Graham, Mathematical Sciences, Univ. of Montana, Missoula, MT 59812, USA. – J. L. Beck, Dept of Ecosystem Science and Management, Univ. of Wyoming, Laramie, WY 82071, USA

Conservation success often hinges on our ability to link demography with implementable management actions to influence population growth ( $\lambda$ ). Nest success is demonstrated to be important to  $\lambda$  in greater sage-grouse *Centrocercus urophasianus*, an imperiled species in the North American sagebrush-steppe. Enhancing this vital rate through management represents an opportunity to increase bird numbers inside population strongholds. We identified management for grass height as an action that can improve nest success in an analysis of sage-grouse nests ( $n = 529$ ) from a long-term study (2003–2007) in the Powder River Basin, southeast Montana and northeast Wyoming, USA. Average grass height by study area and year varied (11.4–29.2 cm) but its positive effects on nest survival were consistent among study years and study areas that differed in absolute rates of nest success. We tested the predictive ability of models by grouping output from log-link analyses (2004–2006) into two bins with nest success probabilities  $< 0.45$  and  $> 0.55$ , and validated the relationship with additional data from 2003 and 2007. Nests with probabilities  $> 0.55$  were 1.64 (2004–2006) to 3.11 (2007) times more likely to hatch than those  $< 0.45$ , except in 2003 when an early wet spring resulted in universally high grass height at nest sites (29.2 cm) and high predicted nest success (64%). The high predictive power of grass height illustrates its utility as a management tool to increase nest success within priority landscapes. Relationships suggest that managing grass height during drought may benefit sage-grouse populations.

Achieving desired conservation outcomes requires planning at scales that match the biological needs of wide-ranging focal species (Nicholson et al. 2013). Inherent in conservation success is our ability to link demography to implementable management actions that influence population growth ( $\lambda$ ; Mills 2012). Implementing locally beneficial conservation practices inside intact ecosystems maximally benefits species for which landscape context matters (Wilson et al. 2007, Schultz 2010). Advances in spatial ecology make landscape prioritization more feasible (Millsbaugh and Thompson 2009), but identifying intact targets is only a first step (Knight et al. 2008). Still missing in most plans is a demographic link between a conservation action and its ability to influence demographic traits influencing  $\lambda$  (Wisdom et al. 2000, Caswell 2001).

Greater sage-grouse *Centrocercus urophasianus* (hereafter sage-grouse) are native only to western arid and semiarid sagebrush *Artemisia* spp. landscapes (Schroeder et al. 1999), and extirpated from half their range (Schroeder et al. 2004), the species is a candidate for listing under the federal Endangered Species Act (US Fish and Wildlife Service 2010). Major fragmenting threats include energy development (Naugle 2012), wildfire (Bukowski and Baker 2013, Murphy et al.

2013), cultivation for row crop production (Foley et al. 2011) and others (Knick et al. 2013). The current sage-grouse distribution encompasses 76 million hectares, yet population densities are highly clumped across their range (Doherty et al. 2010a). In efforts to focus conservation actions, the US Fish and Wildlife Service identified “Priority Areas for Conservation” (PACs; US Fish and Wildlife Service 2013) by consulting US states to incorporate the best available population and habitat data into site delineation. Research has focused on reducing threats to populations within PACs (Baruch-Mordo et al. 2013, Copeland et al. 2013), yet management actions that aim to bolster populations within priority areas will be critical for a species with declining distribution.

The purpose of our paper is to increase conservation effectiveness by exploring linkages between demography and implementable actions to benefit populations. Nest success is demonstrably important to  $\lambda$ , and enhancing this vital rate through management may benefit populations (Taylor et al. 2012). Variation in nest survival may in part be explained by grass height (DeLong et al. 1995), a feature influenced by grazing (Rickard et al. 1975), and a preeminent landuse in sagebrush systems. We used generalized linear models to

estimate the influence of vegetation and nest characteristics on sage-grouse nest survival within a landscape context (Dinsmore et al. 2002, Rotella et al. 2004). Findings will help guide the US Dept of Agriculture's Sage Grouse Initiative (SGI) in implementing rotational grazing systems designed to increase hiding cover for nesting grouse inside PACs on 847 000 ha of privately-owned rangelands (<www.sagegrouseinitiative.com/our-work/proactive-conservation/> under Grazing Systems).

## Material and methods

### Study area

We sampled sage-grouse in two distinct study areas in Johnson and Sheridan Counties in northeast Wyoming (southern region), and Bighorn, Rosebud, and Powder River Counties in southeast Montana (northern region), USA. Northern study areas were dominated by sagebrush, with conifer encroachment in more rugged landscapes and overall larger grassland areas. Southern study areas were also dominated by sagebrush, but had no conifers and exhibited smaller grassland areas. Shrub-steppe habitats were dominated by Wyoming big sagebrush *A. tridentata wyomingensis* with an understory of native and non-native grasses. Land use in both study areas was dominated by cattle ranching and land tenure was a mix of federal, state and private. Doherty et al. (2008) provides detailed descriptions of study areas. Because of the differences in landscape context, study area was included as a categorical blocking variable.

### Capture, radio-tracking and predictor variables

We captured sage-grouse in rocket-nets and walk-in traps (Giesen et al. 1982) and by spotlighting (Wakkinen et al. 1992) March–April and July–October in 2003–2007. We aged females, fitted them with necklace style VHF radio collars, and relocated sage-grouse to monitor nests by ground based radio-tracking throughout the breeding season. We used established protocols (Connelly et al. 2003) to quantify local vegetative features known to influence habitat selection within  $\leq 15$  m of nests (Connelly et al. 2000, Hagen et al. 2007; Table 1). Doherty et al. (2010b) provides a full description of nest monitoring.

### Statistical analyses and model selection

We used generalized linear models with a binomial likelihood and a log-link to estimate the influence nest age, study area and grass height on the daily survival rates (DSR) of nests (Dinsmore et al. 2002, Rotella et al. 2004). We derived nest survival rates by multiplying DSR together over the 28 day predicted incubation time for sage-grouse. We divided samples into nests used to build the model ( $n = 383$  nests in 2004–2006) and those used to test model stability and predictive capability ( $n = 146$  in 2003 and 2007).

We followed an iterative system for model selection. We first included a variable that controlled for the known effect of a spring snow storm in 2005 on DSR in all variable screenings and final model selection (Walker 2008).

Table 1. List of variables used in model selection explaining sage-grouse nest survival, Powder River Basin, Montana and Wyoming, USA, 2004–2006.

Candidate variables	Description
Local scale habitat variables	
Shrub canopy cover	using the line-intercept method along two 30 m perpendicular transects centered at nest or random locations (Canfield 1941)
Shrub density	all shrubs > 15 cm within 1 m of transect line were counted, total /120 m <sup>2</sup>
Quadratic shrub canopy cover	shrub canopy cover + (shrub canopy cover × shrub canopy cover)
Nearest shrub height	height of nearest shrub to Daubenmire quadrant location. There were 10 Daubenmire quads on each of the two 30 m transects for a total of 20 Daubenmire quads. They were spaced 3 m apart and started at 0 m
Visual obstruction at nest	height density readings at 0, 1, 3 and 5 m from nest or available shrub in each cardinal direction (Robel et al. 1970)
Nearest grass height	average of the vegetative droop height for the nearest grass from the 20 Daubenmire quadrants
Tallest grass height	average of the vegetative droop height for the tallest grass from the 20 Daubenmire quadrants
Average grass height	(nearest grass height + tallest grass height)/2
Nest characteristic variables	
Hen age	yearling or adult (Walker 2008)
Nest age	(nest age in days + nest age in days <sup>2</sup> ) (Walker 2008)
Snowstormmarker	grouped 7 nests that were abandoned following major snow event in May 2005
Abiotic site variables	
Study area	north or south Powder River Basin
Year	year of observation

We assigned predictor variables into 1 of 3 model categories: 1) habitat, 2) nest characteristic, and 3) site variables (Table 1). We first examined univariate selection for study area and the 8 habitat variables, and removed variables if 95% confidence intervals overlapped zero. If predictor variables were highly correlated ( $r \geq |0.7|$ ), only the variable with the greatest biological merit was included in the model (Chatfield 1995). When variables were moderately correlated (i.e.  $|0.3| \leq r < |0.7|$ ), we checked for stability and consistency of parameter estimates as predictor variables were added.

We allowed each variable that made it past variable screening to compete with all other combinations of variables to identify the most parsimonious model for habitat and study area. If variables made it past screening we determined if their addition improved model fit via Akaike's information criterion with a small sample size correction factor ( $AIC_c$ ; Burnham and Anderson 2002). After obtaining the best habitat model using  $AIC_c$  values, we then tested if inclusion of nest characteristic variables (Table 1) and an additional abiotic site variable (year effect) documented in Walker (2008) were still important predictor variables when included with

habitat covariates. We followed the exact variable screening and AIC methods described above to test if these variables improved model fit.

We tested the predictive strength of the final habitat model by grouping predicted nest survival probability from log-link analyses (2004–2006) into two bins with probabilities of nest survival,  $< 0.45$  and  $> 0.55$ , generically representing low and high nest survival probabilities, respectively. We then compared observed nest success from independent data sets (2003 and 2007) between low and high validation bins, and calculated the ratio of observed nest success between the high and low bins. We reasoned that observed nest success should be higher in the top validation bin if the final model predicted nest success well across years, demonstrated by a ratio of observed nest success  $> 1$  between bins. We further evaluated the predictive model by comparing predicted nest success from our top model to observed nest success by year. Average grass height around nesting sage-grouse in a given year (Table 1) was the only continuous predictor variable included in our top model, thus we evaluated how well one variable served as an indicator of nest success. Statistical analyses were performed in program SAS ver. 8.0 (SAS Inst. <http://v8doc.sascom/sashtml/>).

We performed a bootstrap analysis to quantify precision and the effect size of grass height on nest survival, using beta coefficients from the best approximating model (Burnham and Anderson 2002). We used the logistic exposure equation (Rotella et al. 2004) to generate the predicted probability of successfully hatching a nest for each bootstrap dataset ( $n = 5000$ ) by systematically varying grass height within the observed range of variation. We computed at each percentage the probability of successfully hatching a nest for each of 5000 simulations. We ordered these probabilities and used a rankit adjustment (Chambers et al. 1983) to estimate upper and lower 95% confidence intervals.

## Results

Nearest, tallest and average grass height were the only variables with significant coefficients when tested univariately. Nearest, tallest and average grass height were all positively associated with nest success, but were highly correlated and could not be included in the same model. Average and nearest grass height had virtually identical univariate coefficient estimates, however average grass height showed less variation around the estimate (average grass height  $\beta = 0.034$ ,  $SE = 0.013$ ,  $95\% CI = 0.008–0.060$  vs nearest grass height  $\beta = 0.039$ ,  $SE = 0.019$ ,  $95\% CI = 0.001–0.076$ ). Further, average grass height outcompeted nearest and tallest grass measures based on  $AIC_c$  values, thus it was retained for additional modeling.

The addition of study area increased model fit, while hen age and year effects were removed from the model because they explained no additional variation in nest survival when included with habitat variables and confidence intervals around effect estimates overlapped zero. The inclusion of nest age increased model fit ( $w_i = 0.974$ ; Table 2). Our final model included average grass height, nest age, study area and the variable that controlled for the known effect of a spring snow storm in 2005 on DSR.

Table 2. Comparisons of grass height, study area and nest age variables to identify the  $AIC_c$  best model explaining sage-grouse nest survival, Powder River Basin, Montana and Wyoming, 2004–2006<sup>a</sup>.

Model	K	$AIC_c$	$\Delta AIC_c$	$w_i$
Average grass height + study area + nest age	6	834.418	0.000	0.974
Average grass height + study area	4	841.634	7.216	0.026
Average grass height	3	866.099	31.681	0.000
Study area	3	927.881	93.463	0.000

<sup>a</sup>all models included a categorical blocking variable which controlled for nests abandoned in a heavy spring storm in 2005 (Walker 2008).

Estimates of average grass height tracked annual trends in nest success (Fig. 1; northern region 2003–2007, beta estimate = 0.036,  $p = 0.023$ ; southern region 2004–2007, beta estimate = 0.079,  $p = 0.001$ ). Bootstrap analyses showed the positive relationship between average grass height and nest success (Fig. 2). Our final model including grass height and study area demonstrated large effect sizes (Fig. 2). Nests with probabilities  $> 0.55$  were 1.64 (2004–2006) to 3.11 (2007) times more likely to hatch than those  $< 0.45$  (Table 3), except in 2003 when average grass height (29.2 cm) and apparent nest success reached their highest recorded levels (68%, Fig. 1).

## Discussion

High predictive power of grass height illustrates its utility as a management tool to benefit sage-grouse populations. Findings show grass height is a strong predictor of nest survival inside intact landscapes, and increasing hiding cover can increase nest success, a demographic rate that explains a

Figure 1. Apparent and predicted annual nest survival by year for sage-grouse in the Powder River Basin, Montana and Wyoming, US, 2003–2007. The final model included the effects of grass height, nest age, study area, and 2005 spring snow storm. Grass height measurements were averaged across nests within years to make annual predictions.

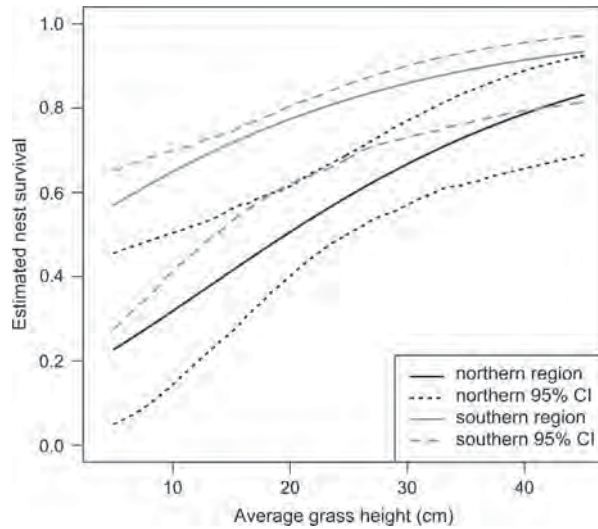

Figure 2. Relationship between average grass height and sage-grouse nest survival, Powder River Basin, Montana and Wyoming, USA, 2004–2006. Estimates of nest survival (95% confidence intervals [CIs]) in both study areas are based on 5000 bootstrap samples.

third of variation in  $\lambda$  (Taylor et al. 2012). Moreover, grass height is a reliable management tool because it explained variation (Fig. 2) despite variability in absolute rates of nest success between study areas. Positive effects of grass height should be evaluated on other important demographic rates including adult female and chick survival (Taylor et al. 2012) to see if benefits extend beyond what is now known.

Managing grass height in large and intact landscapes with grazing is a tool that may benefit populations in eastern Montana and northeast Wyoming. Positive effects of grass height in our study areas explained variation in nest success between years with large and precise effect sizes. Differing intercepts prohibit extrapolating of results to novel sagebrush systems because absolute effects likely depend upon regional conditions that influence grass and shrub composition. South and west of our study areas where sagebrush rather than grass provides most hiding cover, grass height had only a weak effect on nest success, and nest fates were dominated by year and site effects (Holloran et al. 2005). Grass height is positively related to nest success for other prairie grouse species

Table 3. Validation of grass height as a predictor for sage-grouse nest success, Powder River Basin, Montana and Wyoming, 2003–2007. We tested the AICc best model (Table 2) by calculating the predicted probability of hatching for each nest by applying grass height and region coefficients from log-link analysis (2004–2006) to observed grass heights at nests. We used the predicted probability ( $n$  is number of nests in each category) of hatching to group nests with probabilities of  $<0.45$  and  $>0.55$  and then compared apparent nest success ratios. We also validated the relationship with independent data sets (2003 and 2007). Nest age was excluded because we exponentiated daily survival rate for nests across the 28-day incubation period.

Predicted probability	Observed nest success		
	2003	2004–2006	2007
$p < 0.45$ (low)	0.714 ( $n = 7$ )	0.486 ( $n = 70$ )	0.200 ( $n = 5$ )
$p > 0.55$ (high)	0.667 ( $n = 30$ )	0.796 ( $n = 184$ )	0.623 ( $n = 52$ )
Ratio (high/low)	0.93	1.64	3.11

and subspecies (Attwater's prairie-chickens *Tympanuchus cupido attwateri*, Lehmann 1941; plains sharp-tailed grouse *T. phasianellus jamesi*, Hillman and Jackson 1973; greater prairie-chicken *T. cupido pinnatus*, McKee et al. 1998).

Findings suggest that maintaining grass height during drought may provide the greatest benefits to populations. Average grass height and predicted nest success in this study is within the range of published literature (Schroeder et al. 1999, Connelly et al. 2000). Benefits may be negligible in years resembling 2003 when spring rains provided abundant grass and the correspondingly highest predicted nest success for the northern study area. High variation in pooled grass height by study area and years (11.4–29.2 cm) also suggested that modifying grazing practices to maintain nesting cover could improve a habitat feature that otherwise limits  $\lambda$ . We have identified a strong corollary of nest success in the Powder River Basin (PRB). If this relationship is validated in new study areas across different parts of the sage-grouse range, and if the relationship between grass height and nest success can be calibrated within these new areas, grass height may be useful as a surrogate to monitor nest success.

Findings emphasize the importance of an indirect effect of grazing on sage-grouse nest success. Results have broad implications because livestock grazing is the most widespread land use in the world (Holechek et al. 2003), affecting 70% of land area in the western US (Fleischner 1994). Effects of grazing on sage-grouse habitat may be wide-ranging depending upon current and historic timing and intensity of grazing, soil conditions, precipitation, plant communities and habitat features under consideration (Beck and Mitchell 2000, Connelly et al. 2000, 2004, Crawford et al. 2004). However, adjustments to duration and timing of grazing also may increase residual cover with the added benefit of increasing long-term rangeland health on which birds depend. For example, reducing the short-term stocking rate of sheep increased black grouse *Tetrao tetrix* numbers by 6% annually in Europe by increasing residual cover (Calladine et al. 2002). Replicated experiments to document sage-grouse response to different grazing systems are needed to help guide land managers to practices that are beneficial to sage-grouse and economically viable to producers (Krausman et al. 2011).

Habitat management within a PAC-based conservation strategy may benefit populations, but sage-grouse are a wildland species, and grass height is of little consequence if sagebrush systems continue to be replaced by anthropogenic land uses (Knick et al. 2013). Viability of ranching as a predominant land use may in part determine the future of sage-grouse conservation in the West. The SGI has increased by four-fold their implementation of rotational grazing systems by resting for up to 17 months the pastures used by nesting sage-grouse within 488 000 ha inside Montana's PACs (J. Siddoway pers. comm.). Our findings suggest that these types of grazing systems that promote nest success may provide one mechanism to offset population losses by increasing bird numbers.

Subject: Habitat Objectives Drop In Language

To: Jeffery Foss &lt;jfoss@blm.gov&gt;

Cc: Jon Beck &lt;jmbeck@blm.gov&gt;, Kurt Wiedenmann &lt;kwiedenmann@blm.gov&gt;

Jeff,

Here are some comments/edits on the drop in language that's been shared this morning. There are two files attached which include what would be in the Idaho plan direction/decision – a track changes version and a clean version, both with comments describing the rationale for any adjustments that were made.

These have incorporated the habitat objectives table language into these documents. We like the version which included the statement –

**“The habitat objectives will be part of the sage-grouse habitat assessment to be used during land health evaluations (see Monitoring Framework, Appendix X).” Which helps define what they are applicable to. This in conjunction with the recommended wording change for the previous sentence to “These habitat indicators are consistent with existing indicators used by the BLM to assess GRSG habitat” help clarify, in our minds, what these are used for and helps broaden their applicability which clearly describing how they are used in the grazing program context.**

**In addition the bullet for lek buffers that reads -**

-

**“Range improvements which do not impact or which provide a conservation benefit to sage-grouse, such as fences for protecting important seasonal habitats, meet the lek buffer requirement.”**

**We think should be changed to read –**

**Range improvements which do not impact or which provide a conservation benefit to sage-grouse, such as fences for protecting important seasonal habitats, would be exempt from the lek buffer requirement.**

**The reason for this is that really an optics – the first statement implies that such improvements meet the buffer (distance) requirement even though they may not conform to that distance requirement, where the second sentence portrays more the meaning that is such structures meet those requirements then they would be exempt from the buffer (distance) criteria.**

**Revised language from our most recent document Review – This version includes drop in language from Vicki Herren.**

HM-OBJ-2: Incorporate GRSG Seasonal Habitat Objectives (Table 2-3) into the design of projects or activities, as appropriate, based on site conditions and ecological potential, unless achievement of fuels management objectives require additional reduction in sagebrush cover to meet strategic protection of GRSG habitat and conserve habitat quality for the species or at least one of the following conditions can be demonstrated and documented in the NEPA analysis associated with the specific project:

A specific objective is not applicable to the site-specific conditions of the project or activity;

An alternative objective is determined to provide equal or better protection for GRSG or its habitat (based on appropriate scientific findings); or

Analysis concludes that following a specific objective would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.

The Habitat Objectives for Greater Sage-Grouse (Table XX) are a list of indicators and values that describe desired Greater Sage-Grouse seasonal habitat conditions. The values for the indicators were derived using a synthesis of current local and regional GRSG habitat research and data and reflect variability of ecological sites. These habitat indicators cover indicators are consistent with existing indicators used by the BLM to assess GRSG habitat.

The habitat objectives will be part of the sage-grouse habitat assessment to be used during land health evaluations (see Monitoring Framework, Appendix X). These habitat objectives may not be obtainable or desired uniformly across the designated GRSG habitat management areas. For an assessment area, the determination on whether the objectives have been met, or making progress toward meeting, will be based on the area's landscape context and ecological ability to meet the indicators.

When determining if an area-site is meeting habitat objectives, the measurements from that are a particular site will be assessed based on the range of values for the indicators in the habitat objectives table. The habitat objectives table is one component of sage-grouse multi-scale habitat assessment (see Monitoring Framework, Appendix X). The results of which the habitat assessment will be used during the land health evaluation to ascertain if the land health standard applicable to sage-grouse habitat (e.g., special status species habitat standard) is being met.

~~When authorizing activities in sage-grouse habitat, the BLM will consider if habitat objectives are being achieved. If the habitat objectives are not being achieved, and the site has the potential for achieving these~~

~~objectives, the BLM will determine the causal factor(s) and make the necessary management adjustments to address the causal factor(s), following current BLM regulations and policy.~~

TABLE Deleted JMB

**6.15.15 Sage Grouse Letter to Crapo and Risch.pdf**  
944K

However, when the BLM recently announced their proposed plan and Environmental Impact Statement (EIS) for sage-grouse habitat, I was disappointed that significant new information was included which was not part of the co-preferred alternative plan. What's more, I am concerned about such critically important issues as the dozens of required design features for conservation projects, the unstated and still unknown mitigation requirements, and restrictions on state and private land overlaying federal minerals.

Idaho needs a chance to implement its plan and prove its merits. H.R. 1735 and the Lee/Crapo/Inhofe Amendment can play an important role in that effort. I am especially interested in the Lee/Crapo/Inhofe provisions related to a ten-year extension of time for State management of sage-grouse in the Senate NDAA. Mountain Home Air Force Base and our other military training facilities in Idaho should not be hampered with a federal plan that, unlike the Idaho plan, treats secondary-threats as primary threats, creating unnecessary restrictions on multiple uses of federal land, including mining and grazing.

Thank you for your consideration and assistance in achieving our shared goals. Please do not hesitate to contact me with any questions or concerns.

As Always – Idaho “Esto Perpetua”

## high voltage transmission line drop-in

1 message

---

Hildner, Michael <mhildner@blm.gov>  
To: Jonathan Beck <jmbeck@blm.gov>  
Cc: Lauren Mermejo <lmermejo@blm.gov>

Mon, Feb 9, 2015 at 12:39 PM

Hi Jon,

Thanks for bringing that error to my attention. The correct guidance is below. I've also updated the WO files, so it has the right guidance:

For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and **Important Habitat Management Areas (IHMA)s** are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservations measures.”*

Hi BLM-ID,

In coordinating with FS, we noticed that the GRSG guidance document you received was missing one piece of direction. I have added the following bullet point to your SFA guidance :

"· Do Include Forest Service Lost River Mountains North (~5,000 acres) Area and South Area (~6,000 acres)—these areas will be treated as PHMA, with the SFA management actions for this FS-land."

I've also attached a map that specifically identifies these two areas for your reference (please ignore all the other identified areas on the map with regard to the above bullet point).

I have reattached the guidance for purposes of version control, but this is the only change you will see in it. Sorry about the oversight, and thanks a lot as always. Let me know if you have any questions.

—

# Surface Management Agency of Non ADPP Habitat on BLM Surface/ Subsurface Management within DRAFT FWS Areas of Significance/Sagebrush Focal Areas

## - North Central Idaho

### Legend

-  FWS Areas of Significance / Sagebrush Focal Areas
- Surface Management Agency**
-  Non-Habitat, Bureau of Land Management
-  Non-Habitat, US Fish and Wildlife Service
-  Non-Habitat, Forest Service
-  Non-Habitat, National Park Service
-  Non-Habitat, Bureau of Reclamation
-  Non-Habitat, State
-  Non-Habitat, Private
-  Non-Habitat, Other/ Undetermined
-  ADPP Habitat or Non-Habitat Outside of BLM Surface/ Subsurface Management

**Data Sources:**  
**Subsurface Estate:** Acquired from BLM WY State Office for MT/ND/SD, WY, CO, UT, and Southern ID in August 2014. \*Only surface estate is used for classification in NV, OR and CA.  
**Surface Management Agency:** Downloaded from BLM Geocommunicator on December 13th, 2013 verified as current on March 6th, 2014.  
**BLM Administrative Draft Proposed Plan Habitat Category Data:** Submitted by individual BLM EISs between March 5th, 2014 and December 2nd, 2014.  
**FWS Areas of Significance:** Data provided by FWS, accompanying Memorandum FWS/AES/058711 (10/27/2014).

## North-Central Idaho

IDM71\_0000619

***BLM-IDAHO***

**Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)**

**January 30, 2015**

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

***Issue:***

**Development in Highly Important Landscapes**

***Direction:***

As more specifically provided in this guidance, the ADPP will include Sagebrush Focal Areas (SFA), consisting of the BLM and FS-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. In the Special Status Species Section of Chapter 2, include the following management action drop in language (for the Proposed Plan only):

*“Designate Sagebrush Focal Areas (SFA) as shown on Map X (x acres). SFAs will be managed as PHMA, with the following additional management:*

- 1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.*
- 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.*

- 3) *Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."*

**The NOC will provide updated shapefiles that delineate the SFAs.**

Except as otherwise provided below, the ADPP will provide that all BLM- and FS-managed lands (including subsurface) within SFAs will be allocated and managed as PHMA and include the management actions above.

- *Do Not Include the following in SFA Management*
  - Hawley Mountain WSA (ID), Shoshone WSA (ID), Cedar Buttes WSA (ID), Lower Salmon Falls Creek (ID), Little Jack Wilderness (ID), Bruneau-Jarbidge Wilderness (ID) in non-habitat – The current management in these areas is generally protective of GRSG. As applicable, these will continue to be managed so as not to impair their suitability for preservation as wilderness, or under the terms of the Wilderness Act to preserve wilderness character.
    - To the extent that these areas were analyzed for contingent management as general or priority habitat, the ADPP will include contingent allocations and management direction that would apply in the event that Congress releases the areas from WSA status
  - Non-habitat areas outside Little Jack and Bruneau-Jarbidge Wilderness and Salmon Falls Creek ACEC which were previously shown within the SFA –These areas will not be managed as PHMA or SFA.
- Do Include Forest Service Lost River Mountains North (~5,000 acres) Area and South Area (~6,000 acres)– these areas will be treated as PHMA, with the SFA management actions for this FS-land.
- Do Include Donkey Hills ACEC –In order to consolidate parcels for protection as SFAs, this area will be treated as PHMA and included for SFA management.
- *Do Not Include Other Agency Land in SFA Management* – while lands managed by other agencies will be shown on the SFA maps, BLM ADPP decisions will not be applied to them.
- *Do Not Include Private/State Lands in SFA Management* – while private lands may be within the SFA boundaries, ADPP decisions will not be applied to them, but may apply to Federal subsurface underlying such lands as provided below.
- *Subsurface Estate:*
  - Under private/state lands: subsurface estate in PHMA and GHMA should be treated as PHMA with SFA management actions.

- Under other Federal lands: subsurface state should be treated as PHMA with SFA management actions if it is not already withdrawn (such as in Refuges or Parks) and PHMA or GHMA management was analyzed in the DEIS.

Additional direction/drop in language for the ADPPs on SFAs will be forthcoming.

**Issue:**

**Direction:**

**Mitigation**

The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:**

**Direction:**

**Mapping**

Not Applicable

**Issue:**

**Direction:**

**Disturbance**

Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance (see Attachment II).

Planning units will include the following land use plan actions within their ADPPs that states:

- a. If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid*

*existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*

- b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

**Issue:**

**Direction:**

**Vegetation Objectives**

The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*

**Issue:**

**Direction:**

**Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas,*

*including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

***Issue:***

***Direction:***

**Mineral Materials (Salable Minerals)**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

***Issue:***

***Direction:***

**High-voltage Transmission and Major Pipeline ROWs and Corridors**

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that

are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservations measures.”*

**Issue:** Coal Suitability  
**Direction:** Not Applicable in Idaho

**Issue:** Fluid Mineral Resources (Including Geothermal)  
**Direction:** All ADPPs will include the following as a conservation objective:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Issue:** No Surface Occupancy (NSO) Exception Language  
**Direction:** Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral

leases at the time of leasing only and may not be applied to existing fluid mineral leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*“No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action’s impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.”*

**Issue:**

**Direction:**

**Adaptive Management**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

***Issue:***

***Direction:***

**Application of Lek Buffers**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA and PHMA (see Attachment IV) through this drop-in Chapter 2 language:

*“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review ([Open File Report 2014-1239](#)) in accordance with Appendix X.”*

Allocation Direction

\*Southwest Montana will follow the allocations designated for the MT ADPP

Attachment I

**GREATER SAGE-GROUSE RMPA/FEIS  
TEMPLATE LANGUAGE FOR ADDRESSING  
MITIGATION**

[ ] = Instructions

[ ] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

**Chapter 1 - Introduction**

[Nothing new to add to EIS]

**Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]**

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

**Mitigation**

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- **Compensatory Mitigation Siting**
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

Durability (protective and ecological): the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain*

*the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

### **Additional Information/Formulas**

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU:

$$\begin{aligned} & \text{Disturbance Percentage} \\ & = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100 \end{aligned}$$

Disturbance Calculations for Project Analysis Areas (PAAs):

$$\text{Disturbance Percentage} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^{12}}{\text{Acres within the PAA} * \left( \frac{\text{Acres of Effective Habitat within the PAA}}{\text{Acres within the PAA}} + 0.3 \right)} \right) \times 100$$

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2.

Project analysis area (PAA) method for permitting surface disturbance activities:

1. Determine potentially affected occupied leks by placing a four-mile buffer around the project boundary as defined by the proposed area of physical disturbance related to the project. All occupied leks within this buffer will be considered affected by the proposed project.
2. Next place a four mile boundary around each of the occupied leks identified in item 1, above.
3. The polygon formed by the merging and dissolving of polygons from step 1 and 2 creates the Project Analysis Area (PAA) for surface disturbance activities.
4. Map existing disturbances within the analysis area or use locally available spatial data. Use of digitized NAIP imagery is recommended.
5. Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
6. Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
7. Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
8. If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>
<b>Energy (oil &amp; gas)</b>	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300

Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights-of-way		X	

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales		
		Broad/Mid (Populations)	Intermediate (BSU)	Local/Project (Seas. Hab.)
Habitat Degradation	Unit:	WAFWA Populations	Biologically Significant Unit	Project/Local Habitat Area <sup>5</sup>

<b>ACRONYMS</b>				
PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit				
EVT = Existing Vegetation Type                      BpS = Areas of Biotic Potential				
<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.				
<sup>2</sup> Westwide data will be used only if state or local data are not available.				
<sup>3</sup> This footnote was removed from the table. January 2015.				
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.				
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management				
<sup>6</sup> The project analysis area will be based on a 4-mile radius polygon around the project area combined with a 4-mile buffer around any leaks within the project boundary in PHMA (Idaho methodology).				
<sup>7</sup> See Table 2				

## Attachment III

# Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance

### Purpose

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

### Guidance

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment IV

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

**Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Attachment V

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

  - linear features (roads) within 3.1 miles of leks
  - infrastructure related to energy development within 3.1 miles of leks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis.

  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

Cc: Lauren Mermejo &lt;lmermejo@blm.gov&gt;

Hi Jon,

Thanks for bringing the oversight to my attention. Attached is the corrected guidance, which makes clear that the lek buffer and fluid mineral prioritization guidance needs to be applied in IHMA also.

Thanks,  
Michael

On Thu, Feb 12, 2015 at 9:31 AM, Beck, Jonathan <jmbeck@blm.gov> wrote:

Michael, as we were working with the final issues resolution language we found a few more instances where the language in the allocation was not consistent with the allocation table and Idaho's 3-tired habitat mapping. These are the same as the issue we discussed earlier for transmission lines. Please see the attached language with track changes edits and comments. The areas needing your attention are fluid minerals and lek buffers. Thanks, Jon

231K

- 3) *Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."*

**The NOC will provide updated shapefiles that delineate the SFAs.**

Except as otherwise provided below, the ADPP will provide that all BLM- and FS-managed lands (including subsurface) within SFAs will be allocated and managed as PHMA and include the management actions above.

- *Do Not Include the following in SFA Management*
  - Hawley Mountain WSA (ID), Shoshone WSA (ID), Cedar Buttes WSA (ID), Lower Salmon Falls Creek (ID), Little Jack Wilderness (ID), Bruneau-Jarbidge Wilderness (ID) in non-habitat – The current management in these areas is generally protective of GRSG. As applicable, these will continue to be managed so as not to impair their suitability for preservation as wilderness, or under the terms of the Wilderness Act to preserve wilderness character.
    - To the extent that these areas were analyzed for contingent management as general or priority habitat, the ADPP will include contingent allocations and management direction that would apply in the event that Congress releases the areas from WSA status
  - Non-habitat areas outside Little Jack and Bruneau-Jarbidge Wilderness and Salmon Falls Creek ACEC which were previously shown within the SFA –These areas will not be managed as PHMA or SFA.
- Do Include Forest Service Lost River Mountains North (~5,000 acres) Area and South Area (~6,000 acres)– these areas will be treated as PHMA, with the SFA management actions for this FS-land.
- Do Include Donkey Hills ACEC –In order to consolidate parcels for protection as SFAs, this area will be treated as PHMA and included for SFA management.
- *Do Not Include Other Agency Land in SFA Management* – while lands managed by other agencies will be shown on the SFA maps, BLM ADPP decisions will not be applied to them.
- *Do Not Include Private/State Lands in SFA Management* – while private lands may be within the SFA boundaries, ADPP decisions will not be applied to them, but may apply to Federal subsurface underlying such lands as provided below.
- *Subsurface Estate:*
  - Under private/state lands: subsurface estate in PHMA and GHMA should be treated as PHMA with SFA management actions.

- Under other Federal lands: subsurface state should be treated as PHMA with SFA management actions if it is not already withdrawn (such as in Refuges or Parks) and PHMA or GHMA management was analyzed in the DEIS.

Additional direction/drop in language for the ADPPs on SFAs will be forthcoming.

**Issue:**

**Direction:**

**Mitigation**

The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:**

**Direction:**

**Mapping**

Not Applicable

**Issue:**

**Direction:**

**Disturbance**

Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance (see Attachment II).

Planning units will include the following land use plan actions within their ADPPs that states:

- a. If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid*

*existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*

- b. If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

**Issue:**

**Direction:**

**Vegetation Objectives**

The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*

**Issue:**

**Direction:**

**Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas,*

*including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

***Issue:***

***Direction:***

**Mineral Materials (Salable Minerals)**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

***Issue:***

***Direction:***

**High-voltage Transmission and Major Pipeline ROWs and Corridors**

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that

are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and Important Habitat Management Areas (IHMA) are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservations measures.”*

**Issue:** Coal Suitability  
**Direction:** Not Applicable in Idaho

**Issue:** Fluid Mineral Resources (Including Geothermal)  
**Direction:** All ADPPs will include the following as a conservation objective:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA, IHMA, and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA, IHMA, and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Issue:** No Surface Occupancy (NSO) Exception Language  
**Direction:** Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral

leases at the time of leasing only and may not be applied to existing fluid mineral leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*“No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action’s impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.”*

**Issue:**

**Direction:**

**Adaptive Management**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

***Issue:***

***Direction:***

**Application of Lek Buffers**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA, IHMA, and PHMA (see Attachment IV) through this drop-in Chapter 2 language:

*“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239) in accordance with Appendix X.”*

Allocation Direction

\*Southwest Montana will follow the allocations designated for the MT ADPP

## Attachment I

# GREATER SAGE-GROUSE RMPA/FEIS TEMPLATE LANGUAGE FOR ADDRESSING MITIGATION

[ ] = Instructions

[ ] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

## Chapter 1 - Introduction

[Nothing new to add to EIS]

## Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

## Mitigation

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- Compensatory Mitigation Options
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- Compensatory Mitigation Siting
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- Compensatory Mitigation Project Types and Costs
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- Compensatory Mitigation Compliance and Monitoring
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain*

*the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
  
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
  
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
  
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

### **Additional Information/Formulas**

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU:

$$\begin{aligned} & \text{Disturbance Percentage} \\ & = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100 \end{aligned}$$

Disturbance Calculations for Project Analysis Areas (PAAs):

$$\text{Disturbance Percentage} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^{1,2}}{\text{Acres within the PAA} * \left( \frac{\text{Acres of Effective Habitat within the PAA}}{\text{Acres within the PAA}} + 0.3 \right)} \right) \times 100$$

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2.

Project analysis area (PAA) method for permitting surface disturbance activities:

1. Determine potentially affected occupied leks by placing a four-mile buffer around the project boundary as defined by the proposed area of physical disturbance related to the project. All occupied leks within this buffer will be considered affected by the proposed project.
2. Next place a four mile boundary around each of the occupied leks identified in item 1, above.
3. The polygon formed by the merging and dissolving of polygons from step 1 and 2 creates the Project Analysis Area (PAA) for surface disturbance activities.
4. Map existing disturbances within the analysis area or use locally available spatial data. Use of digitized NAIP imagery is recommended.
5. Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
6. Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
7. Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
8. If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>
<b>Energy (oil &amp; gas)</b>	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300

Other developed rights-of-way		X	

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales		
		Broad/Mid (Populations)	Intermediate (BSU)	Local/Project (Seas. Hab.)
Habitat Degradation	Unit:	WAFWA Populations	Biologically Significant Unit	Project/Local Habitat Area <sup>5</sup>

<b>ACRONYMS</b>				
PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit				
EVT = Existing Vegetation Type                      BpS = Areas of Biotic Potential				
<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.				
<sup>2</sup> Westwide data will be used only if state or local data are not available.				
<sup>3</sup> This footnote was removed from the table. January 2015.				
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.				
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management				
<sup>6</sup> The project analysis area will be based on a 4-mile radius polygon around the project area combined with a 4-mile buffer around any lands within the project boundary in PHMA (Idaho methodology).				
<sup>7</sup> See Table 2				

## Attachment III

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment IV

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

**Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSR RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSR habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSR habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSR Habitat Objectives Table and Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Attachment V

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

  - linear features (roads) within 3.1 miles of leks
  - infrastructure related to energy development within 3.1 miles of leks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis.

  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

Good afternoon –

On behalf of Director Tom Schultz, Idaho Department of Lands, attached is a copy of Governor Otter's letter to Dan Ashe, Director, U.S. Fish and Wildlife Service which accompanied the final Greater-sage Grouse Conservation Plan approved by the Idaho State Board of Land Commissioners. That final plan is also attached here.

I apologize if you are receiving this information in duplicate.

Regards,

**Renée Miller**

C.L. "BUTCH" OTTER  
GOVERNOR

May 1, 2015

Dan Ashe, Director  
U.S. Fish and Wildlife Service  
U.S. Department of the Interior  
1849 C Street NW, Room 3331  
Washington, D.C. 20240-0001

Dear Dan,

The state of Idaho (State) reinforced its strategy to conserve greater sage-grouse (GRSG) and its habitat last month with the approval of additional conservation measures on State endowment trust lands and activities that fall under Idaho Department of Lands (IDL) regulatory and fire-related authorities.

The Idaho State Board of Land Commissioners (Land Board) approved the GRSG Conservation Plan (Land Board's Plan) on April 21, 2015. The Idaho Oil and Gas Conservation Commission (Commission) approved the Land Board's Plan on April 23, 2015. Included with this correspondence is a copy of the Land Board's Plan for your review.

The Land Board's Plan was developed with input from natural resource industry user groups, environmental organizations and relevant State and federal agencies. It is important to point out, however, that the implementation of the Land Board's Plan is contingent upon the incorporation of the foundational elements of the federal alternative (which is my plan) into the relevant Resource Management Plans (RMPs) in Idaho.

In addition to a landscape conservation approach for GRSG within the Land Board's Plan, the State of Idaho has backed up its commitment to GRSG conservation with a legislative appropriation of \$750,000 for additional conservation activities in Idaho. Some of this funding will be applied to projects on State endowment lands.

The State of Idaho has been proactive and collaborative in our efforts to conserve GRSG and its habitat in Idaho while maintaining working landscapes and the economic vitality of the State. These efforts demonstrate Idaho's commitment to the conservation of this iconic western species.

As always – Idaho, "Esto Perpetua"

A handwritten signature in black ink that reads "C.L. Butch Otter".

C.L. "Butch" Otter  
Governor of Idaho

## Executive Summary

Sage-grouse is a candidate species being reviewed by the U.S. Fish and Wildlife Service (USFWS) to determine listing status under the Endangered Species Act (ESA).

As part of Idaho's commitment to conserving sage-grouse, the Idaho Department of Lands (IDL) developed conservation measures (CMs) for endowment trust land (endowment lands) management programs and for programs that fall under some IDL regulatory and assistance functions. The CMs for IDL programs that involve sage-grouse habitat are included in the Greater Sage-Grouse Conservation Plan outlined in this document, which the State Board of Land Commissioners (Land Board) and Idaho Oil and Gas Conservation Commission approved in April 2015 (Appendix F and G). The Greater Sage-Grouse Conservation Plan (Land Board's Plan) complements and augments the Governor's statewide plan to conserve the most important habitat for sage grouse in Idaho.

IDL collected comments on a draft sage-grouse plan. Input came from natural resource industry user groups, environmental organizations, and relevant state and federal agencies to fine-tune the plan.

Implementation of the Land Board's Plan is contingent upon the federal government's acceptance and incorporation of the Governor's plan in its final decisions on sage-grouse in Idaho.

For proposed activities by third parties on endowment lands, IDL will implement sage-grouse CMs as enforceable stipulations in authorizing documents such as leases, permits, and easements. For activities that take place on privately owned lands in sage-grouse habitat but involve some IDL regulatory and assistance functions, CMs are presented as voluntary best management practices.

Endowment lands are managed under a mandate in the Idaho Constitution (Article IX Section 8) to maximize long-term financial returns to public schools and other State of Idaho institutions. Approximately 1.4 million acres of the total 2.4 million acres of endowment land in Idaho are rangelands, and nearly half of these endowment rangelands are in Core and Important sage-grouse Habitat Zones identified by the Idaho Alternative, and as concurred by the USFWS.

The IDL also carries out a number of regulatory and assistance duties. The IDL regulatory and assistance responsibilities that affect sage-grouse habitat include regulating certain oil and gas development activities; dredge and placer mine permitting; mine reclamation plan approvals; and abandoned mine land reclamation. The IDL also supports enhanced fire preparedness and suppression in sage-grouse habitat.

Page intentionally blank

## 1. Brief History

In 2010, the USFWS determined Greater Sage-Grouse (sage-grouse) warranted protection under the ESA, but it was precluded from listing due to higher priority species. In the USFWS decision, the primary threats listed for Idaho were wildfire, invasive species, and infrastructure development.

The timeline for USFWS analysis was further accelerated when in 2011 a multidistrict litigation in the U.S. District Court of the District of Columbia resulted in a settlement agreement between the litigants and the USFWS. The settlement agreement required the USFWS to implement a six-year work plan to enable the agency to systematically review and address the needs of more than 250 species listed on the 2010 *Candidate Notice of Review* to determine if they should be added to the Federal Lists of Endangered and Threatened Wildlife and Plants. The USFWS agreed to determine the listing status of sage-grouse in 2015. Later in 2012, the U.S. District Court for the District of Idaho ruled that pursuant to the D.C. District Court settlement, the USFWS must reevaluate the status of sage-grouse under the ESA by September 30, 2015. In response to these deadlines, then-Secretary of the Interior Ken Salazar invited the 11 western states impacted by a potential listing of the species, including Idaho, to develop state-specific regulatory mechanisms to address the cited deficiencies in an effort to preclude a listing under the ESA.

As a direct outcome of the proposed ESA listing review, the U.S. Bureau of Land Management (BLM) initiated a draft Land Use Plan Amendment and Environmental Impact Statement (EIS) pertaining to the sage-grouse throughout BLM's management zones within sage-grouse habitat.

In March 2012, Governor C.L. "Butch" Otter issued Executive Order No. 2012-02 establishing the Governor's Sage-Grouse Task Force. The task force's goal was ultimately to develop state-specific regulatory mechanisms for the BLM to incorporate the state's plan as an alternative in the BLM environmental analysis pursuant to the National Environmental Policy Act (NEPA) EIS. The *Idaho Alternative* was submitted to the BLM in September 2012. The *Idaho Alternative* was incorporated as Alternative E in the November 2013 BLM Draft Idaho and Southwest Montana Sub-Regional Sage-grouse Land Use Plan Amendment and EIS, where it was presented as a "co-preferred Alternative" along with the BLM Alternative D.

The Land Board's Plan complements the Governor's *Idaho Alternative* Sage-Grouse Plan for federal land management in Idaho.

The Land Board's Plan utilizes the *State of Idaho Habitat Zone* classifications defined in 2012 by the Governor's task force. Consistent with the *Idaho Alternative*, IDL focuses conservation efforts on the Core and Important Habitat Zones, which include the great majority of the sage-grouse populations in Idaho. There are more than 10,500,000 acres in Core and Important sage-grouse Habitat Zones in Idaho, with the vast majority of these acres under federal management (Table 1.1). IDL has surface or mineral ownership of almost 690,000 acres of Core and Important habitat, with about 619,000 acres of surface ownership in these habitat zones. While the IDL ownership is a relatively small proportion of the 10.5 million acres of habitat (less than 6 percent), almost half of endowment rangelands are found within the Core and Important Habitat Zones.

## 2. Purpose of the Plan

The Plan has a threefold purpose:

- (1) It summarizes CMs for endowment land programs and IDL regulatory and assistance programs that are complementary to the *Idaho Alternative* for sage-grouse conservation actions on federal land.
- (2) It communicates to the USFWS that, along with the *Idaho Alternative*, there are adequate existing regulatory mechanisms to alleviate the primary threats to sage-grouse and sage-grouse habitat in Idaho (such certainty will be necessary to prevent the sage-grouse from being listed under the ESA).
- (3) It preserves the statutory responsibility of IDL to manage endowment lands under a constitutional mandate to maximize long-term financial returns to state institutions, mainly public schools.

For proposed activities by third parties on endowment lands, IDL will implement sage-grouse CMs as enforceable stipulations in authorizing documents such as leases, permits and easements. The authorized activities include: alternative energy development (solar, wind, and geothermal); oil and gas exploration and development; mining; grazing; miscellaneous commercial activities; and the granting of access through rights-of-way, including easements. In addition, IDL as the land manager will implement and support fire prevention and mitigation measures and wildfire suppression efforts to minimize the impact to sage-grouse and their habitat.

For regulatory and assistance activities on private land, CMs will be voluntary BMPs because IDL does not have the statutory authority within its regulatory programs or assistance activities to require adoption by authorized parties. Regulatory and assistance activities include: abandoned mine lands projects; dredge and placer mine permitting; mine reclamation plan approvals; and oil and gas permits (e.g. seismic imaging surveys, well drilling). Where appropriate, IDL will include recommended BMPs within its authorizing documents to encourage compliance.

IDL also will implement actions through its roles and responsibilities that support enhanced fire preparedness and suppression in sage-grouse habitats.

## 3. Coordination

Utilizing available funding, IDL will collaborate, coordinate, and utilize cooperative planning efforts to implement and monitor proposed CMs to protect and potentially improve sage-grouse habitat. Coordination efforts could include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups, lease/permit holders, and nongovernmental organizations.

Current sage-grouse coordination efforts in which IDL is involved include:

- a. *Bruneau-Owyhee Sage-Grouse Habitat Project (Federal Register- NOI, 01/20/2015),*
- b. *Burley Interagency Landscape Sage-Grouse Habitat Restoration Project,*
- c. *Tri-State Interagency Fuel Break Project (Federal Register-NOI, 2015),*
- d. *Paradigm Fuel Break Project (BLM Draft EA, 01/24/2014),*

- e. *Jarbidge Fuel Breaks Project (DOI-BLM-ID-T010-2011-0006-EA),*
- f. *BLM/IDFG/IDL Rangeland Rehabilitation MOU (Final MOU 02/2015), and*
- g. *Owyhee Land exchange (Agreement to Initiate signed December, 2008).*

In addition, IDL's FY 2016 budget includes a one-time appropriation of \$55,000 from the General Fund to cover IDL personnel costs within the Forest and Range Protection program for two heavy equipment mechanic positions to refurbish water tender equipment. This equipment will be utilized by the rangeland fire protection associations (RFPAs) in suppressing rangeland fire in the sage-grouse landscape. The FY 2016 budget also includes a one-time appropriation of \$195,000 in dedicated funds (Earnings Reserve Fund) for operating expenses within the Lands and Waterways program for fire prevention fuel breaks, conifer encroachment treatments, post-fire seeding, fire prevention brush management, wildlife fencing, flagging, and water development wildlife escape ramps.

#### **4. Greater Sage-Grouse Management Areas**

The Land Board's Plan utilizes the *State of Idaho Habitat Zone* classifications as described in the *Idaho Alternative, September 2012*, and as proposed by the Governor's Sage-Grouse Task Force. The *Idaho Alternative* designated a Sage-Grouse Management Area ("SGMA") with three distinct management zones: Core Habitat ("CHZ"), Important Habitat ("IHZ") and General Habitat ("GHZ"). At this time, IDL is not proposing any CMs for endowment lands or regulatory and assistance activities within the GHZ.

IDL concurs with and repeats the following statements from the *Idaho Alternative*:

*The State recognizes that any attempt to map sage-grouse habitat must, by necessity, be at a broad, programmatic scale. The mapping of boundaries presented above is not intended to equate to verified boundary locations or on-the-ground habitat types from which the public can determine with certainty whether any particular location is inside or outside of a particular management zone.*

*Rather, the mapping exercise is intended to give governmental entities, land managers, project proponents and the public a general idea of where certain types of habitat and conservation priorities are spatially located as of the date of the map. The State also recognizes that this mapping exercising depicting current habitat for the species is not static, and any map must be verified through site-specific environmental analysis.*

As described in the *Idaho Alternative*, additional lands beyond the identification thresholds have "been included in the CHZ to consolidate key breeding areas, to include wilderness areas and lands within national monuments, and to foster population connectivity with neighboring states." The IHZ similarly includes "areas of value for migration corridors, connectivity among breeding areas, and long-term persistence of each of the two key meta-populations of sage-grouse in Idaho." By default of the broad scale mapping exercise, both the CHZ and IHZ also include some areas that are neither sage-grouse habitat nor connectivity corridors.

The *Idaho Alternative* lists specific vegetation criteria to be considered for livestock grazing management on federal lands.

*Grazing within the CHZ and IHZ will be managed according to the process outlined in the text below. The first step, and perhaps the most important, is to inform and educate affected permittees regarding sage-grouse habitat needs and conservation measures. These habitat needs or*

*characteristics outlined in Tables 3-5 will be incorporated into relevant resource management plans as the desired conditions with the understanding that these desired conditions may not be achievable: (a) due to the existing ecological condition, ecological potential or the existing vegetation; or (b) due to casual events unrelated to existing livestock grazing.*

The IDL Range Management/Livestock Grazing measures do not include the vegetative criteria recommended for grazing on federal lands. The IDL livestock grazing component is from the previously vetted and approved 2006 Conservation Plan for the Greater Sage-grouse in Idaho ("2006 Idaho Plan"), and as detailed in Section 16 below.

The *Idaho Alternative* uses a *Core, Important, and General* habitat zone classification that is somewhat different from the BLM subregional alternative habitat classification of *Priority, Important, and General Habitat Management Areas* for Idaho. In addition to differences in habitat classifications there exist variations between on-the-ground habitat mapping in the *Idaho Alternative* and the BLM subregional Alternative. However, both Alternatives recognize the value of a three-tiered habitat approach which is essential to the functionality of the adaptive management process outlined in the *Idaho Alternative*. In 2014, the State of Idaho and the Idaho BLM came to final agreement of the sage-grouse habitat map for purposes of completion of the Final EIS for management actions on federal lands. The State and IDL both recognize the value of having a consistent classification across the sage-grouse landscape in Idaho, and IDL fully adopts the habitat map agreed upon by the State of Idaho and the Idaho BLM.

IDL will recognize any habitat management updates resulting from the five-year formal map review.

## **5. Adaptive Management**

### **5.a. Adaptive Management for Federal Lands**

The *Idaho Alternative* (September, 2012) Adaptive Management Triggers have been further refined and presented to the USFWS (Brian Kelly) in a letter from Governor Otter dated March 14, 2013. The trigger discussion has been copied from that letter, in part for reference:

*The adaptive triggers provide a regulatory backstop to prevent further loss and stabilize habitats and populations in the CHZ, and to a lesser extent in the IHZ, where a demonstrated significant loss has either occurred over time or unexpectedly (i.e., Murphy Complex Fire). These adaptive triggers are employed when dramatic shifts in population or habitat occurs based on an average over a three year period compared to 2011 values. Additionally, these adaptive triggers place the primary and secondary threats to the species in proper context to appropriately evaluate the cause(s) of the decline.*

*In addition to the below description, Idaho's Alternative utilizes two types of triggers to help determine whether changes in management are necessary. The triggers are broken down into a "soft" trigger and a "hard" trigger. The "soft" trigger becomes operative when one of the following occurs:*

- *10% decline in maximum number of males counted and a finite rate of change below 1.0 but not significantly on CHZ over a period of three years; or*
- *10% loss of nesting and wintering habitat in the CHZ of a Conservation Area over a period of three years.*

When the monitoring information indicates that the “soft trigger” may be tripped, an Implementation Team – aided by the technical expertise of IDF&G – will assess the factor(s) leading to the decline and identify potential management actions. See Idaho Alternative at 7. The Implementation Team<sup>1</sup> may consider possible changes in management to the CHZ. As to the IHZ, the Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state’s ability to meet the overall management objective. It is anticipated IDF&G will collect data annually and will make recommendations to the Implementation Team by August 31<sup>st</sup> for population triggers and January 15<sup>th</sup> for habitat triggers. (Per D. Kemner, IDFG, IDFG will collect population data and the BLM will collect habitat data)<sup>2</sup>.

The “hard” trigger becomes operative when one of the following occurs:

- 20% loss in CHZ nesting and/or<sup>2</sup> wintering habitat over a period of three years; or
- 20% decline in maximum number of males counted and a finite rate of change significantly below 1 within a CHZ of a<sup>2</sup> Conservation Area over a period of three years.

If the hard trigger becomes operative according to the monitoring information, management changes are no longer discretionary and will be implemented in the following manner:

First, the IHZ will be managed according to the CHZ provisions primarily impacting the ability to consider infrastructure projects. Like the “soft trigger,” the Implementation Team will analyze the actual cause(s) of the decline. The flow chart (Appendix II of letter is titled Adaptive Trigger Strategy- Determine What Caused a Hard Trigger to Become Operative and What Management Actions are Necessary) illustrates the process used to determine which threat(s) caused the habitat or population loss.

As the illustration denotes, the Service identified wildfire, invasive species, and infrastructure as the primary threats and West Nile Virus, improperly managed grazing, and recreation as secondary threats. This adaptive trigger strategy focuses the analysis on mitigating the primary threats to the

---

<sup>1</sup> Excerpted from the clarification letter sent to Steve Ellis, Idaho State Director, BLM from Dustin Miller, Administrator, Governor’s Office of Species Conservation dated July 1, 2013:

*As part of the state’s responsibility under the MOU, Governor Otter would issue an Executive Order (under state law, an EO has the force and effect of law) establishing an Implementation Task Force to meet the state’s role and responsibilities under the MOU. This task force would be similar in composition to Governor Otter’s Sage-Grouse Task Force pursuant to Executive Order 2012-02.*

*The Implementation Task Force would be tasked with providing Governor Otter advice and counsel on at least the following issues: (1) analyzing the annual sage-grouse monitoring data to determine whether an adaptive response is appropriate and necessary given the population and habitat objectives provided in the Governor’s Alternative; (2) providing input during the National Environmental Policy Act (NEPA) process for on-the-ground infrastructure projects; and (3) prioritizing habitat restoration opportunities. The Implementation Task Force would submit these recommendations to the Governor, and based on his review and concurrence, will transmit these recommendation to the appropriate agency as part of the underlying NEPA analysis. The ultimate decision involving public land management would fall to the appropriate agency.*

*The Implementation Task Force will make recommendations based on the data and recommendations provided by a science subcommittee led by the Idaho Department of Fish and Game (IDFG). The Implementation Task Force may solicit outside experts if necessary.*

<sup>2</sup> Personal communication with Don Kemner, Idaho Fish and Game, April 11, 2015 correcting and clarifying items in letter that were refined for the DEIS.

species in the CHZ. Only where the monitoring information indicates the cause(s) of the decline is not a primary threat will the Implementation Team analyze the secondary threats to the species and determine whether further management actions are needed.

Population and habitat objectives are measured against baselines are illustrated in the tables below. The baseline for habitat within each CA is the 2011 nesting and wintering habitat for the CHZ and IHZ. (See Tables 1 and 2, *Idaho Alternative*, 2012.) The population baseline is the maximum number of males counted on lek routes in 2011 within the CHZ and the average finite rate of change of population for 2009-2011 within the CHZ. It is measured the same way in IHZ. CHZ and IHZ triggers are analyzed separately. The habitat triggers are also analyzed separately from the population triggers.

## **5.b. Adaptive Management for Endowment Lands**

While IDL recognizes that the soft and hard triggers would become operative across the landscape in a conservation area, regardless of land ownership, the appropriate response to address a soft or hard trigger tripping will only take place on federal land according to the *Idaho Alternative*. However, if the Implementation Team determines the causal factors are applicable to IDL managed land, IDL commits to implementing CMs tailored to meet the identified causal factor. These would likely be implemented immediately under an emergency action clause pending IDL Director approval. However, any CM to be implemented long-term that is a major deviation from the Land Board's Plan would need to be approved by the Land Board as an amendment to the Plan.

IDL will also utilize monitoring results to make any recommendations to the Land Board for their consideration as amendments to the Plan.

## **6. Anthropogenic Disturbance**

Impacts caused by anthropogenic disturbances on sage-grouse can vary depending on the type of activity and local habitat conditions. In addition, cumulative impacts of multiple activities can have significant, negative impacts on sage-grouse populations. In the *Administrative Draft Proposed Plan*, the BLM utilizes a 3 percent disturbance limit across all landowners within eight Biologically Significant Unit areas. Because endowment lands make up such a small percentage of Core and Important Habitat Zones, IDL will not place a disturbance limit within any defined areas on endowment lands since these limits would result in a violation of the fiduciary trust responsibilities bestowed on the Land Board and IDL in managing endowment lands in accordance with the Constitutional mandate.

## **7. Mitigation**

At this time, the State of Idaho has not finalized a mitigation plan, nor have there been funding sources identified or allocated to implement such a mitigation plan. Idaho's proposed mitigation plan is described in the "Framework for Mitigation of Impacts from Infrastructure Projects on Sage-Grouse and Their Habitats" (Sage-Grouse Mitigation Subcommittee of the Idaho Sage-Grouse Advisory Committee, December 2010).

IDL will commit to following Idaho’s mitigation plan once fully developed to the extent adequate funding exists.

## Plan Format

The Plan format uses two PARTS. PART I presents the CMs IDL will implement in its authorizing documents (e.g. leases) for third party activities on endowment lands. In addition, PART I identifies activities to be undertaken by IDL as the land manager related to fire prevention, wildfire suppression, and land transactions (e.g. land exchanges).

PART II presents the CMs IDL will recommend as voluntary best management practices for mining operators and oil and gas operators on non-state lands. In addition, PART II identifies activities to be undertaken by IDL under its statutory roles regarding fire prevention, wildfire suppression, and abandoned mine land reclamation.

Each Part then follows the numbered headings used in the BLM *Administrative Draft Proposed Plan* as an organizational outline and reader courtesy.

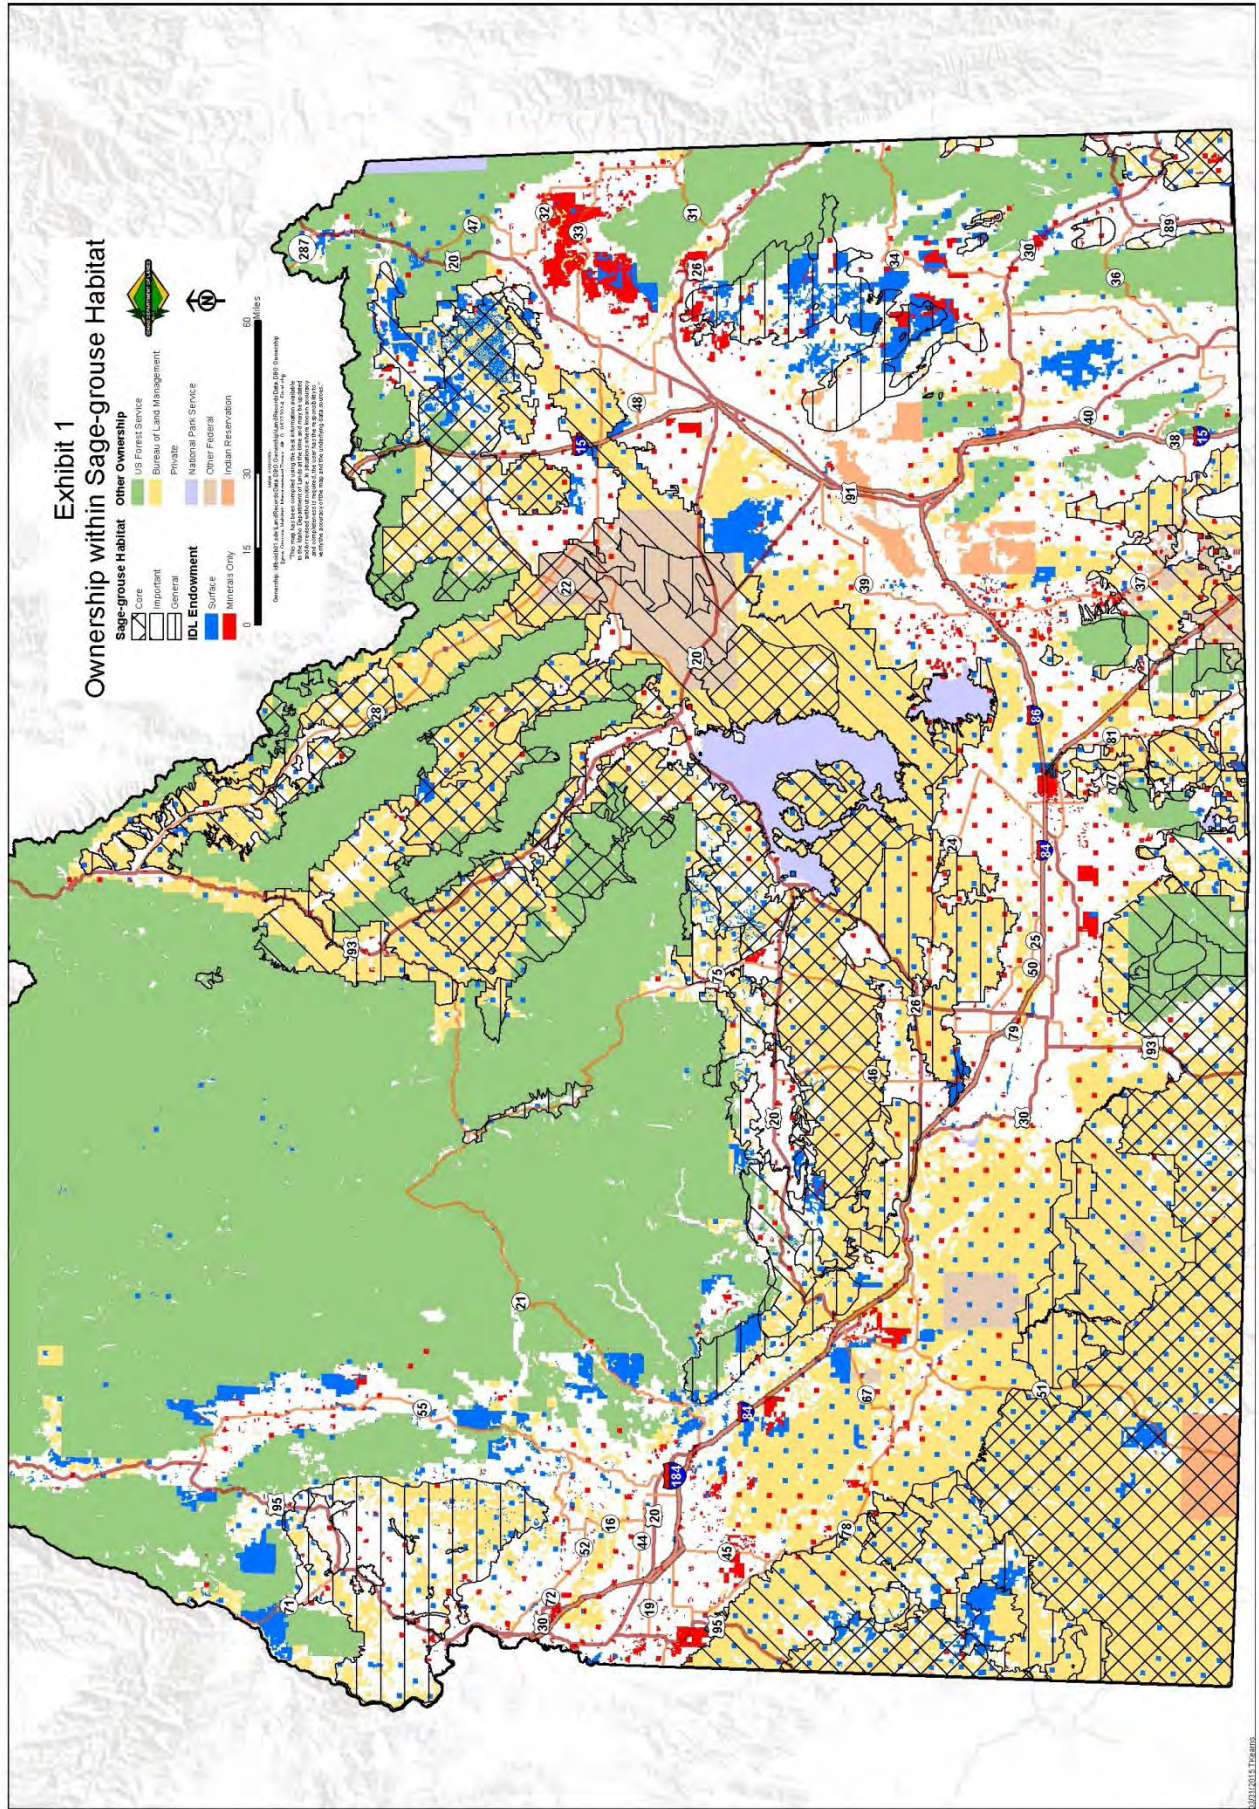

**TABLE 1.1 IDL Ownership within Sage-grouse Habitat by Conservation Area and Habitat Zones**

Conservation Area	Habitat Zone	Total Acres All Owners	Total IDL Ownership		IDL Surface Ownership		IDL Minerals Ownership Only	
		Acres	Acres	%	Acres	%	Acres	%
Idaho Desert	Core	1,017,180	31,702	3.12	29,853	2.93	1,849	0.18
	Important	1,064,653	43,510	4.09	38,710	3.64	4,800	0.45
	Total	2,081,833	75,212	3.61	68,563	3.29	6,649	0.32
Idaho Mountain Valleys	Core	2,110,685	177,006	8.39	164,286	7.78	12,720	0.60
	Important	1,602,894	135,004	8.42	120,881	7.54	14,124	0.88
	Total	3,713,578	312,010	8.40	285,166	7.68	26,844	0.72
Idaho Southern	Core	856,442	47,207	5.51	38,352	4.48	8,855	1.03
	Important	1,225,756	70,727	5.77	51,073	4.17	19,654	1.60
	Total	2,082,198	117,934	5.66	89,425	4.29	28,509	1.37
Idaho West Owyhee	Core	2,034,057	133,498	6.56	130,801	6.43	2,697	0.13
	Important	609,354	50,345	8.26	45,616	7.49	4,729	0.78
	Total	2,643,412	183,843	6.95	176,417	6.67	7,425	0.28
All Conservation Areas	CHZ and IHZ	10,521,022	688,999	6.55	619,571	5.89	69,428	0.66

## **Exhibit 1**

### **Ownership by Sage-Grouse Habitat Zone**

## **PART I. CONSERVATION MEASURES FOR ACTIVITIES ON STATE ENDOWMENT TRUST LANDS**

For proposed activities by third parties on endowment lands in Core and Important Habitat Zones, IDL will implement CMs as enforceable stipulations in authorizing documents such as leases, permits and easements. The authorized activities include: alternative energy development (solar, wind, and geothermal); oil and gas exploration and development; mining; grazing; miscellaneous commercial activities; and the granting of access through rights-of-way, including easements.

Also, IDL as the land manager will implement and support fire prevention and mitigation measures and wildfire suppression efforts to conserve sage-grouse habitat. In addition, IDL will include an analysis of sage-grouse habitat impacts when considering land transactions that are located in Core or Important Habitat Zones.

Because of the diversity of terrain and vegetation types within the sage-grouse region of Idaho, it is difficult to design a “one size fits all” set of CMs. Science and technology also change over time, and new options or alternatives may be proposed as part of a site-specific management plan. Site-specific management plans submitted by applicants or lessees must provide equal or better results than the CMs described below. Site-specific management plans will be reviewed and approved by the appropriate IDL staff. When anticipated results are uncertain, IDL will confer with the Idaho Department of Fish and Game (IDFG) prior to approving any site-specific management plan.

### **8. Fire Prevention on Endowment Land**

IDL is committed to conserving habitat for the sage-grouse in Idaho, which is under threat from the invasion of annual grasses and the loss of habitat from fire. IDL has developed wildfire preparedness and prevention measures that are complementary with the January 5, 2015 U.S. Department of Interior, Secretary of Interior Order Number 3336. The Order from Secretary Jewell sets forth enhanced policies and strategies for preventing and suppressing rangeland fire and for restoring sagebrush landscapes impacted by fire across the West.

In Idaho, there are 619,571 acres of endowment lands located within Core and Important Habitat Zones. These lands contain about 82,000 Animal Unit Months (AUMs) of leased forage. As a primary threat wildland fire has the potential to significantly impact endowment rangelands located in Core and Important Habitat Zones. Between 2009 and 2014, more than 19,000 acres of Core and Important sage-grouse habitat burned on endowment rangelands due to wildland fire. Based on historical averages, approximately 3,200 acres of endowment rangelands are expected to burn each year within Core and Important Habitat Zones with significant impacts to grazing lessees and endowment beneficiaries.

During the 2014 fire season, 2,957 acres of Core Habitat Zone burned on endowment rangelands making 470 AUMs of livestock forage unavailable for one to two years. In 2014, Core habitat restoration costs on 2,088 acres of those endowment lands totaled nearly \$45,000. Left unaddressed, the primary threat of wildland fire within Core and Important Habitat Zones on endowment rangelands is expected to continue at the same rate.

The following CMs will be incorporated as stipulations for any authorizing documents, (except livestock grazing which is addressed separately under item 16), issued within Core and Important sage-grouse habitat:

**8.1.** Authorized parties will be required to develop and be prepared to implement a fire prevention and an emergency response plan that covers all aspects of operations, which will include: coordination with local jurisdictions, such as the cities, counties, landowners, IDL, RFPAs, and federal land management agencies; emergency contact numbers and information, including 911 and local fire dispatch centers; and fire prevention and safety procedures that will include evacuation routes and procedures, the designated safety meeting place, and emergency shutdown procedures.

**8.2.** Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.

**8.3.** Authorized parties will ensure that field personnel are aware of:

- a. fire prevention and emergency response plan,
- b. evacuation routes and procedures,
- c. designated safety meeting places, and
- d. emergency shutdown procedures.

**8.4.** Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

## **9. Wildfire Suppression on Endowment Land**

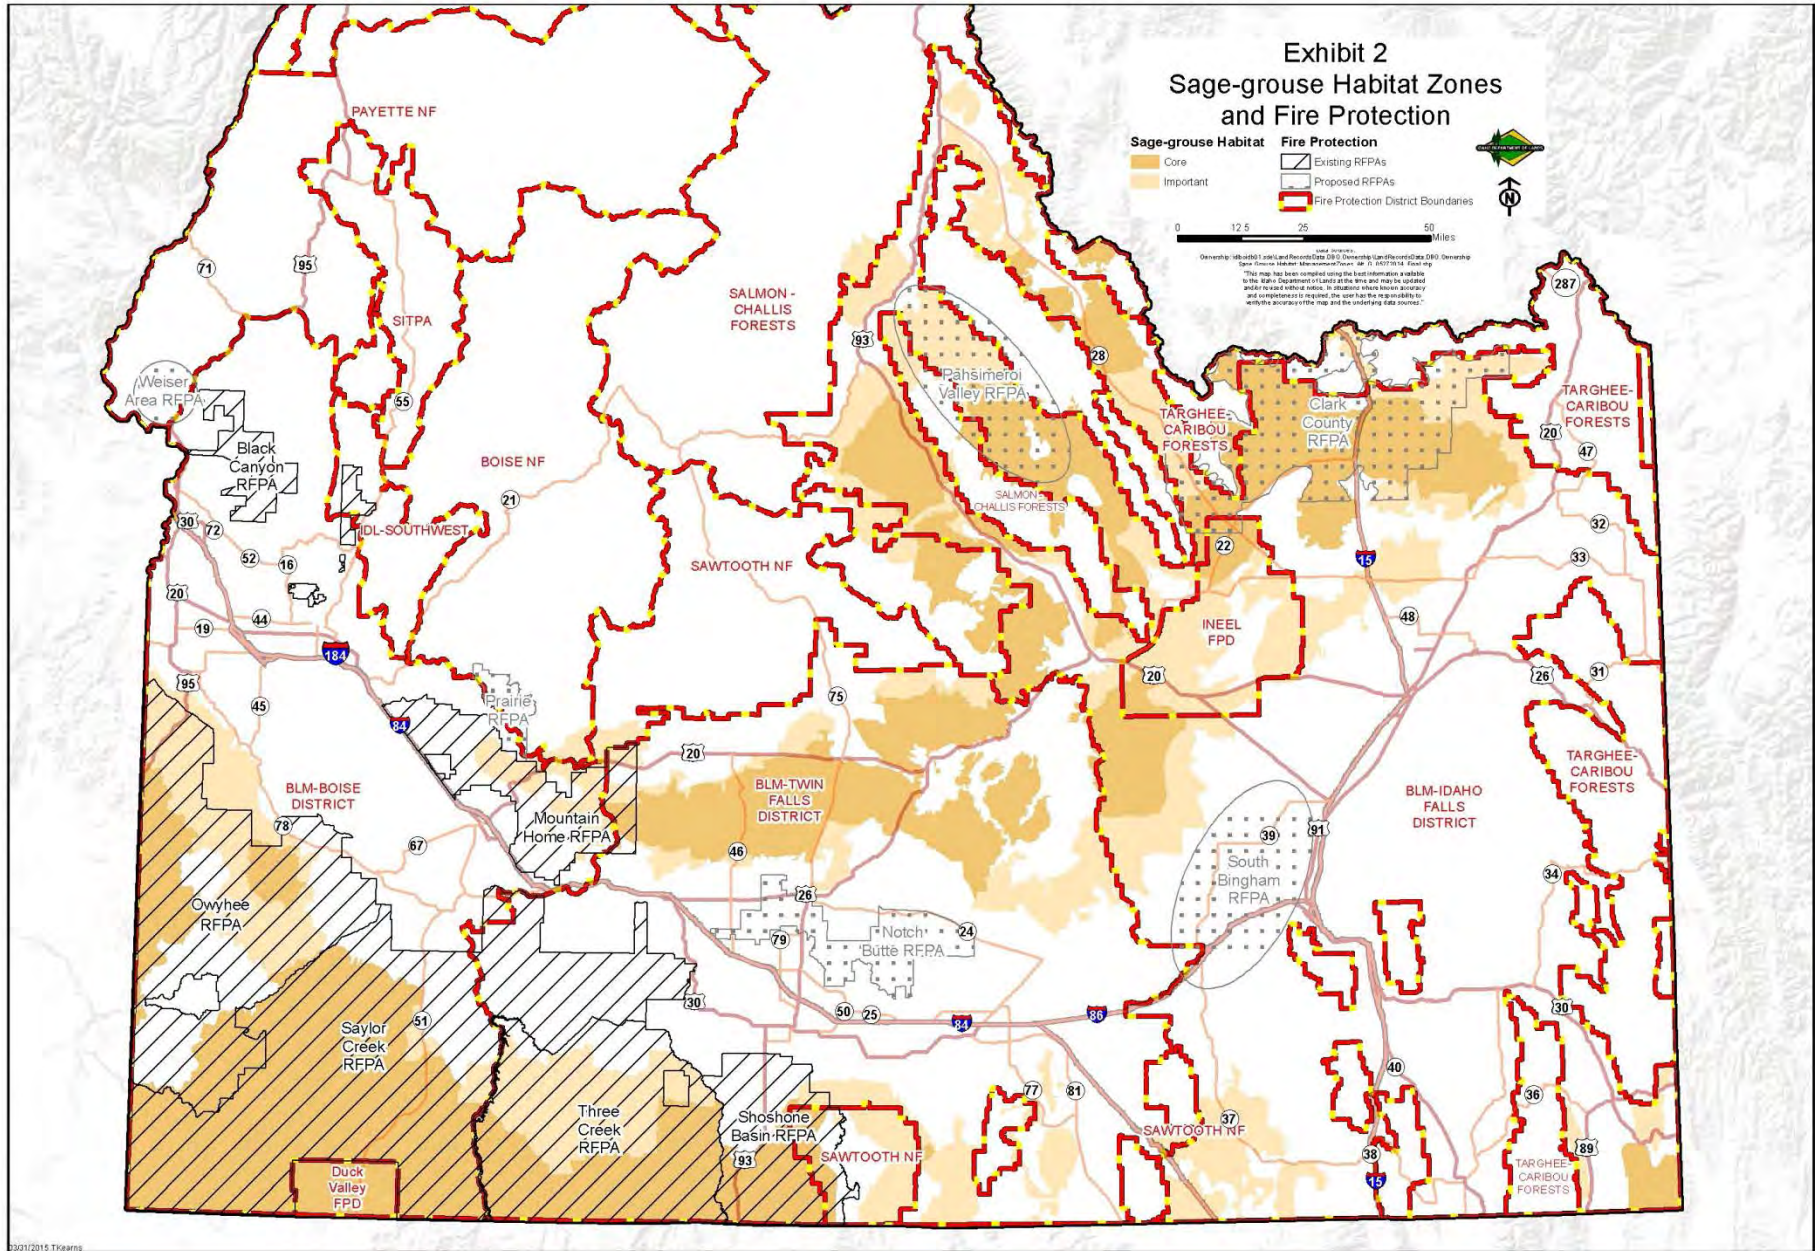

Appendix C outlines how wildfire protection responsibilities are organized in Idaho, and how Idaho funds its fire program, particularly suppression costs for fires that burn on lands protected by the State of Idaho (IDL and two timber protective associations). Exhibit 2 displays the IDL, federal, and active and proposed rangeland fire protection association boundaries within the sage-grouse landscape.

IDL is committed to conserving habitat for sage-grouse in Idaho, which is under threat from the invasion of annual grasses and the loss of habitat from fire. IDL has developed wildfire suppression guidance that is complementary with the January 5, 2015 U.S. Department of Interior, Secretary of Interior Order Number 3336. The Order from Secretary Jewell sets forth enhanced policies and strategies for suppressing rangeland fire and for restoring sagebrush landscapes impacted by fire across the West.

None of the IDL forest protective districts have suppression responsibilities within any currently identified Core or Important Habitat Zones. Likewise, as of December 2014, none of the IDL forest protective districts have suppression responsibilities within any currently identified General habitat zone.

## Exhibit 2

### Sage-Grouse Habitat Zone and Fire Protection

When IDL fire suppression resources are dispatched as a cooperating agency to another agency's incident within sage-grouse habitat, the resources will utilize that agency's BMPs as applicable for sage-grouse habitat and as instructed in the dispatched resource's briefing. Interagency cooperation suppression activities are assumed to follow the prioritization associated with the BLM/U.S. Forest Service Fire and Invasive Assessment Team (BLM/FS FIAT) plans. For extended attack fires involving endowment rangelands, in or near Core or Important Habitat Zones:

**9.1.** IDL may assign a Resource Advisor (primarily a Resource Specialist-Range) to provide local information regarding sage-grouse habitat during the in-brief and continually throughout the incident. The Resource Advisor will also be engaged with the incident to assess sage-grouse habitat that may be affected by the fire or suppression activities.

## **10. Fuels Management on Endowment Land**

Wildfires in a rangeland ecosystem can grow quickly and affect hundreds of thousands of acres of sage-grouse habitat in a matter of days or within a single burning period. Due to rapid fire spread, the potentially long response times due to remoteness, and limited sites for firefighters to establish safe anchor points to engage wildfires in some of these areas, these fires can be difficult to manage. Additionally, only one of the three legs of the fire triangle (fuel, oxygen, and heat) can be modified, which is fuel, making fuels management key in wildfire control in sage-grouse habitat.

**10.1.** Unless otherwise specified as part of a land use plan, IDL will consider the full array of fuels management treatment types (prescribed fire, mechanical, chemical, and biological) when implementing CMs and BMPs on endowment rangelands.

**10.2.** Where applicable IDL will design fuels treatment objectives on endowment rangelands to protect existing Core and Important Habitat Zones, modify fire behavior, restore native plants, and create landscape patterns to benefit sage-grouse habitat, as resources permit and consistent with the BLM/FS FIAT plans .

**10.3.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to use proper livestock management and targeted grazing as a treatment to reduce vegetative fire fuels, reduce annual grass densities, and to enhance and protect Core and Important Habitat Zones.

**10.4.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically remove standing and encroaching conifer near sage-grouse leks, nesting, wintering and brood-rearing habitat, as resources permit. Examples of IDL cooperative efforts include:

- a. *Bruneau-Owyhee Sage-Grouse Habitat Project (Federal Register- NOI, 01/20/2015)*
- b. *Burley Interagency Landscape Sage-Grouse Habitat Restoration Project*

**10.5.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically implement brush management treatments and rehabilitate annual grasslands to reduce vegetative fire fuels within and to protect Core and Important Habitat Zones, as resources permit.

**10.6.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically establish green and brown strip fuel breaks along existing roads and other disturbances; identify and target higher-risk roads for fuel break construction and maintenance based on fire history maps; and use properly managed and targeted livestock grazing to create fuel break patterns that protect Core and Important Habitat Zones. Fuel breaks to include annual monitoring and maintenance. Examples of IDL cooperative efforts include:

- a. *Tri-State Interagency Fuel Break Project (Federal Register-NOI, 2015)*
- b. *Paradigm Fuel Break Project (BLM Draft EA, 01/24/2014)*
- c. *Jarbidge Fuel Breaks Project (DOI-BLM-ID-T010-2011-0006-EA)*

**10.7.** IDL will authorize private, state and federal contractor fuel break construction across IDL managed land.

**10.8.** IDL will prioritize fuel management treatments within Key Areas (large contiguous blocks of endowment land within Core and Important habitat that USFWS has identified as a priority for conservation efforts). Fuel management treatments within Key Areas will incorporate sage-grouse seasonal habitat guidelines as presented in Tables 3-5 *Idaho Alternative* (developed from Connelly et al. 2000). When habitat parameters are uncertain or in doubt, IDL will confer with IDFG prior to conducting any fuel management treatments within the Key Areas.

## **11. Wildfire Restoration and Rehabilitation on Endowment Land**

Wildfire restoration/rehabilitation is essential for conserving sage-grouse habitat. The increasing frequency and intensity of rangeland fire poses a significant threat to habitat as well as increasing opportunity for the accelerated invasion of non-native annual grasses, in particular cheatgrass and medusahead rye, and the spread of pinyon-juniper across the sagebrush-steppe ecosystem. By quickly taking action to restore/rehabilitate following wildfire, this opportunity is decreased as we increase the likelihood of desired vegetation reestablishing.

**11.1.** IDL will form partnerships, agreements, and cooperate with lessees, working groups, and other federal, state, county and private partners in post-fire restoration treatments of Core and Important Habitat Zones on state endowment trust rangelands damaged by fire. Restoration and rehabilitation efforts will be consistent with the BLM/FS FIAT plans.

- a. *BLM/IDFG/IDL Rangeland Rehabilitation MOU (Final MOU 02/2015)*

**11.2** IDL will prioritize fire restoration/rehabilitation treatments within Key Areas. Fire restoration/rehabilitation treatments within Key Areas will incorporate sage-grouse seasonal habitat guidelines as presented in Tables 3-5 *Idaho Alternative* (developed from

Connelly et al. 2000). When habitat parameters are uncertain or in doubt, IDL will confer with IDFG prior to conducting any fire restoration/rehabilitation treatments within the Key Areas.

## **12. Habitat Restoration and Vegetation Management on Endowment Land**

**12.1.** As resources permit, IDL will give high priority to vegetation restoration, rehabilitation or manipulation projects in Core and Important habitat within the Key Areas first, followed by those areas not within the Key Areas, consistent with the BLM/FS FIAT plans that include:

- a. Cooperative efforts that may improve Core and Important Habitat Zones over multiple ownerships.
- b. Projects that may provide connectivity between suitable habitats or expand existing good quality habitat within Core and Important Habitat Zones on endowment rangelands.
- c. Sites where environmental variables contribute to improved chances for project success.
- d. Projects that address conifer encroachment within Core and Important Habitat Zones. Priority for treatment as Phase 1 (<10 percent conifer cover), Phase 2 (10-30 percent), and Phase 3 (>30 percent).
- e. Where desirable perennial bunchgrasses and/or forbs are deficient in existing sagebrush stands, use appropriate mechanical, aerial, or other techniques to re-establish desired species.
- f. Re-establish sagebrush cover on recently burned native areas within suitable Core and Important Habitat Zones, with consideration to endowment rangeland forage productivity, local needs and conditions.

**12.2.** Assess existing on-site vegetation to ascertain if enough desirable perennial vegetation exists to consider techniques to increase on-site seed production to facilitate an increase in density of desired species.

**12.3.** Use available plant species based on their adaptation to the site when developing seed mixes.

**12.4.** Use post-treatment control to reduce annual grass densities, invasive and noxious weed competition through targeted livestock grazing and herbicide applications.

**12.5.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically remove standing and encroaching conifer near sage-grouse leks, nesting, wintering and brood-rearing habitat, as resources permit.

- a. *Bruneau-Owyhee Sage-Grouse Habitat Project (Federal Register- NOI, 01/20/2015)*
- b. *Burley Interagency Landscape Sage-Grouse Habitat Restoration Project*

**12.6** IDL will prioritize habitat restoration treatments within Key Areas. Habitat restoration treatments within Key Areas will incorporate sage-grouse seasonal habitat

guidelines as presented in Tables 3-5 *Idaho Alternative* (developed from Connelly et al. 2000). When habitat parameters are uncertain or in doubt, IDL will confer with IDFG prior to conducting any habitat restoration treatments within the Key Areas.

### **13. Invasive Plant Species on Endowment Land**

Exotic annual grasses and other invasive plants alter habitat suitability for sage-grouse by reducing or eliminating native forbs and grasses essential for food and cover. Exotic annual grasses, in particular cheatgrass and medusahead rye, also facilitate an increase in mean fire frequency. For endowment lands, the following CMs for invasive plant species will be applied through lease stipulations or other recordable instrument stipulations.

**13.1.** Vehicles and equipment operated by IDL or lessees that will travel off approved /designated transportation routes will be inspected and cleaned of seeds and propagules to prevent the spread of invasive and noxious plant species.

**13.2.** Through a cooperative effort, invasive and noxious plant species will be inventoried and monitored pre-disturbance and throughout the life of the project by the lessee and the lessor or a designated agent.

**13.3.** Reclamation activities will include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) will be certified weed free by the appropriate federal or State of Idaho agency.

**13.4.** Authorized parties will use BMPs and appropriate treatments including chemical, mechanical and biological to treat invasive and state listed noxious plant species. When regulated chemicals are determined to be the best treatment, authorized parties will use Idaho licensed professional applicators to treat noxious plant species with the approved and properly documented herbicide. Weeds will be treated promptly when located on a project site.

### **14. Infrastructure Development / Lands and Realty on Endowment Land**

The *Idaho Alternative* defines “infrastructure”:

*... as discrete, large-scale anthropogenic features, including highways, high voltage transmission lines, commercial wind projects, energy development (e.g., oil and gas development, geothermal wells, airports, mines, cell phone towers, landfills, residential and commercial subdivisions, etc.)*

*Infrastructure related to small-scale ranch, home and farm businesses (e.g., stock ponds, fences, range improvements) do not fall within this definition. These issues are not included within this definition, and are addressed in other sections of the Alternative or through local resource management plans.*

Infrastructure development on endowment lands can vary from minor road or fencing construction to utility-scale renewable energy facilities including wind farms, geothermal power plants, and

solar power plants. These developments regardless of their size can have a measurable and substantial impact on sage-grouse and their habitat. All infrastructure developments require some form of road construction to deliver materials for construction and perform regular maintenance to facilities. These roads are often graded gravel roads and are maintained periodically for easy access to sites. Other smaller roads are developed for access to geothermal well pads, wind turbines, or pipelines. Roads may also be necessary for third-party access to private or federal lands.

Transmission lines must be built in order to harness power from wind turbines, geothermal sites, or solar sites and to provide for grid reliability. Additionally, fences are often erected to protect facilities such as turbines or substations from vandalism. These features all have the potential to directly, or indirectly, affect sage-grouse at multiple scales and over time.

The potential for renewable energy development to occur on endowment lands located in Core and Important Habitat Zones is very low. However, any proposed development will be required to comply with the CMs identified in the following sections. These same CMs will also be included as stipulations in rights-of-way, when IDL authorizes parties to access other lands by using endowment lands.

#### **14.1. Surface Use and Timing**

**14.1.1.** Controlled surface use and timing limitations as described below will be applied within Core and Important Habitat Zones, unless species occupancy and distribution determined by the IDFG recommends otherwise.

**14.1.2.** No surface occupancy is allowed within 1 km (0.62 mi.) of an occupied lek in the designated Core and Important Habitat Zones. Livestock grazing is not considered surface occupancy.

**14.1.3.** During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000-foot elevation may be used as a general distinction.

**14.1.4.** Major construction and maintenance activity shall be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

#### **14.2. Noise**

Limit noise levels from discretionary activities within Core and Important Habitat Zones to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from two hours before sunset to two hours after sunrise during breeding season. Ambient noise levels will be determined by measurements taken at the perimeter of an occupied lek at sunrise.

### **14.3. Fencing**

Findings from Stevens et al. 2012 show that sage-grouse collisions are highly variable spatially, and targeting efforts for fence marking is more strategic and cost-effective. Analysis revealed that terrain ruggedness and distance from the lek were primary factors associated with fence collision risk across the landscape. Use Natural Resource Conservation Service (NRCS) fence collision data and local knowledge to determine low, medium or high risk level around occupied leks. Fence segments within Key Areas will be the first priority.

**14.3.1.** New and existing wire fence segments constructed by authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011).

Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.

**14.3.2.** As necessary and feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important Habitat Zones.

### **14.4. Water Supply Structures**

**14.4.1.** New or modified spring developments (including pipelines) shall be designed by authorized parties to maintain or enhance the free-flowing characteristics of springs and wet meadows, which will help maintain continuity of the pre-developed riparian areas.

**14.4.2.** As an exception to 14.4.4.1., on projects requiring water to be pumped such as solar, hydro or fossil fuel operation, floated tanks will be allowed to conserve water resources and efforts will be made by the lessee to treat these tanks for mosquito species that carry West Nile Virus.

**14.4.3** The construction of new ponds or reservoirs by authorized parties will be minimized, except as needed to meet important resource management or restoration objectives, to reduce the potential impact from West Nile Virus on sage-grouse.

**14.4.4.** Wildlife escape ramps in new and existing water troughs and open-water storage tanks shall be installed and maintained to facilitate the use of and escape by wildlife.

### **14.5. Constructed Improvements**

**14.5.1.** Construction methods will be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.

**14.5.2.** Infrastructure will be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed for access to facilities. Requirements from public utilities will be followed for all installations

**14.5.3.** Surface disturbances will be clustered in order to limit surface occupancy.

**14.5.4.** New utility developments and transportation routes will be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.

**14.5.5.** Use best available science in concurrence with IDFG to address concerns of towers and other elevated structures as perches for predatory or corvid birds.

**14.5.6.** New structures with a height over five feet will not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built, or presently exist, the lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.

**14.5.7.** Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

**14.6. Site Reclamation** (non-fire related rehabilitation/reclamation)

**14.6.1.** Site reclamation will be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.

**14.6.2.** Reclamation activities and plans will consider the ecological site potential. The goal of the reclamation will be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.

**14.6.3.** Sites will be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

## Transition Lands/Land Tenure

IDL considers opportunities to sell, purchase, develop, or exchange endowment lands to meet its constitutional mandate to maximize long term returns to the owning beneficiaries by diversifying land holdings, maximizing the rate of return to the trusts, improving public access to endowment lands, and consolidating endowment lands for more efficient management. In order to accomplish these objectives, IDL must be able to maintain the flexibility to move lands into and out of the identified habitat zones. Lands identified for potential ownership changes are termed “transition lands.”

The ultimate decision authority for determining to auction or exchange endowment lands lies with the Land Board. IDL commits to providing the Land Board relevant data and analysis to inform them on potential impacts to sage-grouse habitat of land transitions within Core or Important sage-grouse Habitat Zones through the following CMs.

**14.7.** Any tract proposed for sale or exchange within Core or Important Habitat Zones will include an analysis on the impact to sage-grouse habitat resulting from the transition. This analysis will include, but not limited to:

- Acres in and percentages of Core and Important Habitat Zones.
- Quality/type of habitat (number of leks, breeding, nesting, early brood rearing, summer/late brood rearing, fall, winter).
- Any knowledge of new owner’s implementation/commitment for sage-grouse conservation measures to estimate overall impact to sage-grouse habitat conservation.
- IDFG data and review comments.

## 14.8 BLM Land Exchanges

IDL adopts a general strategy aimed at reducing endowment ownership of Key Habitat within Core Habitat Zones through completion of land exchanges with the BLM. This strategy would provide the greatest levels of certainty for conservation of core sage-grouse habitat.

Once endowment lands have been proposed to be included in a formal land exchange with the submission and acceptance of an Agreement to Initiate (ATI) with the BLM, the IDL, with Land Board concurrence, would commit to up to a three-year deferral on leasing of those lands for mineral development in order to accomplish the exchange.

Key habitat areas within Core Habitat Zones within the endowment trust estate would be prioritized for exchange. In exchange for those endowment lands, IDL would prioritize BLM lands and/or minerals with the following characteristics for acquisition consistent with its duty to maximize revenue over the long term in accordance with Article IX, Section 8 of the Idaho Constitution: 1) lands and minerals located outside of Core and Important Habitat Zones, 2) lands with oil and gas resource development potential, 3) lands with non-native vegetation (previously seeded crested wheatgrass), and 4) lands that block up existing IDL ownership, not necessarily limited to the current disposal lists in the respective Resource Management Plans.

Given the long timeframes that can be associated with federal land exchanges, IDL proposes that the Department of Interior consider adopting a streamlined exchange process, similar to authorities contained in the 2014 Farm Bill for the U.S. Department of Agriculture. Land exchanges that provide a net benefit to conservation of core sage grouse habitat, should be considered for a categorical exclusion under the National Environmental Policy Act (NEPA).

#### **14.9. Owyhee Land Exchange**

In December, 2008 the BLM and IDL entered into an Agreement to Initiate Land Exchange. IDL's objectives for parcel acquisition selection include: improved range (crested wheatgrass seedings), parcels outside Core or Important sage-grouse habitat or bighorn sheep habitat, parcels that block up current IDL ownership and/or provide legal access to existing ownership, and parcels that may have Higher and Better Use (HBU) potential. Objectives for disposition of IDL lands include: wholly within or adjacent to designated wilderness, scattered parcels with no legal access and no management control, other scattered IDL parcels within large blocks of BLM ownership. Acreage in the current version of the exchange includes approximately 28,000 acres of IDL ownership and 32,000 acres of BLM ownership. Parcels in the exchange are displayed in Appendix D.

**14.10** New acquisitions of endowment lands within the Core and Important Habitat Zones would be discouraged; however, if minor amounts of lands were acquired, they would be managed according to the IDL sage-grouse CMs.

### **15. Mineral Leasing on Endowment Land**

For all mineral leasing activities on endowment lands, CMs for the sage-grouse will be applied through lease stipulations or other recordable instrument stipulations that are enforceable. Mineral leasing can be slightly more complex due to the potential for split estate scenarios, where the surface owner is different than the mineral estate owner. In these cases, IDL would still include CMs as lease stipulations when leasing involves only the mineral estate (where the endowed beneficiary is not the surface owner).

#### **15.1. Fluid Mineral Leasing on Endowment Land**

Fluid minerals are resources of oil, natural gas (gas), and natural gas condensate. The first commercially-viable resources of gas were discovered in Payette County in 2010. Exploration activity is also located in adjacent counties to Payette County. Recent leasing in south central and southeast Idaho suggests exploration interests in these areas. Additional resource discoveries are possible in all of these areas. Presently, IDL has no exploration activities to regulate for fluid minerals located in Core or Important sage-grouse Habitat Zones.

The resources in Payette County were discovered with conventional drilling operations, which utilized vertical well bores that penetrated permeable gas accumulations within site-

specific gas traps. These types of deposits are termed conventional gas (or oil) resources. In contrast, unconventional resources are continuously-distributed oil or gas accumulations in fine-grained rocks, which generally cannot be exploited through conventional methods and techniques. Unconventional resources have not been identified in Idaho, but the potential for their discovery does exist. For endowment lands, the following oil and gas lease stipulations will be included in the lease document and advertised prior to lease auction on tracts within Core and Important Habitat Zones.

#### **15.1.1. Surface Use and Timing**

- a. Controlled surface use and timing limitations as described below will be applied within Core and Important Habitat Zones, unless species occupancy and distribution determined by IDFG recommends otherwise.
- b. No surface occupancy is allowed within 1 km (0.62 mi.) of an occupied lek in the designated Core and Important Habitat Zones.
- c. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000-foot elevation may be used as a general distinction.
- d. Major construction and maintenance activity will be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

#### **15.1.2. Noise**

Limit noise levels from discretionary activities within Core and Important Habitat Zones to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from two hours before sunset to two hours after sunrise during breeding season. Ambient noise levels will be determined by measurements taken at the perimeter of an occupied lek at sunrise.

#### **15.1.3. Fencing**

New and existing wire fence segments constructed by authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.

#### **15.1.4. Water Supply Structures**

Wildlife escape ramps in new and existing open-water storage tanks shall be installed and maintained to facilitate the use of and escape by wildlife.

#### **15.1.5. Constructed Improvements**

- a. Construction methods will be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- b. Infrastructure will be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, will be located along roads already in existence or required to be newly constructed for access to facilities.
- c. Surface disturbances will be clustered in order to limit surface occupancy.
- d. New utility developments and transportation routes will be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- e. Use best available science in concurrence with IDFG to address concerns of towers and other elevated structures as perches for predatory or corvid birds.
- f. New structures with a height over five feet will not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built, or presently exist, the lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- g. Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

#### **15.1.6. Site Reclamation for Leases**

- a. Site reclamation will be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- b. Reclamation activities and plans will consider the ecological site potential. The goal of the reclamation will be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- c. Sites will be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

## **15.2. Mining Activities on Endowment Lands**

Mineral leasing and any subsequent mining activities on state endowment trust lands require authorization and oversight by IDL. IDL uses written procedures, including mineral lease pre-auction inspections, quarterly or yearly mineral lease inspections, and mineral lease enforcement to ensure compliance by authorized parties. The following conservation measures will be incorporated into the IDL mineral leases that are in Core and Important sage-grouse Habitat Zones.

### **15.2.1. Surface Use and Timing**

- a. Controlled surface use and timing limitations as described below will be applied within Core and Important Habitat Zones, unless species occupancy and distribution determined by the Idaho Department of Fish and Game (IDFG) recommends otherwise.
- b. No surface occupancy is allowed within 1 km (0.62 mi.) of an occupied lek in the designated Core and Important Habitat Zones.
- c. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations, project activities will be avoided within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000-foot elevation may be used as a general distinction.
- d. Major construction and maintenance activity will be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

### **15.2.2. Noise**

Limit noise levels from discretionary activities within Core and Important Habitat Zones to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before sunset to 2 hours after sunrise during breeding season. Ambient noise levels will be determined by measurements taken at the perimeter of an occupied lek at sunrise.

### **15.2.3. Fencing**

New and existing wire fence segments constructed by authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.

#### **15.2.4. Water Supply Structures**

Wildlife escape ramps in new and existing open-water storage tanks shall be installed and maintained to facilitate the use of and escape by wildlife.

#### **15.2.5. Constructed Improvements**

- a. Construction methods will be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- b. Infrastructure will be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, will be located along roads already in existence or required to be newly constructed for access to facilities.
- c. Surface disturbances may be clustered in order to limit surface occupancy.
- d. New utility developments and transportation routes will be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- e. Use best available science in concurrence with IDFG to address concerns of towers and other elevated structures as perches for predatory or corvid birds.
- f. New structures with a height over five feet will not be constructed by authorized parties within 1km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within 3 km of breeding period habitats. If these structures must be built, or presently exist, the lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- g. Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

#### **15.2.6. Site Reclamation for Leases**

- a. Site reclamation will be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- b. Reclamation activities and plans will consider the ecological site potential. The goal of the reclamation will be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- c. Sites will be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

### **16. Range Management/Livestock Grazing on Endowment Land**

IDL recognizes that healthy rangelands provide a basic foundation for productive sage-grouse habitat. Conservation and improvement of sage-grouse habitat is consistent with long-term

grazing management systems that support conditions or trends toward healthy rangelands. Within the 2006 Conservation Plan for the Greater Sage-Grouse in Idaho (“2006 Idaho Plan”), IDL agreed to take measures that protect or improve important and critical wildlife habitat, subject to the fundamental mission of IDL to support endowment beneficiaries. Though the impact of livestock grazing to rangelands is recognized as a secondary threat to sage-grouse habitat in Idaho, roughly 619,571 surface acres or 44 percent of endowment rangelands are within Core and Important Habitat Zones. IDL identifies proper livestock grazing as a tool that could benefit sage-grouse habitats by taking into consideration flexibility and site-specific management opportunities.

Identified within the 2006 Idaho Plan, livestock management practices are not stand-alone actions. Management activities should be considered in combinations best characterized by a complete and effective grazing program and that also considers key sage-grouse conservation needs. IDL further recognizes that opportunities exist for state and federal agencies, grazing lessees and university researchers to collaborate on efforts to modify current conditions and needed management actions in terms of livestock grazing in sage-grouse habitats throughout southern Idaho. IDL will administer endowment rangelands and livestock grazing leases in Core and Important Habitat Zones with lease stipulations that are drawn from, in part, the CMs specified within the 2006 Idaho Plan as well as more recent IDFG recommendations.

Issue Addressed	Conservation Measure(s)
Livestock management and leks.	<ol style="list-style-type: none"> <li>1. Use lek route or other relevant information to identify leks where the placement of sheep camps, bed grounds, herding or related activities is repeatedly disturbing displaying birds on active leks. Dates of concern are from March 15 through May 1 in lower elevation with habitats and March 25 through May 15 in higher elevation habitats. Once such leks are identified, IDL will work closely with sheep ranchers, Local Working Groups and/or IDFG to identify mutually agreed upon alternative sites or herding routes that eliminate or reduce disturbance. In selecting such alternative sites/routes, focus on areas away from leks and that do not provide breeding habitat characteristics, where feasible. If such lek-specific CMs cannot be developed (due to time or logistical constraints), domestic sheep grazing activities described above will be avoided within the lesser of 1 km (0.62 mi) or direct line of sight of any such lek during the lekking periods.</li> <li>2. IDL will provide maps to lessees to ensure that sheep operators and herders are aware of the location of possible or occupied leks.</li> </ol>
Livestock management and late brood rearing habitat.	<ol style="list-style-type: none"> <li>1. Due to the preference of forbs by domestic sheep, manage sheep allotments using grazing management techniques that promote and maintain a diversity of desirable annual and perennial forbs. Suggestions include:               <ol style="list-style-type: none"> <li>A. Alternate or rotate areas for spring turnout.</li> <li>B. Promote light, once-over use of vegetation, as opposed to repeated use during the same season</li> </ol> </li> </ol>

Issue Addressed	Conservation Measure(s)
	<p>by the same band or successive bands of sheep.</p> <p>C. Ensure that permittees, foremen, herders and sheep camp tenders are informed of management and movement requirements, such as related to the avoidance of recent burns, burned area rehabilitation seedings or other restoration sites.</p> <p>D. Employ open (loose) herding of sheep as opposed to tightly bunched sheep.</p> <p>2. Manage grazing of riparian areas, meadows, springs, and seeps in a manner that promotes vegetation structure and composition appropriate to the site. In some cases enclosure fencing may be a viable option. However, in some cases, (e.g., enclosed meadows) the availability and quality of herbaceous species may be improved by periodic grazing use of enclosure and should be considered in the grazing management program.</p> <p>3. In agricultural fields where sage-grouse use has been documented or is likely, willing lessees may wish to avoid or limit use of alfalfa by livestock after the last cutting, to provide residual alfalfa for use by sage-grouse broods.</p>
Livestock management during periods of drought.	<p>1. In sage-grouse nesting and brood-rearing habitats, adjust livestock use (season, utilization, stocking, intensity, and/or duration) during drought to minimize the additional stress placed on herbaceous species. This is anticipated to reduce impacts on perennial herbaceous cover, plant species diversity and plant vigor. IDL will cooperate with lessees and federal partners as needed.</p> <p>2. IDL will continue to foster the coordination of drought management activities and outreach through the Idaho Rangeland Drought Task Force committee.</p>
Placement of salt and mineral supplements.	<p>1. When using salt or mineral supplements: a) place them in existing disturbed sites, areas with reduced sagebrush cover, seedings, or cheatgrass sites (for example) to reduce impacts to sage-grouse breeding habitat, b) where feasible, use salts or mineral supplements to improve management of livestock for the benefit of sage-grouse habitat.</p>
Placement of fences and other structures.	<p>1. Findings from Stevens et al. 2012 show that sage-grouse collisions are highly variable spatially, and targeting efforts for fence marking is more strategic and cost-effective. Analysis revealed that terrain ruggedness and distance from the lek were primary factors associated with fence collision risk across the landscape. Use Natural Resource Conservation Service (NRCS) fence collision data and local knowledge to determine low, medium or high risk level around occupied leks. Fence segments within Key Areas will be the first priority.</p> <p>2. New and existing wire fence segments constructed by</p>

Issue Addressed	Conservation Measure(s)
	<p>authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.</p> <p>3. Where feasible, IDL will recommend placement of new fences and structures with consideration of their impact on sage-grouse. In general, avoid constructing new fences within 1 km (0.62 mi) of occupied leks (adopted from Connelly et al. 2000b). Where feasible, place new, taller structures such as corrals, loading facilities, water storage tanks, windmills etc., as far as possible from occupied leks to reduce opportunities for perching raptors. Careful consideration, based on local conditions, will also be given to the placement of new fences or structures near other important seasonal habitats (winter-use areas, movement corridors etc.). In order to reduce potential impacts, fence markers will be used to mitigate mortality within areas identified by IDL, lessees or cooperative partners.</p>
Design and placement of water developments.	<p>1. IDL and lessees will cooperate on site-specific new spring developments in sage-grouse habitat. Spring developments will be designed to maintain or enhance the free-flowing characteristics of springs and wet meadows by the use of float valves on troughs or other features where feasible. Retrofit existing water developments during normal maintenance activities to maintain or enhance lentic, riparian properties and minimize annual maintenance.</p> <p>2. IDL and lessees will cooperate to ensure that new and existing livestock troughs and open water storage tanks are fitted with wildlife escape ramps/ladders to facilitate the use of and escape from troughs by sage-grouse and other wildlife. Floating boards or similar objects will not be used as these are too unstable and are ineffective. IDL and lessees will cooperate to ensure that USDA-NRCS design requirements for wildlife escape ramps are followed when installed.</p>

## 17. Wild Horses and Burros

No direct measures, this item included to maintain sequential numbering system utilized for the BLM *Administrative Draft Proposed Plan*.

## 18. Travel Management

**18.1.** On site traffic should be reduced by use of telemetry and other remote sensing tools.

**18.2.** During operations, existing roads or trails should be employed and activities should be contained as close to existing roads and trails as feasible.

**18.3.** Roads should be designed by authorized parties to an appropriate minimum standard necessary to accommodate their intended purpose.

**18.4.** Road crossings should be constructed by authorized parties at right angles to ephemeral drainages and stream crossings.

## **19. Recreation**

Recreation has been determined to not be a primary threat to sage-grouse in Idaho, but the measures listed above in Sections 13 and 14 will also apply to recreation leases.

## **20. Implementation and Monitoring**

Implementation of the CMs through lease/permit/easement stipulation will be incorporated into existing lease/permit/easement issuance procedures. A copy of the applicable CMs will be provided to all interested applicants for a lease, permit or easement on endowment lands located in Core or Important Habitat Zones, so the applicant is informed of the expected requirements when entering the application process. The CMs will be incorporated into the authorizing document either directly or by separate addendum. See Appendix B for IDL's DRAFT Implementation Plan.

Monitoring of CMs required through lease/permit/easement stipulation will be incorporated into existing lease/permit inspection procedures. Inspection forms will be amended to include a section for documenting that CMs were implemented and an assessment of their effectiveness. See Appendix E for IDL's DRAFT Monitoring Plan (not yet completed).

Procedures for land transactions will be amended to include an analysis of the impacts on sage-grouse when the transaction includes transition lands within Core or Important Habitat Zones. The results of this analysis will be included in the information provided to the Land Board for their review of the proposed transaction.

## **PART II. CONSERVATION MEASURES FOR IDL ACTIVITIES IN THE FIRE PROGRAM AND FOR REGULATED ACTIVITIES IN THE OIL & GAS AND MINERALS PROGRAMS**

For regulatory and assistance activities on private land, CMs will be voluntary BMPs because IDL does not have the statutory authority within its regulatory programs or assistance activities to require adoption by authorized parties. Regulatory and assistance activities include: abandoned mine lands projects; dredge and placer mine permitting; mine reclamation plan approvals; and oil and gas permits (e.g. seismic imaging surveys, well drilling). Where appropriate, IDL will include recommended BMPs within its authorizing documents to encourage compliance.

In addition, IDL has roles and responsibilities in its fire program where CMs will be implemented to address conservation of sage-grouse habitat in Core and Important Habitat Zones.

### **8. Wildfire Preparedness/Prevention**

IDL is committed to conserving habitat for the greater sage-grouse in Idaho, which is under threat from the invasion of annual grasses and the loss of habitat from fire. IDL has developed the following wildfire preparedness and prevention conservation measures that are complementary with the January 5, 2015 U.S. Department of Interior, Secretary of Interior Order Number 3336. The Order from Secretary Jewell sets forth enhanced policies and strategies for preventing and suppressing rangeland fire and for restoring sagebrush landscapes impacted by fire across the West.

**8.1.** IDL will continue to support the ongoing operations of taxing and non-taxing fire districts in Idaho, when requested and as available, through equipment acquired through the Federal Excess Personal Property (FEPP) program and Firefighter Property (FFP) program, and through Volunteer Fire Assistance (VFA) grant fund allocations.

**8.2.** IDL will continue to support the formation and ongoing operations of RFPAs through the IDL South Idaho Fire Program Liaison. This position is the point of contact for any needs or issues raised by RFPAs and their cooperators. The position coordinates information needs on an annual cycle as well as facilitating an annual meeting for all RFPA Board of Directors and their cooperators, held following fire season.

**8.3.** IDL will continue to support, as funding is available, the formation and operation of RFPAs through start-up funding that provides personal protective equipment, radios, firefighting equipment, and training materials.

**8.4.** IDL will continue to utilize burning permits (per Idaho Code 38-115, Rule IDAPA 20.04.01.060) during the designated closed fire season as a fire prevention and control tool. Burning permits acquaint the permit holder with the laws and requirements for safe burning. During times of critical fire hazard, all burning may be stopped by the suspension of burning permits. Closed fire season provides for public safety and the protection of land resources by ensuring that all burning operations which may occur during periods of high

fire danger are conducted under safe conditions and in such manner that the danger of uncontrolled fire spread is minimized.

**8.5.** IDL will continue to participate in the Idaho Fire Restrictions Plan (per Idaho Code 38-115, Rule IDAPA 20.04.01.060; IDAPA 20.04.01.070; IDAPA 20.04.01.090; and IDAPA 20.04.01.120), which is an interagency document that outlines coordination efforts regarding fire restrictions and closures. The purpose of fire restrictions is to reduce the risk of human-caused fires during unusually high fire danger and/or burning conditions. An interagency approach for initiating restrictions or closures helps provide consistency among the land management partners, while defining the restriction boundaries so they are easily distinguishable to the public.

## **9. Wildfire Suppression**

Appendix C outlines how wildfire protection responsibilities are organized in Idaho, and how Idaho funds its fire program, particularly suppression costs for fires that burn on lands protected by the State of Idaho (IDL and two timber protective associations).

None of the IDL forest protective districts have suppression responsibilities within any currently identified Core or Important Habitat Zones. Likewise, as of December 2014, none of the IDL forest protective districts have suppression responsibilities within any currently identified General habitat zone.

When IDL fire suppression resources are dispatched as a cooperating agency to another agency's incident within sage-grouse habitat, the resources will utilize that agency's BMPs as applicable for sage-grouse habitat and as instructed in the dispatched resource's briefing. Interagency cooperation suppression activities are assumed to follow the prioritization associated with the BLM/U.S. Forest Service Fire and Invasive Assessment Team (BLM/FS FIAT) plans.

## **10. Fuels Management**

IDL does not have general regulatory authority over fuels management on non-state rangelands.

## **11. Wildfire Restoration and Rehabilitation**

IDL does not have general regulatory authority over wildfire restoration and rehabilitation on non-state rangelands.

## **12. Habitat Restoration and Vegetation Management**

IDL has limited authority to regulate habitat restoration and vegetation management, but will address vegetation management through voluntary BMPs and permit stipulations. See section 15.

### **13. Invasive Plant Species**

IDL has limited authority to regulate invasive species, but will address invasive species management through voluntary BMPs and permit stipulations. See Section 15.

### **14. Infrastructure Development**

The *Idaho Alternative* defines “infrastructure”:

*... as discrete, large-scale anthropogenic features, including highways, high voltage transmission lines, commercial wind projects, energy development (e.g., oil and gas development, geothermal wells, airports, mines, cell phone towers, landfills, residential and commercial subdivisions, etc.)*

*Infrastructure related to small-scale ranch, home and farm businesses (e.g., stock ponds, fences, range improvements) do not fall within this definition. These issues are not included within this definition, and are addressed in other sections of the Alternative or through local resource management plans.*

Because of the diversity of terrain and vegetation types within the sage-grouse region of Idaho, it is difficult to design a “one size fits all” set of CMs. Science and technology also change over time, and new options or alternatives may be proposed as part of a site-specific management plan. Site-specific management plans submitted by authorized parties should provide equal or better results than the CMs described below. Site specific management plans will be reviewed by appropriate IDL staff and the IDFG prior to a final recommendation from IDL.

IDL has limited authority to regulate infrastructure development, but will address infrastructure development through voluntary BMPs and permit stipulations. See Section 15.

### **15. Minerals**

#### **15.1. Fluid Minerals**

Fluid minerals are resources of oil, natural gas (gas), and natural gas condensate. The first commercially-viable resources of gas were discovered in Payette County in 2010. Exploration activity is also located in adjacent counties to Payette County. Recent leasing in south central and southeast Idaho suggests exploration interests in these areas. Additional resource discoveries are possible in all of these areas. Presently, IDL has no exploration activities to regulate for fluid minerals located in Core or Important sage-grouse Habitat Zones.

The resources in Payette County were discovered with conventional drilling operations, which utilized vertical well bores that penetrated permeable gas accumulations within site-specific gas traps. These types of deposits are termed conventional gas (or oil) resources. In contrast, unconventional resources are continuously-distributed oil or gas accumulations in fine-grained rocks, which generally cannot be exploited through conventional methods

and techniques. Unconventional resources have not been identified in Idaho, but the potential for their discovery does exist.

### **15.1.2. Oil and Gas Activities – Regulatory Compliance**

The IDL is the administrative arm of the Idaho Oil and Gas Conservation Commission (Commission) pursuant to § 47-319(2) which states that the commission is authorized to; "...regulate the exploration for and production of oil and gas, prevent waste of oil and gas and to protect correlative rights, and otherwise to administer and enforce this act. It has jurisdiction over all persons and property necessary for such purposes. In the event of a conflict, the duty to prevent waste is paramount." Under this authority, § 47-321 provides for the commission to establish spacing units which are legally described boundaries overlaying the resource and set a fixed acreage per well, with the well located in the center of the boundary. § 47-321(b) states that these spacing units are established by the Commission in order to; "...result in the efficient and economical development of the pool as a whole..."

At this time for conventional drilling techniques, the default spacing, set by the Commission, is 640 acres for gas and 40 acres for oil. As surface use restrictions grow, the Commission could see requests to modify the default spacing unit in order to limit surface disturbance. As the Commission receives these requests, IDL will provide sage-grouse habitat data so that the Commission, if it chooses, can incorporate such information into its decision establishing a new spacing unit.

The BMPs listed below will be provided to all applicants seeking permit issuance for operations in Core or Important sage-grouse Habitat Zones. If they agree to voluntarily comply with some or all of the practices, those practices will be incorporated as a stipulation in the permit.

#### **15.1.2.1. Oil and Gas Activities**

The following BMPs will be provided to all operators making application to drill a well, treat a well, or conduct seismic explorations in Core or Important Habitat Zones.

##### **a. Wildfire Prevention**

- i. Authorized parties will be required to develop and be prepared to implement a fire prevention and an emergency response plan that covers all aspects of operations, which will include: coordination with local jurisdictions, such as the cities, counties, landowners, IDL, rangeland fire protection associations, and federal land management agencies; emergency contact numbers and information, including 911 and local fire dispatch centers; and fire prevention and safety procedures that will include evacuation routes and procedures, the designated safety meeting place, and emergency shutdown procedures.

- ii. Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.
- iii. Authorized parties will ensure that field personnel are aware of:
  - a. fire prevention and emergency response plan,
  - b. evacuation routes and procedures,
  - c. designated safety meeting places, and
  - d. emergency shutdown procedures.
- iv. Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

#### **b. Invasive Species**

- i. All vehicles and equipment that should travel off approved/designated transportation routes or will be utilized during operations will be cleaned before entry to prevent the spread of seeds and propagules. The equipment will also be cleaned at the conclusion of all field activities.
- ii. Through a cooperative effort, invasive and noxious plant species will be inventoried and monitored pre-disturbance and throughout the life of the project by IDL and the authorized party.
- iii. Reclamation activities should include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) should be certified weed free by the appropriate Federal or State of Idaho agency.
- iv. Authorized parties will use BMPs and appropriate treatments including chemical, mechanical and biological to treat invasive and state listed noxious plant species. When regulated chemicals are determined to be the best treatment, authorized parties will use Idaho licensed professional applicators to treat noxious plant species with the approved and properly documented herbicide. Weeds will be treated promptly when located on a project site.

#### **c. Surface Use and Timing**

- i. Conventional well activity and exploration will not be conducted within 0.62 miles of an occupied lek.

- ii. All pipelines and collector lines will be emplaced utilizing horizontal boring methods with a minimum setback of 0.62 miles of an occupied lek.
- iii. Construction of pipelines will be in accordance with seasonal stipulations regarding no operations or construction from March to July.
- iv. Planned pipeline maintenance will not be conducted between 6 p.m. to 8 a.m., except in an emergency situation, within 0.62 miles of an occupied lek during the breeding season.
- v. Compressor stations and other vital operations shall be placed a minimum of 0.62 miles from an occupied lek, unless screening or other mitigation is determined to be as protective.

**d. Noise**

- i. Noise from permitted well sites will not exceed a 65db daily average threshold during the lekking season, within 0.62 miles of an occupied lek.
- ii. Noise levels may be exceeded for emergency situations including well control, threats to freshwater resources, and other environmental safety concerns.

**e. Fencing**

- i. New and existing wire fence segments constructed by authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.
- ii. As necessary and feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important Habitat Zones.

**f. Constructed Improvements**

- i. Construction methods should be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.

- ii. Infrastructure should be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed for access to facilities.
- iii. Surface disturbances should be clustered in order to limit surface occupancy.
- iv. New utility developments and transportation routes should be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- v. Use best available science in concurrence with IDFG to address concerns of towers and other elevated structures as perches for predatory or corvid birds.
- vi. New structures with a height over five feet will not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built, or presently exist, the power lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- vii. Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

**g. Site Reclamation**

- i. Site reclamation should be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- ii. Reclamation activities and plans should consider the ecological site potential. The goal of the reclamation should be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- iii. Sites should be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

## 15.2. Abandoned Mine Lands Program

The Abandoned Mine Lands Program operates on private, federal, and state lands. IDL works with landowners to address safety closures of dangerous mine openings and reclaim areas to protect human health. Reclamation is also performed to improve water quality and wildlife habitat, but public safety projects take precedence. IDL develops and controls these projects, and can incorporate sage-grouse CMs into the projects. Abandoned mine land projects will implement the following BMPs within Core and Important sage-grouse Habitat Zones.

### a. Wildfire Prevention

- i. Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.
- ii. Authorized parties will ensure that field personnel are aware of:
  - a. fire prevention and emergency response plan,
  - b. evacuation routes and procedures,
  - c. designated safety meeting places, and
  - d. emergency shutdown procedures.
- iii. Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

### b. Invasive Species

- i. Vehicles and equipment operated by IDL or authorized parties that will travel off approved /designated transportation routes will be inspected and cleaned of seeds and propagules to prevent the spread of invasive and noxious plant species.
- ii. Weeds should be inventoried and monitored pre-disturbance by IDL, and throughout the life of the project.
- iii. Reclamation activities should include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) should be certified weed free by the appropriate federal or State of Idaho agency.
- iv. Authorized parties will use BMPs and appropriate treatments including chemical, mechanical and biological to treat invasive and state listed noxious plant species. When regulated chemicals are

determined to be the best treatment, authorized parties will use Idaho licensed professional applicators to treat noxious plant species with the approved and properly documented herbicide. Weeds will be treated promptly when located on a project site.

### **c. Surface Use and Timing**

- i. Controlled surface use and timing limitations should be applied within Core and Important Habitat Zones, unless species occupancy and distribution determined by IDFG recommends otherwise.
- ii. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000-foot elevation may be used as a general distinction.
- iii. Major construction and maintenance activity should be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

### **d. Noise**

Limit noise levels from discretionary activities within Core and Important Habitat Zones to no more than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from two hours before sunset to two hours after sunrise during breeding season. Ambient noise levels should be determined by measurements taken at the perimeter of an occupied lek at sunrise.

### **e. Fencing**

- i. New and existing wire fence segments constructed by authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.
- ii. As necessary and feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes

and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important Habitat Zones.

#### **f. Water Supply Structures**

- i. New or modified spring developments (including pipelines) should be designed by authorized parties to maintain or enhance the free-flowing characteristics of springs and wet meadows, which will help maintain continuity of the pre-developed riparian areas.
- ii. The construction of new ponds or reservoirs by authorized parties should be minimized, except as needed to meet important resource management or restoration objectives, to reduce the potential impact from West Nile Virus on sage-grouse. On projects requiring water to be pumped such as solar, hydro or fossil fuel operation, floated tanks will be allowed to conserve water resources and efforts will be made by the authorized parties to treat these tanks for mosquito species that carry West Nile Virus.
- iii. Wildlife escape ramps in new and existing water troughs and open-water storage tanks shall be installed and maintained to facilitate the use of and escape by wildlife.

#### **g. Constructed Improvements**

- i. Construction methods should be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- ii. Infrastructure should be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed for access to facilities. Requirements from public utilities will be followed for all installations.
- iii. Surface disturbances should be clustered in order to limit surface occupancy.
- iv. New utility developments and transportation routes should be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- v. Use best available science in concurrence with IDFG to address concerns of towers and other elevated structures as perches for predatory or corvid birds.

- vi. New structures with a height over five feet will not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built the power lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- vii. Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

#### **h. Site Reclamation**

- i. Site reclamation should be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- ii. Reclamation activities and plans should consider the ecological site potential. The goal of the reclamation should be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- iii. Sites should be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

### **15.3. Mining Regulatory Program**

The Mining Regulatory program operates on private, federal, and state lands and covers all dredge and placer mining and surface mining operations. Activities classified as exploration, such as drilling or trenching, only require a notification to IDL. Dredge and placer mining operations over ½ acres require a permit and bond. Surface mining operations that produce materials for immediate or ultimate sale require a reclamation plan and bond. Coordinated reviews with Idaho Department of Environmental Quality, Idaho Department of Water Resources, and IDFG are required for operations that may impact water quality.

The BMPs listed below will be provided to all applicants seeking reclamation plan approval or permit issuance for mining operations in Core or Important sage-grouse Habitat Zones. If they agree to voluntarily comply with some or all of the practices, those practices will be incorporated as a condition of reclamation plan or permit approval.

To further contribute to conservation of sage-grouse habitat, IDL will also coordinate with IDFG to evaluate existing mines and their potential impact on sage-grouse habitat. The following best management practices will be suggested to these mine operators. IDL will also work with IDFG to develop an informational brochure for new mine operators so they may consider adopting these BMPs into their proposed operations.

#### **a. Wildfire Prevention**

- i. Authorized parties will be required to develop and be prepared to implement a fire prevention and an emergency response plan that covers all aspects of operations, which will include: coordination with local jurisdictions, such as the cities, counties, landowners, IDL, rangeland fire protection associations, and federal land management agencies; emergency contact numbers and information, including 911 and local fire dispatch centers; and fire prevention and safety procedures that will include evacuation routes and procedures, the designated safety meeting place, and emergency shutdown procedures.
- ii. Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.
- iii. Authorized parties will ensure that field personnel are aware of:
  - a. fire prevention and emergency response plan,
  - b. evacuation routes and procedures,
  - c. designated safety meeting places, and
  - d. emergency shutdown procedures.
- iv. Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

#### **b. Invasive Species**

- i. Vehicles and equipment operated by IDL or authorized parties that will travel off approved/designated transportation routes will be inspected and cleaned of seeds and propagules to prevent the spread of invasive and noxious plant species.
- ii. Through a cooperative effort, invasive and noxious plant species will be inventoried and monitored pre-disturbance and throughout the life of the project by IDL and the authorized party.

- iii. Reclamation activities should include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) should be certified weed free by the appropriate federal or State of Idaho agency.
- iv. Authorized parties will use BMPs and appropriate treatments including chemical, mechanical and biological to treat invasive and state listed noxious plant species. When regulated chemicals are determined to be the best treatment, authorized parties will use Idaho licensed professional applicators to treat noxious plant species with the approved and properly documented herbicide. Weeds will be treated promptly when located on a project site.

**c. Surface Use and Timing**

- i. Controlled surface use and timing limitations should be applied within Core and Important Habitat Zones, unless species occupancy and distribution determined by IDFG recommends otherwise.
- ii. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000-foot elevation may be used as a general distinction.
- iii. Major construction and maintenance activity should be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

**d. Noise**

- i. Limit noise levels from discretionary activities within Core and Important Habitat Zones to no more than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from two hours before sunset to two hours after sunrise during breeding season. Ambient noise levels should be determined by measurements taken at the perimeter of an occupied lek at sunrise.
- ii. Authorized party will keep noise levels on existing infrastructure within the 0.62 mile buffer to 65 decibels or less.

#### **e. Fencing**

- i. New and existing wire fence segments constructed by authorized parties that are located in high risk areas identified by the NRCS Fence Collision Risk Tool will be marked using collision diverter markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.
- ii. As necessary and feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important Habitat Zones.

#### **f. Water Supply Structures**

- i. New or modified spring developments (including pipelines) should be designed by authorized parties to maintain or enhance the free-flowing characteristics of springs and wet meadows, which will help maintain continuity of the pre-developed riparian areas.
- ii. The construction of new ponds or reservoirs by authorized parties should be minimized, except as needed to meet important resource management or restoration objectives, to reduce the potential impact from West Nile Virus on sage-grouse. On projects requiring water to be pumped such as solar, hydro or fossil fuel operation, floated tanks should be allowed to conserve water resources and efforts should be made by the authorized parties to treat these tanks for mosquito species that carry West Nile Virus.
- iii. Wildlife escape ramps in new and existing water troughs and open-water storage tanks should be installed and maintained to facilitate the use of and escape by wildlife.

#### **g. Constructed Improvements**

- i. Construction methods should be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- ii. Infrastructure should be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed

for access to facilities. Requirements from public utilities will be followed for all installations.

- iii. Surface disturbances should be clustered in order to limit surface occupancy.
- iv. New utility developments and transportation routes should be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- v. Use best available science in concurrence with IDFG to address concerns of towers and other elevated structures as perches for predatory or corvid birds.
- vi. New structures with a height over five feet should not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built the power lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- vii. Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

#### **h. Site Reclamation**

- i. Site reclamation should be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- ii. Reclamation activities and plans should consider the ecological site potential. The goal of the reclamation should be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- iii. Sites should be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

## **16. Range Management/Livestock Grazing**

IDL does not have general regulatory authority over livestock grazing on non-state lands.

## **17. Wild Horses and Burros**

IDL does not have regulatory authority over wild horses and burros.

## **18. Travel Management**

IDL does not have general regulatory authority over travel management on non-state lands.

## **19. Recreation**

IDL does not have general regulatory authority over recreation on non-state lands.

## **20. Implementation and Monitoring**

Implementation of the CMs through voluntary agreement will be incorporated into existing permit procedures. A copy of the applicable CMs will be provided to all applicants for a permit on lands located in Core or Important Habitat Zones. As part of the application, applicants will acknowledge which, if any, CMs they are willing to voluntarily comply with. Those CMs will then be incorporated into the permit as an enforceable stipulation of the permit. See Appendix B for IDL's DRAFT Implementation Plan.

Monitoring of CMs stipulated in the permit will be incorporated into existing permit inspection procedures. Inspection forms will be amended to include a section for documenting that CMs were implemented and an assessment of their effectiveness. See Appendix E for IDL's DRAFT Monitoring Plan (not yet completed).

Procedures for Abandoned Mine Lands projects will be amended to include an assessment of the impact on sage-grouse when the project includes lands within Core or Important Habitat Zones. The results of this assessment will be used to determine the appropriate CMs to be implemented as part of the project.

### Glossary

Page intentionally blank

## Habitat Classifications

**Core Sage-Grouse Habitat:** State of Idaho delineation of strongholds for sage-grouse populations in Idaho. This habitat is the highest priority for conservation efforts and for policies to address primary threats. It includes approximately 65 percent of known active leks and occupied by approximately 73 percent of male sage-grouse counted at leks throughout the Idaho sage-grouse management area.

**General Sage-Grouse habitat:** Occupied (seasonal or year-round) habitat outside of priority habitat. It includes a few active leks and fragmented or marginal habitat, such as two isolated populations of sage-grouse in the East Idaho Uplands and West Central Idaho. These areas have been identified by the BLM in coordination with respective state wildlife agencies.

**Important Sage-Grouse Habitat:** State of Idaho delineation defined as the 75 percent breeding bird density areas. This habitat includes areas of value for migration corridors, connectivity among breeding areas, and long term persistence of each of the two key metapopulations of sage-grouse in Idaho. It includes approximately 25 percent of the known active leks. This habitat is occupied by an estimated 22 percent of sage-grouse males. Captures high quality habitat and populations necessary for providing a management buffer for the core habitat.

**Key Habitat:** State of Idaho delineation of areas of generally intact sagebrush that provide sage-grouse habitat during some portion of the year including winter, spring, summer, late brood-rearing, fall, transition sites from winter to spring, spring to summer, and summer/fall to winter. Key habitat may or may not provide adequate nesting, early brood-rearing, and winter cover due to elevation, snow depth, lack of early season forbs, limited herbaceous cover, or small sagebrush patch size.

**Priority Sage-Grouse habitat:** Areas that have been identified as having the highest conservation value to maintaining sustainable sage-grouse populations. These areas would include breeding, late brood-rearing, and winter concentration areas. The BLM has identified these areas in coordination with respective state wildlife agencies.

## Lek Classification

**Lek:** A traditional courtship display area attended by male sage-grouse in or next to sagebrush-dominated habitat. A lek is designated based on observations of two or more male sage-grouse engaged in courtship displays. Subdominant males may display on itinerant courtship display areas during population peaks. Such areas usually fail to become established leks. Therefore, a site where less than five males are observed strutting should be confirmed active for two years before meeting the definition of a lek (Connelly et al. 2000; Connelly et al. 2003, 2004). Each state may have a slightly different definition of lek, active lek, inactive lek, occupied lek, and unoccupied leks. Regional planning will use the appropriate definition provided by the state of interest.

**Lek buffer:** Buffers are calculated from the center (IDFG GPS coordinate) of the lek. Exact lek edges are difficult to define because leks shift and birds move on any given day.

**Lek complex:** A lek or group of leks within 2.5 kilometers (1.5 miles) of each other between which male sage-grouse may interchange from one day to the next. Fidelity to

leks has been well documented. Visits to multiple leks are most common among yearlings and less frequent for adult males, suggesting an age-related period of establishment (Connelly et al. 2004).

**Lek, abandoned:** A lek in otherwise suitable habitat that has not been active for 10 consecutive years. To be designated abandoned, a lek must be inactive (see above criteria) in at least four nonconsecutive courtship display seasons spanning the 10 years. The site of an abandoned lek should be surveyed at least once every 10 years to determine whether it has been reoccupied by sage-grouse.

**Lek, active:** Any lek that has been attended by male sage-grouse during the courtship display season.

**Lek, destroyed:** A formerly active lek site and surrounding sagebrush habitat that has been destroyed and is no longer suitable for sage-grouse breeding.

**Lek, inactive:** Any lek where sufficient data suggests that there was no courtship display activity throughout a lekking season. Absence of strutting grouse during a single visit is insufficient documentation to establish that a lek is inactive. This designation requires documentation of one of the following scenarios:

- An absence of sage-grouse on the lek during at least two ground surveys separated by at least seven days. These surveys must be conducted under ideal conditions (April 1-May 7 or other appropriate date based on local conditions), no precipitation, light or no wind, half-hour before sunrise to one hour after sunrise).
- A ground check of the exact known lek site late in the courtship display season (after April 15) that fails to find any sign (tracks, droppings, feathers) of strutting activity. Data collected by aerial surveys should not be used to designate inactive status as the aerial survey may actually disrupt activities.

**Lek, occupied:** A lek that has been active during at least one strutting season within the prior 10 years. This is the status IDFG recommends for long term decision making.

**Lek, undetermined:** A lek that has not been surveyed to determine status.

**Lek, unoccupied:** A lek that has either been destroyed or abandoned.

## **Habitat Use and Periods**

**Breeding period:** Includes lekking, nesting and early brood-rearing periods, generally March 1 through June 30 (Connelly et al. 2000b).

- *Early brood rearing habitat:* Generally upland sagebrush habitats relatively close to sage-grouse nest sites. These areas are important to broods during the first few weeks after hatching. Forb and insect abundance and diversity are important factors. (See Connelly et al. 2000b)

**Late brood rearing:** This occurs in a variety of habitats used by sage-grouse from late June to early November.

- *Late Brood-rearing habitat:* Includes mesic sagebrush and mixed shrub communities, wet meadows, and riparian habitats, as well as some agricultural lands (e.g., alfalfa fields).

**Lekking period:** This should be determined locally, but approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000 foot elevation may be used as a general distinction.

**Nesting period:** Generally April 1 through June 15.

**Winter concentration periods:** For the purpose of this plan, generally December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology. IDL shall confer with IDFG biologists for local variations.

- *Sage-Grouse winter habitats:* Occupied annually by sage-grouse and provide sufficient sagebrush cover and food to support birds throughout the entire winter (especially periods with above average snow cover).

## Implementation Plans

Page Intentionally blank

# Land Board's Greater Sage-Grouse Conservation Plan Implementation

*Implementation of the Land Board's Plan is contingent upon the federal government's acceptance and incorporation of the Governor's plan in its final decisions on sage-grouse in Idaho.*

## Part I. Implementation Plan for Endowment Land Activities

The following Implementation Plan (IP) will apply to activities on state endowment trust lands within Core and Important sage-grouse Habitat Zones in response to the Land Board's Greater Sage-Grouse Conservation Plan. The following IP addresses authorizations previously granted by IDL and authorizations that may be granted by IDL in the future. These activities include:

- alternative energy development (solar, wind, and geothermal leases and land use permits);
- oil and gas exploration and development (leases and land use permits);
- mining (minerals leases, land use permits and construction permits);
- grazing (grazing leases, land use permits and construction permits);
- miscellaneous commercial activities (commercial leases, land use permits and construction permits); and
- granting of access through rights-of-way, including easements.

This document also addresses the implementation of fire prevention and mitigation measures and wildfire suppression efforts to minimize the impact to sage-grouse and their habitat.

### I. Previous Authorizations Granted by IDL

IDL recognizes that written authorization through leases, permits and easements has been granted to third parties for activities on state endowment trust lands within Core and Important Habitat Zones prior to the approval of the IDL Greater Sage-Grouse Conservation Plan. These authorizing documents logically do not contain the conservations measures identified in the Land Board's Greater Sage-Grouse Conservation Plan that would be included with authorizations granted today or in the future by IDL. To resolve this matter IDL will accomplish the following:

- Within 60 days of the date of the Record of Decision (ROD) for the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS, IDL will complete a comprehensive GIS analysis to determine the type, number and location of all IDL authorizing documents within Core and Important Habitat Zones.

- Within six months of the date of the ROD, IDL will develop instrument modifications for each authorizing document identified in the GIS analysis within Core Habitat Zones. The instrument modifications will identify the appropriate stipulations for the activity and allow the instrument holder the opportunity to agree to these instrument terms.
- Within 18 months of the date of the ROD, IDL will develop instrument modifications for each authorizing document identified in the GIS analysis within Important Habitat Zones. The instrument modifications will identify the appropriate stipulations for the activity and allow the instrument holder the opportunity to agree to these instrument terms.
- Once developed, IDL will mail the instrument modifications to the instrument holders with a cover letter explaining the purpose of the instrument modification and encourage their execution of the document due to the benefits to the greater sage-grouse and their habitat. The letter will identify a 30-day timeframe for their response.
- IDL will follow-up in writing with those instrument holders that do not respond within 30 days, offering them a second opportunity to accept the instrument modification.
- If an instrument holder does not agree to the instrument modification, IDL will attempt to make direct contact with the party to discuss the conservation measures and provide educational and supporting documents that would encourage their participation. In addition, IDL will identify which conservation measures are sticking points and give consideration, on a case-by-case basis, to negotiating conservation measure stipulations and come to an agreement on those measures that are acceptable to the instrument holder. As a fallback measure, IDL would include conservation measures as stipulations in any new authorization following the expiration of the existing authorization.

## **II. Future Authorizations to be Granted by IDL**

For new activities proposed by third parties on state endowment trust lands in Core and Important Habitat Zones and for new instruments generated following the expiration of an instrument that expires after the date of the ROD, IDL will implement conservation measures as enforceable stipulations in authorizing documents such as leases, land use permits, construction permits and rights-of-way.

IDL will develop and implement specific instrument templates that include the appropriate conservation measures as mandatory and enforceable stipulations. As a result, all new authorizations granted by IDL within Core and Important Habitat Zones will contain conservation measures in alignment with the Land Board's Greater Sage-Grouse Conservation Plan. IDL will provide these instrument templates to third parties inquiring about or making application for a proposed activity within a Core and Important habitat zone and explain the significance of these stipulations.

### III. Fire Prevention and Mitigation Measures and Wildfire Suppression Efforts

IDL does not have direct wildfire suppression responsibilities within any greater sage-grouse Core or Important habitats in Idaho. However, IDL does have jurisdictional authority for state lands within greater sage-grouse habitat.

Wildland fire protection for federal, state and private lands within greater sage-grouse habitat in southern Idaho is provided by federal agencies through the **Cooperative Fire Protection and Stafford Act Agreement** and by the cooperative efforts of volunteer RFPAs and fire service organizations (city, county and rural fire departments).

In the interest of promoting conservation efforts of the greater sage-grouse and its habitat under this plan, IDL will:

1. Provide maps to all RFPAs that include the location of any designated Core or Important greater sage-grouse habitat within their RFA boundaries by May 10, 2015 (Beginning date of closed fire season in Idaho as designated in Idaho Code Title 38 Section 115.).
2. On any fire affecting or threatening Important or Core habitat on state or private lands requiring an Incident Management Team (IMT), IDL will assign an IDL line officer to jointly work with the federal protecting agency to develop greater sage-grouse conservation objectives for fire suppression activities that will be incorporated into:
  - a. the Wildland Fire Decision Support System (WFDSS);
  - b. the Leader's Letter of Intent to the team;
  - c. the joint Delegation of Authority; and
  - d. ensure the objectives are fully implemented in daily Incident Action Plans.
3. Conservation objectives will include:
  - a. Incident priorities:
    - i. Firefighter safety
    - ii. Public Safety
    - iii. Improvements
    - iv. Resource Values
      - Sage-grouse Core and Important habitat
      - Other resource and property values (historical, archeological, recreational, aesthetics, livestock, etc.).
  - b. Utilize direct attack as the primary tactic to minimize burned acres in greater sage-grouse Core and Important habitat.
  - c. Accept relatively small acreage, short-term ground disturbance due to heavy equipment use to meet higher objectives.
  - d. Rehabilitation for burned acres will promote reestablishment of greater sage-grouse habitat within or adjacent to Core and Important habitat.
4. IDL will consider and promote fire prevention and mitigation measures including but not limited to:
  - a. Master fuel break systems across all ownerships.
  - b. Proposals to adjust fire restriction boundaries and associated use restrictions in the Idaho Fire Restrictions Plan based on protection of Core and Important greater sage-grouse habitat.

- c. Develop annual grazing plans or targeted grazing practices to reduce fuel loading in locations that would be advantageous as a wildfire control location.

## **Part II. Implementation Plan for IDL's Regulatory and Assistance Activities**

The following Implementation Plan (IP) will apply to regulatory and assistance activities administered by IDL within Core and Important sage-grouse Habitat Zones. The IP was developed in response to the Land Board's Greater Sage-Grouse Conservation Plan. Conservation measures will be voluntary best management practices on private land because IDL does not have the statutory authority within its regulatory or assistance programs to require adoption by authorized parties. The following IP addresses authorizations previously granted by IDL and authorizations that may be granted by IDL in the future. These activities include:

- Dredge and placer mining (exploration notices and permits);
- Surface mining (exploration notices and reclamation plans);
- Oil and gas exploration and development (seismic and drilling permits, spacing requests);
- Abandoned mine land reclamation.

### **I. Previous Authorizations Granted by IDL**

IDL recognizes that written authorizations through permit and plan approvals and contracts have been granted to third parties for activities within Core and Important Habitat Zones prior to the approval of the Land Board's Greater Sage-Grouse Conservation Plan. These authorizing documents do not contain the conservations measures identified in the Land Board's Greater Sage-Grouse Conservation Plan that would be included with authorizations granted today or in the future by IDL. To resolve this matter IDL will accomplish the following:

- Within 60 days of the date of the Record of Decision (ROD) for the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS, IDL will complete a comprehensive GIS analysis to determine the type, number and location of all IDL authorizing documents within Core and Important Habitat Zones.
  - No outstanding abandoned mine lands contracts are present in Core and Important sage grouse Habitat Zones.
- Within 6 months of the date of the ROD, IDL will develop appropriate conservation measures for each authorizing document identified in the GIS analysis within **Core** Habitat Zones. IDL will also notify each operator that their activity falls within this zone, and provide the conservation measures to the operators.
- Within 18 months of the date of the ROD, IDL will develop appropriate conservation measures for each authorizing document identified in the GIS analysis within Important

Habitat Zones. IDL will also notify each operator that their activity falls within this zone, and provide the conservation measures to the operators.

- If impacts to greater sage-grouse habitat are irreversible, IDL will suggest working within the Idaho Mitigation Framework and utilizing the compensatory mitigation process the State Sage-Grouse Advisory Committee develops.
- Ongoing inspections of these operations will include recommendations that give guidance on how the operators can follow the conservation measures

## **II. Future Authorizations to be Granted by IDL**

IDL will develop an information brochure for oil and gas and mining operators who want to explore or develop minerals in Core and Important habitats.

For new activities proposed in Core and Important Habitat Zones and for amendments to existing approved activities, IDL will forward the applications to IDFG for comments and recommendations.

During the review process, IDL will suggest sage-grouse conservation measures to those mine operators based on:

- Feedback from IDFG
- Sage-grouse conservation measures in the IDL plan
- The specific details of the proposed mine

New abandoned mine land projects in Core and Important habitat will be implemented by IDL in conformance with the IDL Greater Sage-Grouse Conservation Plan. This includes inspections and work performed by IDL staff, as well as those performed by contractors and subcontractors.

As a result, all new authorizations granted by IDL within Core and Important Habitat Zones will include recommendations for conservations measures in alignment with the Land Board's Greater Sage-Grouse Conservation Plan. IDL will work with the operators as needed to implement the conservation measures or to implement voluntary mitigation measures, if needed.

## Appendix C

### Wildfire Protection in Idaho Responsibilities and Funding

Page intentionally blank

## **Wildfire Protection in Idaho Responsibilities and Funding Model**

### **How is fire response organized in Idaho?**

There are approximately 53.5 million acres of land in Idaho, which is divided into 16 forest protective districts. Two of these districts cover lands protected by the Forest Service and the Bureau of Land Management (BLM), and two are tribal districts. The State of Idaho – the Idaho Department of Lands (IDL) and two timber protective associations – provide direct wildfire protection on approximately 6.3 million acres of private, state and some federal forest lands.

The BLM provides primary wildfire protection on most of the lands that have sage-grouse habitat in Idaho.

Due to the scattered nature of ownership in Idaho, some state and private lands are located within federal protection areas, while some federal lands are located within state protection areas. These are known as “offset acres.” Fire managers assign a relative value to each acre to characterize how easily fires can be ignited and how difficult those fires likely will be to control. Through an “offset agreement” the federal agencies protect approximately 900,000 acres of private and state endowment land around Idaho in exchange for the State of Idaho protecting approximately 800,000 acres of federal land. Generally speaking, forested lands in Idaho are included in the offset agreement and rangelands in Idaho are not included the offset agreement.

More than 200 local and rural fire districts provide structure protection in generally non-urban parts of the state that would otherwise not have structural fire protection.

Five rangeland fire protection associations (RFPAs) assist the BLM in providing initial attack on rangelands in southern Idaho. IDL works closely with the BLM and ranchers to establish RFPAs to enable quick initial attack of range fires. Approximately 230 ranchers in southern Idaho are members of five different RFPAs, and there are six additional areas where ranchers have begun to have conversations about starting new associations. IDL expects at least one more RFPA to be formed before the start of the 2015 fire season. Continued support of RFPAs is a key part of the IDL Sage Grouse Conservation Plan. The RFPAs are volunteer initial attack organizations and are not intended to participate in extended attack situations.

Page 4 of Appendix C shows a 2014 map of forest protection district boundaries and current RFPA boundaries in Idaho.

### **Funding Fire Suppression in Idaho**

Fire protection funding is grouped into two categories – preparedness and suppression.

- **Preparedness**: The first is preparedness, providing resources to be ready in advance of an actual fire. This includes hiring firefighters, ensuring they have the necessary training, tools, and supplies, and purchasing or leasing equipment such as fire engines. In FY14 IDL spent approximately \$11 million in preparedness costs.

Preparedness on state-protected lands is funded by a combination of assessments levied on parties who own forested land, federal funds, and the State General Fund.

The forest land assessment is 60 cents per acre with a surcharge for forested parcels with structures. The IDL, in its role as the owner of endowment lands, contributes to preparedness expenses, just like private forest landowners. In FY14 IDL contributed 60 cents per acre on 974,312 endowment acres that receive protection from the fire management function of IDL, for a total of \$584,587.

In recognition that the value Idahoans place on forests is not limited to harvestable timber, Idaho Code spreads the costs of protection beyond timber. While still requiring forest landowners to provide protection, the law limits the potential liability accruing to the landowner by establishing maximum protection assessments and committing general fund tax revenue to cover expenses over that amount.

- **Suppression:** The second component of wildfire protection is suppression. There is a stable source of funding to pay wildfire suppression costs on lands protected by the State of Idaho. When personnel and equipment are dispatched to a fire managed by the State of Idaho, payment for resources assigned to the fire is made from the General Fund through deficiency warrant authority granted by the Idaho Legislature to the State Board of Land Commissioners. Contracts for aircraft also are charged to deficiency warrants. Deficiency warrant authority allows IDL to spend money to promptly suppress wildfires. Deficiency warrants have been used since at least the early 1970s. When the Idaho Legislature convenes in January it reviews the suppression bills incurred during the previous and current fiscal years, and appropriates funds to pay for the expenditures.

The 10-year average of suppression costs on lands protected by the State of Idaho, including the 2014 fire season, is approximately \$10.5 million. The 10-year average fire size on lands protected by the State of Idaho, including the 2014 fire season, is approximately 19,000 acres. In FY14, IDL employed 261 permanent employees and 202 seasonal employees. Fifty-five percent of IDL FY14 permanent employees worked in a forestry and fire capacity, and during fire season the total percentage of permanent employees contributing to IDL fire duties expands because many members of staff who are not categorized as “fire” help in fire efforts. These staff members are part of fiscal, GIS, operational leadership, administrative staff, and executive staff. Sixty percent of the IDL FY14 seasonal workforce worked in forestry and fire (38 percent in fire).

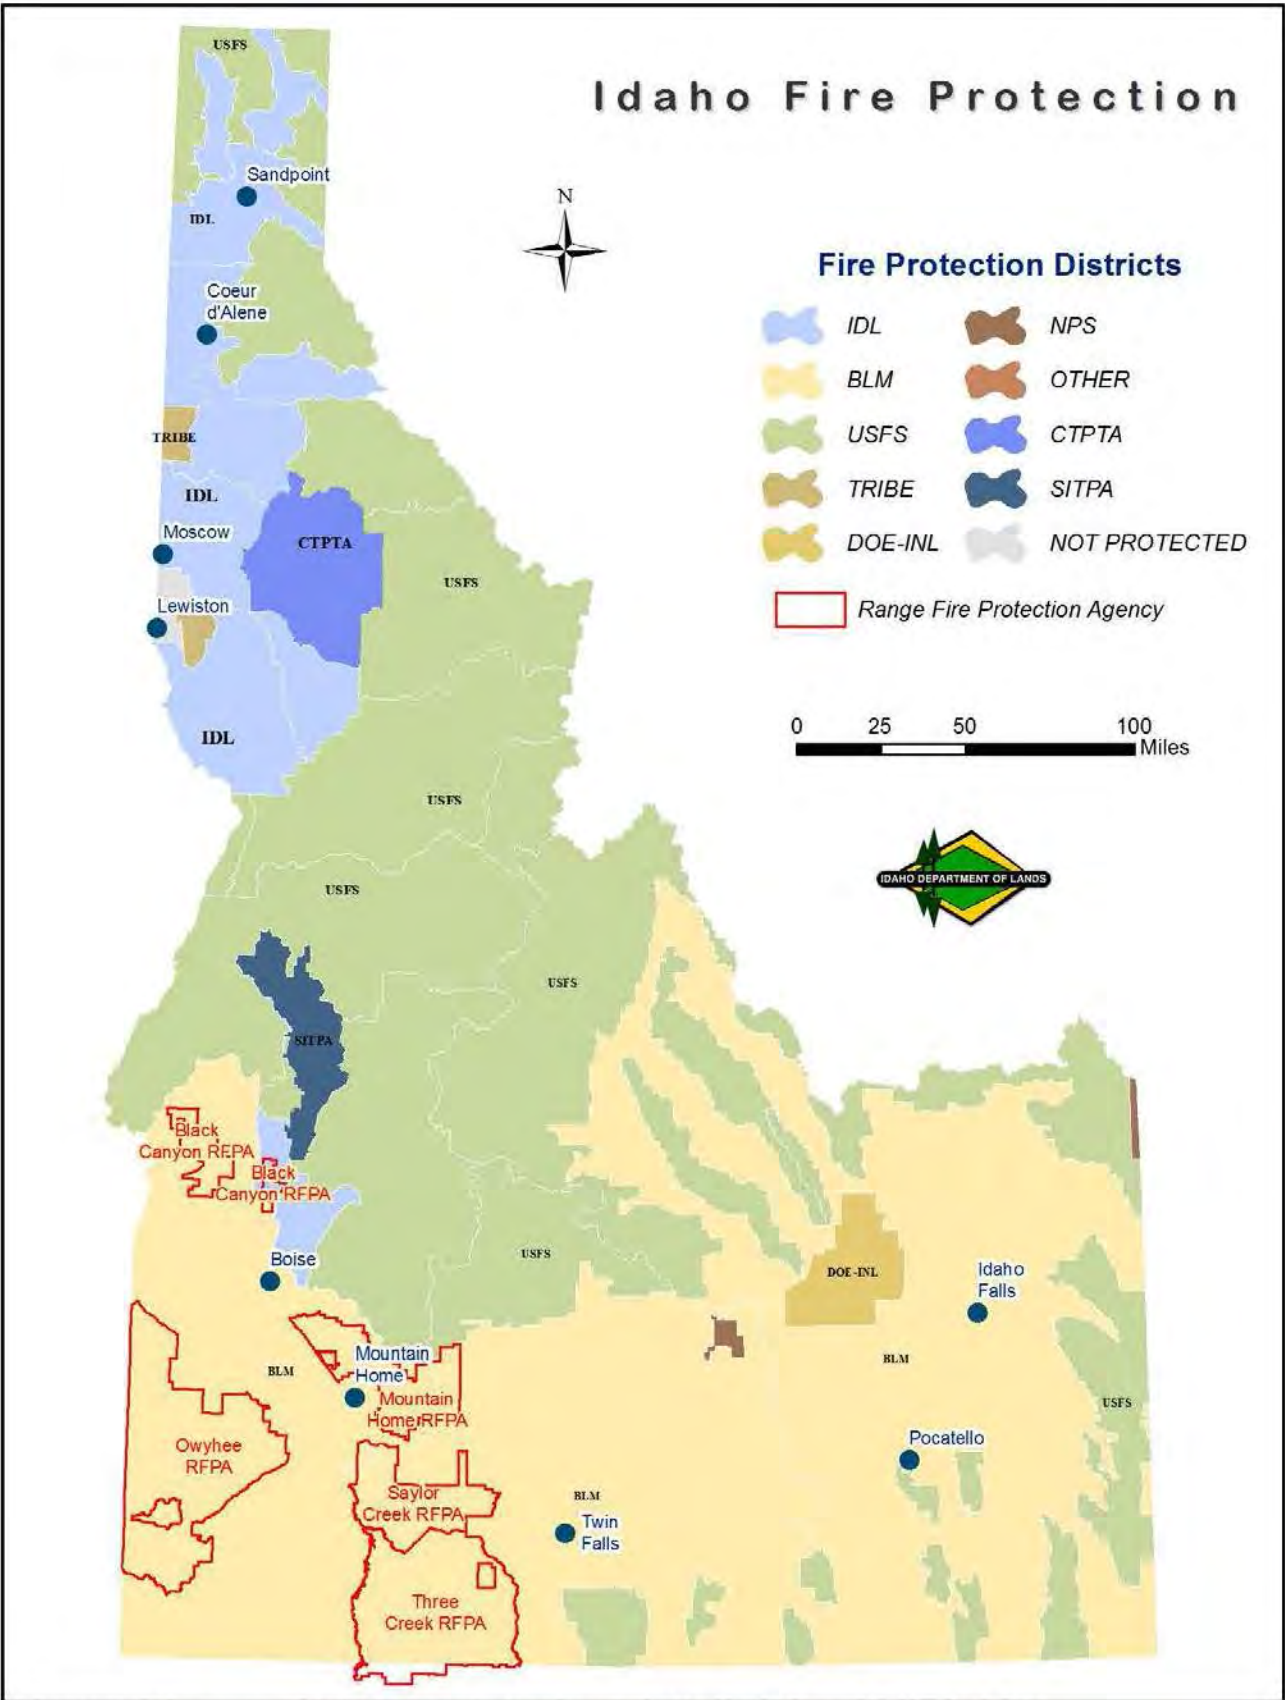

***If a fire starts on forest land in Idaho***, regardless of ownership (federal, state, or private), the protection agency (Forest Service, BLM or IDL) is responsible for paying the suppression bill, not the owner of the land where the fire starts or burns. However, if a fire investigator determines negligence is a factor in igniting a human-caused fire, the responsible party is responsible for paying the suppression costs.

***If a fire starts on privately owned rangeland***, then the responding agency (BLM, rangeland fire protection association, rural fire district, or sometimes the Forest Service) bears the cost of its own suppression action. In cases involving declared emergencies, the Federal Emergency Management Agency (FEMA) may cover a portion of the costs if communities or infrastructure are threatened. The State of Idaho does not have direct wildfire protection responsibility on rangelands.

**Currently by agreement, if a fire starts on rangeland owned by the State of Idaho,** does not spread to another ownership and is suppressed by the BLM, then the IDL will pay the suppression costs. If a fire starts on rangeland owned by the State of Idaho and spreads to another ownership, then IDL will pay a pro-rata share of the BLM's suppression costs. The IDL does not share in suppression costs when a fire starts on another ownership and spreads onto or across rangeland owned by the State of Idaho.

While IDL does incur fire suppression costs when the State of Idaho assists federal fire managers on fires they manage, the federal agencies reimburse IDL for use of State personnel and resources.

### State Board of Land Commissioners Approval Memo

## STATE BOARD OF LAND COMMISSIONERS

April 21, 2015

Regular Agenda

### SUBJECT

IDL Proposed Greater Sage-Grouse Conservation Plan

### BACKGROUND

The Greater Sage-grouse (sage-grouse) is a candidate species currently being reviewed by the US Fish and Wildlife Service (USFWS) to determine listing status under the Endangered Species Act (ESA). As a direct outcome of the proposed ESA listing review, the US Bureau of Land Management (BLM) initiated a draft Land Use Plan Amendment (LUPA) and Environmental Impact Statement (EIS) pertaining to the sage-grouse throughout BLM's management zones within sage-grouse habitat.

The State of Idaho engaged in similar efforts and Governor Otter submitted an Idaho Plan to be considered by the BLM in the EIS alternative analysis.

In October 2014, Director Tom Schultz established a working group which consisted of various IDL staff which oversee programs potentially impacted by the listing of the sage-grouse. This group held regular meetings to develop recommended conservation measures as part of IDL's Proposed Greater Sage-Grouse Conservation Plan based on the group's review of the science and what other western states are proposing, as well as designed to be complementary to Governor's Alternative for federal land management in Idaho.

For proposed activities by third parties on state endowment trust lands, IDL will implement sage-grouse conservation measures as enforceable stipulations in authorizing documents such as leases, permits, and easements. The authorized activities include: alternative energy development (solar, wind, and geothermal); oil and gas exploration and development; mining; grazing; miscellaneous commercial activities; and the granting of access through rights-of-way, including easements. In addition, IDL as the land manager will implement and support fire prevention and mitigation measures and wildfire suppression efforts to minimize the impact to sage-grouse and their habitat.

For regulatory and assistance activities, conservation measures will be voluntary best management practices (BMP's) on private land because IDL does not have the statutory authority within its regulatory programs or assistance activities to require adoption by authorized parties. Regulatory and assistance activities include: Abandoned Mine Lands Projects; Dredge and Placer Mine Permits; Mine Reclamation Plan Approvals; and Oil and Gas Permits (seismic imaging surveys, well drilling). Where appropriate, IDL will include recommended best management practices within its authorizing documents to encourage compliance.

Additionally, for some fire programs, IDL will implement actions through its roles and responsibilities that support enhanced fire preparedness and suppression in sage-grouse habitats.

## DISCUSSION

On February 17, 2015, Idaho Department of Lands (IDL) presented the Proposed Greater Sage-Grouse Conservation Plan to the Land Board as an information item. IDL sought initial feedback from the Land Board and indicated IDL would initiate an extensive stakeholder outreach effort and then come back to the Land Board for final approval of the plan at a future meeting.

Since that time IDL has completed the stakeholder outreach effort across all industries potentially impacted by the plan soliciting feedback on the Proposed Greater Sage-Grouse Conservation Plan using group and individual meetings. These meetings included direct discussions regarding language in the plan and the impacts of the proposed conservations measures on their industry practices.

IDL has revised the Proposed Greater Sage-Grouse Conservation Plan (Attachment 1) based on the feedback from stakeholder groups and on-going interactions with sister agencies. A summary of comments received by IDL is included as Attachment 2. A table of all comments received, with IDL responses, is included as Attachment 3. In addition, IDL's response to the U.S. Fish and Wildlife Service comment letter, written in conjunction with the Office of Species Conservation and Governor's Office, is included as Attachment 4. Finally, an informational sheet with key elements of the draft plan is Attachment 5.

## RECOMMENDATION

The Department recommends the Board approve the proposed Plan.

Upon approval, implementation of the Plan will be contingent on the federal agencies (USFWS and BLM) acceptance and incorporation of the Governor's Plan into the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS. Implementation will begin within 60 days of the Record of Decision (ROD) for the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS.

If the ROD does not include the foundational elements of the Governor's Plan, IDL will reevaluate, revise the Plan if necessary and inform the Board or seek approval as needed.

## BOARD ACTION

A motion was made by Controller Woolf that the Board adopt the Department recommendation, including the language of the second and third paragraphs in the Department's recommendation, and approve the proposed Plan. Attorney General Wasden seconded the motion. The motion carried on a vote of 5-0.

### Idaho Oil and Gas Conservation Commission Approval Memo

# IDAHO OIL AND GAS CONSERVATION COMMISSION

April 23, 2015

Regular Agenda

## SUBJECT

IDL Proposed Greater Sage-Grouse Conservation Plan

## BACKGROUND

The Greater Sage-grouse (sage-grouse) is a candidate species currently being reviewed by the US Fish and Wildlife Service (USFWS) to determine listing status under the Endangered Species Act (ESA). As a direct outcome of the proposed ESA listing review, the US Bureau of Land Management (BLM) initiated a draft Land Use Plan Amendment (LUPA) and Environmental Impact Statement (EIS) pertaining to the sage-grouse throughout BLM's management zones within sage-grouse habitat.

The State of Idaho engaged in similar efforts and Governor Otter submitted an Idaho Plan to be considered by the BLM in the EIS alternative analysis. In October 2014, IDL Director Tom Schultz established a working group which consisted of various IDL staff which oversee programs potentially impacted by the listing of the sage-grouse. This group held regular meetings to develop recommended conservation measures as part of IDL's Proposed Greater Sage-Grouse Conservation Plan based on the group's review of the science and what other western states are proposing, as well as designed to be complementary to Governor's Alternative for federal land management in Idaho.

As a result, IDL will implement sage-grouse conservation measures as enforceable lease stipulations for proposed oil and gas development activities occurring on state endowment lands. Regarding oil and gas regulatory activities under the purview of the Commission, IDL has developed voluntary conservation measures. These conservation measures will be presented as recommended best management practices (BMP's) to companies applying for drilling permits. These companies will then select which BMP's they can comply with to be incorporated as permit conditions. These BMP's will then become required and verified through the inspection process.

## DISCUSSION

On February 12, 2015 the Idaho Department of Lands (IDL) presented the Proposed Greater Sage-Grouse Conservation Plan to the Commission as an informational item. IDL sought initial feedback from the Commission and indicated IDL would initiate an extensive stakeholder outreach effort and then come back to the Commission for final approval of the plan at a future meeting.

Since that time IDL has completed the stakeholder outreach effort by soliciting feedback on the Proposed Greater Sage-Grouse Conservation Plan using group and individual meetings. These meetings

included direct discussions regarding language in the plan and the impacts of the proposed conservation measures on practices of the oil and gas industry.

IDL has revised the Proposed Greater Sage-Grouse Conservation Plan (Attachment 1) based on the feedback from stakeholder groups and on-going interactions with sister agencies. Excerpts from the plan for the Commission's consideration are included as Attachment 2. A summary of the comments received by IDL pertaining to oil and gas is included as Attachment 3. A copy of all comments received related to Oil and Gas, with IDL responses, is included as Attachment 4. Finally, IDL's response to the U.S. Fish and Wildlife Service comment letter, written in conjunction with the Office of Species Conservation and Governor's Office, is included as Attachment 5.

Implementation of the Proposed Greater Sage-Grouse Conservation Plan will occur through voluntary agreements between industry and IDL. Updated Standard Operating Procedures will call for IDL to provide applicants requesting permits to drill within core and important habitat with Conservation Measures (CM's). Applicants will then acknowledge which, if any, CM's can be complied with and incorporated as enforceable permit conditions. Monitoring of CM's stipulated to will be incorporated into existing permit inspection procedures. Inspection forms will be amended to include sections for documenting implementation of CM's as well as an assessment of effectiveness.

#### RECOMMENDATION

The Department recommends the Commission approve the applicable sections of Part II of the proposed Plan.

Upon approval, implementation of the Plan will be contingent on the federal agencies (USFWS and BLM) acceptance and incorporation of the Governor's Plan into the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS. Implementation will begin within 60 days of the Record of Decision (ROD) for the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS.

If the ROD does not include the foundational elements of the Governor's Plan, IDL will reevaluate and revise the Plan if necessary and inform the Commission or seek approval as needed.

#### COMMISSION ACTION

A motion was made by Commissioner Classen that the Commission approve the recommendation. Vice Chairman Chipman seconded the motion. The motion carried on a vote of 5-0.

Subject: Re: Livestock - updated language question

I think that would be fine. We can also share this example/question with the rest of the regions to help them better understand.

Hi Joan -

I have checked with Vicki, who checked with Kimberley Hackett in the Range Program, and we offer the following suggestion. In short, the potential response needs to be in the alternative that is chosen for the decision. Kim offers up other actions that could be in an alternative. Does this clarify?

For a permit renewal EA, riparian habitat in a few areas is not meeting desired conditions. Within a couple different alternatives, several approaches were considered to resolve the issue. For Alternative A, modification of the grazing season was applied and included a provision for fencing if the desired conditions were not met. In this case, the fencing is included as part of the decision, but no additional analysis or decision would be needed.

In another example,

For Alternative A, modification of the grazing season was applied and included a provision for temporarily closing all or a portion of a pasture/allotment if the desired conditions were not met. In this case, the closure is included as part of the decision, but no additional analysis or decision would be needed.

On Tue, Feb 17, 2015 at 6:55 PM, Suther, Joan <[jsuther@blm.gov](mailto:jsuther@blm.gov)> wrote:

Hi all - this direction regarding NEPA is still unclear to me.

- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and Land Health Standards (43 CFR 4180.2) and defined responses that will allow the

authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.

Here is a short example of how we think this would be applied by having an adequate range of alternatives initially. Is this along the lines of what you are intending?

*For a permit renewal EA, riparian habitat in a few areas is not meeting desired conditions. Within a couple different alternatives, several approaches were considered to resolve the issue. For Alternative A, modification of the grazing season was applied. In Alternative B, fencing was considered. Alternative A was the decision. Subsequent monitoring revealed that desired conditions were still not found. In this case, the fencing alternative would be a new decision, but no additional analysis would be needed.*

Below are some common questions, and basic answers, on the direction that came out this week. We will thoroughly discuss on the calls next week. Note, state specific questions are not included.

Also, please note that we will be providing updated guidance, including minor clarifications and corrections, to the State Directors tomorrow.

Please let me know if you get any other common questions. Thanks for all of your work on this.

### Frequently Asked Questions

Are these final? We are making minor changes/corrections which will be distributed to the State Directors on Friday.

Can we modify the Vegetative Objective Table? No, the indicators must stay the same. However, you can have a range of values.

*Does the Vegetative Objectives Table apply to Priority and General Habitat? Yes.*

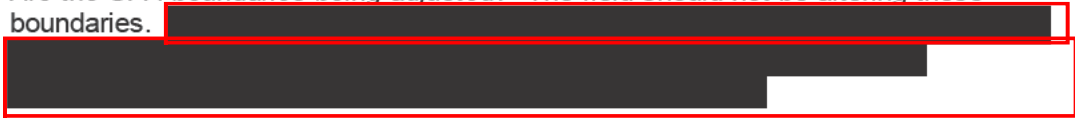

*Do the NSO provisions apply only to oil and gas? No, it applies to all fluid minerals including geothermal. We are correcting the guidance.*

*Which data layer gets submitted to the NOC for ROWs? The data layer for High Voltage Transmission Lines and Major Pipelines should be submitted, not the minor ROWs layer.*

*Do we keep buffers established as management actions in our plans? Yes, keep existing buffer decisions in the plans. However, these will not be submitted to the NOC as an allocation decision, with the exception of fluid mineral allocations in CO, WY and MT.*

*Does the buffer direction supersede the allocation and other management actions? No, it is part of project implementation. When presented with an action, you will 1) check allocations – can you do this in PHMA/GHMA? 2) does this meet the density/disturbance calculation? 3) apply any buffers established as management actions in your plan 4) apply the USGS buffer direction*

*Are the SFA boundaries being adjusted? The field should not be altering these boundaries.*

A large rectangular area of the document is redacted with black ink. The redaction covers several lines of text, including the question and answer regarding SFA boundaries. The redacted area is outlined in red.

*How will WAFWA Management Zone Teams integrate with existing state and local working groups? As these are established, you should work to include the same parties, consistent with FACA.*

Hi Jon –

Attached is the FS Proposed Plan for drop into Chapter 2.

Lauren

---

 ID Draft Proposed Planning Language V24.docx  
100K

# Idaho and SW Montana Forest Service Proposed Plan Amendment

---

## Forest Service Plan Components

**Desired conditions** - A description of specific social, economic, and/or ecological characteristics of the plan area, or a portion of the plan area, toward which management of the land and resources should be directed. Desired conditions must be described in terms that are specific enough to allow progress toward their achievement to be determined, but do not include completion dates. (36 CFR 219.7(e)(1)(i)) FSH 1909.12, Chapter 20)

**Guideline** – A constraint on project and activity decisionmaking that allows for departure from its terms, so long as the purpose of the guideline is met. (§ 219.15(d)(3)). Guidelines are established to help achieve or maintain a desired condition or conditions, to avoid or mitigate undesirable effects, or to meet applicable legal requirements. (36 CFR 219.7(e)(1)(iv); FSH 1909.12, Chapter 20)

**Objective** - A concise, measurable, and time-specific statement of a desired rate of progress toward a desired condition or conditions. Objectives should be based on reasonably foreseeable budgets. (36 CFR 219.9(e)(1)(ii)) FSH 1909.12, Chapter 20)

**Standard** - A mandatory constraint on project and activity decisionmaking, established to help achieve or maintain the desired condition or conditions, to avoid or mitigate undesirable effects, or to meet applicable legal requirements. (36 CFR 219.7(e)(1) (iii)) FSH 1909.12, Chapter 20)

## General Greater Sage-grouse

**GRSG-GEN-DC-001-Desired Condition** – The landscape for greater sage-grouse encompasses large contiguous areas, approximately 6 to 62 square miles in area, to provide for multiple aspects of species life requirements. Within these landscapes, a variety of sagebrush-community compositions exist, with variations in subspecies composition, co-dominant vegetation, shrub cover, herbaceous cover, and stand structure, to meet seasonal requirements for food, cover, and nesting for greater sage-grouse.

**GRSG-GEN-DC-002-Desired Condition** – Anthropogenic disturbance is focused in non-habitat areas outside of priority, sagebrush focal, important, and general habitat management areas<sup>1</sup>. Disturbances in general habitat management areas are limited, and there is little to no disturbances in priority, sagebrush focal, and important habitat management areas except for valid existing rights and existing authorize uses.

**GRSG-GEN-DC-003-Desired Condition** – In all seasonal habitats, 70% of lands capable of producing sagebrush have 10 to 30% sagebrush canopy cover and less than 10% conifer canopy cover. In addition, within breeding and nesting habitat, sufficient herbaceous vegetation structure and height provides overhead and lateral concealment for nesting and early brood rearing life stages. Within brood rearing habitat, wet meadows and riparian areas sustain a rich diversity of perennial forb species relative to site potential. Within winter habitat, sufficient sagebrush height

---

<sup>1</sup> Suitable greater sage-grouse habitat within polygons identified as priority or general habitat management areas. Areas of non-habitat within a polygon are not included as part of any priority or general habitat management areas. Sagebrush focal areas may include areas of non-habitat.

and density provides food and cover for greater sage-grouse during this seasonal period. Specific desired conditions for greater sage-grouse based on seasonal habitat requirements are in table 1.

**Table 1. Seasonal Habitat Desired Conditions for Greater Sage-grouse.**

ATTRIBUTE	INDICATORS	DESIRED CONDITON
<b>BREEDING AND NESTING<sup>1,2,3</sup> (Seasonal Use Period March 1-June 15) Apply 6.2 miles from active leks.<sup>4</sup></b>		
Lek Security	Proximity of trees <sup>5</sup>	Trees or other tall structures are none to uncommon within 1.86 miles of leks <sup>6,7</sup>
	Proximity of sagebrush to leks <sup>6</sup>	Adjacent protective sagebrush cover within 328 feet of lek <sup>6</sup>
Cover	Seasonal habitat extent <sup>7</sup>	>80% of the breeding and nesting habitat
	Sagebrush canopy cover <sup>6,7,8</sup>	15 to 25%
	Sagebrush height <sup>7</sup> Arid sites <sup>6,7,9</sup> Mesic sites <sup>6,7,10</sup>	12 to 32 inches 16 to 32 inches
	Predominant sagebrush shape <sup>6</sup>	>50% in spreading <sup>11</sup>
	Perennial grass canopy cover <sup>6,7</sup> Arid sites <sup>7,9</sup> Mesic sites <sup>7,10</sup>	≥10% ≥15%
	Perennial grass height <sup>6,7,8</sup>	Provide overhead and lateral concealment from predators <sup>7</sup>
	Perennial forb canopy cover <sup>6,7,8</sup> Arid sites <sup>9</sup> Mesic sites <sup>10</sup>	≥5% <sup>6,7</sup> ≥10% <sup>6,7</sup>
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>		
Cover	Seasonal habitat extent <sup>7</sup>	>40% of the brood-rearing/summer habitat
	Sagebrush canopy cover <sup>6,7,8</sup>	10 to 25%
	Sagebrush height <sup>7,8</sup>	16 to 32 inches
	Perennial grass canopy cover and forbs <sup>7,8</sup>	>15%
	Riparian areas/mesic meadows	Proper Functioning Condition <sup>12</sup>
	Upland and riparian perennial forb availability <sup>6,7</sup>	Preferred forbs are common with several preferred species present <sup>13</sup>
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>		
Cover and Food	Seasonal habitat extent <sup>6,7,8</sup>	>80% of the winter habitat
	Sagebrush canopy cover above snow <sup>6,7,8</sup>	>10%
	Sagebrush height above snow <sup>6,7,8</sup>	>10 inches <sup>14</sup>

Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred in Table III-2.</p> <p><sup>14</sup>The height of sagebrush remaining above the snow depends upon snow depth in a particular year. Intent is to manage for tall, healthy, sagebrush stands.</p>		

**GRSG-GEN-ST-001-Standard** – In priority, sagebrush focal, and important habitat management areas, do not permit new lands or recreation special use authorizations unless all existing discrete anthropogenic disturbances cover less than 3% of the total greater sage-grouse habitat within the Biologically Significant Unit and the proposed project analysis area, regardless of ownership (Appendix Z – Disturbance Cap Guidance).

**GRSG-GEN-ST-002-Standard** - In priority, sagebrush focal, and important management areas, only allow new authorized land uses if the residual impacts to greater sage-grouse or their habitats are fully offset by compensatory mitigation projects that provide a net conservation gain to the species, which will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Any compensatory mitigation will be durable, timely, and in addition to what would have resulted without the compensatory mitigation, as addressed in the Mitigation Framework (Appendix X).

**GRSG-GEN-GL-001-Guideline** - During lekking (March 1 to April 30) surface disturbing and disruptive activities, including noise at 10dB above ambient (not to exceed 20-24 dB) to lekking birds should be restricted from 6 pm to 9 am at a distance of 3.1 miles from the perimeter of an occupied lek.

**GRSG-GEN-GL-002-Guideline** – During breeding and nesting (March 1 to June 15), surface disturbing and disruptive activities to nesting birds should be restricted.

**GRSG-GEN-GL-003-Guideline** - When breeding and nesting habitat overlaps with other seasonal habitats, habitat should be managed for breeding and nesting desired habitat conditions displayed in table 1.

**GRSG-GEN-GL-004-Guideline** – Development of tall structures within 2.0 miles from the perimeter of occupied leks, as determined by local conditions (such as vegetation or topography), with the potential to disrupt breeding or nesting by creating new perching/nesting opportunities avian predators or by decreasing the use of an area, should be restricted in nesting habitat.

## Adaptive Management

**GRSG-AM-ST-001-Standard** – If a hard trigger is identified, immediate action is necessary to stop a severe deviation from greater sage-grouse conservation objectives. The hard trigger response will be an entire restrictive alternative, or one or more appropriate components of a more restrictive alternative, such as the immediate cessation of authorizing land use authorizations. An interagency team will conduct an assessment to determine the causal factor(s) and recommend corrective strategies (Appendix Z - Adaptive Management Guidance and Sideboards).

**GRSG-AM-ST-002-Standard** – If a soft trigger is identified, apply more conservative or restrictive implementation measures (e.g., extending seasonal restrictions for seasonal surface disturbing activities, modifying seasons of use for livestock grazing, and applying additional restrictions on discretionary activities) for the specific causal factor in the decline of populations and/or habitats, with consideration of local knowledge and conditions (Appendix Z - Adaptive Management Guidance and Sideboards).

## Lands and Realty

### Special Use Authorizations (non recreation)

**GRSG-LR-SUA-O-001-Objective** - In priority, sagebrush focal, and important habitat management areas, retrofit existing tall structures (e.g., power poles, cellular towers) with perch deterrents or other anti-perching devices within 2 years of signing the Record of Decision.

**GRSG-LR-SUA-ST-001-Standard** – In priority and sagebrush focal habitat management areas, restrict issuance of new lands special use authorizations for infrastructure, such as high-voltage transmission lines, major pipelines, hydropower, distribution lines, and cellular towers. Exceptions must be limited and based on rationale (e.g., monitoring, modeling, or best available science) that explicitly demonstrates that adverse impacts to greater sage-grouse will be avoided by the exception.

**GRSG-LR-SUA-ST-002-Standard** – In general habitat management areas, new lands special use authorizations may be authorized for infrastructure, such as high-voltage transmission lines and major pipelines, if they can be located within existing designated corridors and the authorization includes stipulations to protect greater sage-grouse and their habitats.

**GRSG-LR-SUA-ST-003-Standard** – In priority, sagebrush focal, and important habitat management areas, do not authorize temporary lands special uses (i.e., facilities or activities) that result in loss of habitat or would have long-term (greater than 5 years) negative impact on greater sage-grouse or their habitats.

**GRSG-LR-SUA-ST-004-Standard** – In priority, sagebrush focal, important, and general habitat management areas, require protective stipulations (e.g., noise, tall structure, guy wire removal, perch deterrent installation) when issuing new authorizations or during renewal, amendment, or reissuance of existing authorizations that authorize infrastructure (e.g., high-voltage transmission lines, major pipelines, roads, distribution lines, and cellular towers).

**GRSG-LR-SUA-ST-005-Standard** – In priority, sagebrush focal, important, and general habitat management areas, locate upgrades to existing transmission lines within the existing designated corridors unless an alternate route would benefit greater sage-grouse or their habitats.

**GRSG-LR-SUA-ST-006-Standard** - In priority, sagebrush focal, important, and general habitat management areas, when a lands special use authorization is revoked or terminated and no future use is contemplated the authorization holder must remove overhead lines and other infrastructure in compliance with 36 CFR 251.60(i).

**GRSG-LR-SUA-ST-007-Standard** - In priority, sagebrush focal, important, and general habitat management areas, if the potential long-term (greater than 5 years) impacts of mitigation (e.g., relocation or burying) to greater sage-grouse or their habitats are greater than the potential impacts from new lands special use authorizations, do not pursue the mitigation. If mitigation is not feasible or would result in short-term (less than 5 years) or long-term impacts, incorporate additional terms and conditions in the special use authorization for protection of greater sage-grouse or their habitats

**GRSG-LR-SUA-ST-008-Standard** – In priority, sagebrush focal, important, and general habitat management areas, co-locate new infrastructure (e.g., high-voltage transmission lines, major pipelines, roads, distribution lines, and cellular towers) with existing infrastructure to limit disturbance to the smallest footprint, or where it best limits impacts to greater sage-grouse or their habitats. When co-location of new infrastructure is not accomplished,

locate it adjacent to existing infrastructure, roads, or already disturbed areas. Consider new communication tower sites where necessary for public safety.

**GRSG-LR-SUA-GL-001-Guideline** – In priority and sagebrush focal management areas, outside of existing designated corridors, new transmission lines and pipelines should be buried to limit disturbance to the smallest footprint unless explicit rationale is provided that the biological impacts to greater sage-grouse and its habitat are being avoided. When new transmission lines and pipelines are not buried, locate them adjacent to existing transmission lines.

## Land Ownership Adjustments

**GRSG-LR-LOA-ST-001-Standard** – In priority, sagebrush focal, important, and general habitat management areas, do not approve land ownership adjustments unless the action results in a net conservation gain to greater sage-grouse or they will not directly or indirectly adversely impact greater sage-grouse conservation.

**GRSG-LR-LOA-GL-001-Guideline** – In priority, sagebrush focal, important, and general habitat management areas with minority federal ownership, consider land ownership adjustments to achieve a landownership pattern (e.g., consolidation, reducing fragmentation) that supports improved greater sage-grouse population trends and habitats.

## Land Withdrawal

**GRSG-LR-LW-GL-001-Guideline** – In priority, sagebrush focal, and important habitat management areas, utilize land withdrawals as a tool, where appropriate and subject to valid existing rights, to prevent activities that will be detrimental to greater sage-grouse or their habitats.

## Wind and Solar

**GRSG-WS-ST-001-Standard** – In priority and sagebrush focal management areas, do not authorize new solar and wind utility-scale and/or commercial energy development except for on-site power generation associated with existing industrial infrastructure (e.g., mine site).

**GRSG-WS-GL-001-Guideline** – In important habitat management areas, new wind energy utility-scale and/or commercial development should be restricted. If development cannot be restricted due to existing authorized use, adjacent developments, or split estate issues, then ensure that stipulations are incorporated into the authorization to protect greater sage-grouse and their habitats.

## Greater Sage-grouse Habitat

**GRSG-GRSGH-O-001-Objective** – Every 10 years for the next 50 years, improve greater sage-grouse habitat by removing invading conifers and other undesirable species in the number of acres shown in table 2.

**Table 2. Treatment Acres per Decade.**

FOREST	ACRES		
	MECHANICAL <sup>1</sup>	PRESCRIBED FIRE <sup>2</sup>	GRASS RESTORATION <sup>3</sup>
Boise	1000	2000	0
Caribou-Targhee-Curlew	3000	2000	3000
Salmon-Challis	5000	1000	0
Sawtooth	7000	1000	7000
Beaverhead-Deerlodge	0	0	0

<sup>1</sup>Removal of conifers that have invaded sagebrush including phase one juniper that is 10% or less and reducing sagebrush cover in areas over 30% canopy cover

<sup>2</sup>Acres are those that are greater than 30% sagebrush canopy cover and/or invaded by 10% or greater conifer.

<sup>3</sup>Acres presently dominated by annual grasses that could be improved by herbicide application and seeding of perennial vegetation.

**GRSG-GRSGH-ST-001-Standard** – Design habitat restoration projects to move towards desired conditions (table 1) and incorporate the concepts outlined in Appendix X - *Using resistance and resilience concepts to reduce impacts of invasive annual grasses and altered fire regimes on the sagebrush ecosystem and greater sage-grouse: A strategic multi-scale approach.*

**GRSG-GRSGH-GL-001-Guideline** – Sagebrush removal in greater sage-grouse breeding and nesting and wintering habitats should be restricted unless necessary to support attainment of desired habitat conditions (table 1).

**GRSG-GRSGH-GL-002-Guideline** – When removing conifers that are encroaching into greater sage-grouse habitat, avoid persistent woodlands (old growth relative to the site or more than 100 years old).

**GRSG-GRSGH-GL-003-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, actions and authorizations should be designed to limit the spread and effect of non-native plant species.

**GRSG-GRSGH-GL-004-Guideline** - To facilitate safe and effective fire management actions, in priority, sagebrush focal, important, and general habitat management areas, fuels treatments should be designed to reduce the spread and intensity of wildfire in high-risk areas (i.e., areas of increased potential for ignition and in areas where there is a potential for wildfire that would be difficult for suppression resources to contain and control).

**GRSG-GRSGH-GL-005-Guideline** - In priority, sagebrush focal, important, and general habitat management areas, native plant species should be used, when possible, to restore, enhance, or maintain desired habitat conditions (table 1).

**GRSG-GRSGH-GL-006-Guideline** – In priority, sagebrush focal, and important habitat management areas, vegetation treatment projects should only be conducted if they restore, enhance, or maintain desired habitat conditions (table 1).

## Livestock Grazing

**GRSG-LG-DC-001-Desired Condition** – In priority, sagebrush focal, and important habitat management areas, livestock grazing is managed to ensure adequate nesting cover and does not conflict with the attainment of other vegetative attributes (table 1).

**GRSG-LG-ST-001-Standard** – In priority, sagebrush focal, and important habitat management areas, do not authorize construction of water developments unless beneficial to greater sage-grouse habitat.

**GRSG-LG-GL-001-Guideline** - Grazing guidelines should be applied in each of the seasonal habitats in table 3. If values in table 3 guidelines cannot be achieved based upon a site-specific analysis using Ecological Site Descriptions, long-term ecological site capability analysis, or other similar analysis, adjust grazing management to move towards desired habitat conditions in table 1 consistent with the ecological site capability. Do not use drought and degraded habitat condition to adjust values. Grazing guidelines in table 3 would not apply to isolated parcels of National Forest System lands that have less than 200 acres of greater sage-grouse habitat.

**Table 3. Grazing Guidelines for Greater Sage-grouse Seasonal Habitat.**

Seasonal Habitat	Grazing Guidelines
Breeding and nesting <sup>1</sup> within 6.2 miles of occupied leks	Perennial grass height: <sup>2</sup> When grazing occurs during breeding and nesting season (March 1 to June 15) manage for upland perennial grass height of 7 inches <sup>3,4,5</sup> When grazing occurs post breeding and nesting season (June 16 to October 30) manage for 4 inches <sup>4,5,6</sup> of perennial grass height.
Brood rearing and summer <sup>1</sup>	Retain an average stubble height of 4 inches for herbaceous riparian/mesic meadow vegetation <sup>7,8</sup>
Winter <sup>1</sup>	≤35% use of sagebrush

<sup>1</sup> For descriptions of Seasonal Habitat and Seasonal Periods of greater sage-grouse see table 1.

<sup>2</sup> Grass heights only apply in breeding and nesting habitat with ≥10% sagebrush cover to support nesting.

<sup>3</sup> Holloran et al. 2005. *Greater sage-grouse nesting habitat selection and success in Wyoming*.

<sup>4</sup> Average droop height, assuming current vegetation composition has the capability to achieve these heights. Heights will be measured at the end of the nesting period (Connelly, 2000).

<sup>5</sup> Hagen C., J.W. Connelly, and M.A. Schroeder. 2007. *A meta-analysis of greater sage-grouse *Centrocercus urophasianus* nesting and brood-rearing habitats*. *Wildlife Biology* 13(1): 42-50.

<sup>6</sup> Stubble height to be measured at the end of the growing season.

<sup>7</sup> Crawford et al. 2004. Ecology and Management of sage-grouse and sage-grouse habitat. "In riparian brood-rearing habitat, sage-grouse prefer the lower vegetation (5-15 cm (2-6 in) vs. 30-50 cm (12-20 in); Oakleaf 1971, Neel 1980, Klebenow 1982, Evans 1986) and succulent forb growth stimulated by moderate livestock grazing (Neel 1980, Evans 1986). "Moderate use equates to a 10-cm residual stubble height for most grasses and sedges."

<sup>8</sup> Stubble height to be measured in the meadow areas used by greater sage-grouse for brood-rearing (not on the hydric greenline).

**GRSG-LG-GL-002-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, consider closure of grazing allotments, pastures, or portions of pastures, or managing the allotment as a forage reserve as opportunities arise under applicable regulations, where removal of livestock grazing would enhance the ability to achieve desired habitat conditions (table 1).

**GRSG-LG-GL-003-Guideline** – Bedding sheep and placing camps within 1.2 miles from the perimeter of a lek during lekking (March 1 to April 30) should be restricted.

**GRSG-LG-GL-004-Guideline** – During breeding and nesting season (March 1 to June 15), trailing livestock through breeding and nesting habitat should be minimized. Specific routes should be identified, existing trails should be used, and stopovers on active leks should be restricted.

**GRSG-LG-GL-005-Guideline** – Fences should not be constructed or reconstructed within 1.2 miles from the perimeter of occupied leks, unless the collision risk can be mitigated through design features or markings (e.g., mark, laydown fences, and design).

**GRSG-LG-GL-006-Guideline** – New permanent livestock facilities (e.g., windmills, corrals) should not be constructed within 1.2 miles from the perimeter of occupied leks.

## Fire Management

**GRSG-FM-ST-001-Standard** – In priority, sagebrush focal, important, and general habitat management areas, do not use prescribed fire, except for pile burning, in 12-inch or less precipitation zones unless necessary to facilitate site preparation for restoration of greater sage-grouse habitat consistent with desired conditions in table 1.

**GRSG-FM-ST-002-Standard** – In priority, sagebrush focal, and general management areas, if it is necessary to use prescribed fire to facilitate site preparation for restoration of greater sage-grouse habitat consistent with desired conditions in table 1, the associated NEPA analysis must identify how greater sage-grouse desired conditions would

be met, why alternative techniques were not selected, and how potential threats to greater sage-grouse habitat would be minimized.

**GRSG-FM-GL-001-Guideline** – In wintering or breeding and nesting habitat, sagebrush removal or manipulation, including prescribed fire, should be restricted unless the removal strategically reduces the potential impacts from wildfire.

**GRSG-FM-GL-002-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, when reseeding in fuel breaks, fire resistant native plant species should be used if available, or consider using fire resistant non-native to meet resource objectives.

**GRSG-FM-GL-003-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, treatments should be designed to restore, enhance, or maintain greater sage-grouse habitat.

**GRSG-FM-GL-004-Guideline** – Locating temporary wildfire suppression facilities (e.g., incident command posts, spike camps, helibases, mobile retardant plants) in priority, sagebrush focal, and general habitat management areas should be restricted.

**GRSG-FM-GL-005-Guideline** - In priority, sagebrush focal, important, and general habitat management areas, cross-country vehicle travel during fire operations should be restricted whenever safe and practical to do so, as determined by fireline leadership, incident commanders, etc.

**GRSG-FM-GL-006-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, burnout operation areas should be avoided by constructing direct fire lines, whenever safe and practical to do so, to improve suppression effectiveness and minimize loss of existing sagebrush habitat as determined by fireline leadership, incident commanders, etc.

**GRSG-FM-GL-007-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, prescribed fire prescriptions should minimize undesirable effects on vegetation and/or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of hydrophobicity).

**GRSG-FM-GL-008-Guideline** - In priority, sagebrush focal, important, and general habitat management areas, roads and natural fuel breaks should be incorporated into fuel break design to improve effectiveness and minimize loss of existing sagebrush habitat.

**GRSG-FM-GL-009-Guideline** - In priority, sagebrush focal, important, and general habitat management areas, all fire associated vehicles and equipment should be power-washed before entering and exiting the area to minimize the introduction of undesirable invasive plant species.

**GRSG-FM-GL-010-Guideline** - Unit-specific greater sage-grouse fire management toolboxes containing maps, lists, contact information for qualified resource advisors, local guidance, and relevant information should be developed.

**GRSG-FM-GL-011-Guideline** – Localized maps of priority, sagebrush focal, important, and general habitat management areas should be provided to dispatch offices and extended attack incident commanders to use when prioritizing wildfire suppression resources and designing suppression tactics.

**GRSG-FM-GL-012-Guideline** - In or near priority, sagebrush focal, important, and general habitat management areas, a greater sage-grouse resource advisor should be assigned to all extended attack fires.

**GRSG-FM-GL-013-Guideline** – On critical fire weather days, available fire suppression resources should be pre-positioned to optimize a quick and efficient response into priority, sagebrush focal, important, and general habitat management areas.

**GRSG-FM-GL-014-Guideline** - During periods of multiple fires, line officers should be involved in setting priorities to help protect priority, sagebrush focal, important, and general habitat management areas.

**GRSG-FM-GL-015-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, consider using fire retardant and mechanized equipment only if it is likely to result in minimizing burned acreage.

**GRSG-FM-GL-016-Guideline** – In priority, important and general habitat management areas, to minimize sagebrush loss, mop-up should be conducted where the burned areas adjoin unburned islands, doglegs, or other habitat features, as safety and available resources allows.

## Wild Horse and Burro

**GRSG-HB-GL-001-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, wild horse and burro populations should be managed within established appropriate management levels to restore, enhance, or maintain greater sage-grouse desired habitat conditions (table 1).

**GRSG-HB-GL-002-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, appropriate management levels should be adjusted if greater sage-grouse management standards are not met due to degradation that can be at least partially attributed to wild horse or burro populations.

## Recreation

**GRSG-R-DC-001-Desired Condition** – In priority, sagebrush focal, important, and general habitat management areas, existing and new recreation special use authorizations and expansion of special use authorizations restrict effects to greater sage-grouse and their habitats.

**GRSG-R-ST-001-Standard** – In priority, sagebrush focal, and important habitat management areas, do not authorize temporary recreation uses (i.e., facilities or activities) that result in loss of habitat or would have long-term (greater than 5 years) negative impacts on greater sage-grouse or their habitats.

**GRSG-R-GL-001-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, terms and conditions that protect and/or restore greater sage-grouse habitat within the permit area should be included in new recreation special use authorizations. During renewal, amendment, or reauthorization, terms and conditions in existing permits and operating plans should be modified to protect and/or restore greater sage-grouse habitat.

**GRSG-R-GL-002-Guideline** – In priority, sagebrush focal, and important habitat management area, new recreational facilities or expansion of existing recreational facilities (e.g., roads, trails, campgrounds), including special use authorizations for facilities and activities, should not be approved unless the development results in a net conservation gain to greater sage-grouse and/or their habitats or the development is required for visitor safety.

## Roads/Transportation

**GRSG-RT-DC-001-Desired Condition** - In priority, sagebrush focal, important, and general habitat management areas, within the travel management system, greater sage-grouse experience minimal disturbance during breeding and nesting (March 1 to June 15) and wintering periods (November 1 to February 28).

**GRSG-RT-ST-001-Standard** – In priority, sagebrush focal, important, and general habitat management areas, do not construct or allow new road or trail construction (does not apply to realignments for resource protection) except when necessary for administrative access, public safety, or to access valid existing rights. If necessary to construct new roads and trails for one of these purposes, construct them to the minimum standard, length, and number and avoid, minimize, and mitigate impacts

**GRSG-RT-ST-002-Standard** – Do not conduct or allow road and trail maintenance activities within 2 miles from the perimeter of active leks during lekking (March 1 to April 30) from 6 pm to 9 am.

**GRSG-RT-ST-003-Standard** – In priority, sagebrush focal, and important habitat management areas, do not grant public access on temporary energy development roads, unless consistent with all other terms and conditions included in the land use management plan.

**GRSG-RT-GL-001-Guideline** – In priority, sagebrush focal, and important habitat management areas, new roads and road realignments should be designed and administered to reduce collisions with greater sage-grouse.

**GRSG-RT-GL-002-Guideline** – In priority, sagebrush focal, and important habitat management areas, road construction within riparian areas and mesic meadows should be restricted. If not possible to restrict construction within riparian areas and mesic meadows, roads should be designed and constructed at right angles to ephemeral drainages and stream crossings, unless topography prevents doing so.

**GRSG-RT-GL-003-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, when decommissioning roads and unauthorized routes, restoration activity should be designed to move habitat towards desired conditions (table 1).

**GRSG-RT-GL-004-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, dust abatement terms and conditions should be included in road use permits when dust has the potential to impact greater sage-grouse.

**GRSG-RT-GL-005-Guideline** - In priority, sagebrush focal, important, and general habitat management areas, road and road-way maintenance activities should be designed and implemented to reduce the risk of vehicle or human-caused wildfires and the spread of invasive plants.

## Minerals

### Fluid Minerals – Unleased

**GRSG-M-FMUL-ST-001-Standard** - In priority, sagebrush focal, and important habitat management areas, any new oil and gas leases must include a no surface occupancy stipulation. There will be no waivers, exceptions, or modifications. An exception could be granted by the authorized officer with unanimous concurrence from a team of agency greater sage-grouse experts from the Fish and Wildlife Service, Forest Service, and State wildlife agency if:

- There would be no direct, indirect, or cumulative effects to greater sage-grouse or their habitats or
- Granting the exception provides an alternative to a similar action occurring on a nearby parcel and
- The exception provides a clear net conservation gain to greater sage-grouse.

**GRSG-M-FMUL-ST-002-Standard** – In general habitat management areas, any new leases must include appropriate controlled surface use and timing limitation stipulations to protect greater sage-grouse and their habitat.

**GRSG-M-FMUL-ST-003-Standard** – In sagebrush focal habitat management areas, there will be no surface occupancy and no waivers, exceptions, or modifications for fluid mineral leasing.

**GRSG-M-FMUL-ST-004-Standard** – In priority, sagebrush focal, and general management areas, when analyzing leasing of fluid mineral resources, prioritize development in non-habitat areas first and then in the least suitable habitat for greater sage-grouse, subject to valid existing rights, law, and regulations.

### Fluid Minerals – Leased

**GRSG-M-FML-ST-001-Standard** – In priority, sagebrush focal, and important habitat management areas, when approving the Surface Use Plan of Operation portion of the Application for Permit to Drill on existing leases that are not yet developed, require that leaseholders avoid and minimize surface disturbing and disruptive activities consistent with the rights and conditions granted in the lease.

**GRSG-M-FML-ST-002-Standard** – In priority, sagebrush focal, and important habitat management areas, when facilities are no longer needed or leases are relinquished, require reclamation plans to include terms and conditions to restore habitat to desired conditions as described in table 1.

**GRSG-M-FML-ST-003-Standard** – In general habitat management areas, authorize new transmission line corridors, transmission line right-of-ways, transmission line construction, or transmission line-facility construction associated with fluid mineral leases with stipulations necessary to protect greater sage-grouse and their habitats, consistent with the terms and conditions of the permit.

**GRSG-M-FML-ST-004-Standard** – Locate compressor stations on portions of a lease that are non-habitat and are not used by greater sage-grouse, and if there would be no direct, indirect, or cumulative effects on sage-grouse or their habitat. If this is not possible, work with the operator to use mufflers, sound insulation, or other features to reduce noise.

**GRSG-M-FML-ST-005-Standard** – In priority, sagebrush focal, and general management areas, when authorizing development of fluid mineral resources, prioritize development in non-habitat areas first and then in the least suitable habitat for greater sage-grouse, subject to valid existing rights, law, and regulations

**GRSG-M-FML-GL-001-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, operators should be encouraged to reduce disturbance to greater sage-grouse habitat. At the time of approval of the Surface Use Plan of Operation portion of the Application for Permit to Drill, terms and conditions should be included to reduce disturbance to greater sage-grouse habitat, where appropriate and feasible and consistent with the rights granted to the lessee.

**GRSG-M-FML-GL-002-Guideline** – On Federal leases in priority, sagebrush focal, and important habitat management areas, when surface occupancy cannot be restricted due to valid existing rights or development requirements, disturbance and surface occupancy should be limited to areas least harmful to greater sage-grouse based on vegetation, topography, or other habitat features.

**GRSG-M-FML-GL-003-Guideline** - In priority, sagebrush focal, and general management areas, where the federal government owns the surface and the mineral estate is in non-federal ownership, coordinate with the mineral estate owner/lessee to apply appropriate stipulations, conditions of approval, conservation measures and required design features to the appropriate surface management instruments to the maximum extent permissible under existing authorities.

## Fluid Minerals – Operations

**GRSG-M-FMO-ST-001-Standard** – In priority, sagebrush focal, and important habitat management areas, do not authorize employee camps.

**GRSG-M-FMO-ST-002-Standard** – In priority, sagebrush focal, and important habitat management areas, when feasible, do not locate tanks or other structures that may be used as raptor perches. If this is not feasible, use perch deterrents.

**GRSG-M-FMO-GL-001-Guideline** – In priority, sagebrush focal, and important habitat management areas, closed-loop systems should be used for drilling operations with no reserve pits, where feasible.

**GRSG-M-FMO-GL-002-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, during drilling operations, soil compaction should be reduced and soil structure should be maintained using the best available techniques to improve vegetation reestablishment.

**GRSG-M-FMO-GL-003-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, dams, impoundments and ponds for mineral development should be constructed to reduce potential for West Nile virus. Examples of methods to accomplish this include:

- Increase the depth of ponds to accommodate a greater volume of water than is discharged.
- Build steep shorelines (greater than 2 feet) to reduce shallow water and aquatic vegetation around the perimeter of impoundments to reduce breeding habitat for mosquitoes.
- Maintain the water level below that of rooted aquatic and upland vegetation. Restrict flooding terrestrial vegetation in flat terrain or low-lying areas.
- Construct dams or impoundments that restrict down-slope seepage or overflow by digging ponds in flat areas rather than damming natural draws for effluent water storage or lining constructed ponds in areas where seepage is anticipated.
- Line the channel where discharge water flows into the pond with crushed rock or use a horizontal pipe to discharge inflow directly into existing open water.

- Line the overflow spillway with crushed rock and construct the spillway with steep sides.
- Fence pond sites to restrict access by livestock and other wild ungulates.
- Remove or re-inject produced water.
- Treat waters with larvicides to reduce mosquito production where water occurs on the surface.

**GRSG-M-FMO-GL-004-Guideline** – In priority, sagebrush focal, important, and general habitat management areas to keep habitat disturbance at a minimum, a phased development approach should be applied to fluid mineral operations, wherever possible, consistent with the rights granted under the lease. Disturbed areas should be reclaimed as soon as they are no longer needed for mineral operations.

### Coal Mines - Unleased

**GRSG-M-CMUL-ST-001-Standard** – In priority, sagebrush focal, and important habitat management areas, do not authorize surface disturbances (e.g., appurtenant facilities) for new underground coalmines.

### Coal Mines – Leased

**GRSG-M-CML-ST-001-Standard** – In priority, sagebrush focal, and important habitat management areas, do not authorize new appurtenant facilities for existing underground mines unless no technically feasible alternative exists. If new appurtenant facilities associated with existing mine leases cannot be located outside of priority, sagebrush focal, and important habitat management areas, co-locate them with any existing disturbed areas, if possible. If co-location is not possible, then construct new facilities to minimize disturbed areas while meeting mine safety standards and requirements, as identified by MSHA mine-plan approval process, and locate the facilities in an area least harmful to greater sage-grouse habitats based on vegetation, topography, or other habitat features.

**GRSG-M-CML-GL-001-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, when coal leases are subject to readjustment, additional requirements should be included in the readjusted lease to protect and reduce threats to greater sage-grouse and their habitats to conserve, enhance, and restore habitat for long-term viability.

### Locatable Minerals

**GRSG-M-LM-ST-001-Standard** – In priority, sagebrush focal, and important habitat management areas, approve Plans of Operation with mitigation to protect greater sage-grouse and their habitats, consistent with the rights of the mining claimant as granted by the General Mining Act of 1872, as amended.

**GRSG-M-LM-GL-001-Guideline** – In priority, sagebrush focal, important, and general habitat management areas to keep habitat disturbance at a minimum, a phased development approach should be applied to operations consistent with the rights granted under the General Mining Act of 1872, as amended. Disturbed areas should be reclaimed as soon as they are no longer needed for mineral operations.

**GRSG-M-LM-GL-002-Guideline** - In priority, sagebrush focal, important, and general habitat management areas, abandoned mine sites should be closed or mitigated, subject to valid or existing rights, to reduce predation of greater sage-grouse by eliminating tall structures that could provide nesting opportunities and perching sites for predators.

## Non-energy Leasable Minerals

**GRSG-M-NEL-GL-001-Guideline** – In priority, sagebrush focal, important, and general habitat management areas, at the time of issuance of prospecting permits, exploration licenses and leases, or readjustment of leases, the Forest Service should provide recommendations to the Bureau of Land Management for the protection of greater sage-grouse and their habitats.

**GRSG-M-NEL-GL-002-Guideline** - In priority, sagebrush focal, and general habitat management areas, the Forest Service should recommend to the Bureau of Land Management that expansion or readjustment of existing leases avoid, minimize, or mitigate the effects to greater sage-grouse and their habitat

## Mineral Materials

**GRSG-M-MM-ST-001-Standard** – In priority and sagebrush focal management areas, do not allow new mineral material disposal or development.

**GRSG-M-MM-ST-002-Standard** – In priority, sagebrush focal, and important habitat management areas, free-use mineral material collection permits may be issued and expansion of existing active pits may be allowed, except from March 1 to April 30 between 6 pm and 9 am within 2 miles from the perimeter of occupied leks, if doing so is within the Biologically Significant Unit and does not exceed the disturbance cap.

**GRSG-M-MM-ST-003-Standard** - In priority, sagebrush focal, important, and general habitat management areas, any permit for existing mineral material operations must include appropriate requirements for operation and reclamation of the site to restore or maintain desired habitat conditions (table 1).

## Glossary of Terms as Used in this Plan

**Active lek** - Any lek that has been attended by male greater sage-grouse during the most recent strutting season.

**Adjacent** – Installation of new linear improvements parallel, near, or next to existing linear improvements.

**Administrative access** - Access for resource management and administrative purposes such as fire suppression, cadastral surveys, permit compliance, law enforcement, and military in the performance of their official duty, or other access needed to manage National Forest System lands or uses.

**Allotment management plan** - A written program of livestock grazing management, including supportive measures, if required, designed to attain specific, multiple-use management goals in a grazing allotment. The Plan is prepared in consultation with the permittee(s), lessee(s), and other affected interests. Livestock grazing is considered in relation to other uses of the range and to renewable resources, such as watershed, vegetation, and wildlife. The Plan establishes seasons of use, the number of livestock to be permitted, the range improvements needed, and the grazing system.

**Ambient (noise level)** - Sometimes called background noise level, reference sound level, or room noise level is the background sound pressure level at a given location, normally specified as a reference level to study a new intrusive sound source.

**Anthropogenic disturbances** – Human-created features include but are not limited to paved highways, graded gravel roads, transmission lines, substations, wind turbines, oil and gas wells, geothermal wells and associated facilities, pipelines, landfills, agricultural conversion, homes, and mines.

**Appurtenant (minerals)** - A piece of equipment (e.g., pump jack, separator, storage tank, compressor station, metering equipment) necessary for production.

**Authorized uses** - An activity (i.e., resource use) occurring on the public lands that is either explicitly or implicitly recognized and legalized by law or regulation. The term may refer to activities occurring on the public lands for which the Forest Service has issued a formal authorization document (e.g., livestock grazing permit, special use authorization, approved plan of operation, etc.). Formal authorized uses can involve both commercial and noncommercial activity, facility placement, or event. These authorized uses are often spatially or temporally limited. Unless constrained or bounded by statute, regulation, or an approved land use plan decision, legal activities involving public enjoyment and use of the public lands (e.g., hiking, camping, hunting, etc.) require no formal Forest Service authorization.

**Biologically significant unit** - A geographical/spatial area within greater sage-grouse habitat that contains relevant and important habitats that is used as the basis for comparative calculations to support evaluation of changes to habitat. A biologically significant unit or subset of the unit is used in the calculation of the anthropogenic disturbance threshold and in the adaptive management habitat trigger.

The biologically significant unit is defined as:

- Idaho: All of the modeled nesting and delineated winter habitat, based on 2012 data, within priority and/or important habitat management areas within a Conservation Area.
- Montana: All of the priority and sagebrush focal management areas.

**Co-locate** - Installation of new linear improvements in or on existing linear improvements.

**Communication tower site** - Sites that include broadcast types of uses (e.g., television, AM/FM radio, cable television, broadcast translator) and non-broadcast uses (e.g., commercial or private mobile radio service, cellular telephone, microwave, local exchange network, passive reflector).

**Compensatory mitigation** – Compensating for the residual impact of a certain action or parts of an action by replacing or providing substitute resources or environments(s).

**Compensatory mitigation projects** – The restoration, creation, enhancement, and/or preservation of impacted resources, such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements)

**Conservation area** - Areas determined to be necessary to monitor population objectives to evaluate the disturbance density and adaptive regulatory triggers and engage adaptive management responses. Conservation Areas may contain priority, sagebrush focal, important, and general habitat management areas. Specifically, these areas are Mountain Valleys, Desert, West Owyhee, and Southern and Southwestern Montana.

**Disruptive activities** - Land resource uses/activities that are likely to alter the behavior, displace, or cause excessive stress to greater sage-grouse populations occurring at a specific location and/or time. Actions that alter behavior or cause the displacement of individuals such that reproductive success is negatively affected, or an individual's physiological ability to cope with environmental stress is compromised.

**Distribution line** - An electrical utility line with a capacity of less than 100kV or a natural gas, hydrogen, or water pipeline less than 24" in diameter.

**Diversity (species)** – The number, distribution, and geographic ranges of plant and animal species including focal species and species-at-risk.

**Durable (protective and ecological)** - The administrative, legal, and financial assurances that secure and protect the conservation status of a compensatory mitigation site, and the ecological benefits of a compensatory mitigation project, for at least as long as the associated impacts persist.

**Enhance** - The improvement of habitat by increasing missing or modifying unsatisfactory components and/or attributes of the habitat (e.g., road commissioning) to meet greater sage-grouse objectives.

**Exception (minerals)** - A case-by-case exemption from a lease stipulation. The stipulation continues to apply to all other sites within the leasehold to which the restrictive criteria apply. The authorized officer (any employee of the Forest Service to whom has been delegated the authority to perform the duties described in the applicable Forest Service manual or handbook) may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of greater sage-grouse.

**Feasible** – see technically/economically feasible.

**Fluid minerals** - Oil, gas, coal bed natural gas, and geothermal resources.

**General habitat management areas** - Areas identified by the Forest Service, in coordination with respective state wildlife agencies, as those areas outside of priority and sagebrush focal management areas and occupied by greater sage-grouse seasonally or year-round.

**Grazing system** - Scheduled grazing use and non-use of an allotment to reach identified goals or objectives by improving the quality and quantity of vegetation. Include, but are not limited to, developing pastures, utilization levels, grazing rotations, timing and duration of use periods, and necessary range improvements.

**Habitat** - An environment that meets a specific set of physical, biological, temporal, or spatial characteristics that satisfy the requirements of a plant or animal species or group of species for part or all of their life cycle.

**Hard triggers** - Thresholds indicating that immediate action is necessary to stop a severe deviation from sage grouse conservation objectives set forth in the land and resources management plan.

**High-voltage transmission line** – An electrical power line that is 100 kilovolts or larger.

**Holder** – An individual or entity that holds a valid special use authorization.

**Impact** - The effect, influence, alteration, or imprint caused by an action.

**Important habitat management areas** - High value habitat and populations that provide a management buffer for the priority and sagebrush focal management areas and connect patches of priority and sagebrush focal management areas. The areas encompass areas of generally moderate to high conservation value habitat and/or populations and, in some conservation areas, include areas beyond those identified by USFWS as necessary to maintain redundant, representative, and resilient populations. The areas are typically adjacent to priority and sagebrush focal management areas but generally reflect somewhat lower greater sage-grouse population status and/or reduced habitat value due to disturbance, habitat fragmentation, or other factors. No important habitat management areas are designated within the southwestern Montana conservation area.

**Indicators** - Factors that describe resource condition and change and can help the BLM and the Forest Service determine trends over time.

**Isolated parcel** - An individual parcel of land that may share a corner, but does not have a common border with another parcel.

**Invasive species (invasives plant species, invasives)** - An alien species whose introduction does or is likely to cause economic or environmental harm or harm to human health. The species must cause, or be likely to cause, harm, and be exotic to the ecosystem it has infested before considered invasive.

**Landscape** – A distinct association of land types that exhibit a unique combination of local climate, landform, topography, geomorphic process, surficial geology, soil, biota, and human influences. Landscapes are generally of a size that the eye can comprehend in a single view.

**Lease** – A type of special use authorization (usually granted for uses other than linear rights-of-way) that is used when substantial capital investment is required and when conveyance of a conditional and transferable interest in National Forest System lands is necessary or desirable to serve or facilitate authorized long-term uses, and that may be revocable and compensable according to its terms.

**Leasable minerals** - Those minerals or materials designated as leasable under the Mineral Leasing Act of 1920. These include energy-related mineral resources such as oil, natural gas, coal, and geothermal, and some non-energy minerals, such as phosphate, sodium, potassium, and sulfur. Geothermal resources are also leasable under the Geothermal Steam Act of 1970.

**Lessee** - A person or entity authorized to use and occupy National Forest System land under a specific instrument identified as a lease. Forest special use leases are limited to authorize certain wireless communication uses. Leases are also used for certain mineral leasable activities.

**Lek** - A courtship display area attended by male greater sage-grouse in or adjacent to sagebrush dominated habitat. For management purposes, leks with less than five males observed strutting should be confirmed active for 2 years to meet the definition of a lek (Connelly et al 2000, Connelly et al. 2003, 2004).

**Locatable minerals** - Mineral disposable under the General Mining Act of 1872, as amended, that was not excepted in later legislation. They include hardrock, placer, industrial minerals, and uncommon varieties of rock found on public domain lands.

**Major pipeline** – A pipeline that is 24 inches or more in outside-pipe diameter (Mineral Leasing Act of 1920 30 U.S.C. § 181; 36 CFR 251.54(f)(1)).

**Mineral** - Any naturally formed inorganic material, solid or fluid inorganic substance that can be extracted from the earth, any of various naturally occurring homogeneous substances (as stone, coal, salt, sulfur, sand, petroleum, water, or natural gas) obtained usually from the ground. Under Federal laws, considered as locatable (subject to the general mining laws), leasable (subject to the Mineral Leasing Act of 1920), and salable (subject to the Materials Act of 1947).

**Mineral materials** - Common varieties of mineral materials such as soil, sand and gravel, stone, pumice, pumicite, and clay that are not obtainable under the mining or leasing laws but that can be acquired under the Materials Act of 1947, as amended.

**Minimization mitigation** - Minimizing impacts by limiting the degree or magnitude of the action and its implementation.

**Mitigation** - Includes specific means, measures, or practices that could reduce, avoid, or eliminate adverse impacts. Mitigation can include avoiding the impact altogether by not taking a certain action or parts of an action, minimizing the impact by limiting the degree of magnitude of the action and its implementation, rectifying the impact by repairing, rehabilitation, or restoring the affected environment, reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action, and compensating for the impact by replacing or providing substitute resources or environments.

**Modification (oil and gas)** - A fundamental change to the provisions of a lease stipulation, either temporarily or for the term of the lease. A modification may include an exemption from or alteration to a stipulated requirement. Depending on the specific modification, the stipulation may or may not apply to all other sites within the leasehold to which the restrictive criteria applied.

**Native plant species** - Species that were found here before European settlement, and consequently are in balance with these ecosystems because they have well developed parasites, predators, and pollinators.

**No surface occupancy (NSO)** - Use or occupancy of the land surface for fluid mineral exploration or development prohibited to protect identified resource values. The NSO stipulation includes stipulations that may be worded as “No Surface Use/Occupancy,” “No Surface Disturbance,” “Conditional NSO,” or “Surface Disturbance or Surface Occupancy Restriction (by location).”

**Occupied Lek** - A lek that has been active during at least one strutting season within the prior 10 years.

**Opportunity (allotment closure)** - A suitable or favorable time to abolish or close an allotment because of nonuse violations, term permit waivers where the permit is waived back to the government, resource protection, or permit actions resulting in cancellation of the permit.

**Permit** — A special use authorization that provides permission, without conveying an interest in land, to occupy and use National Forest System land or facilities for specified purposes, and which is both revocable and terminable.

**Persistent woodlands** – Long-lived pinyon-juniper woodlands that typically have sparse understories and occur on poor substrates in the assessment area.

**Plan of Operation** - A Plan of Operation is required for all mining activity conducted under the General Mining Act of 1872, as amended, if the proposed operations will likely cause significant disturbance of surface resources. The Plan of Operation describes the type of operations proposed and how they would be conducted, the type and standard of existing and proposed roads or access routes, the means of transportation to be used, the period during which the proposed activity will take place, and measures to be taken to meet the requirements for environmental protection (36 CR 228.4).

**Prescribed fire** - Any fire ignited by management actions to meet specific objectives. A written, approved prescribed fire plan must exist and NEPA requirements, where applicable, must be met before ignition.

**Priority management areas** - Areas identified by the Forest Service, in coordination with respective state wildlife agencies, as having the highest conservation value to maintaining sustainable greater sage-grouse populations. These areas include breeding, late brood-rearing and winter concentration areas.

**Reclamation plans** – Plans that guide the suite of actions taken within an area affected by human disturbance, the outcome of which is intended to change the condition of the disturbed area to meet pre-determined objectives and/or make it acceptable for certain defined resources (e.g., wildlife habitat, grazing, ecosystem function, etc.).

**Residual impacts** - Impacts from an implementation-level decision that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Restoration** - Implementation of a set of actions that promotes plant community diversity and structure that allows plant communities to be more resilient to disturbance and invasive species over the long term. The long-term goal is to create functional, high quality habitat that is occupied by greater sage-grouse. Short-term goal may be to restore the landform, soils and hydrology and increase the percentage of preferred vegetation, seeding of desired species, or treatment of undesired species.

**Right-of-way** - Land authorized to be used or occupied for the construction, operation, maintenance, and termination of a project or facility passing over, upon, under or through such land.

**Road or trail** - A road or trail wholly or partly within or adjacent to and serving the National Forest System that the Forest Service determines is necessary for the protection, administration, and utilization of the National Forest System and the use and development of its resources.

**Sagebrush focal areas** – A subset of priority greater sage-grouse habitat, as identified by the U.S. Fish and Wildlife Service, which are considered most vital to the species persistence and therefore, have the strongest levels of protection.

**Soft triggers** - An intermediate threshold indicating that management changes are needed at the implementation level to address habitat or population losses.

**Special use authorization** - A written permit, term permit, lease, or easement that authorizes use or occupancy of National Forest System lands and specifies the terms and conditions under which the use or occupancy may occur.

**Stipulation (general)** - A term or condition in an agreement, contract, or written authorization.

**Stipulation (oil and gas)** - A provision that modifies standard oil and gas lease terms and conditions in order to protect other resource values or land uses and is attached to and made a part of the lease.

**Soft trigger** - An intermediate threshold indicating that management changes are needed at the implementation level to address habitat or population losses.

**Surface disturbing and disruptive activities** - Actions that alter the vegetation, surface/near surface soil resources, and/or surface geologic features, beyond natural site conditions and on a scale that affects other public land values. Examples of surface disturbing activities may include operation of heavy equipment to construct well pads, roads, pits and reservoirs; installation of pipelines and power lines; and the conduct of several types of vegetation treatments (e.g., prescribed fire, etc.). Surface disturbing activities may be either authorized or prohibited

**Surface use** - Activities that may be present on the surface or near-surface (e.g., pipelines) of public lands. When administered as a use restriction (e.g., no surface occupancy), this phrase prohibits all but specified resource uses and activities in a certain area to protect particular sensitive resource values and property. This designation typically applies to small acreage sensitive resource sites (e.g., plant community study enclosure, etc.), and/or administrative sites (e.g., government ware-yard, etc.) where only authorized, agency personnel are admitted.

**Tall structures** - A wide array of infrastructures (e.g., poles that support lights, telephone and electrical distribution, communication towers, meteorological towers, high-tension transmission towers, and wind turbines) that have the potential to disrupt lekking or nesting birds by creating new perching/nesting opportunities and/or decreasing the use of an area. A determination as to whether something is considered a tall structure would be based on local conditions such as vegetation or topography.

**Technically/economically feasible** - Actions that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant. It is the Forest Service's sole responsibility to determine what actions are technically and economically feasible. The Forest Service will consider whether implementation of the proposed action is likely given past and current practice and

technology; this consideration does not necessarily require a cost-benefit analysis or speculation about an applicant's costs and profit.

**Temporary special use permit** – A type of permit that terminates within 1 year or less after the approval date. All other provisions applicable to permits apply fully to temporary permits. Temporary special use permits are issued for seasonal or short-duration uses involving minimal improvement and investment.

**Term permit** – An authorization to occupy and use National Forest System land, other than rights-of-way for a specified period that is both revocable and compensable according to its terms.

**Timely** - The conservation benefits from compensatory mitigation accruing as early as possible or before impacts have begun.

**Transmission line** - An electrical utility line with a capacity greater than or equal to 100kV or a natural gas, hydrogen, or water pipeline greater than or equal to 24" in diameter.

**Travel management system** – Planned and authorized roads, trails, and areas for motor vehicle use on National Forest System lands that are managed in a controlled, sustained manner.

**Utility-scale and/or commercial energy development** – A project that is capable of producing 20 or more megawatts of electricity for distribution to customers through the electricity-transmission-grid system.

**Valid existing rights** - Documented, legal rights, or interests in the land, which allow a person or entity to use said land for a specific purpose and that are still in effect. Such rights include but are not limited to fee title ownership, mineral rights, and easements. Such rights may have been reserved, acquired, granted or otherwise authorized under various statutes of law.

**Vegetation treatments** - Management practices that are designed to maintain current vegetation structure or change the vegetation structure to a different stage of development. Vegetation treatment methods may include managed fire, prescribed fire, chemical, mechanical, and seeding.

**Viability** - For purposes of the National Forest Management Act and its enabling regulations, viability is the availability of habitat that allows a species to persist on landscapes for long-periods (multi-generational) of time. It assumes that populations are abundant (sufficient numbers) and well-distributed (sufficient redundancy of populations) to provide for long-term population persistence on a landscape.

**Waiver (oil and gas)** - Permanent exemption from a lease stipulation. The stipulation no longer applies anywhere within the leasehold.

**West Nile virus** - A virus that is found in temperate and tropical regions of the world and most commonly transmitted by mosquitoes. West Nile virus can cause flu-like symptoms in humans and can be lethal to birds, including greater sage-grouse.

**Wildfire suppression** - An appropriate management response to wildfire, or prescribed fire that results in curtailment of fire spread and eliminates all identified threats from the particular fire.

John,

The Preliminary habitat data utilized in the DRAFT EIS and posted to inside Idaho would be the two datasets in the links below. One for the Preliminary General Habitat and one for the Preliminary Priority Habitat.

Links to inside Idaho:

[Greater Sage-Grouse Preliminary General Habitat \(Version 2, April 2012\) for Idaho](#)[Greater Sage-Grouse Preliminary Priority Habitat \(Version 2, April 2012\) for Idaho](#)

These are the base habitat layers used in multiple analysis for differing alternatives within the draft. There are multiple alternatives, and multiple maps associated with those alternatives, so a more specific answer to your request would depend on more specific information related to the alternative in question and the maps and data associated with that alternative.

I have spoken with John Beck who will be returning to the office next week. I will meet with him then and determine if there are additional data associated with your specific request. If so, we will ensure we get those to you at that time, but in the interim, these are the base habitat layers posted to inside Idaho utilized in the DRAFT EIS effort.

Thank you,

jon

Mr. Norred -

As I mentioned on the telephone, we are searching for the GIS layers for the mapping associated with the Draft Sage Grouse EIS. In particular, I need the GIS layers that show the habitat designations in the Draft Sage Grouse EIS. Scott Pugrud and I met with John Beck yesterday and he indicated that you would be a good source of information regarding the GIS layer information.

Sean and Karl are my mapping experts, so I've included them in this email string. Please forward them the relevant information.

Sincerely,

**John**

**Subject:** RE: ACECs - Alt F

Meredith,

The Wild Earth Guardians alternative came with two, what we took to be, distinct ACEC nominations. The first was all areas identified as preliminary priority habitat. That was the easy one to delineate and includes all those BLM and Forest Service areas that contained PPH, preliminary priority habitat as described in the April 2012 refined mapping effort. These areas were also the preliminary priority areas described in Alternative B – the NTT Alternative. The second proposal was ‘a system of ACECs to protect sage-grouse’ – we took this to be a more refined delineation of the most important areas for the protection of critical sage-grouse habitats. Paul and Don initially worked with the key habitat map and other mapped seasonal habitats to delineate these areas. This was primarily areas on BLM lands since the more refined evaluation did not note any Forest Service areas meeting these criteria. We then met with each field office and district to further refine these areas and describe what habitats and values those areas provided for sage-grouse.

Both of these ACEC proposals were displayed in Alternative F as two sub-alternatives – an all PPH with both BLM and Forest Service Proposed ACECs and Zoological Areas respectively; and a system of ACECs that ended up being only BLM Proposed ACECs.

Hi Brent,

Can you provide any additional clarification on the two Alternative F sub-alternatives? Diane's explanation is a decent start, but I'm curious about more detail regarding Option B.

Thanks,

Meredith

**Subject:** Re: ACECs - Alt F

There is a huge difference in the areas of the ACECs in the two proposals for Alternative F. I wonder if Brent has a more complete description of these. From the metadata

Alternative F has 2 variations: A is the "all preliminary priority habitat (PPH)" variation and B is the "extensive system of proposed ACECs". Because Options A and B overlap in some places acreage calculations using the original source data will result in inflated acreages! This feature class does not have overlapping polygons within itself, and names of ACECs and Zoological Areas are correct for Option A. Option B can be thought of as a subset of Option A (it adds no new areas,) but names and labels are sometimes different than Option A.

Hi Jon and Diane,

I'm revising the description of ACECs under Alternative F in the EIS, but I don't actually know what the two sub-alternatives are! Can either of you explain them to me? In the DEIS, this is the description that we had, though the acres in the updated Table 2-2 show a fairly large difference between F1 and F2:

"Under Alternative F, BLM would designate 17 or 18 new ACECs and the Forest Service would designate 12 new Zoological Areas."

On the maps in the ACEC appendix, it appears that one designates all PPH as an ACEC, and the other has fewer acres as ACECs, but I did not see 12 Zoological Areas listed in the key.

Thoughts?

Thanks,

Meredith

## GRSG Implementation and Coordination

The BLM, Forest Service, US Fish and Wildlife Service and the State of Idaho have coordinated on GRSG monitoring and management for numerous years as part of the 2006 Idaho Sage Grouse Conservation Plan. Much of this ongoing work provides a firm foundation from which to build future coordination efforts, especially in regard to implementation of the GRSG RMP Amendment. With some specific adjustments and additional inclusions in those efforts the effective implementation of the GRSG RMP Amendment can be achieved.

There are several decisions, or components of decisions that would benefit from close coordination between the State of Idaho, BLM, Forest Service and the US Fish and Wildlife Service. These include: application and assessment of the adaptive management strategy; application of the right-of-way screening process; and development and implementation of any potential project mitigation efforts.

Figure 1 describes a conceptual relationship between the agencies for coordination and project evaluation/implementation.

**Figure 1 – Conceptual Relationship Between Agencies**

For description an example project proposal will be tracked through the consideration and evaluation process.

### **I. Project Proposal is Initially Screened by BLM or Forest Service**

This initial screened would evaluate whether the proposal conforms to the land use plan allocation decisions (Open, Open with Limitations, Closed). The BLM/Forest Service Field Office or Ranger District would work in coordination with the State or Supervisor's Office to evaluate this conformance.

For BLM if the proposal is not in conformance then a non-conformance letter from the State Director would be sent to the project proponent and the project would not be considered further.

If the project were found to conform to the land use plan allocations then consideration would continue.

### **II. Project Proposal would be Coordinated with State and USFWS**

The State Implementation Task Force (set up through Idaho Executive Order) would convene to apply the right-of-way screening process to the proposal, informed by GRSG population monitoring accomplished by IDF&G. This evaluation would be vetted through the Governor's Office and a recommendation from the Governor would be provided to the BLM/Forest Service.

The BLM and/or Forest Service would work with local offices to apply the right-of-way screening process to the proposal, informed by the disturbance level (cap), and habitat conditions (amount).

The BLM/Forest Service decision maker would utilize the information from internal review and State recommendations to determine whether the project conforms to all land use plan guidance and whether to consider the project further.

For BLM if the proposal is not in conformance then a non-conformance letter from the State Director would be sent to the project proponent and the project would not be considered further.

If the project were found to conform to the land use plan guidance then consideration would continue.

### **III. BLM and/or Forest Service would Initiate Project NEPA**

The NEPA analysis would be developed by the local unit office in full consideration of local habitat conditions. This process would describe alternatives to the proposal that would reduce or eliminate impacts and full identify residual impacts to GRSG.

### **IV. Share Residual Impacts with the State of Idaho and USFWS**

The State Implementation Task Force would consider the residual impacts and work to develop an appropriate mitigation package to be included within analysis of the project proposal. This Governor would recommend to BLM the inclusion of the mitigation package within the project proposal.

### **V. BLM Incorporates and Analyzes Mitigation in NEPA Evaluation**

### **VI. State of Idaho would Administer Mitigation Consistent with the Mitigation Strategy**

As part of the implementation of the GRSG RMP Amendment the BLM and Forest Service will work cooperatively with the State to develop a Mitigation Strategy. Part of this strategy will define the operating procedures such as credits, banking, funding process, etc. This component is likely to strongly involve State oversight, with the specifics remaining to be determined.

### **VII. Mitigation is Implemented**

Carman, Stephanie &lt;scarman@blm.gov&gt;

Mon, May 4, 2015 at 8:30 AM

To: Joan Suther <jsuther@blm.gov>, Lauren Mermejo <lmermejo@blm.gov>, Jonathan Beck <jmbeck@blm.gov>, Quincy Bahr <qfbahr@blm.gov>, Pamela Murdock <pmurdock@blm.gov>, "Carlson, John C" <jccarls@blm.gov>, Erin Jones <erjones@blm.gov>, Bridget Clayton <bclayton@blm.gov>

Cc: Michael Hildner <mhildner@blm.gov>, Matthew Magaletti <mmagalet@blm.gov>, Vicki Herren <vherren@blm.gov>, Kimberly Hackett <khackett@blm.gov>, David Batts <david.batts@empis.com>, Richard Mayberry <rmayberr@blm.gov>

As you may have heard, we are changing the drop in language referencing grass banks as an example. Please use the below language instead in the grazing section:

- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fire breaks.*

A reserve common allotment is an area which is designated in the land use plan as available for livestock grazing but reserved as an area available for use as an alternative to grazing in another allotment in order to facilitate rangeland restoration treatments and recovery from natural disturbances such as drought or wildfire. The reserve common allotment would provide needed flexibility that would help the agency apply temporary rest from grazing where vegetation treatments and/or management would be most effective.

## high voltage transmission line drop-in

1 message

Hildner, Michael <mhildner@blm.gov>  
To: Jonathan Beck <jmbeck@blm.gov>  
Cc: Lauren Mermejo <lmermejo@blm.gov>

Mon, Feb 9, 2015 at 12:39 PM

Hi Jon,

Thanks for bringing that error to my attention. The correct guidance is below. I've also updated the WO files, so it has the right guidance:

For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that are co-located), apply the following language as a management action in their ADPP:

“Priority Habitat Management Areas (PHMAs) and **Important Habitat Management Areas (IHMAs)** are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzingGRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservations measures.”

Hi Folks –

Every two weeks the State Directors involved in the GRSG National Planning Strategy, Ed Roberson, Jessica Rubado, Johanna and myself engage in a conference call to make decisions on issues that have come forward at a national scale. The attached documents are instructional guidance that have been approved by the State Directors to be carried forward into the planning efforts.

GRSG3 is the Chapter 2 Outline that I e-mailed to you all earlier this week.

GRSG4 is made up of two documents: One on how the Alternatives, Drafts, and Finals will proceed thru reviews from the Regional Management Teams; and the other on how they will proceed thru reviews at the Washington Office (with time-lines).

GRSG8 is an overview of the Cumulative Effects Strategy (Environmental Baseline Report, Timeline and Schedules, Related Technical Supports; CEA Collaboration and Communication, and the Way Forward).

In addition, earlier in May, the SDs agreed that a no grazing alternative will be considered (either fully analyzed or as an alternative considered but eliminated from detailed analysis) in the sub-regional EISs.

As the conference calls occur and issues are resolved, I will be forwarding the issue papers (instructional guidance) or verbal decisions that are agreed upon.

This afternoon's conference call will focus on ACECs guidance; NTT language (applicable and appropriate); and forming a Team to develop consistent language for a variety of topics. I will let you know of the outcome and send forward the issue papers or final outcomes when we have State Director concurrence on those subjects.

If you have any questions, please give me a call.

## GRSG3 – DD: May 7, 2012

### Recommended Chapter 2 Outline Focused on New Greater Sage-Grouse Amendments

(Great Basin and Rocky Mountain Region)

5/2/12

#### Proposed Outline and Alternatives:

Chapter 2 Outline:

1. General Description of each Alternative
2. Management Common to All Action Alternatives
3. No-Action Alternative – Roll-up of management actions that specifically protect Greater Sage-Grouse in existing Land Use Plans into a sub-regional perspective
4. Action Alternatives
  - Alternative 1: State Wildlife Agency/BLM/FS Maps with management from NTT Report applied to PPH and PGH. This would be based off of the initial (or updated) map used for scoping. Any management recommendation from the NTT that would not apply should be clearly described with rationale...such as: “No management actions from the NTT concerning wild horse and burros are carried forward because there are no wild horses or burros in the sub-regional effort.”
  - Alternative 2: Conservation Groups-based Alternative. At a minimum, apply NTT Report management with extended boundaries (PPH/PGH/Connectivity habitat) and more stringent management. May apply ACEC/Special Management Area proposals. This potential alternative is currently being flushed out in Draft by EMPSi based on scoping comments, and will be shared with the “group” within the next few weeks.
  - Alternative 3: Sub-regional adjustments to NTT Report Alternative with BLM/FS map adjustments for PPH and PGH. Make changes to the recommendations from the NTT Report and adjust habitat boundaries based on science, resource trade-offs, scoping comments, and internal staff expertise.
  - Alternative 4: Governor’s State proposals
  - Alternative 5 (optional): Additional alternative(s) There may be sub-regional alternatives that do not apply to other sub-regional efforts that were brought forward from scoping. We do not need to maintain consistency from this perspective....there is some autonomy associated with each of these efforts....and if you need to create another alternative outside of the current range to respond to scoping comments, that is perfectly acceptable.
5. Alternatives Considered but Eliminated from Detailed Analysis
6. Tables
  - Comparison of Alternatives Tables
  - Comparison of Impacts Tables
  - Comparison of Alleviated Threats Tables

#### **Greater Sage-Grouse Goal (common to all)**

*Conserve, enhance, and restore the sagebrush ecosystem upon which Greater Sage-Grouse populations depend in an effort to maintain and/or increase their abundance and distribution, in cooperation with other conservation partners.*

#### **Greater Sage-Grouse Objectives**

*Protect priority Greater Sage-Grouse habitats from disturbances that will reduce distributions or abundance of Greater Sage-Grouse..... (see NTT objectives or others)...**will change by alternative.** We*

will need to work on some consistency in objective statements across those alternatives that are closely related by sub-region....such as Alternative 1 and 2.

**Outline for RESOURCE DECISIONS for Greater Sage-Grouse** Note: All of the Headings in Chapter 2 and proposed decisions come out of the NTT Report – so, in at least one alternative, these headings should show up with proposed management decisions or allocations. Based on scoping comments, other resources may apply.

**Lands and Realty** (Addresses threats/issues associated with infrastructure [power lines, communication towers, railroads, etc.]; urbanization; renewable energy development; transmission corridors; habitat conversion to agriculture; and locatable mineral development)

Among others, includes decisions (regulatory mechanisms) for:

- Rights-of-way;
- Land tenure adjustments;
- Utility corridor designation;
- Proposed mineral withdrawals.

**Vegetation** (Addresses threats/issues associated with Pinyon-juniper encroachment; invasive plants (annual grasses and other noxious weeds); riparian areas; and habitat restoration activities.)

Among others, includes decisions (regulatory mechanisms) for:

- Vegetation treatments;
- Prescribed fire;
- Control/suppression and eradication of invasive species;
- Allowable uses or active management/treatment;
- Riparian areas;
- Habitat restoration activities.

**Wildland Fire** (Addresses threats/issues associated with wildfire suppression, fuels management, and fire rehabilitation.)

Among others, includes decisions (regulatory mechanisms) for:

- Fire management strategies and areas identified for suppression;
- Fire suppression activities and ESR activities.

## **Minerals**

**Leasable Minerals** (Addresses threats/issues with oil and gas leasing and development; geothermal leasing and development; non-energy leasable minerals; - and all associated infrastructure.)

Among others, includes decisions (regulatory mechanisms) for:

- New leases: Areas open/closed to leasing; open with NSO, CSI, TL stipulations;
- Existing leases: Mitigation/BMPs;
- Leasable mineral development on Split-estate lands.

**Coal** (Addresses threats/issues from coal mining and infrastructure.)

Among others, includes decisions (regulatory mechanisms) for:

- Coal leasing and development;
- Existing leases: Mitigation/BMPs.

**Locatable Minerals** (Addresses threats/issues from hard rock mining and infrastructure.)

Among others, includes decisions (regulatory mechanisms) for:

Existing claims and development: Mitigation/BMPs;  
Proposed withdrawals – tied to lands and realty actions (but defines the areas).

**Saleable Minerals** (Addresses threats/issues from saleable mineral development.)

Among others, includes decisions (regulatory mechanisms) for:

Saleable minerals (open or closed);  
Reclamation.

**Travel Management** (Addresses threats/issues associated with motorized access and route networks.)

Among others, includes decisions (regulatory mechanisms) for:

Areas open, closed, or limited to OHV use.  
Implementation-level Travel Plans.

**Recreation** (Addresses threats/issues associated with excessive and focused recreational activities.)

Among others, includes decisions (regulatory mechanisms) for:

Special Recreation Permitting.

**Range Management** (Addresses threats/issues associated with livestock fences; grazing systems; range improvements; season of use; stocking rates.)

Among others, includes decisions (regulatory mechanisms) for:

Completing land health assessments;  
Processing grazing permits;  
Implementing management actions after land health and habitat evaluations;  
Treatments to increase forage for livestock or wild ungulates;  
Structural range improvements and livestock management tools;  
Retirement of grazing privileges.

**Wild Horse and Burro Management** (Addresses threats/issues associated with impacted habitats and increase of exotic plant species – especially during drought.)

Among others, includes decisions (regulatory mechanisms) for:

Appropriate management levels;  
Prioritizing gathers;  
Incorporating habitat objectives and management considerations in all HMAs;  
Land health assessments and structural range improvements.

**Special Designations** (Addresses threats/issues associated with additional special management needed to protect/preserve Greater Sage-Grouse and habitat)

Among others, includes decisions (regulatory mechanisms) for:

Designating Areas of Critical Environmental Concern.

**Other Specific Resources tied threats/issues by Sub-region from scoping or internal expertise.....**

## GRSG4 – DD: May 18, 2012

### FINAL DRAFT (5/3/12)

## Greater Sage-Grouse (GRSG) Regional Management Team Coordination and Review Protocol

### Step 1: Initiate Draft Review – Field/District/State or Sub-regional Office

Conduct an overall review of GRSG plan amendments and/or revisions to evaluate the range of alternatives, Draft RMP, Proposed RMP, and associated NEPA analysis, for compliance with Federal law and policy, including the National BLM Greater Sage Grouse Strategy and recent policy and guidance issued to implement the strategy, including conservation measures identified in the National Technical Team (NTT) Report, and to ensure incorporation of explicit objectives and desired habitat conditions, management actions, and area-wide use restrictions necessary to conserve Greater Sage-Grouse and its habitat. The review process should include:

- Preparing an NTT Conservation Measures Review Table comparing NTT Conservation Measures with existing or proposed conservation measures for each Program Area.
- Identifying which proposed conservation measures deviate from the NTT conservation measures, and providing clear justification or substantiation for the deviation.
- [For Proposed plan amendments and/or revisions only] Preparing a logical and legally supportable rationale and biological substantiation for the Preferred Alternative.

This documentation and Regional review will be required at the following stages of the planning process:

- When the range of alternatives are identified (for new amendments)\*
- Administrative Draft RMP/Draft EIS (before sending back to WO for review)
- Administrative Proposed RMP/Final EIS (before sending back to WO for review)

\*Ongoing Draft and Proposed plan amendments and/or revisions will be initially reviewed for adequacy of alternatives during the Draft or Proposed plan amendment and/or revision review.

The Field/District/State or Sub-regional documentation of this review must be extremely detailed, provide a logical and legally supportable rationale for the determination, and any necessary record support for such rationale. This documentation will suffice as the administrative record for potential litigation and subsequent internal BLM administrative review. If the initial plan revision/amendment is in compliance with Federal law and policy, including BLM IM 2012-044, the planning team will brief the findings to the State Director for RMP approval. Any lack of compliance with Federal law or policy will be addressed prior to State Director submittal to the Regional Project Manager.

### Step 2: Forward Approved RMP Determination/Documentation to Regional Inter-disciplinary (ID) Team through Regional Project Manager

If the affected State Director is satisfied with the outcome of the initial review and findings set forth in Step 1, above, he/she will concur with the findings, and forward them to the Regional Project Manager (PM) via an internal memo.

When GRSG plan amendments and/or revisions are received by the Regional PM, she will convene select members of the Regional ID Team and ad-hoc members, as needed, for a Regional RMP review. At a minimum, review members will include:

- State Project Planning Lead,
- Regional PM,
- Regional PM from the other region,
- Appropriate State Wildlife Agency or other designated representative(s), and
- Regionally assigned USFWS representative(s).

In addition, ad-hoc members may include:

- WO Planning representative,
- WO sage-grouse lead,
- Regionally-assigned USFS representative,
- Regionally-assigned WO Solicitor,
- BLM Management Representatives from other states (other than the State that has completed the initial consistency review), and
- Sub-regional ID Team Leads.

Once the review is completed, and if there is unanimous agreement (not consensus agreement) among the reviewers that the amendment and/or revision is in compliance with Federal law and policy, including BLM IM 2012-044, then the Regional PM will document this finding in a Memorandum for the File (administrative record) with the signatures of each of the reviewers (including the USFWS).

If there is not unanimous agreement, those items requiring further consideration should be consolidated into a briefing paper for the Regional Management Team. However, if the planning effort is in an early stage in the planning process and the issues brought forth can be corrected by making some essential changes (in wording, decisions, or analysis), the Regional PM will discuss directly with the Regional Management Team Leads, USFWS representative, and the affected State Director in an effort to timely resolve the issues. Once agreement is reached, the USFWS will be requested to provide a letter of support.

### **Step 3: Brief the Findings to the Regional Management Team**

The Regional PM will brief the findings of the review to a core group of the Regional Management Team including the State Director Leads from both regions, representatives from the USFWS, State Game and Fish and/or Governor's Office, Forest Service, and other ad-hoc members as appropriate.

The appropriate Regional Management Team State Director will brief and apprise the Management Team of specific items requiring further consideration. If the Regional Management Team also determines that certain elements of the RMP amendments and/or revisions (including range of alternatives, Draft RMP, Proposed RMP, and associated NEPA analysis) are not in compliance with Federal law and policy, including BLM IM 2012-044, they will provide recommendations to the State Director.

### **Step 4: WO Review and Approval**

The RMP amendments and/or revisions (including range of alternatives, Draft RMP, Proposed RMP, and associated NEPA analysis) forwarded to the WO for final approval prior to printing or FRN release will

include an appropriate briefing package for the Director including a transmittal memo that outlines the state, sub-regional and regional coordination and review process and findings, relevant background information, and any issues, anomalies, or unresolved issues. The Regional ID Team concurrence signature page should also be attached to the memo.

For more information on the WO review framework, see WO Information Memorandum dated \_\_\_\_\_ from Ed Roberson.

**GRSG4 – DD: May 18, 2012**

**Information Memorandum**

**To:** Rocky Mountain and Great Basin Regional Management Teams

**From:** Ed Roberson, Assistant Director, Renewable Resources and Planning

**Date:** INSERT

**Re:** Greater Sage-Grouse review framework and land use planning guidance

This memo provides a review framework for the regional Greater Sage-Grouse Resource Management Plan (RMP) Amendment Environmental Impact Statements (EISs) along with ongoing RMP amendments and/or revisions within Greater Sage-Grouse habitat that will be considering the conservation measures identified in the Sage-Grouse National Technical Team (NTT) Report. It also provides additional guidance on a number of Greater Sage-Grouse planning issues.

**Responsibilities**

The BLM National Greater Sage-Grouse Planning Strategy Charter established teams at various levels throughout the BLM, and also set out the teams' membership, roles and responsibilities. For the purposes of the NTT review process, each team identified in the charter was given a specific role. The National Policy Team (NPT) was charged with overseeing the development of consistent regulatory mechanisms across the range of the Greater Sage-Grouse. The Regional Management Teams (RMTs) were charged with facilitating partner engagement in the BLM planning process and fostering broad collaboration for Greater Sage-Grouse conservation; evaluating the adequacy of current RMPs and ongoing amendments and/or revisions to determine the level of revision or amendment needed; and providing direction for consistent Purpose and Need statements and range of alternatives. The Regional and Sub-regional IDTs were charged with incorporating the conservation measures into the alternatives and ensuring consistent application.

**Planning Strategy Instruction Memorandum (No. 2012-044)**

The Planning Strategy IM provided specific direction to the BLM on how to consider the conservation measures contained in the NTT Report during the land use planning process. Specifically, the conservation measures must be considered and analyzed, as appropriate, into at least one alternative in the land use planning process. Thus, each Sub-regional Interdisciplinary Planning Team (Sub-regional IDT) must demonstrate that the conservation measures are subjected to a hard look analysis as part of the planning and National Environmental Policy Act (NEPA) process.

## *INTERNAL WORKING DOCUMENT*

To demonstrate this hard look analysis, each Sub-regional IDT needs to document the process they went through in considering the conservation measures. This documentation can be accomplished in a variety of ways, but should include at a minimum the following:

- Administrative Draft RMPs/Draft EISs
  - NTT Conservation Measure review table which identifies which measures were included in the alternatives along with other proposed conservation measures that were not identified in the NTT report.
  - The table should include explanations, with supporting rationale, when the proposed conservation measures deviate from the NTT report, or when specific conservation measures are not considered.
- Administrative Proposed RMPs/Final EISs:
  - A logical and legally supportable rationale and biological substantiation for the Preferred Alternative.

This table will need to be included with the internal review planning documents submitted to the BLM Washington Office (WO).

### **Regional Management Team Coordination and Review Protocol**

To implement these responsibilities, the RMT is developing a review and approval protocol for evaluating the Greater Sage-Grouse RMP Amendment EISs and ongoing RMP amendments and/or revisions within Greater Sage-Grouse habitat to determine if they meet the intent of the NTT Report and are in conformance with the requirements of IM No. 2012-044. The U.S. Fish and Wildlife Service (FWS), U.S. Forest Service (FS), and State Fish and Game Agencies, are members on the RMTs and Sub-regional IDTs. Before any Greater Sage-Grouse RMP Amendment EISs or ongoing RMP amendments and/or revisions within Greater Sage-Grouse habitat are sent to the WO for formal review, the RMT review process must be able to document whether the FWS agrees that the planning document meets the intent of the NTT Report and is consistent with the requirements of WO IM No. 2012-044. This documentation will be required at the following stages of the planning process:

- Administrative Draft RMP/Draft EIS (before sending back to WO for review)
- Administrative Proposed RMP/Final EIS (before sending back to WO for review)

Once the planning documents meet these requirements, they can be transmitted to the WO for formal review.

For more information on the RMT Review Protocol, see (CITE TO JOHANNA'S MEMO)

### **Washington Office Sage Grouse Planning Review Team**

The WO has established a Greater Sage-Grouse Planning Review Team that will be charged with reviewing all Greater Sage-Grouse RMP Amendment EISs and all ongoing RMP amendments and/or revisions within Greater Sage-Grouse habitat. This team will include representation from each of the following resource programs:

- Planning and NEPA

*INTERNAL WORKING DOCUMENT*

- Range Management
- Wildlife
- Fluid Minerals
- Solid Minerals
- Lands and Realty
- Travel and Transportation
- Recreation
- Wild Horses and Burros
- Fire Management
- WO Solicitors Office

The Greater Sage-Grouse Planning Review Team will be tasked with reviewing the Greater Sage-Grouse RMP Amendment EISs and the relevant Greater Sage-Grouse sections of the ongoing RMP amendments and/or revisions to ensure that applicable conservation measures have been considered, as per the requirements the NTT Report and IM No. 2012-044. As specified earlier, a NTT conservation measure table must be included as part of each review to explain how conservation measures were addressed/incorporated.

For the Greater Sage-Grouse RMP Amendment EISs, the WO Planning review must occur at the following stages of RMP development. The Greater Sage-Grouse Planning Review Team will complete its review within the following timeframes:

- Upon completion of a draft range of alternatives – 1 week
- Administrative Draft RMP/Draft EIS – 2 weeks
- Administrative Proposed RMP/Final EIS – 2 weeks

For plans currently undergoing amendment and/or revision in Greater Sage-Grouse habitat, the Greater Sage-Grouse Planning Review Team will review the applicable Greater Sage-Grouse sections as per the normal WO RMP review process. However, the timeframes associated with the reviews will be expedited from the normal 3 week review period to the following:

- Administrative Draft EIS – 2 weeks
- Administrative Final EIS – 2 weeks

Upon completion of the each review period, the Greater Sage-Grouse Planning Review Team will provide a briefing/summary to the NPT.

**GRSG8 – DD: May 18, 2012**

**Concept of Operations  
for BLM’s Greater Sage-Grouse Baseline Report  
and Cumulative Effects Analyses**

This Concept of Operations is the approach for implementing both the “BLM’s Greater Sage-Grouse Unifying Cumulative Effects Strategy” issued in November 2011 and addressing related technical questions for measuring condition and trend over time. The goal of Cumulative Effects Strategy is to provide a framework and methodology for conducting cumulative effects analyses as part of the greater sage-grouse planning initiative, and in particular provide consistency at multiple spatial scales. As a principle component of the cumulative effects effort, the Environmental Baseline Report will set a baseline for the resources that will address cumulative effects at planning unit, sub-regional, and regional levels. The Baseline report should be incorporated into related NEPA analyses by reference. The purpose of the Cumulative Effects Analysis Concept of Operations (CEACO) is to describe roles for “how” work will get done and expectations for collaboration and communication with others.

**A. Environmental Baseline Report**

In response to the FWS 2010 Listing Decision, the Baseline Report and Cumulative Effects Framework will focus on the quantity and distribution of:

1. Habitat (Priority and General)
2. Habitat Threats
3. Habitat Protections

And at three different scales:

1. Range-wide
2. Regions
3. Sub-regions

The environmental baseline report is a critical initial step for consolidating information useful the regional, subregional and planning unit team products. The following identifies milestone steps and dates related to the CEA effort.

**B. Timeline and schedules**

- |   |                     |
|---|---------------------|
| • Complete the IGO with USGS                          | April 11, 2012      |
| • Develop draft environmental baseline report outline | April 13, 2012      |
| • Final Baseline report outline                       | April 30, 2012      |
| • Final analyses (habitat/protection/threats)         | June 29, 2012       |
| • Draft Baseline report                               | July 27, 2012       |
| • Final Baseline report                               | September 14, 2012* |

*\*Note that the final is a deliverable date; however, the planning teams should have access to preliminary analyses, results and references by late July 2012.*

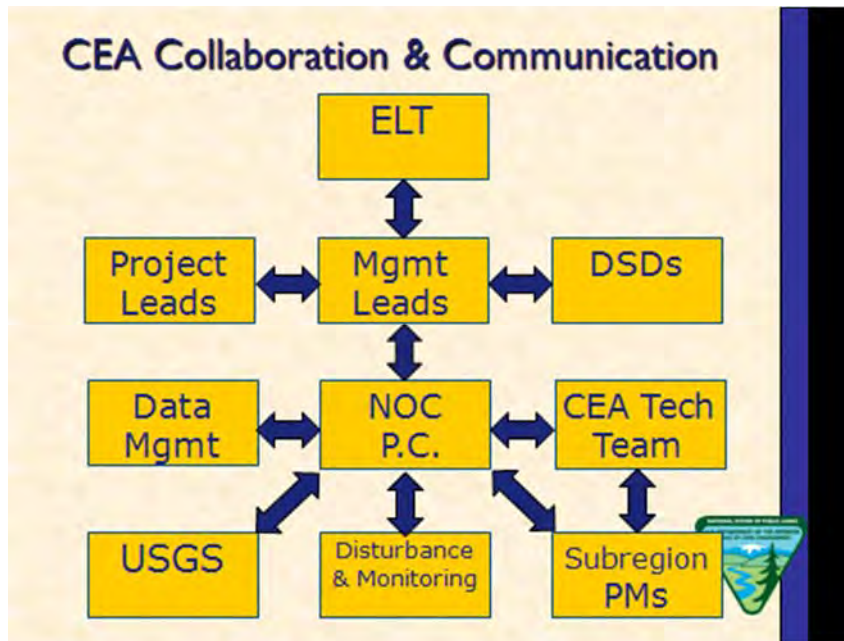

### **C. Related Technical Support**

In addition to the immediate tasks associated with the Baseline describing current cumulative impacts, related technical support is needed to clarify the framework for analyzing alternatives, and developing recommendations for incorporating a reliable measure for potential cumulative effects of the future. This includes both direct disturbance and habitat condition at multiple scales.

The hierarchy of technical support described in the following section will also provide expertise on parallel efforts such as:

- 1) Support for CEA framework
  - Compilation of additional data supplemental to the framework
  - Gather alternative data from teams for consistency checks
  - Provide supplemental analyses of alternatives to subregional teams and EMPSi
  - Support subregional team reporting
- 2) Measuring disturbance
  - Definition
  - Available methodologies
- 3) Monitoring
  - Evaluate key ecosystem attributes and core indicators from AIM for applicability for sage grouse
  - Make recommendations for a solid foundation upon which Greater Sage-Grouse habitat cumulative effects can be assessed over time

### **D. CEA Collaboration and Communication**

- **Executive Leadership:** The Management Leads for the CEA effort report to the BLM members of the National Policy Team.
  - Ed Roberson, Amy Lueders, and Don Simpson.
- **Management Leads:** A DSD and NOC DRS Division Chief will oversee direction of the CEA efforts
  - Theresa Hanley and Roxanne Falise.
- **Program/Project Leads:** Principle leaders for the national programmatic effort and the Great Basin/Rocky Mountain Regional Teams.
  - Members: Joe Stout, Jessica Rubado, Lauren Mermejo, and Johanna Munson.
- **NOC Project Coordination:** Staff responsible for execution and delivery of national CEA efforts, including delivery of the Baseline Report. These individuals work in partnership with USGS Fort Collins Science Center who is responsible for developing and issuing the Baseline Report via an interagency agreement. Additionally, oversees and directs priorities for related work of the NOC Wildlife Habitat Spatial Analysis Lab.
  - Frank Quamen, David Wood, Jim Wood, TBD Data Administer, and NOC Wildlife Habitat Spatial Analysis Lab
- **CEA Technical Team:** These individuals are considered experts in their fields and were responsible for developing the Strategy referenced above. This team may continue to advise on developing analytical products, review of deliverables and integration of products into the regional planning processes.
  - Members: Tom Rinkes, Chris Keefe, Robin Sell, Brian Amme, Doug Havlina, Dave Goodman, Patrick Mahoney, Frank Quamen, David Wood, Ben Kniola, Mike Pellant, Jeff Rose (BLM); Glen Stein, Chris Colt, Dustin Bambrough, Pam Bode (USFS). Additional subject matter experts will be added as needed.
- **Data Management Team:** This team works with overall GSG strategy data management hierarchy in order to advise on direction related to data acquisition and sharing.
  - Members: Duane Dippon, Steve Gregonis, Shawn Servoss, Russ Jackson, Frank Quamen, Lara Juliusson, Ben Kniola, Brian Mueller, Patrick Mahoney, and SO GIS Program Leads.

- **Disturbance Monitoring Team:** This team proposes defensible methods and helps ensure an acceptable level of consistency for analyzing disturbances to habitat caused by land uses.
  - Members: Frank Quamen, David Wood, Chris Keefe, Jason Taylor, and Matt Bobo.
- **USGS:** A team of USGS scientists are working in partnership with BLM to provide additional science support, peer review and products.

#### **E. A Potential Way Forward:**

The conceptual models, key ecosystem attributes, and core indicators and methods from the BLM Assessment, Inventory, and Monitoring (AIM) Strategy provide a structured, defensible framework to describe the condition, trend, amount, location, and pattern of habitats managed by the BLM. Specifically the key ecosystem attributes (biological integrity, site and soil stability, hydrologic function, and landscape integrity) and their associated indicators of habitat quality, provide a solid foundation upon which Greater Sage-Grouse habitat (and simultaneously, other habitat) cumulative effects can be assessed on lands managed by the BLM. Collection of these AIM-based monitoring data west-wide has just begun; and therefore; these data can currently provide only a low-precision, broad-scale measure of rangeland health. That said, the framework upon which AIM is built may serve as a model for how we can measure cumulative effects now, and how to reliably measure and document potential cumulative effects of the future.

**Subject:** GrSG Key Issue Paper and Agenda for Monday

Dear Sage-grouse SDs, Mike and Ron,

I am getting ready to go home for the day and wanted to send you the agenda and some more reading material for our discussions on Monday.

Joe sent you out three papers yesterday for your review. I have attached a paper that includes the 12 key remaining issues that were discussed last week in our meeting with the states representatives in Denver. The paper highlights each issue and provides either the direction we will proceed with or recommendations for discussion and decision. The paper also has 5 attachments including: a Disturbance white paper, GrSG Land use plan objectives guidance, guidance for incorporating GrSG RMP decisions into grazing authorizations, an updated draft planning schedule, and a paper on the roles and responsibilities for a GrSG strike team process with steps to get us to the ROD. The discussion in the morning will help us prepare for the afternoon meeting.

As the first agenda shows, we will discuss these on Monday morning between 9 and 12. Then we will go to lunch and meet up with Sarah, Jim and Bret. The afternoon provide time for Sarah and Jim to discuss the status of the one-on-one meetings with the states; to share with Sarah, Jim and Bret where BLM is with the 12 remaining key issues; and to have a discussion about next steps. This is where we will discuss the planning schedule, strike teams, our approach on the input into the conservation efforts data base and stakeholder outreach.

Hopefully Sarah, Jim and Bret will be able to hang around for dinner and some social time with our ELT members before returning to DC. But that is not the end of our fun GrSG day. Amy and I want to meet with you all again after dinner for a discussion related to Plan Implementation. Our resources DSDs met a few weeks ago on this and we need to discuss some key aspect of implementation and begin to make some key decisions about approaches. On Monday morning we will hand out some information developed by the DSDs to help us focus our discussion on what the plan implementation workload will be and to help us discuss how to organize it. I know that you all will be tired at the end of the day. Unfortunately there's no rest in sight for a while. Monday will help us insure we are all in alignment and on the page as we move to completion of our proposed plans, then to the signing of the RODs and finally to implementing the plans effectively across the range.

Thank you all for all you and your teams have done to date. See you Monday. ed

GREATER SAGE GROUSE MEETING  
NATIONAL CONSERVATION TRAINING CENTER  
SHEPHERDSTOWN, WV  
OCTOBER 20, 2014  
BLM/DOI Coordination  
1:00pm – 5:00pm

Meeting objective : To discuss BLM's approach on the remaining GRSG key issues and reach agreement on a path forward and next steps.

October 17, 2014

## GRSG Planning - Key Remaining Issues

- Issue: Disturbance  
Direction: Per the original April 2014 NPT guidance on disturbance, all states will use the 3% disturbance cap, with the exception of WY which is 5%. See [Attachment 1](#) for the appropriate scales, methodology for calculating disturbance, and recommended ADPP drop-in language.
- Issue: Mitigation  
Direction: 1) Consistent with the Mitigation Framework which is to be incorporated into all ADPPs as an appendix, the following language should also be incorporated as a proposed plan management action under Special Status Species (GRSG) (excluding Wyoming ADPPS):
- “A net conservation gain to the greater sage-grouse will be achieved by implementing restoration conservation actions outlined in this proposed plan [or amendment], applying a no net unmitigated loss standard for authorized land uses in all GRSG habitat [mention all areas that make up GRSG habitat: PHMA, GHMA, IHMA, and/or Core], and, strategically siting compensatory mitigation actions, via a WAFWA Management Zone Regional Mitigation Strategy as part of a mitigation program in order to achieve cumulative benefits (as outlined in [Appendix X]).”
- As defined in the Mitigation Framework Appendix – “No net unmitigated loss means that impacts from implementation level actions will fully offset to benefit the species. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”
- Issue: Adaptive Management (Highlighted Areas = other potential options/recommendations to consider)  
Recommendation: 1. Wyoming BLM: All remaining WY ADPPs will follow the NPT Adaptive Management guidance and sideboards (WY BLM has proposed Buffalo, Bighorn Basin, and the WY 9 Plan ADPPs to incorporate the Wyoming GRSG Adaptive Management Plan that has been developed by the BLM, FS, USFWS, and WGFD and is also being applied to the Lander planning area). BLM WY’s hard trigger response is provided below:
- “Upon determination that a hard trigger has been tripped, the BLM and FS will immediately defer issuance of permits for new actions with the potential to adversely affect Greater Sage-Grouse. Within 14 days of a determination that a hard trigger has been tripped, the Adaptive Management Working Group will convene and initiate an assessment to determine the causal factor or factors (hereafter called the causal factor

October 17, 2014

assessment). The management agency (BLM and/or FS) and adaptive management group will implement an interim response strategy to direct management until causal factors and appropriate responses can be determined. Recommendations of the adaptive management working group will be implemented immediately through the means most appropriate to the agencies in question. This may include cessation of activities or implementation of measures analyzed in this EIS, if supported by the best available science. The causal factor assessment will be completed within 180 days of initiation. Once the causal factor assessment is completed by the Adaptive Management Working Group, the interim response strategy will be modified appropriately. If a causal factor or factors cannot be identified, the interim response strategy shall stay in place until such time a long-term management or planning document can be implemented.”

2. Idaho BLM: will maintain the adaptive management strategy outlined in their DEIS, as a result of their three tiered habitat approach (PHMA, GHMA, and IHMA).

3. All other sub-regions are to follow the NPT Adaptive Management Guidance and Sideboards.

4. Inconsistencies related to varying adaptive management triggers and responses across jurisdictional boundaries will be resolved by the WAFWA Manage Zone Working Groups.

Issue: Vegetation Objectives

Direction: 1) Establish and incorporate vegetative objectives into all ADPPs that do not currently have them, following FS Table 2-6 (habitat objectives). See [Attachment 2](#) for specific guidance and table template.  
2) Vegetation objects that relate directly to Special Statuse Species (SS) should be in the SS section of the ADPP and pure vegetative objectives should be in the Vegetation section of the document.

Issue: Livestock Grazing Modifications

Direction: 1) The following should be included in the Livestock Grazing section of the ADPPs.

- The BLM will prioritize the modification of grazing permits within GRSG habitat. In setting priorities, areas not meeting land use plan vegetation objective and/or Land Health Standards will take precedence.
- The NEPA analysis for proposed modification of livestock grazing permits/leases will include a range of alternatives that allows the authorizing officer to make adjustments to livestock grazing

October 17, 2014

without conducting additional NEPA and issuance of a proposed/final grazing decision.

- Allotments within GRS habitat will be prioritized for annual review to ensure compliance with the terms and conditions within the grazing permits. When BLM conducts monitoring at a minimum, actual use, utilization, and use supervision data will be collected.

2) See [Attachment 3](#) as to how BLM will incorporate GSGR decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

Issue:

High-voltage Transmission and Major Pipeline ROWs and Corridors

Direction:

1) All sub-regions will apply the recommended NPT allocation guidance for PHMA and GHMA.

2) For sub-regions that have planned priority transmission lines that traverse their planning area (TransWest Express, Gateway South, Gateway West, and Boardman to Hemingway), they will apply the following language as a management action in your sub-regional ADPP:

“Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high voltage transmission line ROWs. All authorizations in these areas must comply with the RDFs and avoidance criteria presented in [\[insert citation here\]](#) of this document. The BLM is currently processing an application for [\[Insert name of transmission project\]](#) and the NEPA review for this project is well underway. This project will include GRS mitigation measures that the BLM is in the process of analyzing through the project’s NEPA review process, therefore these projects would not be subject to the following avoidance criteria and RDFs outlined in this document [\[list the criteria/RDFs\]](#).”

3) UT will not designate corridors (will use WY model, closing all of the PHMA in question except for the route of an existing powerline).

Issue:

Mineral Materials (Salable Minerals)

Direction:

The original NPT Allocation language related to mineral materials has been modified. The following management action should be applied to all ADPPs as follows:

“PHMAs will be closed to new mineral material sales. However, these areas would remain “open” to free use permits and the expansion of existing active pits, only if the following criteria is met:

- the activity is within the BSU and project area disturbance cap;

October 17, 2014

- the activity is subject to no net unmitigated loss;
- the activity applies all applicable required design features; and
- the activity clears the specific sub-regional screening criteria.”

With the exception of Wyoming ADPPs, all other sub-regions will adopt the above this modified NPT guidance language as a management action.

Issue: No Surface Occupancy (NSO) Exception and Modification Language  
Direction: Sub-regional ADPPs for both the Rocky Mountain and Great Basin will include the following NSO language into their ADPPs:

“A modification or exception may only be considered where the proposed action is determined to be in non-habitat, the area is not used by GRSG, and the proposed action would not have direct, indirect, or cumulative effects to GRSG or its habitat. The determination would be made by the BLM in consultation with a team of agency GRSG experts, including an expert from the state wildlife agency, USFWS, and BLM/FS. The State Director must have received a determination before approving any modification or exception. All modifications or exceptions must be approved by the State Director.

Issue: Fluid Mineral Resource Allocation (Including Geothermal)  
Direction: SMART from the START – All ADPPs will include the conservation objective for leasing and development outside of PHMAs, similar to what was included in the Lander ROD:

“In order to avoid surface-disturbing activities in PHMAs, priority will be given to leasing and development of oil and gas and other mineral resources outside of PHMAs, subject to applicable stipulations and valid existing rights. When analyzing leasing and authorizing development of oil and gas and other mineral resources in PHMAs, subject to applicable stipulations for the conservation of greater sage-grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for greater sage-grouse.”

Issue: Coal Suitability  
Direction: 1) ADPPs cannot "close" areas to coal leasing to protect Sage-grouse without going through the suitability process. The suitability determinations in the previous plan (existing management) – and any open/closed allocation decisions for coal leasing based on past determinations – would remain in place.  
2) Sub-regions will include a management action that states:

October 17, 2014

“At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the application area is “suitable” or “unsuitable” for coal leasing. During this process, portions of the application area may not be considered for leasing if leasing is proposed in PHMAs or GHMAs and is likely to have a direct, indirect, or cumulative effect on GRSG or its habitat .”

Issue: Mapping

Direction: 1) NV (in agreement with the State) will use the Coates map to redraw the PACs.  
2) UT will manage non-habitat (Opportunity Areas) as PHMA. All habitats in PACs will be managed as PHMA. Anthro and West Tavaputs will be managed as PHMA.

Issue: Buffers

Direction: Best available science – USGS is currently in the process of facilitating a literature review of the science associated with all buffers identified in the plans. This literature review will be followed by a peer review process. If a buffer distance is not supported by the best available science, this information will be considered in the relevant plan revision or amendment when undergoing WO strike team review.

Issue: Schedule

Direction: Final ADPP allocation data needs to be submitted to the NOC no later than October 31<sup>st</sup>.

For the full proposed GRSG Planning Schedule, see [Attachment 4](#).

Issue: GRSG Washington Office Strike Team

Direction: GRSG strike team will include a consistency review team that reviews the documents prior to Washington Office review/kick-off. This team will also participate in development of the Record of Decisions. See [Attachment 5](#) for GRSG Strike Team Roles and Responsibilities. The GRSG Washington Office Strike Team will:

- Ensure National Policy Team guidance and management direction is consistently incorporated into the GRSG Proposed Plans/Amendments
- Ensure that the Proposed Plans/Amendments include the appropriate conservation framework and objectives
- Ensure the plans collectively result in a cohesive federal land management conservation strategy for the GRSG
- Ensure consistency with the Record of Decisions

INTERNAL WORKING DOCUMENT – NOT FOR DISTRIBUTION  
October 17, 2014

Issue: Plan Consistency

Recommendation: 1) All ADPP amendments will use the Chapter 2 Template provided to the State Directors on October 1, 2014.  
2) The ADPP revisions will use a consistent approach for consolidating all related GRSG proposed management actions in one similar location in the ADPPs. WO-210, BLM Wyoming, and BLM Montana are in the process of developing this approach.

## Attachment 1 – Disturbance White Paper

### Greater Sage -Grouse (GRSG) Land Use Plan Disturbance Cap

#### Purpose

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER data in the land use plans and the use of the west-wide sagebrush availability and habitat degradation estimates for the Priority Habitat Management Areas in each population for management purposes as the LUPs are being implemented.

#### Guidance

- I. Planning units (except in Wyoming) will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. If the 3% anthropogenic disturbance cap is exceeded on all lands (regardless of ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.
  - b. If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to valid existing rights).
- II. Use of west-wide habitat degradation data well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use west-wide data at a minimum and/or locally collected disturbance data as available for the anthropogenic disturbance types listed in Table 1.
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 8 additional features that are

October 17, 2014

considered threats to sage-grouse (see below) using 1 meter resolution NAIP imagery. Use local data if available.

- b) Existing disturbance will be calculated in Wyoming using the Density and Disturbance Calculation Tool (DDCT). This tool along with the State of Wyoming's Core Area Strategy allows for the use of a 5% disturbance cap.
- IV. Fire-burned and habitat treatment areas will not be included in the project scale disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
- V. Planning units are directed to include a cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area.
- Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments))
- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the proposed plans/ FEISs. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.

Additional Information/Formulas

Disturbance Calculations for the BSUs and for the Project Analysis Areas:

- For the BSUs: % Disturbance = (combined acres of the 12 degradation threats\*) ÷ (acres of all lands within the PHMA s in a BSU) x 100.
- For the Project Analysis Area: % Disturbance = (combined acres of the 12 degradation threats \* plus the 8 site scale threats\*\*) ÷ (acres of all lands within the project analysis area) x 100.

\* see Table 3 \*\* see Table 2

Project analysis area method for permitting surface disturbance activities:

- Draw the project analysis area polygon which consists of a 4 mile buffer around the proposed project footprint plus areas intersected by any 4 mile buffers from nearby leks or mapped seasonal habitats.
- Digitize disturbances, include burned areas if deemed acceptable, from NAIP imagery or use locally available data.
- Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
- Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
- Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

Degradation Type	Subcategory	Data Source	Direct Area of Influence	Area Source

### Background

In the USFWS’s 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse’s habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

INTERNAL WORKING DOCUMENT – NOT FOR DISTRIBUTION  
October 17, 2014

- Measure 1: Sagebrush Availability (percent of sagebrush per unit area)
- Measure 2: Habitat Degradation (percent of human activity per unit area)
- Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 8 types of features that are threats to sage-grouse will be used in the project analysis areas.

Broad/Mid-Scale (Population)	Intermediate Scale (BSU)	Local/Project (Seasonal Habitat)
<b>Habitat Degradation</b>	<b>Habitat Degradation</b>	<b>Habitat Degradation</b>

## Attachment 2: Greater Sage-Grouse (GRSG) Land Use Plan Vegetation Objectives

### Greater Sage -Grouse (GRSG) Land Use Plan Vegetation Objectives

After reviewing the vegetation objectives from the current ADPPs and recognizing the wide variation between objectives in the plans, and due to the concern by the FWS about consistency across the land use plans, the following describes a process to gain consistent objectives across the range of sage-grouse while recognizing the unique ecological sites and vegetation characteristics in the planning areas.

#### Purpose

- I. Provide the planning units with template language for a land use planning vegetation objective to be incorporated into the administrative draft proposed plans (ADPP).
- II. Provide guidance on the use of a template for Greater Sage-Grouse (GRSG, sage-grouse) habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on the use of the vegetation and sage-grouse habitat objectives during land health assessments.

#### Background

Vegetation objectives from the current ADPPs have been reviewed and were found to have a wide variation among the plans. Some ADPPs contain vegetation and habitat objectives similar to the direction and template provided above. Some ADPPs contain measurable objectives based on mapped conditions within the planning area. Some ADPPs make a commitment to develop specific objectives through the NEPA process for permit renewals. Several ADPPs refer to using the standards in the Sage-Grouse Habitat Assessment Framework as their objectives and it is recognized that the HAF gives the BLM the tools to make informed decisions about the suitability of sage-grouse habitat through interpretation of the relationships between all the habitat measures and objectives as well as other factors and uses appropriate measures at appropriate scales. This wide variation in vegetation objectives will make it very difficult for the FWS to be able to look across the range. The direction contained in this guidance will resolve this issue.

#### Guidance

- I. Planning units will include the following land use plan vegetation objectives within the Vegetation section of their administrative draft proposed land use plans(ADPPs) that states:
  - a. In all Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover (Aldridge et al. 2008, Doherty et al. 2010, Wisdom et al. 2011). Maintain ecological processes as described in BLM Technical Reference 1734-6 “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) to sustain these habitats.

INTERNAL WORKING DOCUMENT – NOT FOR DISTRIBUTION

October 17, 2014

BLM has identified lands across the range of sage-grouse capable of producing 10-30% sagebrush canopy cover. The Final EIS will identify the Priority Habitat Management Areas and will include an objective to maintain the desired condition of 10-30% sagebrush canopy cover in a minimum of 70% of those lands.

- II. Planning units will populate the attached template to provide fine- and site-scale vegetation objectives for sage-grouse life history stages based on the ecology in your region. This template should be included in the Special Status Species section of the ADPP. Provide appropriate peer-reviewed science to support the habitat values for the indicators.

Fine- and site-scale sage-grouse habitat suitability indicators for seasonal habitats are identified in the Sage-Grouse Habitat Assessment Framework (HAF). The HAF has incorporated the Connelly et al. (2000) sage-grouse guidelines as well as many of the core indicators in the AIM strategy (Toevs et al. 2011). There may be a need to develop adjustments to height and cover or other site suitability values described in the HAF; any such adjustments should be ecologically defensible. To foster consistency, however, adjustments to site suitability values at the local scale should be avoided unless there is strong, scientific justification for making those adjustments. That justification should be provided. WAFWA Management Zone adjustments must be supported by regional plant productivity and habitat data for the floristic province. If adjustments are made to the site-scale indicators, they must be made using data from the appropriate seasonal habitat designation (breeding/nesting, brood-rearing, winter) collected from sage-grouse studies found in the relevant area and peer-reviewed by the appropriate wildlife management agency(ies) and researchers

ATTRIBUTE	INDICATORS	DESIRED CONDIT ION	Refer ence
<b>BREEDING AND NESTING</b> (Seasonal Use Period March 1-June 15 )			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions

WINTER <sup>1</sup> (Seasonal Use Period November 1 -February 28 )			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. Field offices are to conduct land health assessments at the watershed or comparable, larger scale and use the LUP vegetation objective and the sage-grouse habitat objectives to determine if GRSG habitat is meeting the desired condition.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (IIRH, Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in sage-grouse habitat, the BLM should collect the sage-grouse habitat-specific data to inform the HAF indicators that may not have been collected using the IIRH or the Core Indicators methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment 3: Incorporating GSGR RMP Decisions into Grazing Authorizations

### Incorporating GSGR RMP Decisions into Grazing Authorizations

#### Purpose

The purpose is to provide recommended ADPP language and outline the process for prioritizing the modification of grazing permits/leases, provide for adjusting livestock grazing within the terms and conditions of permits, and accomplish annual compliance monitoring within GRS habitat.

#### Background

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with either:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Appropriation authority (Section 411, PL 113-76-for permits that the BLM is unable to fully process before their expiration).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The rider relieves the BLM’s renewal processing workload while allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015”. The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

October 17, 2014

The BLM may modify terms and conditions of a permit or lease following consultation, cooperation, and coordination<sup>2</sup> with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public. Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record, and interested public who is affected by the proposed actions, terms or conditions, or modifications relating to applications, permits and agreements (including range improvement permits), or leases.

A. Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:

- The BLM will prioritize the modification of grazing permits within GRSG habitat. In setting priorities, areas not meeting land use plan vegetation objective and/or Land Health Standards will take precedence.
- The NEPA analysis for proposed modification of livestock grazing permits/leases will include a range of alternatives that allows the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA and issuance of a proposed/final grazing decision.
- Allotments within GRSG habitat will be prioritized for annual review to ensure compliance with the terms and conditions within the grazing permits. When BLM conducts monitoring, at a minimum, actual use, utilization, and use supervision data will be collected.

Process for Modifying Grazing Permits to Meet GRSG RMP Amendments/Revisions Objectives

If an evaluation area includes GRSG habitat that will require the modification of a grazing permit, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

BLM will develop criteria to prioritize the workload to modify grazing permits (fully processed or rider) within GRSG habitat. In setting priorities, areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential examples for prioritizing permit modifications could include:

- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet land use plan GRSG Special Status Species habitat objectives?
- Is there data that indicates that land use plan GRSG Special Status Species habitat objectives are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

The NEPA analysis will include adaptive management options when the GRSG Special Status Species habitat objectives are not being met. The NEPA analysis on the proposed modification of the

---

<sup>2</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

October 17, 2014

permit/lease should include a range of alternatives that allows the authorized officer to make the following adjustments to livestock grazing without additional NEPA or issuance of a proposed/final grazing decision. Implementation of management actions to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

B. Annual Compliance Monitoring of Modified Grazing Permits.

Allotments within GRSG habitat will be prioritized for annual monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Actual Use
- Utilization
- Use Supervision

## Attachment 4 – National GRSG Planning Schedule

### Schedule Assumptions

1. Modifications made to the ADPPs from roll-up and state meetings will not impact sub-regions from being able to submit their final ADPP data to the NOC by October 31, 2014.
2. All ADPP data submitted to the NOC by October 31, 2014 has been properly QAed/QCed by the BLM States.
3. The WO has the capacity to review all 15 Draft FEISs in 2 weeks.
4. Smooth Protest Resolution process.
5. No appeals from the governor’s consistency review.
6. All plans will go forward with informal Section 7 Consultation (30 days). If formal Section 7 Consultation is need, 135 days would be needed. This consultation would be initiated between steps 9 and 10.

National GRSG Planning Schedule			
Key Milestones are highlighted in red			
Step #	Roll-up/Planning 12 Step Process	Dates	Assumptions/Notes
1	Sub region sends memo to AD 200 for review	Complete	
2	AD 200 reviews memo and contacts sub regional SD.	Complete	
2a	Sub regions send ADPP data to the NOC.	Complete	
3	NOC completes WAFWA MZ Tier II CEA MZ tables	ON HOLD	NOC needs 1 month
3a	NOC completes WAFWA MZ Roll up land use allocation maps	Complete	
3b	EMPSi completes Tier II CEA MZ analysis and sends analysis to sub-regions	ON HOLD	6-10 weeks
4G	Great Basin Federal Family Roll up review meetings	Complete	
4R	Rocky Mountain Federal Family Roll up review meetings	Complete	
5	Meeting with States on Final Federal Plans (Face-to-Face)	10/13/14 to 10/17/14	
6	Final Resolution of Federal Plans (State Director’s meeting)	10/20/14	
7	Secretaries of DOI and USDA Briefing	10/22/14	
	Sub-regions complete ADPP and Chapter 2	10/31/14	
	Sub-regions re-send ADPP data to the NOC, reflecting changes from FFM s, discussions with the States, and from interagency leadership briefings	10/31/14	
3	NOC completes WAFWA MZ Tier II CEA MZ tables	11/21/14	3 weeks  Assumes all data has been appropriately QAed/QCed
3b	EMPSi completes Tier II CEA MZ analysis and sends analysis to sub-regions	11/21/14 to 1/2/15	6 weeks
	Direct and Indirect impact analysis is completed for the proposed plan	10/31/14 to 12/3/14	5 weeks
	BLM/FS ID-teams review of impact analysis (for those planning efforts using contractors on ly)	12/3/14 to 12/17/14	2 weeks
	BLM/FS ID-teams review CEA	1/2/15 to 1/16/15	
	BLM/Contractors compile, format, tech edit, and QA PLUPA/FEIS	1/2/15 to 1/16/15	2 weeks
	EMPSi revises CEAs	1/17/15-1/27/15	

INTERNAL WORKING DOCUMENT – NOT FOR DISTRIBUTION  
October 17, 2014

	Consistency Review Strike Team Reviews all 14 Draft FEISs.	1/19/15 to 1/26/15	1 week
	BLM/FS ID-teams respond to potential issues from Consistency Review Strike Team.  BLM/Contractors incorporate CEAs and make modifications for WO Review versions of the FEIS.	1/26/15 to 1/30/15	1 week
	Submit briefing packet to WO/WO Review Kick-off Briefing	2/2/15	
8	WO Review (CONCURRENT COOPERATING AGENCY REVIEW)	2/2/15 to 2/13/15	2 weeks
	BLM Consolidate/filter all WO BLM/FS & SOL/OGC comments	2/16/15 to 2/18/15	2 days
8a	Sub-regions respond to WO review comments	2/18/15 to 2/25/15	1 week
8b	WO resolves any pending concerns that arise out of the WO Review	2/25/15 to 2/27/15	2 days
	BLM/Contractors make modifications in Public Review versions of the FEIS.	2/27/15 – 3/5/17	1 week
9	<del>National Policy Team Briefing</del>	3/3/15	
10	<del>BLM Director's Briefing</del>		
	Interagency Leadership Briefing		
11	Secretaries of DOI and USDA Briefing	3/6/15	
	BLM/Contractors compile, format, tech edit, and QA PLUPA/FEIS	3/6/15 to 3/13/15	1 week
	Camera-ready copy to GPO/PDF for website	3/13/15	
	Printing and distribution by GPO	3/13/15 to 3/27/15	2 weeks
12	Publish Proposed Plan EISs (falls on a Friday per EPA requirements)	3/27/15	
13	Protest Period Ends (30 day mandatory protest period)	4/27/15	
13a	Protest Resolution Process Ends	5/27/15	30 days

	<del>BLM Director's Briefing</del>		
	Interagency Leadership Briefing		
16	Secretaries of DOI and USDA Briefing	5/29/15	
17	RODs are signed	5/29/15	

## Attachment 5: GRSG Strike Team Roles and Responsibilities

### Greater Sage Grouse Strike Team Roles and Responsibilities

The Greater Sage Grouse (GRSG) Strike Team (ST) is being established to ensure the following outcomes are achieved with the National GRSG Conservation Strategy:

- Ensure National Policy Team guidance and management direction is consistently incorporated into the GRSG Proposed Plans/Amendments
- Ensure that the Proposed Plans/Amendments include the appropriate conservation framework and objectives
- Ensure the plans collectively result in a cohesive federal land management conservation strategy for the GRSG
- Ensure consistency with the Record of Decisions

1). GRSG Core Team – The Core Team is responsible for overall project coordination and to ensure the conservation strategy outcomes are achieved. The Core team is also responsible for coordination with the other GRSG teams, which include the Regional Project Managers, Ad Hoc, WO Planning Review and Protest teams.

GRSG Core Team	
Stephanie Carmen vice Kathy Stangl	BLM National SG Coordinator
Joe Stout	BLM Division Chief, Decision Support, Planning and NEPA
Matthew Magaletti	BLM WO Planning and Environmental Analyst
Steve Small	BLM Division Chief, Wildlife Conservation
Vicki Herren	BLM NOC, Wildlife Biologist
Frank Quamen	BLM NOC, Wildlife Biologist, Geospatial Analyst
Kurt Wiedenmann	BLM Liaison to ASLM
Aaron Moody	SOL
Sarah Shattuck	SOL

2). GRSG Regional Project Managers

GRSG Regional Project Managers	
Lauren Mermejo	BLM Great Basin Project Manager
Johanna Munson	BLM Rocky Mountain Project Manager
Glen Stein	Forest Service Project Manager

3). GRSG Ad Hoc Team – The Ad Hoc team will add capacity and expertise in the areas of communications, web support, planning and applied science. The team will also provide recommendations for solutions to unique situations. Specific deliverables include an internal/external communication plan.

INTERNAL WORKING DOCUMENT – NOT FOR DISTRIBUTION  
October 17, 2014

GRSG Ad Hoc Team	
Mitch Snow	BLM Communications/PAO
TBD	(Writer/Editor/Web Master) Ed is working with Celia, NOC and NIFC
David Batts	EMPSI
Gordon Toevs	BLM, WO AIM Coordinator
Tom Rinkes	BLM, Retired Wildlife Biologist
Mike Pellant	BLM, Retired

4). GRSG Consistency Review Team – The consistency team will be responsible for reviewing all the Administrative Draft Proposed Plans (ADPP) prior to the larger WO review. Specifically, the team will focus on consistent incorporation of National Policy Team, Federal Family meeting and other Washington Office guidance. This team will also be responsible for drafting the Record of Decisions.

GRSG Consistency Review Team	
Review Prior to formal WO Review	
Matthew Magaletti	BLM WO Planning and Environmental Analyst
Lauren Mermejo	BLM Great Basin Project Manager
Johanna Munson	BLM Rocky Mountain Project Manager
EMPSi	TBD
Glenn Stein	Forest Service Project Manager
Development of the Records of Decisions (RODs)	
Matthew Magaletti	BLM WO Planning and Environmental Analyst
Lauren Mermejo	BLM Great Basin Project Manager
Johanna Munson	BLM Rocky Mountain Project Manager
EMPSi	TBD
Glenn Stein	Forest Service Project Manager
Aaron Moody	SOL
Sarah Shattuck	SOL
ASLM Representative	TBD

5). GRSG WO Planning Review Team – The WO Planning Review Team members and procedures are included in Attachment 2.

6). GRSG WO Protest Team – The BLM WO Division of Decision Support, Planning and NEPA is responsible for resolving all land use planning protests. The GRSG Plans and Amendments are subject to a 30-day public protest period. The BLM must resolve all public protests before each GRSG Plan can be approved. The Forest Service will be adopting the BLM's protest resolution process to satisfy their regulatory requirements. The team will develop a protest resolution strategy.

GRSG WO Protest Team	
Michael Hildner	BLM Colorado State Office, Planning and Environmental Analyst (Proposed)
Team members	TBD
Forest Service Team members	TBD

WO GREATER SAGE-GROUSE ADMINISTRATIVE PROPOSED RMP/RMP  
 AMENDMENT AND FINAL EIS REVIEW PROTOCOL

As mentioned in the Land Managers’ Decision Document GRSG-4, the Washington Office Greater Sage-grouse Strike Team has been tasked with “reviewing the Greater Sage-Grouse RMP Amendment EISs and the relevant Greater Sage-Grouse sections of the ongoing RMP amendments and/or revisions to ensure that applicable conservation measures have been considered, as per the requirements the NTT Report and IM No. 2012-044.” The WO review will take approximately two weeks to complete. Prior to the review, you will receive an email and invitation to the WO GRSG Strike Team Kick-off Review Briefing, where the State/Field Office will brief the WO reviewers on the A-PRMP/FEIS. This Kick-off Briefing will initiate the two week WO GRSG Strike Team review period. All comments should be placed on the WO Comment Review Form, which will be linked to the Kick-off Briefing email invitation. Please email your completed comment forms to Matthew Magaletti ([mmagalet@blm.gov](mailto:mmagalet@blm.gov)) at the end of the review period.

- I. What the W O GRSG Strike Team will be looking for during their review of the A-PRMP revision or amendment

Basic RMP Review Procedures	Responsibility
Ensure that the RMP amendment/revision alternatives/proposed management actions are consistent with your program area’s laws, regulations, and policy, and are of sufficient quality to support implementation of BLM programs. WO review should focus on high-level issues concerning national policy and standards. Feel free to use Appendix C of the Land Use Planning Handbook to verify what constitutes an appropriate LUP decision for your program area.	All programs
Review “Alternatives Considered but Not Fully Analyzed” to ensure that rationale for eliminating alternatives is clear and consistent with BLM policy.	All programs
Ensure that chapter 3 and 4 uses accepted criteria, indicators, benchmarks, and methods for analysis, and describes the affected environment clearly and consistently with national policy. Please note that the planning efforts associated with GRSG are focusing on portraying the amelioration of threats to the GRSG and have used baseline information from the USGS’s Baseline Environmental Report (BER), which was conducted specifically for this effort.	All programs
Review Procedures Unique to the GR SG Review	
Are all of the proposed actions presented in the A-PRMP/FEIS sufficiently protective of GRSG such as to contribute to reducing the need to list the species under the Endangered Species Act (per IM-2012-044)?	WO-230
Are all of the BMPs addressed in the NTT Report carried forward as Required Design Features (per GRSG-7)? Focus your review on the RDFs that are specific to your program area.	All programs
Were public comments submitted on the DEIS adequately responded to in the A-PRMP/FEIS (focus specifically on the FWS/State agency comments)? Focus your review on the responses relative to your program area.	All programs
Were all unresolved issues identified during the first regional reviews addressed (per GRSG-14)?	WO-210
Does the A-PRMP/FEIS contain the following consistent National GRSG Planning Strategy components:	WO-210 & WO-230

INTERNAL WORKING DOCUMENT – NOT FOR DISTRIBUTION  
October 17, 2014

<ul style="list-style-type: none"> <li>• Ch. 1 section that provides the context needed to indicate how this planning effort fits into overall National GRSG Planning Strategy.</li> <li>• Population Conservation Summaries in ES or Ch. 1 (including rationale for why NPT allocation decisions were not applied to Priority or General Habitat).</li> <li>• Monitoring Framework Appendix and ch.2 introductory language.</li> <li>• Mitigation Framework and ch. 2 introductory language.</li> <li>• Ensure that the National Policy Team’s consistent allocation recommendations are presented in ch. 2. If not, ensure that there is sufficient rationale provided in the “population conservation summaries” in the Executive Summary.</li> <li>• Adaptive management ch. 2 introductory language and a management action that articulates what the hard trigger is and the related response.</li> <li>• For Great Basin amendments only– ch. 2 introductory language for wild land fire language.</li> <li>• Ch. 4 conservation effects table that ties the analysis back to the COT Report objectives.</li> <li>• Ch. 4 WAFWA MZ level CEA for GRSG (the CEA may not be completed in time for the WO review).</li> </ul>	
<p>Is the A-PRMP/FEIS adaptive management approach consistent with the national adaptive management concept paper and sideboards?</p>	<p style="text-align: center;">WO-210 &amp; WO-230</p>
<p>If the document includes Forest Service units – is this clearly articulated throughout the document?</p>	<p style="text-align: center;">WO-210</p>

II. Next Steps after the WO has submitted comments back to the BLM State Office:

WO-210 will consolidate all of the WO GRSG Strike Team comments and will submit them to the State/Field Office. The State/Field Office will then be responsible for sending back to the WO the WO Comment Review Form with their responses on how they addressed your concerns. Once the responses are sent to WO-210, you will receive an email asking you to verify whether or not your concerns have been addressed appropriately. If your concerns have been addressed and the associated revisions to the ADRMP/APRMP have been made, please email Matthew Magaletti ([mmagalet@blm.gov](mailto:mmagalet@blm.gov)) within 48 hours from receiving the email. If no email is sent to the WO, WO-210 will assume that your concerns have been adequately addressed. WO-210 will notify the State/Field Office that all of the concerns have been resolved and the State/Field office will begin scheduling a briefing with the GRSG National Policy Team (NPT). At the NPT briefing, the NPT members will make the recommendation on whether or not the PRMP can be presented to the BLM Director.

On Oct 20, 2014, at 12:47 AM, Brent Ralston <[bralston@blm.gov](mailto:bralston@blm.gov)> wrote:

Tim,

Here is some more or supplemental information regarding the issues to be discussed:

Disturbance – We discussed our disturbance approach at last Thursday's meeting and seemed to be met with understanding and support (or at least no lack of support) from Sarah Greenberger and Jim Lyons. I have shared our detailed description with Jim and Sarah (cc'ed you and Jeff as well) based on their request.

Mitigation – we have similar language in our current ADPP, I will look at this language to see if we need to adjust anything but the intent is similar.

Adaptive Management – looks like Idaho is to continue in the direction we are working. We need to discuss untripping triggers to respond to USFWS and we will do that this week or next.

Vegetation Objectives – we have objectives in this format in our ADPP.

Livestock Grazing – the priority setting described is similar to what we have in our ADPP, the annual compliance monitoring may be new language for us – I'll check and include.

Transmission – our General areas are not identified as avoidance; however, we still require the RDFs in those areas.

Minerals Materials – looks like the new language has been adjusted to line up more with what we already had in Idaho – I'll check specific language to make sure.

NSO – I believe our plan is consistent with this approach, I need to check language to ensure but will make any adjustments to our language needed to be consistent.

Fluid Mineral – that is language not currently included in our ADPP but can easily be incorporated.

Coal – Not applicable in Idaho or sw Montana.

Mapping – Not applicable to Idaho, we have our own mapping direction.

Buffers – Idaho provided our buffers, backed by the best available science to WO for review, this is a piece that USGS is looking at – we don't expect many, if any changes to our buffers.

Schedule – we are ready to send updated data; there are several pieces of the ADPP we need to resolve and that will be completed by the end of the month. The remaining timeframes match or even extend the timeframes I've been operating under and have communicated with our ID Team, so these should be doable without additional extension from Idaho/swMT.

WO Strike Team – no additional comments.

Plan Consistency – these formats have been/will be provided to EMPSi to they can do that writer/editor work of putting our ADPP into the appropriate format.

**Subject:** GrSG Key Issue Paper and Agenda for Monday

Dear Sage-grouse SDs, Mike and Ron,

I am getting ready to go home for the day and wanted to send you the agenda and some more reading material for our discussions on Monday.

Joe sent you out three papers yesterday for your review. I have attached a paper that includes the 12 key remaining issues that were discussed last week in our meeting with the states representatives in Denver. The paper highlights each issue and provides either the direction we will proceed with or recommendations for discussion and decision. The paper also has 5 attachments including: a Disturbance white paper, GrSG Land use plan objectives guidance, guidance for incorporating GrSG RMP decisions into grazing authorizations, an updated draft planning schedule, and a paper on the roles and responsibilities for a GrSG strike team process with steps to get us to the ROD. The discussion in the morning will help us prepare for the afternoon meeting.

As the first agenda shows, we will discuss these on Monday morning between 9 and 12. Then we will go to lunch and meet up with Sarah, Jim and Bret. The afternoon provide time for Sarah and Jim to discuss the status of the one-on-one meetings with the states; to share with Sarah, Jim and Bret where BLM is with the 12 remaining key issues; and to have a discussion about next steps. This is where we will discuss the planning schedule, strike teams, our approach on the input into the conservation efforts data base and stakeholder outreach.

Hopefully Sarah, Jim and Bret will be able to hang around for dinner and some social time with our ELT members before returning to DC. But that is not the end of our fun GrSG day. Amy and I want to meet with you all again after dinner for a discussion related to Plan Implementation. Our resources DSDs met a few weeks ago on this and we need to discuss some key aspect of implementation and begin to make some key decisions about approaches. On Monday morning we will hand out some information developed by the DSDs to help us focus our discussion on what the plan implementation workload will be and to help us discuss how to organize it. I know that you all will be tired at the end of the day. Unfortunately there's no rest in sight for a while. Monday will help us insure we are all in alignment and on the page as we move to completion of our proposed plans, then to the signing of the RODs and finally to implementing the plans effectively across the range.

Thank you all for all you and your teams have done to date. See you Monday. ed

Hello,

First of all thank you all for taking the time to participate in the meeting with the FWS and the States on Weds. We felt that it was a productive meeting and look forward to meeting the State Representatives at our upcoming one-on-one meetings.

After our Weds. meeting a number of you, along with Neil, Steve and myself to discuss the upcoming SD meeting on October 20th at NCTC. There we plan to discuss where we are with our planning efforts and how to move forward to address the remaining concerns of FWS as it relates to our plans for Greater Sage-grouse habitat conservation. We will provide you with a revised draft planning schedule at our meeting on the 20th as this is very dependent on the decisions we make in the upcoming weeks. We are currently working on the draft agenda for the GrSG discussion. We will likely focus on the Key Remaining Issues as discussed by Neil and Jim at our meetings this week and the steps to complete our proposed plans. The key issues remaining include:

1. PAC Boundaries
2. Addressing Issues Related to Political Boundaries
3. Disturbance Tracking & Setting of Limits
4. Monitoring/ Adaptive Management
5. Mitigation
6. "Mixed" management landscapes (ownership)
7. Lek Buffers
8. ROWs
9. Priority Habitat, NSO, Closures, ACECs, Withdrawals
10. Coal Suitability
11. Livestock Grazing
12. Smart for the Start (related to oil and gas)

You all also asked on Weds night for some additional information on allocations in order to prepare. Attached are the requested maps that the NOC prepared for us that show where we are in compliance with the allocations and where we are not. It is deliberative and pre-decisional, based on the preliminary data your planning team provided, so keep that in mind if you are considering sharing. I have also included a table that addresses explains the deviations in allocations from NPT direction.

Some of you all also requested the follow up action charts from the two Federal Family meetings. I will be sending out in a separate email.

Let me know if you have any questions. Have a great 3 day weekend. Thanks! Ed

Compliance with NPT Guidance								
	NPT Guidance	MT ADPPs	Wyoming ADPPs	NW CO	Utah	NV/NE CA	Oregon	Idaho/SW MT
Solar - Priority	Exclusion	Exclusion	NA <sub>6</sub>	Exclusion	Exclusion	Exclusion	Exclusion	Exclusion Imp – Avoid.
Solar – General	Avoidance	Avoidance	NA <sub>6</sub>	Avoidance	Exclusion	Exclusion	Avoidance	Open Imp – Open Screening process
Wind – Priority	Exclusion	Exclusion	Avoidance <sub>7</sub> Consistent with WY Core Area Strategy	Exclusion	Exclusion	Exclusion	Exclusion	Exclusion Imp – Avoid.
Wind – General	Avoidance	Avoidance	Open Consistent with WY Core Area Strategy	Avoidance	Open Only 32 males in General	Exclusion	Avoidance	Open Imp – Open Screening process
Major ROWs - Priority	Avoidance	Avoidance	Avoidance	Avoidance	Avoidance	Avoidance	Avoidance	Avoidance Imp - Avoid
Major ROWs - General	Avoidance	Open <sub>5</sub> Mixed Ownership Pattern - Screen	Open Consistent with WY Core Area Strategy	Open <sub>12</sub> Mixed Ownership Pattern	Open Only 32 males in General	Avoidance	Avoidance	Open Screening process
Minor ROWs – Priority	Avoidance	Avoidance	Avoidance	Avoidance	Avoidance	Avoidance	Avoidance	Avoidance Imp - Avoid
Minor ROWs – General	Open	Open <sub>4</sub>	Open	Open	Open	Avoidance	Open	Open
Fluids – Priority	NSO	NSO <sub>3</sub>	Open with major/moderate constraints <sub>8</sub>	NSO <sub>10</sub>	NSO	NSO	NSO	NSO Imp - NSO
Fluids – General	Open with Moderate constraints	Open with Moderate constraints	Open with standard/moderat e constraints	Open with Moderate constraints <sub>10</sub>	Open with Standard Constraints Only 32 males in General	NSO	Open with Moderate constraint <sub>513</sub>	Open with Moderate constraints
Non-energy Leasables - Priority	Closed	Closed <sub>2</sub>	Open <sub>9</sub>	Closed	Closed	Closed	Closed	Closed Imp - Open
Non-energy Leasables - General	Open	Open <sub>2</sub>	Open	Open	Open	Closed	Open	Open
Mineral Materials – Priority	Closed	Open <sub>1</sub> Mixed Ownership Pattern - Screen	Open Consistent with WY Core Area Strategy	Open <sub>11</sub> 2-miles from a lek are closed	Closed	Closed	Closed	Closed Imp - Open
Mineral Materials – General	Open	Open	Open	Open	Open	Closed	Open	Open

- 1 – Billings and North Dakota are the only ADPP in MT that is closed to mineral materials in priority habitat.
- 2 – Miles City and Billings have no known non-energy leasables potential, therefore, no LUP allocations were made for this resource.
- 3 – For the Lewistown Amendment, the planning area is currently under protest resolution; therefore, oil and gas leasing will not be addressed in this LUP amendment.
- 4 – Billings is the only ADPP in MT that is avoidance to minor ROWs in general habitat.
- 5 – Billings is the only ADPP in MT that is avoidance to major ROWs in general habitat.
- 6 – For all WY plans, solar was not analyzed in the DEISs.
- 7 – Lander is the only planning area to exclude wind in PH (Core).
- 8 – Related to Fluid Minerals in Core Habitat – NPT guidance provided WY plans with an exception.
- 9 – Related to non-energy leasables in Core Habitat – NPT guidance provided WY plans with an exception.
- 10 – In NWCO – Areas within 1-mile of an active lek are closed to leasable minerals. Areas within 2-miles of an active lek would be NSO (no exceptions). Areas outside of this area in general habitat is subject to existing lease constraints.
- 11 – In NWCO, only areas within 2-miles of an active lek are closed to mineral materials.
- 12 – In NWCO, avoidance extends into GH if within 4-miles of an active lek. No new roads or above-ground structures would be authorized within 1 mile of an active lek.
- 13 – In OR for GH, open with moderate constraints (CSU/TLs) with 1 mile NSO around leks

All --

As mentioned on recent calls, we've been coordinating with DOI on updated talking points (attached) for use in outreach on our land use plans for the Greater Sage-Grouse. We will also share them with your comm leads.

Please let us know if you have any questions.

Thanks,

Celia

Status Update on BLM Land Use Plans for Greater Sage-Grouse  
Internal Working Document  
January 29  
Talking Points for use by State Directors

State Directors should be the point on communication with media within the state. Please pass these talking points on to your district and field managers to ensure they have consistent communication.

Talking Points

- The BLM's multiple use and sustained yield mission requires us to find a balance between the full range of resources, including the conservation of crucial wildlife habitat, and resource uses. These principles have driven the development of BLMs conservation planning strategy for greater sage-grouse and its habitat.
- Our planning process has been complex and highly collaborative with meaningful coordination with the public serving as the cornerstone. Throughout the process, we have worked closely with a broad range of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service, the U.S. Forest Service and many others.
- Working with our partners, as we move from draft plans to final, the BLM and USFS are resolving key issues (like disturbance limits and mitigation approaches) and are moving to complete our proposed land use plans/final EISs by late spring, and the records of decision by late summer.
- We have confidence these plans when final will help ensure the long-term viability of the greater sage-grouse and other iconic wildlife species on public lands and the continued economic vitality of the West.
- Strong Federal land use plans (BLM and USFS), however, will only get us part of the way in ensuring the long-term conservation of greater sage-grouse and avoid the need to list under the Endangered Species Act.
- One third of sage-grouse habitat is administered by the states or is privately-owned. For this reason, strong State plans as well as an effective strategy to reduce the risk of fire to greater sage-grouse habitat are key components of the range-wide strategy. We are continuing our collaboration with our state and federal partners as well as private landowners to ensure all components of a range-wide strategy are in place.
- Together we can ensure listing of the greater sage-grouse is no longer warranted while preserving traditional Western economic activity that is also dependent on a healthy sagebrush range.

### Key Elements to Land Use Plans:

- We are implementing key elements of the planning effort, which will enable us to achieve greater clarity and consistency across the range while honoring specific local approaches and conditions.
- Key elements addressed include:
  - Limiting or eliminating new surface disturbance in sage-grouse priority habitat and minimizing additional disturbance in general habitat.
  - Improving greater sage-grouse habitat condition
  - Reducing the threat of rangeland fire to greater sage-grouse in the Great Basin by placing added priority prevention, suppression and restoration of sagebrush landscapes threatened by rangeland fire through improved federal-state-local collaboration and coordination.

Dear Sage-Grouse SDs,

Title: Sage Grouse State Director Task Force Coordination Meeting - [\(866\) 506-1142](tel:8665061142) - P/C 444397#

When: Mon Jan 19, 2015 4pm - 5pm Eastern Time

I wanted to provide some context for today's call.

We have concluded the majority of our discussions with individual states, FWS and the Department to develop supplemental guidance for your planning efforts to help achieve the clarity and consistency as we move to development of the proposed plans. Today I will send each of you a resolved issue summary personalized for your state that has final direction on land use allocations, Sagebrush Focal Areas, Mitigation, Disturbance, Vegetation Management, Livestock Grazing,

Adaptive Management, Application of Lek Buffers and a few other issues.

We will be discussing these concepts and products at the Governor's Task Force meeting in Denver tomorrow and Wednesday we will advise the governors representatives from your states know that you have received detailed information. We anticipate that you will get with these individuals after they return from the meeting to discuss questions and concerns.

I will be sending you all direction for the development and submission of the cumulative effects analysis data. As it was in May when we prepared for the roll up analysis, it is imperative that this information is submitted as soon as possible and in complete form. There will be a meeting of our geospatial folks and regional project managers this week in Denver to discuss this process as well. We will discuss a few other next step items this afternoon. Look for an email from me or Stephanie in a few hours with your state specific document so you can give it a quick review before the call. Thx. Ed

# INSTRUCTIONS FOR SUBMITTING FINAL ADMINISTRATIVE DRAFT PROPOSED PLAN DATA LAYERS FOR THE GRSG PLANNING EFFORT

**I. ADPP Data definition:** Administrative Draft Proposed Plan (ADPP) data have gone through regional review and reflect the decisions in the ADPP document. The ADPP data comport with the national direction outlined by the BLM WO (January 2015). These data will be used for both the Tier II Cumulative Effects Analysis and Landscape Report. Additionally, these data will be shared with the FWS for use in helping to make a listing decision.

## II. Steps for EISs:

1. Please follow the protocols used in the delivery of No Action through Proposed data (i.e. folder structure, naming conventions, etc.) that were agreed to by the Data Management Team
2. Determine which data layers already submitted to NOC will not change (and note in the tracking spreadsheet)
3. Make needed changes based on data errors detected since the last data delivery
4. Make needed changes based on management decisions from WO
5. Provide a pdf of each program area decision data to EIS Project Leads, State Office ASDs, DSDs, and Regional Project Managers for assistance in reviewing the data
6. Provide approval notification to WO (Stephanie Carman) & NOC (Frank Quamen) after review by EIS Project Leads and State Office ASDs/DSDs
7. Provide approval notification to WO & NOC after review by Regional Project Managers
8. Once data layers have been approved, completely fill out the tracking spreadsheet to note new data delivery, data that have not changed from last submission, and decision categories for which there are no data
9. Submit data to the NOC (all at one time; to Frank Quamen, Anthony Titolo, and Alisa Froistad) along with the tracking spreadsheet documenting the delivery status of all data
10. Respond to QA/QC fails at your earliest convenience, as any corrections needed will delay delivery to the FWS and completion of the CEA

## III. Data Submission/Delivery Deadlines:

- 2/17/15 Submission to Regional Project Managers for review
- 2/20/15 Submission to the NOC
- 3/20/15 Submission to the FWS (assuming all EISs pass QA/QC; If submissions do not pass QA/QC the deadline will be extended to one month after the EIS submits all datasets correctly)

**IV. Data Requirements:** Data have typically failed QA/QC for five reasons. The following rules must be followed:

- A. **DO** use the folder structure, naming conventions, and categories that the Data Management Team agreed to. Variations of names and additional categories will NOT be accepted.
- B. **DO** clip your data to your EIS area. Data should not spill over into other EIS areas or they will create overlapping data which cannot be processed. You must use the common EIS boundaries that were submitted by the Planning Leads.
- C. **DO** clip your data to where we have management authority (Decision data must only be shown only where we have the authority to make management decisions, e.g. BLM surface and/or subsurface, USFS lands).
- D. **DO NOT** clip your data to habitat (e.g., priority habitat, general habitat, priority management areas, PACs, or anything related to habitat). Decision data must cover your entire planning area. We can clip the data here at the NOC if we need to display it only within habitat management types on maps.
- E. **DO NOT** allow any overlaps between decision categories within a program/subject area (e.g., the four Oil and Gas decision categories should never overlap).

***BLM-IDAHO***

**Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)**

**January 19, 2015**

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

***Issue:***

**Development in Highly Important Landscapes**

***Direction:***

The BLM will designate Sagebrush Focal Areas (SFAs) consisting of the BLM-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. The ADPP will reflect the following management guidance for the SFAs:

- 1) The ADPP will recommend administrative withdrawals from the 1872 Mining Law (locatable minerals) in SFAs, subject to valid existing rights.
- 2) These areas will be NSO, without exceptions, for oil and gas development.
- 3) The BLM will prioritize management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases.

**Issue:** **Mitigation**  
**Direction:** The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and assure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:** **Mapping**  
**Direction:** Not Applicable

**Issue:** **Disturbance**  
**Direction:** Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance.

**Issue:** **Vegetation Objectives**  
**Direction:** The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment II for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP.

**Issue:**

**Livestock Grazing**

**Direction:**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*
- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

**Issue:**

**Mineral Materials (Salable Minerals)**

**Direction:**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

**Issue:** **High-voltage Transmission and Major Pipeline ROWs and Corridors**

**Direction:**

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservations measures, avoidance criteria, and RDFs outlined in this document [list the criteria/RDFs].”*

**Issue:**

**Direction:**

**Coal Suitability**

Sub-regions will include the following management action:

*“At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR 3461.5. PHMA is essential habitat for maintaining GRSG for purposes of the suitability criteria set forth at 43 CFR 3461.5(o)(1).”*

**Issue:**

**Direction:**

**Fluid Mineral Resources (Including Geothermal)**

All ADPPs will include the conservation objective for leasing and development outside of GRSG habitat:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable*

*stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h)."*

*"Where a proposed oil and gas or geothermal project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce oil and gas or geothermal resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases."*

**Issue:**  
**Direction:**

**No Surface Occupancy (NSO) Exception Language**

Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new oil and gas leases at the time of leasing only and may not be applied to existing oil and gas leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*No waivers or modifications to an oil and gas lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to an oil and gas lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal oil and gas lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly."*

**Issue:**

**Adaptive Management**

**Direction:**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

**Issue:**

**Application of Lek Buffers**

**Direction:**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA and PHMA (see Attachment X) through this drop-in Chapter 2 language:

*"In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review ([Open File Report 2014-1239](#)) in accordance with Attachment X."*

Buffer Attachment

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* (Open File Report 2014-1239). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

- linear features (roads) within 3.1 miles of leks
- infrastructure related to energy development within 3.1 miles of leks.
- tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
- low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
- surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
- noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as Conditions of Approval to fully address the impacts to leks as identified in the NEPA analysis.

- Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
- If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
  - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater level of protection to GRS and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
  - Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).
- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as Conditions of Approval to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

Allocation Direction

\*Southwest Montana will follow the allocations designated for the MT ADPP

## Attachment I

# GREATER SAGE-GROUSE RMPA/FEIS TEMPLATE LANGUAGE FOR ADDRESSING MITIGATION

[ ] = Instructions

[ ] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

## Chapter 1 - Introduction

[Nothing new to add to EIS]

## Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and assure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

## Mitigation

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and assure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and assure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- **Compensatory Mitigation Siting**
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment III

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

**Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

## Sounds like a plan for moving ahead with our partners

On Fri, Jan 23, 2015 at 4:41 PM, Munson, Johanna <[jmunson@blm.gov](mailto:jmunson@blm.gov)> wrote:

Hi all - based on the conversation today with WO and SG SDs, it looks like our next step is to follow up with our state partners regarding the final proposed plan decisions and additional 10+ issues described in the WGA PPT presentation. Recommend we put a meeting together with them in early February. Will get together with Brent and Jon next week to review where we have ended up on key issues and scope out potential date/times on different calendars and an agenda.

We will also be planning for next Thursday's in person meeting with Regional and local FWS folks related to the ID disturbance calculation methodology.

Keep the faith and have a great weekend!

Dear Sage-Grouse SDs,

Title: Sage Grouse State Director Task Force Coordination Meeting - [\(866\) 506-1142](tel:(866)506-1142) - P/C  
444397#

When: Mon Jan 19, 2015 4pm - 5pm Eastern Time

I wanted to provide some context for today's call.

We have concluded the majority of our discussions with individual states, FWS and the Department to develop supplemental guidance for your planning efforts to help achieve the clarity and consistency as we move to development of the proposed plans. Today I will send each of you a resolved issue summary personalized for your state that has final direction on land use allocations, Sagebrush Focal Areas, Mitigation, Disturbance, Vegetation Management, Livestock Grazing, Adaptive Management, Application of Lek Buffers and a few other issues.

We will be discussing these concepts and products at the Governor's Task Force meeting in Denver tomorrow and Wednesday we will advise the governors representatives from your states know that you have received detailed information. We anticipate that you will get with these individuals after they return from the meeting to discuss questions and concerns.

I will be sending you all direction for the development and submission of the cumulative effects analysis data. As it was in May when we prepared for the roll up analysis, it is imperative that this information is submitted as soon as possible and in complete form. There will be a meeting of our geospatial folks and regional project managers this week in Denver to discuss this process as well. We will discuss a few other next step items this afternoon. Look for an email from me or Stephanie in a few hours with your state specific document so you can give it a quick review before the call. Thx. Ed

**Subject: Re: Idaho disturbance protocol**

Tim

I agree I thought this was resolved. From my view point, ID is a model as it not only incorporates the actual disturbance, it incorporates the density (quality) of the habitat and if the density is lower the disturbance is less than 3%. (Tim, please correct if I did not characterize this correctly.) We had an separate call with ID on this issue months ago but I do not recall who from FWS was present.

Hope this helps

Gordon

Dear friends,

We will need to circle our internal wagons on this issue. I heard this past week, and confirmed yesterday, that ID was using a different disturbance calculation method. To my knowledge, I never had heard that before (yet I am the first to acknowledge my memory is not perfect). I thought we had agreed to 3% with one methodology across the

range. When I asked Ed Roberson this weekend WHY ID is using a different methodology to calculate disturbance, he replied:

*“Idaho has a far more detailed method that they worked out with Mike and Virgil. Brent explained it when we were in the Governors office.*

*It factors in more of disturbance variables from the research. If you want more info we reach out to Brent.”*

I had also reached out to Pat who has seen some (all?) of the ID process and has a potential concern.

So, I think what we need to wrestle with is the following:

Was this process described in the ID alternative that Richard indicated at the last TF meeting we support? As in, have we already indicated as an agency we support it?

Is any potential concern about the outcome of the process significant such that we should raise it now?

Can you all confer to provide a consensus recommendation? Thank you,

**Subject: Re: GRSG: ID disturbance calc methodology**

If it helps, I can give you guys some background what went down last week. Jason and I happened to be in Denver for a SG status assessment meeting and got pulled into this on the edge.

It started with NV not wanting to have any disturbance cap, Sarah G suggested using the latest ID methodology. Then there was discussion of latest ID method being consistent with other states. Last I heard, they were either going with the latest ID with Brent mult factor or the previous ID version, both of which we were okay with us.

As long as they use one or the other of the ID versions we should be okay.....unless there is more to this.

All part of ongoing concern about consistency cross-state.

Let me know if it would help you guys to have more specifics than this.

I agree that Richard is important to have on the call as well as you, Pat, Jesse, and Dennis. I just spoke with Dennis. He said he will work towards arranging a call for Friday.

We understood from our leadership yesterday that the issue was resolved. On Friday we can explain the rationale behind our methodology.

Thanks for the coordination.

We can be available for a call tomorrow or Friday if there is a need to discuss this issue further. If we do have a call, I think it is important to have Pat, Jesse, and Dennis on the line and I can arrange to have Brent explain Idaho's approach and answer questions.

Dennis, can you check the availability of FWS folks then stop by and we can confirm a time that works for both agencies.

Thanks

I'd like to make sure we're all on the same page with the disturbance calculation – I'm not sure my note meant complete endorsement – I'm not knowledgeable enough at this point. I rely on the technical experts to tell me if it's good. As we all know and have said a few times (or more) what may work in one state may pose some problems when we look rangewide. I know Dennis, Jesse and Pat did engage on this yesterday and I've included the summary statement they sent me – reading this, I'm not quite sure where we are but I think we need to have a conversation next – I know this runs the risk of more frustration but I'd rather have that now than later -

I'm in DC, but could possibly get on a call tomorrow or Friday. I don't know Richard's availability today if that's better for you.

*Idaho BLM generated a novel equation for calculating disturbance for the purposes of monitoring for disturbance caps. Although IFWO did not express significant concerns when the calculation was presented by Idaho BLM, since the disturbance cap in Idaho is not likely to be hit under either method, our recent collective review of this equation in more detail (Pat, Jesse, and Jason) suggests that the genesis of this equation was based on the erroneous assumption that other planning efforts were not "incorporating fire" into their disturbance calculations. They note this in their rationale provided in draft proposal - "[a straight 3% disturbance cap] would not account for changes in effective habitat due to loss through fire or gain through restoration and rehabilitation." This is not true - all other planning areas are accounting for changes to the amount of available habitat (what Idaho BLM calls effective habitat) in the denominator of their disturbance calculations. In addition, the equation inserts two terms in their disturbance calculation that make the equation unnecessarily complex and difficult to interpret. First a term for the entire area of the BSU is included in the denominator, yet anthropogenic disturbance is only being measured in the effective habitat. Second, the inclusion of a "constant" is added as a correction factor. The result of adding these terms is that in some circumstances the amount of disturbance (in acres) actually allowed under a 3% cap would vary significantly depending on the equation applied - with Idaho's equation allowing more disturbance before hitting the cap in some scenarios.*

*It is unclear why Idaho BLM developed its own disturbance calculation apart from the rest of the Great Basin planning areas as we have been asking for consistency to the extent possible. That said, IFWO is confident that the conservation outcomes for sage-grouse will be the same regardless of the calculation methodology because the anthropogenic disturbance cap is not likely to be hit under either methodology in Idaho. Fire and invasives remain the greatest threat to sage-grouse habitat in that State. However, there is general agreement that applying Idaho's methodology more broadly could be problematic, because in areas where an anthropogenic disturbance cap is likely to be hit, Idaho BLM's methodology could allow for a higher percentage of anthropogenic disturbance before a cap is hit in some scenarios.*

**From:** Brent Ralston  
**Sent:** Friday, January 23, 2015 12:50 AM  
**To:** Johanna Munson; Jeffery Foss  
**Subject:** RE: Disturbance Calculation TPs  
**Attachments:** Disturbance Response.docx

Johanna & Jeff,

I took a look at the TPs and they seem fine with a little clean-up. I've attached a paper delineating the concerns raised by the USFWS and a response to those concerns. There is one response that I have not included as yet – 1. Because I want to go to bed; and 2. I want to talk with you before going too far down that path since our response may have ramifications to the other efforts. I'll forgo exercising tomorrow so I can be in shortly after 8 a.m. to talk about this.

Fax: 208-373-3805  
Email: [jmunson@blm.gov](mailto:jmunson@blm.gov)

Key habitat includes areas of generally intact sagebrush that provide sage-grouse habitat during some portion of the year.

Diebert - I thought that effective habitat was defined as areas with 70 to 90% sagebrush land cover (based on Knick et al. 2013). So it wouldn't include all sagebrush cover. Did I read that incorrectly?

Idaho BLM generated a novel equation for calculating disturbance for the purposes of monitoring for disturbance caps. Although IFWO did not express significant concerns when the calculation was presented by Idaho BLM, since the disturbance cap in Idaho is not likely to be hit under either method, our recent collective review of this equation in more detail (Pat, Jesse, and Jason) suggests that the genesis of this equation was based on the erroneous assumption that other planning efforts were not "incorporating fire" into their disturbance calculations. They note this in their rationale provided in draft proposal - "[a straight 3% disturbance cap] would not account for changes in effective habitat due to loss through fire or gain through restoration and rehabilitation." This is not true - all other planning areas are accounting for changes to the amount of available habitat (what Idaho BLM calls effective habitat) in the denominator of their disturbance calculations. In addition, the equation inserts two terms in their disturbance calculation that make the equation unnecessarily complex and difficult to interpret. First a term for the entire area of the BSU is included in the denominator, yet anthropogenic disturbance is only being measured in the effective habitat. Second, the inclusion of a "constant" is added as a correction factor. The result of adding these terms is that in some circumstances the amount of disturbance (in acres) actually allowed under a 3% cap would vary significantly depending on the equation applied - with Idaho's equation allowing more disturbance before hitting the cap in some scenarios.

It is unclear why Idaho BLM developed its own disturbance calculation apart from the rest of the Great Basin planning areas as we have been asking for consistency to the extent possible. That said, IFWO is confident that the conservation outcomes for sage-grouse will be the same regardless of the calculation methodology because the anthropogenic disturbance cap is not likely to be hit under either methodology in Idaho. Fire and invasives remain the greatest threat to sage-grouse habitat in that State. However, there is general agreement that applying Idaho's methodology more broadly could be problematic, because in areas where an anthropogenic disturbance cap is likely to be hit, Idaho BLM's methodology could allow for a higher percentage of anthropogenic disturbance before a cap is hit in some scenarios.

## **Responses to Concerns Raised Regarding Idaho's Disturbance Calculation:**

**Concern:** Idaho BLM generated a novel equation for calculating disturbance for the purposes of monitoring for disturbance caps.... It is unclear why Idaho BLM developed its own disturbance calculation apart from the rest of the Great Basin planning areas as we have been asking for consistency to the extent possible.

**Response:** The alternative included in the Draft EIS's describing the National Technical Team Report (Alternative B in the Idaho and Southwestern Montana DEIS) included a management action to apply a 3% disturbance cap. However, there was no description of how this would be applied, calculated or implemented in subsequent management. The Preferred Alternatives (D & E) did not include a disturbance cap since disturbance was not identified as a major concern causing loss of habitat in Idaho or Southwestern Montana and its measurement and applicability was not defined and deemed highly problematic to implement in a meaningful way. When, during the early 2014 Federal Family Meeting USFWS indicated that inclusion of such a disturbance threshold was necessary in order for USFWS to have the assurance and certainty necessary when assessing GRS listing. At that point, outside of Wyoming's Disturbance Density Calculation Tool there was no developed approach to measure or calculate disturbance to evaluate a disturbance cap against.

Idaho BLM invited Dr. Steve Knick to discuss his study regarding disturbance (the only known scientific research describing a disturbance cap). Also as a result of that FFM the BLM's NOC began working on developing a disturbance calculation process that was not as intensive as the Wyoming DDCT approach, based on BLM guidance that anthropogenic disturbance measurement would not follow that approach in other states due the intensive and workload associated with that approach would not be feasible to implement in other states.

Idaho BLM followed the provided guidance to develop biologically significant units (BSUs). The NOC developed 3 equations to try and relate disturbance and habitat. These equations were specifically applicable to broad scales but not applicable to site specific scales. Idaho BLM took the information and built a simple equation measuring and evaluating absolute disturbance to compare against the cap. That equation was defined as:

$$\frac{\text{Acres of Anthropogenic Disturbance within } h \text{ BSU}}{\text{Acres within } h \text{ BSU}}$$

At the time of the August Federal Family Meeting the Idaho BLM had further refined the previous equation to more accurately reflect the findings in Knick's research. Disturbance was discussed at that meeting and it was evident that there was no other clear guidance from either the WO, the NOC or efforts from other states in this subject. Idaho was the only state to have put effort into the need identified by USFWS and the only effort to have a reasonable, scientifically based approach. Idaho did not intentionally deviate from consistent approaches being developed apart from the other Great Basin planning areas; and in fact until more recently Idaho is the only Great Basin planning effort to have put an approach together.

**Concern:** Although IFWO did not express significant concerns when the calculation was presented by Idaho BLM, since the disturbance cap in Idaho is not likely to be hit under either method,... That said, IFWO is confident that the conservation outcomes for sage-grouse will be the same regardless of the calculation methodology because the anthropogenic disturbance cap is not likely to be hit under either methodology in Idaho.

**Response:** Loss of habitat from anthropogenic disturbance is not a major issue in Idaho and Southwestern Montana; however, that does not mean that measurement and evaluation of a disturbance cap can be arbitrary, or any less supportable, or inconsistent with the scientific research available if that research can help inform the conditions and evaluation appropriately.

That is why the Idaho disturbance calculation is defined consistent with the scientific research making it reflective of the known effects to GRSG and supportable to base management decisions upon.

**Concern:** ...our recent collective review of this equation in more detail (Pat, Jesse, and Jason) suggests that the genesis of this equation was based on the erroneous assumption that other planning efforts were not "incorporating fire" into their disturbance calculations. They note this in their rationale provided in draft proposal - "[a straight 3% disturbance cap] would not account for changes in effective habitat due to loss through fire or gain through restoration and rehabilitation." This is not true - all other planning areas are accounting for changes to the amount of available habitat (what Idaho BLM calls effective habitat) in the denominator of their disturbance calculations.

**Response:** The Idaho calculation does consider the effect fire has on the habitat and includes loss of habitat from fire as part of the calculation by weighting the denominator based on the actual habitat available to the GRSG. At the time Idaho developed this scientifically based formula there were no other planning effort attempts to describe the disturbance cap so it would be impossible for Idaho to make any assumptions based on those other efforts, erroneous or otherwise, since none existed. The rationale described is in direct reference to the original equation Idaho BLM used:

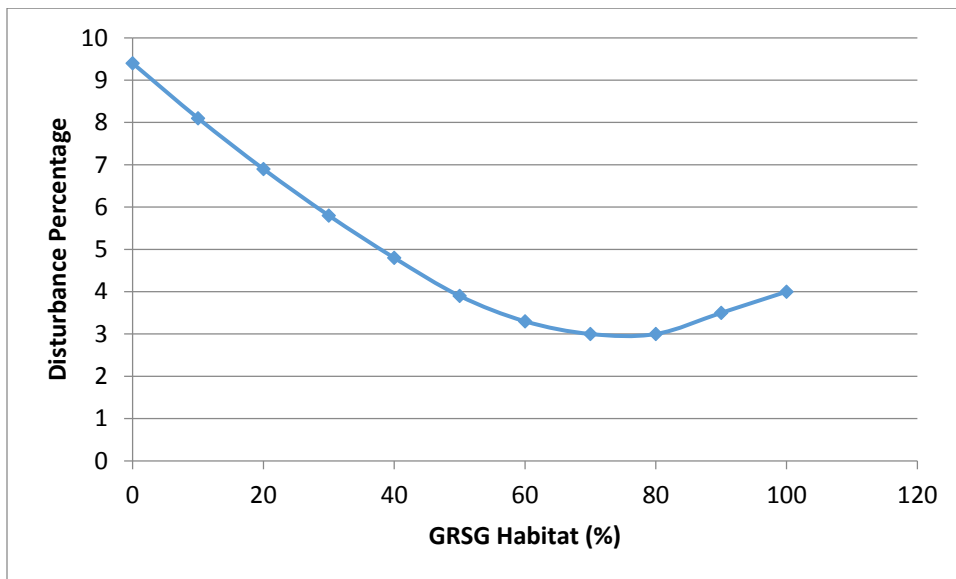

$$\frac{\text{Acres of Anthropogenic Disturbance within } h \text{ BSU}}{\text{Acres with } h \text{ BSU}}$$

Which does not account for changes in habitat due to loss through fire or gain through restoration. Currently, all other planning efforts may have calculations that account for changes in available habitat; however, the existence of these calculations now, roughly six months after Idaho's approach was developed is hardly evidence that the assumptions described in Idaho's approach are erroneous or in some way invalid. As stated previously Idaho's approach was not developed as a deviation or in comparison to other planning effort attempts at calculating the disturbance cap because such attempts did not yet exist when Idaho's approach was completed.

**Concern:** In addition, the equation inserts two terms in their disturbance calculation that make the equation unnecessarily complex and difficult to interpret. First a term for the entire area of the BSU is included in the denominator, yet anthropogenic disturbance is only being measured in the effective habitat. Second, the inclusion of a "constant" is added as a correction factor. The result of adding these terms is that in some circumstances the amount of disturbance (in acres) actually allowed under a 3% cap would vary significantly depending on the equation applied...

**Response:** The two terms at issue here are precisely what make the equation relevant and scientifically accurate and supportable, they may make the calculation more complex but natural systems are complex and mathematical equations developed to describe those systems may be somewhat complex. That they are difficult to interpret does not invalidate their inclusion and the value in numerical description those terms contribute to describing a complex situation. The actual relationship described in Knick et al., when graphed would resemble:

This graph shows the conceptual relationship curve of anthropogenic disturbance suggested by Knick et al. In that research it was shown that when anthropogenic disturbance reached 3% within an area surrounding leks (5-18km) then lek attendance was impacted through fewer birds attending on leks. In the graph above the curve assumes that the area described has 3% of its acres under some sort of anthropogenic developed. According to Knick et al. when 70-80 percent of an area is effective habitat for GRSG then anthropogenic development totaling 3% of that area will start to reduce lek attendance. That research also shows that if the effective habitat percentage within that area is over 90% or less than 70% lek attendance is affected when less than 3% of the area contains anthropogenic development. This relationship would mathematically be described using a parabolic (as opposed to a linear) equation, making it a much more accurate reflection of a complex system but also making it even more complex and difficult to interpret. In addition, while Knick et al. suggests this relationship, and defines the

effects at a 3% anthropogenic disturbance level in conjunction with 70-80% effective habitat. Knick et al., and we are aware of no other scientific studies, does not describe the trajectory of the curve above 80% or below 60%, so actually developing a more accurate, parabolic formula, is not possible at this time.

The Idaho equation is:

$$Disturbance\ Percentage = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance in the BSU}}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100$$

This equation is meant to describe a spatial reality, for that reason it is imperative that the terms be linked with that spatial reality. Without this link any equation descriptive of a spatial reality would become meaningless to the reality it is trying to describe. The purpose of a disturbance cap and a supporting disturbance calculation is to measure and evaluate anthropogenic disturbance over a given area. For the purposes of application this area is defined as the biologically significant unit or BSU. For Idaho the BSU was delineated consistent with BLM guidance and reflective of the Knick et al. research. Idaho's BSU are defined as: all of the modeled nesting and delineated winter habitat, which is based on 2011 data, occurring within Priority and/or Important Habitat Management Areas within individual Conservation Areas for all land ownerships. Modeled nesting habitat is defined as a 10 km area around leks. Based on Idaho Department of Fish and Wildlife surveys and monitoring information this area around leks encompasses a vast majority of the nesting habitat (i.e. IDFG data show that over 90% of nesting occurs within 10 km of the lek). This 10 km is within the 5-18 km range for which Knick et al. identified their research was applicable. Knick communicated to the Idaho ID Team that beyond 18 km the disturbance relationship to lek attendance described in his research was not discernable). The equation calculates a disturbance value within that BSU area by totaling the acres of disturbance within that area and dividing by that area appropriately adjusted by effective habitat within that area to reflect a higher impact of disturbance when effective habitat is lower than the low end of the 70-80% optimum range (This optimum range is also supported by Connelly et al. 2000 (80%) and the BLM's National Technical Team Report (70%)). The equation does not accurately depict the disturbance relationship when effective habitat is greater than 80%. This is due to the fact the equation is linear as opposed to parabolic (discussed earlier) and that the areas within Idaho of most concern for continued presence of GRSG and impacts from anthropogenic disturbance do not exceed 80% effective habitat. This instance only occurs in the Mountain Valleys Conservation Area where existing disturbance is well below 2%. Therefore the applicability of the equation to these conditions is limited.

Anthropogenic disturbance is being measured and evaluated within the entire BSU, not just the effective habitat area, which is why it is important to define the denominator across the BSU scale, not just a portion of the BSU which is where the spatial link becomes critical. How the denominator is described mathematically defines the scale over which the numerator is measured; changing that scale would also require adjustments to the numerator to be

mathematically correct and maintain the spatial link critical for using a numeric equation to describe a spatial effect.

The presence of the constant (0.3) is a mathematical necessity that defines the relationship, it is neither irrelevant, nor is it a 'correction' factor. Correction implies there is something incorrect or erroneous in the equation. The effective habitat denominator adjustment term:

$$\left( \frac{\text{Acres of Effective Habitat within } h \text{ BSU}}{\text{Acres within } h \text{ BSU}} + 0.3 \right)$$

This entire term, in order to accurately reflect Knick et al. (see previous conceptual curve graph), must equal 1 when effective habitat within the BSU represents 70% of the BSU. Without the constant 0.3 added to the effective habitat proportion this term would not equal 1 when effective habitat is at 70%, it would not be a mathematical correct approximation of the disturbance relationship, it would lose its spatial link since this term needs to account for 100% of the acres in the BSU at the 70% habitat/3% disturbance intercept and would therefore become meaningless with respect to the spatial relationship that is being approximated.

That this equation would 'vary significantly depending on the equation applied...' is unequivocally correct since different equations may be describing different conditions. The real question becomes does the Idaho equation 'vary significantly' when compared to equations describing similar conditions? Essentially are we comparing like outcomes (i.e. apples and apples) or unlike outcomes (i.e. apples and oranges). See concern and response below.

**Concern:** ...with Idaho's equation allowing more disturbance before hitting the cap in some scenarios.

**Response:** This conclusion would need to be qualified based on the validity of the equation being used for comparison. While that specific equation has not been provided to verify that conclusion an Excel spreadsheet was shared and if the equation is represented by the disturbance relationship described in that table then the comparison equation can be expressed as:

$$\frac{\text{Acres of Disturbance}}{\text{Effective Habitat}}$$

This equation has the benefit of simplicity; however there are several fundamental flaws with this simple calculation which without further refinement to link the spatial reality with the mathematical formula make any current comparisons are invalid. This equation does not appropriately address: 1) spatial representation; 2) scale of the calculation; 3) consistency with known science; or 4) multiple considerations of single disturbances (i.e. double counting, which links back to the spatial representation aspect of the equation).

When using mathematical equations to describe real-world conditions it is imperative that the link between the spatial conditions and the mathematical representation of those conditions be

understood and maintained. Otherwise any comparison does not have an appropriate foundation for comparison and is ultimately of limited, if any, use. To help illustrate this equation would more accurately be written (which is the relationship described in the Excel Table):

(Acres of Disturbance within Effective Habitat + Acres of Disturbance outside Effective Habitat)

(Acres of Concern (BSU) – Acres outside Effective Habitat)

While more complicated, this equation is more accurately in depicting the actual formula used in the Excel Table provided by USFWS. This is further described when all the acres within the Area of Concern or BSU are Effective Habitat; Acres outside Effective Habitat would be zero, effectively eliminating that term and similarly Acres of Disturbance outside Effective Habitat would be zero since there are no acres outside Effective Habitat, therefore eliminating that term as well; leaving the original simplified version of this equation. However, when there are no Acres outside Effective Habitat within the Acres of Concern is the ONLY condition where this simplified equation actually represents and links to the real-world spatial conditions which are being described. So it is ONLY at this point (when the BSU contains 100% Effective Habitat) that the Idaho methodology and this simple equation can be appropriately compared. As described earlier the Idaho methodology (equation) does not accurately reflect the spatial conditions (according to Knick et al.) above 80% Effective Habitat (See previous discussion regarding why this is not a significant issue in need of resolution). Below 70% Effective Habitat where the Idaho methodology reflects the scientific relationships comparisons; the simple equation loses its spatial link and comparisons are not valid or appropriate.

So why is the spatial link lost? A key principle in translating spatial conditions to mathematical equations is, in this instance, each acre of either disturbance, within effective or outside effective habitat in the equation represents a real acre of disturbance, a real acre within effective habitat, a real acre outside effective habitat. If there are acres outside Effective Habitat within the Area of Concern the more accurate equation described above shows that those acres are REMOVED through subtraction from the denominator. This changes the scale of the calculation (see below) effectively redefining the spatial extent over which the Acres of Disturbance appropriate to the new scale/denominator can be measured. So this equation redefines the spatial extent for comparison through removing acres from the denominator, while at the same time it includes acres of disturbance in the numerator. The spatial representation is lost when the same acres are both included in the numerator but removed from the denominator.

Scale

Consistency with Known Science

Multiple Considerations of Single Disturbances

**Concern:** However, there is general agreement that applying Idaho's methodology more broadly could be problematic, because in areas where an anthropogenic disturbance cap is likely to be hit, Idaho BLM's methodology could allow for a higher percentage of anthropogenic disturbance before a cap is hit in some scenarios.

**Response:** Using Idaho's methodology in other states will be problematic. Not because 'in areas where an anthropogenic disturbance cap is likely to be hit, Idaho BLM's methodology could allow for a higher percentage of anthropogenic disturbance before a cap is hit in some scenarios' (see previous response regarding comparison of different spatially representative equations); but because the data needed to support Idaho's methodology are not readily available in other states. Idaho has collected, reviewed and updated on an annual basis for 12+ years a GRSG Key Habitat Map. This map tracks effective habitat, effects to that habitat from fire, restoration efforts and use by GRSG. This is the data utilized in the adjustment factor for the denominator and it is critical to the use of the equation, without this data actual meaningful application of the equation would not be possible or relevant. This is a data set that we are not aware exists within other planning areas. For this reason application of the Idaho methodology poses implementation concerns for areas beyond Idaho.

**Concern:** I thought that effective habitat was defined as areas with 70 to 90% sagebrush land cover (based on Knick et al. 2013). So it wouldn't include all sagebrush cover.

**Response:** For Idaho's methodology effective habitat is taken to be the Key Habitat areas described by the Idaho Key Habitat Map. Key habitat includes areas of generally intact sagebrush that provide sage-grouse habitat during some portion of the year. This map also identifies areas that could provide GRSG habitat or currently provide habitat at less than optimum levels. These areas are also spatially depicted and as described as: R1 – perennial grass areas with limited sagebrush presence; R2 – annual grassland areas with limited perennial grasses or sagebrush presence; and R3- juniper encroachment within areas previously dominated by sagebrush.

SMA\_of\_NonHab\_On\_BLM\_Surf\_Sub\_WYBasin.pdf;  
SMA\_of\_NonHab\_On\_BLM\_Surf\_Sub\_NCMT.pdf; Non-Habitat is SFAs.xlsx

(please disregard and delete the first email and attachments and use this instead. thank you)

We need UT, MT and ID to provide/verify the following information as soon as possible, hopefully within 1-2 hours. Please call me at 202 380 7421 with any questions.

On the attached maps, you will see highlighted the areas within the USFWS mapped Areas of Significance (our SFAs) which are non-habitat and Federally managed. For each of these, please provide:

Name (I made geographic names, but please change if these are named something specific, like a ACEC)

Acres - Frank is calculating there

Surface Manager

Current Classification (we think non-habitat, but check if these are PHMA or GHMA)

Existing Fluid Management (are these withdrawn or closed already)

Existing Locatable Mineral Management (are these withdrawn or closed already)

Other Allocations/Management Provisions (are there other management actions in here for renewables, ROWs, non-energy leasables, saleables, etc?)

SG Habitat Characteristics (are there are sagebrush lands or leks? seasonal habitat? please confirm that the state wildlife agency will agree with this)

SG Present (are there birds, even seasonally? please confirm that the state wildlife agency will agree with this)

For the BOR land in ID - do we manage the subsurface?

**Issue:****Direction:****Vegetation Objectives**

Greater Sage-Grouse (GRSG) Administrative Draft Proposed Plans (ADPPs) will establish and incorporate vegetation and GRSG habitat objectives (see Attachment II for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used as a minimum to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP.

**Issue:****Direction:****Livestock Grazing Modifications**

The following decisions will be included in the Livestock Grazing section of the ADPPs.

- *The BLM will prioritize ~~evaluation~~processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, existing permits/leases in areas not meeting Land Health Standards, focusing on those containing riparian areas, including wet meadows, will take precedence over those areas meeting objectives/standards. Additional criteria may be used for prioritization.*
- *The NEPA analysis for ~~proposed modification of~~processing livestock grazing permits/leases ~~during the renewal process~~ will include ~~a range of alternatives and scientifically based adaptive management trigger thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses~~ that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA ~~and issuance of~~ issuance of a proposed/final grazing decision.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*

- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing, and whether removing grazing on the area where it had been permitted would be beneficial to GRSG habitat. Any decision to eliminate grazing on a specific area of land may be reconsidered in future LUP efforts.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

## Attachment II

## Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance

### Purpose

- I. Provide the planning units with land use planning vegetation objective that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for vegetation objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on conducting/prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

### Guidance

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region. Planning units are encouraged to work across boundaries when developing the objectives. Provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees

	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the sage-grouse habitat objectives when assessing the applicable standard in sage-grouse habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in sage-grouse designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment III

## Incorporating GSGR RMP Decisions into Grazing Authorizations

### Purpose

The purpose is to provide recommended ADPP language and outline the process for prioritizing the modification of grazing permits/leases in accordance with prioritization criteria, provide for adjusting livestock grazing within the terms and conditions of permits, and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

### Background

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with ~~either~~:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Appropriation authority (Section 411, PL 113-76 for Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The ~~most recent rider is contained~~FLPMA amendment was included in Section 411, Public Law 113-76.<sup>1</sup> The ~~rider~~FLPMA amendment to

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112-74 is amended by striking “and 2013” and inserting “through ~~2015~~2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all

Section 402 (c) allows BLM to renew grazing permits and leases under the same terms and conditions. This relieves the BLM’s renewal processing workload, ~~which allows~~ allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination<sup>3</sup> with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>4</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record, ~~and interested public who is affected by the proposed actions, terms or conditions, or modifications relating to applications, permits and agreements (including range improvement permits), or leases.~~ Copies of the decisions are provided to the interested publics.

### **Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize evaluationprocessing of grazing permits/leases within in Sagebrush Focal Areas (SFAs) followed by ~~other~~ PHMAs outside of the SFAs. In setting workload priorities, existing permits/leases in areas not meeting Land Health Standards, focusing on those containing riparian areas, including wet meadows, will take precedence over those areas meeting objectives/standards. Additional criteria may be used for prioritization.
- The NEPA analysis for ~~proposed modification of processing~~ livestock grazing permits/leases ~~during the renewal process~~ will include a range of alternatives and scientifically based adaptive management trigger thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without

---

applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes-

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> ~~43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).~~

<sup>4</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

conducting additional NEPA ~~and issuance of~~ issuing a proposed/final grazing decision.

- Allotments within SFAs, ~~then followed by those~~ within ~~other~~-PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.
- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing, and whether removing grazing on the area where it had been permitted would be beneficial to GRS habitat. Any decision to eliminate grazing on a specific area of land may be reconsidered in future LUP efforts.

### **Modifying Grazing Permits to Meet GRS RMP Amendments/Revisions Objectives**

~~If an existing permit/lease within PHMAs will require the modification of a grazing permit (because it is not meeting the Land Health Standards), the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.~~

BLM will develop criteria to prioritize the workload to modify existing grazing permits/leases (~~that were~~ either fully processed or ~~were~~ reauthorized based on the Congressional Appropriations rider, or issued under Section 402(c)(2) of FLPMA) within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRS habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRS habitat objectives found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis on the proposed modification of the permit/lease will include adaptive management options when the GRSG habitat objectives found in the Special Status Species section of the land use plan are not being met. The NEPA analysis should include a range of alternatives that allows the authorized officer to make adjustments to livestock grazing without additional NEPA or issuance of a proposed/final grazing decision. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

### **Compliance Monitoring of Modified Grazing Permits**

Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Actual Use
- Utilization
- Use Supervision
- 

### **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will determine whether to specific lands should still be available for livestock grazing through a site-specific evaluation and associated NEPA analysis. The NEPA analysis would analyze whether removing grazing on the area where it had been permitted would be beneficial to GRSG habitat. Any decision to remove grazing on a specific area of land may be reconsidered in future LUP efforts.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

***BLM-IDAHO***

**Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)**

**January 30, 2015**

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

***Issue:***

**Development in Highly Important Landscapes**

***Direction:***

As more specifically provided in this guidance, the ADPP will include Sagebrush Focal Areas (SFA), consisting of the BLM and FS-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. In the Special Status Species Section of Chapter 2, include the following management action drop in language (for the Proposed Plan only):

*“Designate Sagebrush Focal Areas (SFA) as shown on Map X (x acres). SFAs will be managed as PHMA, with the following additional management:*

- 1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.*
- 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.*

- 3) *Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."*

**The NOC will provide updated shapefiles that delineate the SFAs.**

Except as otherwise provided below, the ADPP will provide that all BLM- and FS-managed lands (including subsurface) within SFAs will be allocated and managed as PHMA and include the management actions above.

- *Do Not Include the following in SFA Management*
  - Hawley Mountain WSA (ID), Shoshone WSA (ID), Cedar Buttes WSA (ID), Lower Salmon Falls Creek (ID), Little Jack Wilderness (ID), Bruneau-Jarbidge Wilderness (ID) in non-habitat – The current management in these areas is generally protective of GRSG. As applicable, these will continue to be managed so as not to impair their suitability for preservation as wilderness, or under the terms of the Wilderness Act to preserve wilderness character.
    - To the extent that these areas were analyzed for contingent management as general or priority habitat, the ADPP will include contingent allocations and management direction that would apply in the event that Congress releases the areas from WSA status
  - Non-habitat areas outside Little Jack and Bruneau-Jarbidge Wilderness and Salmon Falls Creek ACEC which were previously shown within the SFA –These areas will not be managed as PHMA or SFA.
- Do Include Donkey Hills ACEC –In order to consolidate parcels for protection as SFAs, this area will be treated as PHMA and included for SFA management.
- *Do Not Include Other Agency Land in SFA Management* – while lands managed by other agencies will be shown on the SFA maps, BLM ADPP decisions will not be applied to them.
- *Do Not Include Private/State Lands in SFA Management* – while private lands may be within the SFA boundaries, ADPP decisions will not be applied to them, but may apply to Federal subsurface underlying such lands as provided below.
- *Subsurface Estate:*
  - Under private/state lands: subsurface estate in PHMA and GHMA should be treated as PHMA with SFA management actions.
  - Under other Federal lands: subsurface state should be treated as PHMA with SFA management actions if it is not already withdrawn (such as in Refuges or Parks) and PHMA or GHMA management was analyzed in the DEIS.

Additional direction/drop in language for the ADPPs on SFAs will be forthcoming.

**Issue:**

**Direction:**

**Mitigation**

The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:**

**Direction:**

**Mapping**

Not Applicable

**Issue:**

**Direction:**

**Disturbance**

Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance (see Attachment II).

Planning units will include the following land use plan actions within their ADPPs that states:

- a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*

- b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

**Issue:**

**Direction:**

**Vegetation Objectives**

The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*

**Issue:**

**Direction:**

**Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

**Issue:**

**Direction:**

**Mineral Materials (Salable Minerals)**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

**Issue:**

**Direction:**

**High-voltage Transmission and Major Pipeline ROWs and Corridors**

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high*

*voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project's NEPA review process, which will include analysis of the following conservations measures.”*

**Issue:** **Coal Suitability**  
**Direction:** Not Applicable in Idaho

**Issue:** **Fluid Mineral Resources (Including Geothermal)**  
**Direction:** All ADPPs will include the following as a conservation objective:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Issue:** **No Surface Occupancy (NSO) Exception Language**  
**Direction:** Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral leases at the time of leasing only and may not be applied to existing fluid mineral leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*“No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action’s impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.”*

***Issue:***

***Direction:***

**Adaptive Management**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also

investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

**Issue:**

**Direction:**

**Application of Lek Buffers**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA and PHMA (see Attachment IV) through this drop-in Chapter 2 language:

*“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239) in accordance with Appendix X.”*

Allocation Direction

\*Southwest Montana will follow the allocations designated for the MT ADPP

	<i>Idaho/SW MT*</i>

## Attachment I

# GREATER SAGE-GROUSE RMPA/FEIS TEMPLATE LANGUAGE FOR ADDRESSING MITIGATION

[ ] = Instructions

[ ] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

## Chapter 1 - Introduction

[Nothing new to add to EIS]

## Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

## Mitigation

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- **Compensatory Mitigation Siting**
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain*

*the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
  
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
  
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
  
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

### **Additional Information/Formulas**

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU:

*Disturbance Percentage*

$$= \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within h BSU}}{\text{Acres within h BSU}} + 0.3 \right)} \right) \times 100$$

Disturbance Calculations for Project Analysis Areas:

*Disturbance Percentage*

$$= \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^{1,2}}{\text{Acres within the Project Area} * \left( \frac{\text{Acres of Effective Habitat within } h \text{ BSU}}{\text{Acres within } h \text{ BSU}} + 0.3 \right)} \right) \times 100$$

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2.

Project analysis area method for permitting surface disturbance activities:

- Draw the project analysis area polygon which consists of a 4 mile buffer around the proposed project footprint plus all of the area within a 4 mile buffer from nearby leks if those lek buffers intersect the project buffer. In areas with mapped or modeled nesting habitats, the areas to be included in the project analysis area are the mapped/modeled habitat within 4 miles beyond the project 4 mile buffer.
- Map disturbances or use locally available data. Use of NAIP imagery is recommended.
- Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
- Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
- Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
- If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales		
		Broad/Mid (Populations)	Intermediate (BSU)	Local/Project (Seas. Hab.)
Habitat Degradation	Unit:	WAFWA Populations	Biologically Significant Unit	Project/Local Habitat Area <sup>6</sup>
	Area of Interest:	PHMAs	PHMAs	PHMAs

	Management:	Internal BLM & FS estimates		Project Authorization
	All Lands:	Yes		Yes
	Fire Included:	No		No
	Who:	BLM NOC		BLM NOC or SOs or FOs

**ACRONYMS**

PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit  
 EVT = Existing Vegetation Type                BpS = Areas of Biotic Potential

<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.  
<sup>2</sup> Westwide data will be used only if state or local data are not available.  
<sup>3</sup> A 5% disturbance cap will be allowed in Wyoming.  
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.  
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management  
<sup>6</sup> The analysis area will be based on a 4-mile project area, 4-mile buffers around leks/lek complexes, or other seasonal habitat, and clipped to sage-grouse habitat and PHMA (DDCT methodology).  
<sup>7</sup> See Table 2

## Attachment III

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment IV

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

**Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Attachment V

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

  - linear features (roads) within 3.1 miles of leks
  - infrastructure related to energy development within 3.1 miles of leks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis.

  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

## **Status Update on BLM Land Use Plans for Greater Sage-Grouse**

*Internal Working Document*

*January 29*

### **Talking Points for use by State Directors**

State Directors should be the point on communication with media within the state. Please pass these talking points on to your district and field managers to ensure they have consistent communication.

#### **Talking Points**

- The BLM's multiple use and sustained yield mission requires us to find a balance between the full range of resources, including the conservation of crucial wildlife habitat, and resource uses. These principles have driven the development of BLMs conservation planning strategy for greater sage-grouse and its habitat.
- Our planning process has been complex and highly collaborative with meaningful coordination with the public serving as the cornerstone. Throughout the process, we have worked closely with a broad range of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service, the U.S. Forest Service and many others.
- Working with our partners, as we move from draft plans to final, the BLM and USFS are resolving key issues (like disturbance limits and mitigation approaches) and are moving to complete our proposed land use plans/final EISs by late spring, and the records of decision by late summer.
- We have confidence these plans when final will help ensure the long-term viability of the greater sage-grouse and other iconic wildlife species on public lands and the continued economic vitality of the West.
- Strong Federal land use plans (BLM and USFS), however, will only get us part of the way in ensuring the long-term conservation of greater sage-grouse and avoid the need to list under the Endangered Species Act.
- One third of sage-grouse habitat is administered by the states or is privately-owned. For this reason, strong State plans as well as an effective strategy to reduce the risk of fire to greater sage-grouse habitat are key components of the range-wide strategy. We are continuing our collaboration with our state and federal partners as well as private landowners to ensure all components of a range-wide strategy are in place.
- Together we can ensure listing of the greater sage-grouse is no longer warranted while preserving traditional Western economic activity that is also dependent on a healthy sagebrush range.

### **Key Elements to Land Use Plans:**

- We are implementing key elements of the planning effort, which will enable us to achieve greater clarity and consistency across the range while honoring specific local approaches and conditions.
- Key elements addressed include:
  - Limiting or eliminating new surface disturbance in sage-grouse priority habitat and minimizing additional disturbance in general habitat.
  - Improving greater sage-grouse habitat condition
  - Reducing the threat of rangeland fire to greater sage-grouse in the Great Basin by placing added priority prevention, suppression and restoration of sagebrush landscapes threatened by rangeland fire through improved federal-state-local collaboration and coordination.

GRSG State Directors:

Attached is a document for our discussion on the conference call this afternoon which highlights the proposed decisions to be discussed with USFWS on Friday - please do not share this widely. (I have copied your Executive Assistants so they can get them to you or your Proxy for the call.) For each issue, following the statement of the BLM Issue Direction, there are internal notes on the BLM's high-level messages, previous concerns from USFWS, and short summaries of the concerns we have heard from the state directors. (These sections are for our use and will not be shared with the USFWS.) I am continuing to reach out to some of you state directors today to discuss these items and encourage you to bring up concerns which are not noted in this document on the call this afternoon.

I have also attached the "Allocation Table" which shows areas of consistency with the NPT guidance. Again, please do not share this widely.

Important Note: None of this is yet final; after discussions today with you and the meetings with USFWS on Friday and Monday, we will be meeting with the Secretary on Tuesday. We anticipate that we will have final information to share then.

We look forward to the discussion at 3:30 eastern time (1:30 mountain and 12:30 pacific). ed

Hi Vicki, Stephanie, and Frank,  
Please see the attached. The actual amount would be less since we are already having them do fine scale habitat mapping for our PHMAs which would give us the sagebrush density info they describe here. I have also attached a report of the work they have already completed for us in one of the core areas. Just wanted you to be aware of this potential methodology for getting good sagebrush maps throughout the west that would be much better than the current west-wide habitat data we are currently using. Open Range has a working relationship with ESRI and are looking to be able to deliver this information via a web portal for managers. Gregg Simonds will be in DC in early Feb. and may be contacting you Steph and Vicki to see if he can arrange a visit and discuss this more fully with you. J

John

I really enjoyed the visit too.  
Thanks for the map.

Attached is my proposal to get the % sagebrush cover throughout the state this winter. This work could be analyzed to assess Habitat Degradation and Energy and Mining Density but they are not part of this proposal.

Please let me know what you think and i'd be happy to answer any questions.

<open range priority core areas.pdf>

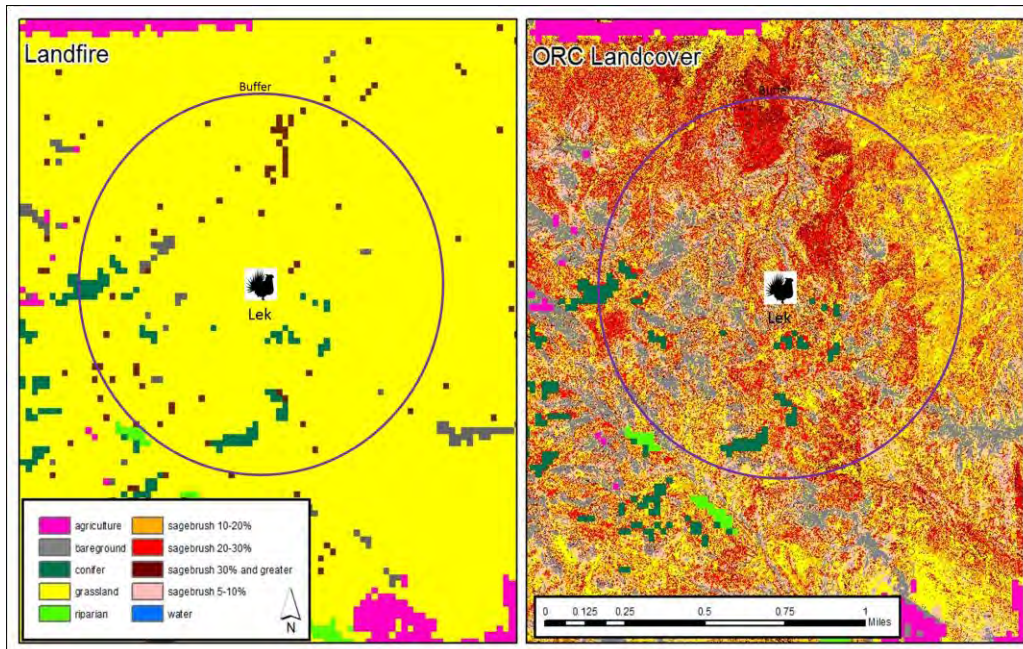

John

**Open Range Consulting (ORC) proposal to assess % sagebrush throughout Montana using a quick and inexpensive (\$.04/ac) method that has accuracy between 70 - 90% and can be completed this winter (2015).**

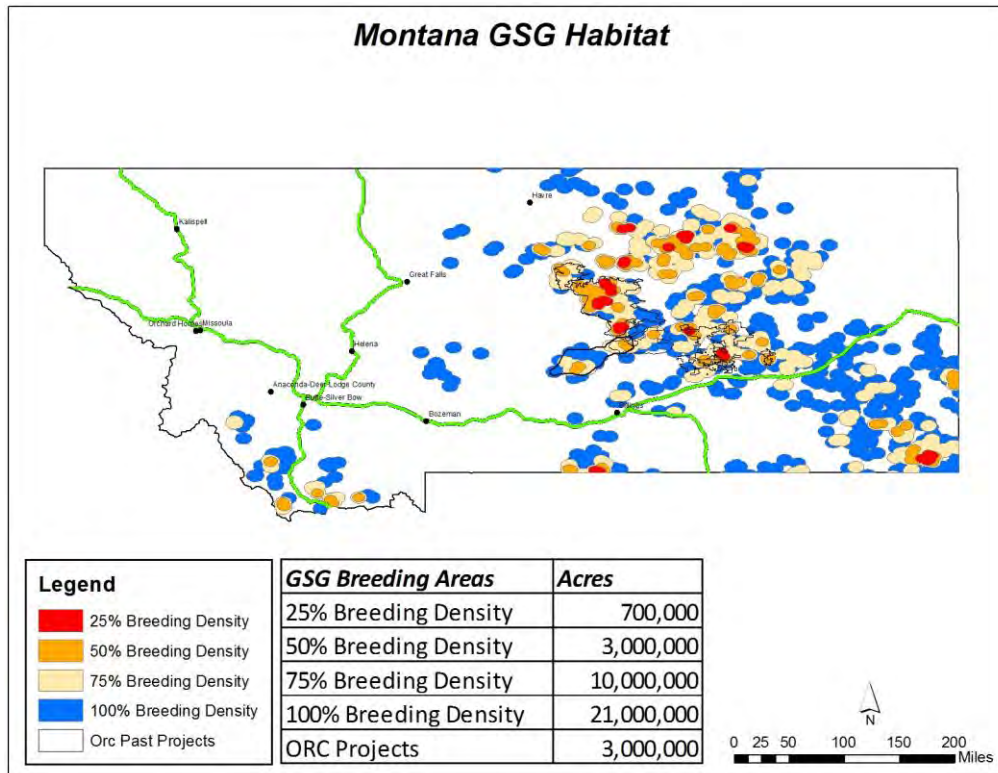

The Sage-Grouse Habitat Assessment Framework (HAF) states that landscape conservation is a scale-dependent process whereby priority landscapes are identified across the species range (broad-scale) and the appropriate conservation actions are implemented within seasonal habitats to benefit populations at the site scale (Stivers et al. 2010). The BLM and USFS (The Greater Sage-Grouse Monitoring Framework, 2014) states “this multi-scale monitoring approach is necessary, as sage-grouse are a landscape species and conservation is scale-dependent to the extent that conservation actions are implemented within seasonal habitats to benefit populations”. Further, it states “the tendency to look at a single indicator of habitat suitability or only one scale limits managers’ ability to identify the threats to sage-grouse and to respond at the appropriate scale.

The Greater Sage-Grouse Monitoring Framework identified 18 threats contributing to the destruction, modification, or curtailment of sage-grouse habitat or range. These 18 threats have been aggregated into three broad- and mid-scale measures, one of which is; Sagebrush Availability (percent of sagebrush per unit area). The best currently available imagery to assess % sagebrush is LANDFIRE EVT. The Greater Sage-Grouse Monitoring Framework, 2014 recognize that current data sets might be “inadequate” and “will strive to develop or obtain information to fill these data gaps” if needed.

The following figure illustrates the difference between Landfire EVT and the ORC’s proposal assessment at the exact same area around a GSG lek in Montana. The left panel depicts LANDFIRE EVT capabilities, whereas the panel on the right depicts ORC’s proposal’s capabilities. We believe that our proposed % sagebrush cover map will provide the accuracy necessary to jump start the decision support needed in GSG planning. Further, our map work can be used to enrich future broad scale readily available imagery and it can be served through ERSI platform (either via internet or cloud).

Budget:		
	Imagery Preprocessing	\$ .01/acre
	Field Photography	\$ .015/acre
	Analysis	\$ .02/acre
Total		\$ .045/acre

**Total Cost to do all of Montana GSG habitat \$900,000**

**Cautionary Note:** We have only “dry lab” this procedure using newly available 1- foot aerial imagery from ERSI and we validated processes’ estimate our % sagebrush estimates using photos that we have taken from our previous fieldwork. Our dry lab analysis, both in Utah and Montana, has shown that it is very promising that we can accurately assess the % of sagebrush using our process. We believe that we can put our equipment (camera, computer software, hardware) into a pod and take the pictures from a helicopter. We haven’t done the helicopter part yet but assume enough though we haven’t done our photos from a helicopter it has a very high change of working well. Because, airborne pods have already been developed for this purpose, are inexpensive and readily available.

**Potential:** Taking pictures via a helicopter will give us a tremendous range and coverage in a short amount of time (million acres per day). These pictures couple with the 1 foot imagery and our techniques that we’ve developed to integrate them provides a unique opportunity to get much more accurate ( $r^2=0.70-0.90$ ) and differenced assessment of sagebrush % over statewide scales than is currently available. This assessment would allow strategic planners to have confidence in the accuracy of sagebrush cover throughout the state. This cover estimate can be overlaid with the priority GSG areas and their leks throughout the state of Montana and planner could then estimate limitation to seasonal habitat for local populations. Identifying opportunities and limitation would enrich the state wide strategic planning efforts by helping to prioritize where the “biggest bang for the buck”, in time and money, would be best spent on local efforts to preserve and enhance habitat. It would also identify who would be needed in making projects happen, what administrative steps would be needed, who could be potential funders and both ecological and economic validation for the actions. Finally, it would help our field assessment using photographic ground sampling that provides details of understory conditions to estimate range land conditions (ecological states), treatment potential, feedback on effects of management actions and change detection.

## **Introduction/Background**

Open Range Consulting (ORC) contracted with the Bureau of Land Management (BLM) to assess important ground cover attributes of sage-grouse habitat of the Winnett area within the state of Montana using geospatial technology. With the potential listing of sage-grouse as a threatened species, this project is part of a concerted effort to assess the condition of sage-grouse habitat at a landscape level. The Winnett Project Area (WPA) corresponds to Montana's Core sage-grouse Areas 3 and 5 and has significant sage-grouse populations representing two of twelve core areas in the state. These core areas have the greatest breeding densities in the state. They are only a third of all of Montana's sage-grouse habitat acreage but have 75% of all the known breeding sage-grouse. The information contained in this report and its associated deliverables will support management efforts to protect and enhance sage-grouse habitat in Core Areas 3 and 5.

In order to assess the important characteristics of sage-grouse habitat, ORC delineated rudimentary but very important habitat conditions throughout the entire project area. On the uplands, this included the percent cover of sagebrush, bare ground, and herbaceous matter. For drainage areas, it included the amount of late summer riparian vegetation within the Potential Riparian Area (PRA). ORC's ability to assess rudimentary ground cover conditions over an entire landscape, robustly describes the area's functionality, can detect trends, and allows for the analysis of the relationship between management action (e.g. grazing and land treatments) and conditions.

The deliverables of this project have unlimited potential to be used as information in creating management plans. They provide not only a baseline, but also a replicable technique for future assessment of implemented plans. Because the assessments are at a landscape level, places that have had management success can be documented. These successes can then be used as examples to change management where the results have not been successful. For example, a drainage reach with increasing or stable green vegetation can be identified. Management practices resulting in increases can be examined and then be applied to a stream reach that has decreasing or unstable riparian vegetation.

## **Geographic Overview**

The WPA is 1,481,063 acres, located in Central Montana. The town of Winnett is largely surrounded by it. It is part of sage-grouse Core Areas 3 and 5. The size and location of the project area was selected in consultation with Mathew Comer, wildlife biologist, Lewistown District BLM. The project area was chosen based on high lek densities, public land ownership, and budget constraints. The landscape is characterized by flat to rolling hills topography with intermixed croplands, grasslands and sagebrush dominating the aspect. Sagebrush and thus sage-grouse habitat is associated with clay soils that are not amendable to farming. Sagebrush areas are grazed except for Conservation Reserve Program (CRP) lands. These lands were historically cropland that was converted back to mostly grass species. Elevations range from 2,475 feet to 4,050 feet. Figure 1 shows the location of the study area in relation to nearby towns and its location within Montana.

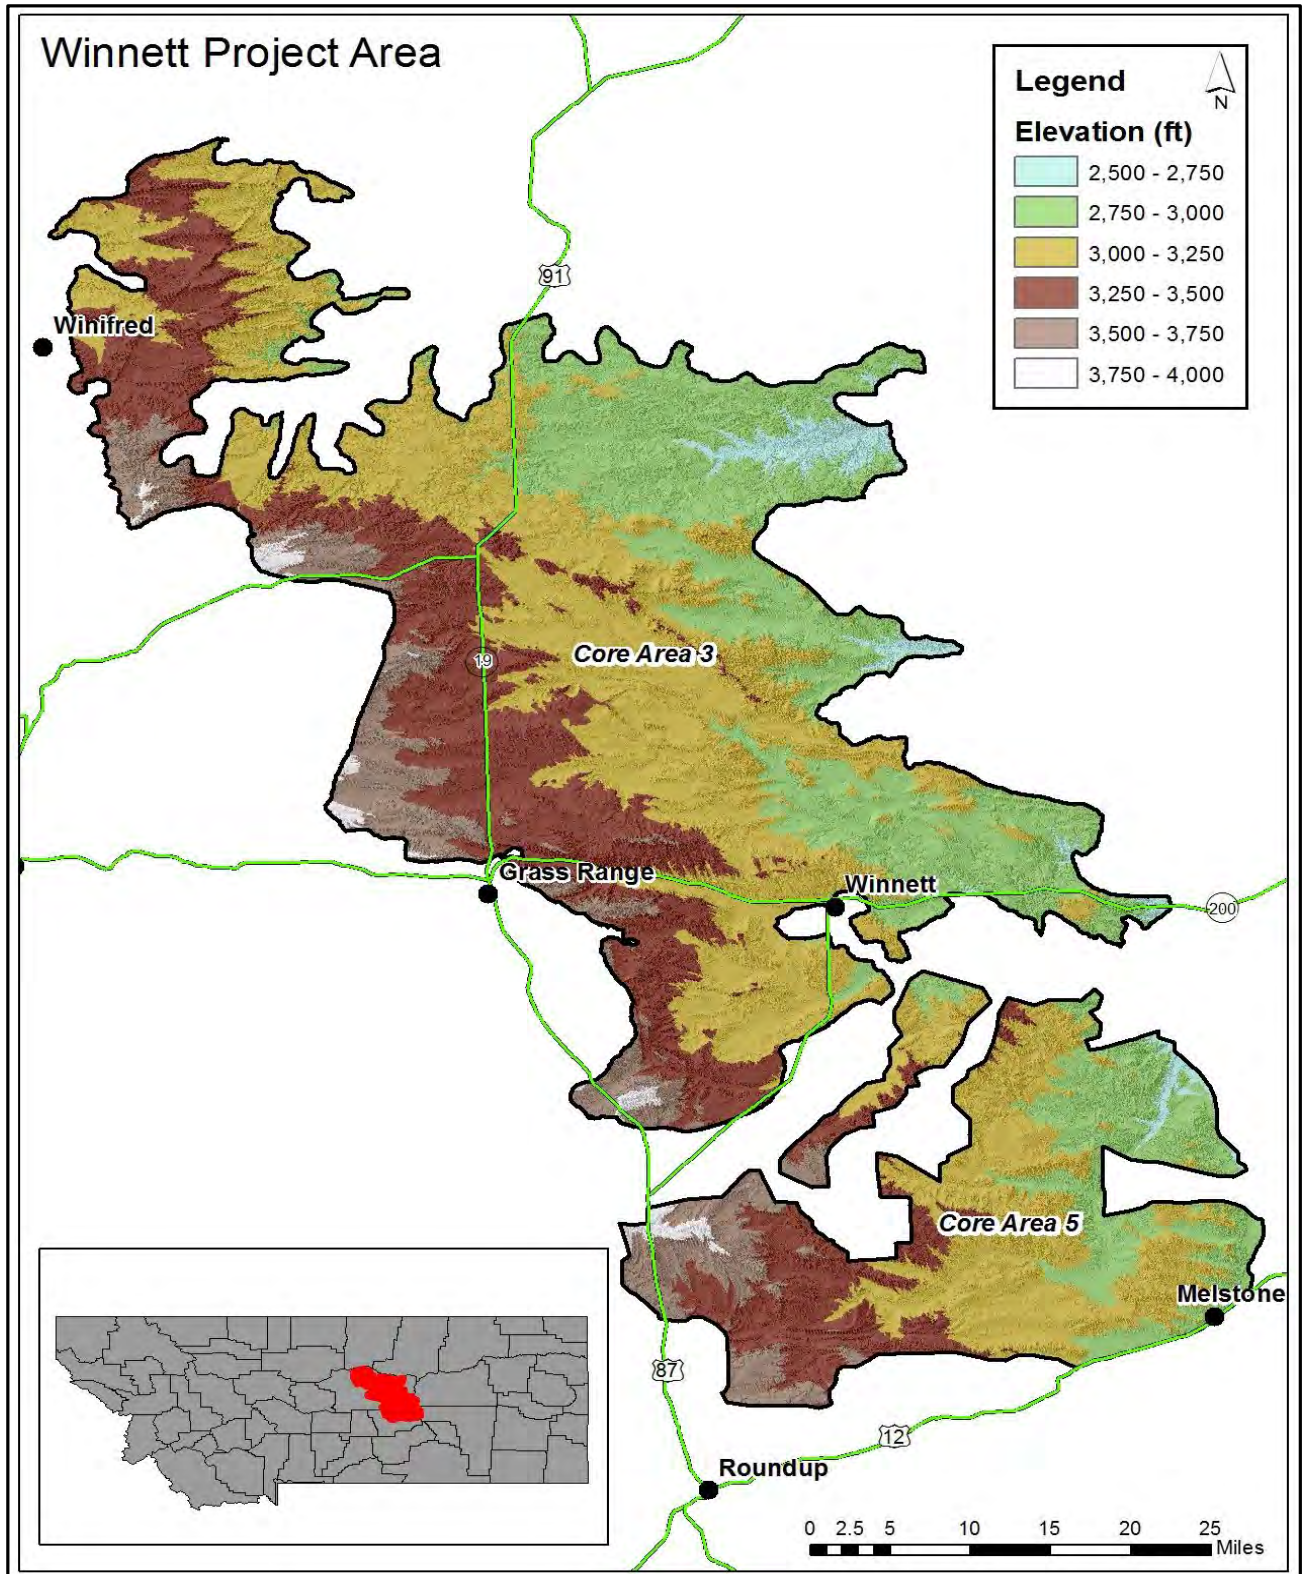

Figure 1. Winnett Project Area

## **Deliverables**

The body of this report is organized in response to the actual deliverables in the contract. For each deliverable, there is an explanation of the method followed by examples of the deliverables in map and/or tabular format.

- A 30m resolution map of dominant landcover and the associated ground sample database
- Continuous cover samples of functional groups of bare ground, herbaceous, litter, and shrub using Ground Based Vertical Photography (GBVP).
- Continuous cover maps of the functional ground cover groups of the entire project area at 1m and 30m resolution
- An assessment of riparian condition and trend over time
- Estimate of upland areas with greater site potential (areas of accumulation)
- An assessment of sagebrush cover and trend over time
- Procedures/information for consistent follow-up monitoring to produce the same results.
- A geographic database that contains all of the above information in common GIS formats

## **Dominant Landcover**

The Northwest Regional Gap Analysis (NWReGap) (Davidson et al., 2009) and Landfire (USDI-USGS Landfire) vegetative classification methods were developed to describe dominant vegetation cover types on a statewide basis by correlating ground samples to satellite imagery. It classifies a landscape by the dominant aspect of vegetation cover (e.g. sagebrush, grasslands, greasewood, conifers, etc.). ORC's dominant landcover map for the WPA was based on the same principles but customized and enriched to provide more focus on mapping the important landcover types of grassland and cover classes of sagebrush at a much finer scale. Figure 2 illustrates the concept of landcover types. The foreground is represented by sagebrush, an area behind the fence is dominated by perennial grass, and the distant hills show areas dominated by conifer.

Figure 2. Dominant Landcover

By focusing on and augmenting the samples within the sagebrush and grass landcover types, it was possible to differentiate sagebrush cover into four landcover levels (5-10%, 11-20%, 21-30%, and >30%). These categories are associated with early and late brood rearing as well as winter habitats for sage-grouse. Thus, they have greater spatial resolution of important sage-grouse habitat types. Figure 3 demonstrates the difference in resolution and precision of the Landfire datasets and ORCs landcover product when zoomed in to the same place and geographic extent.

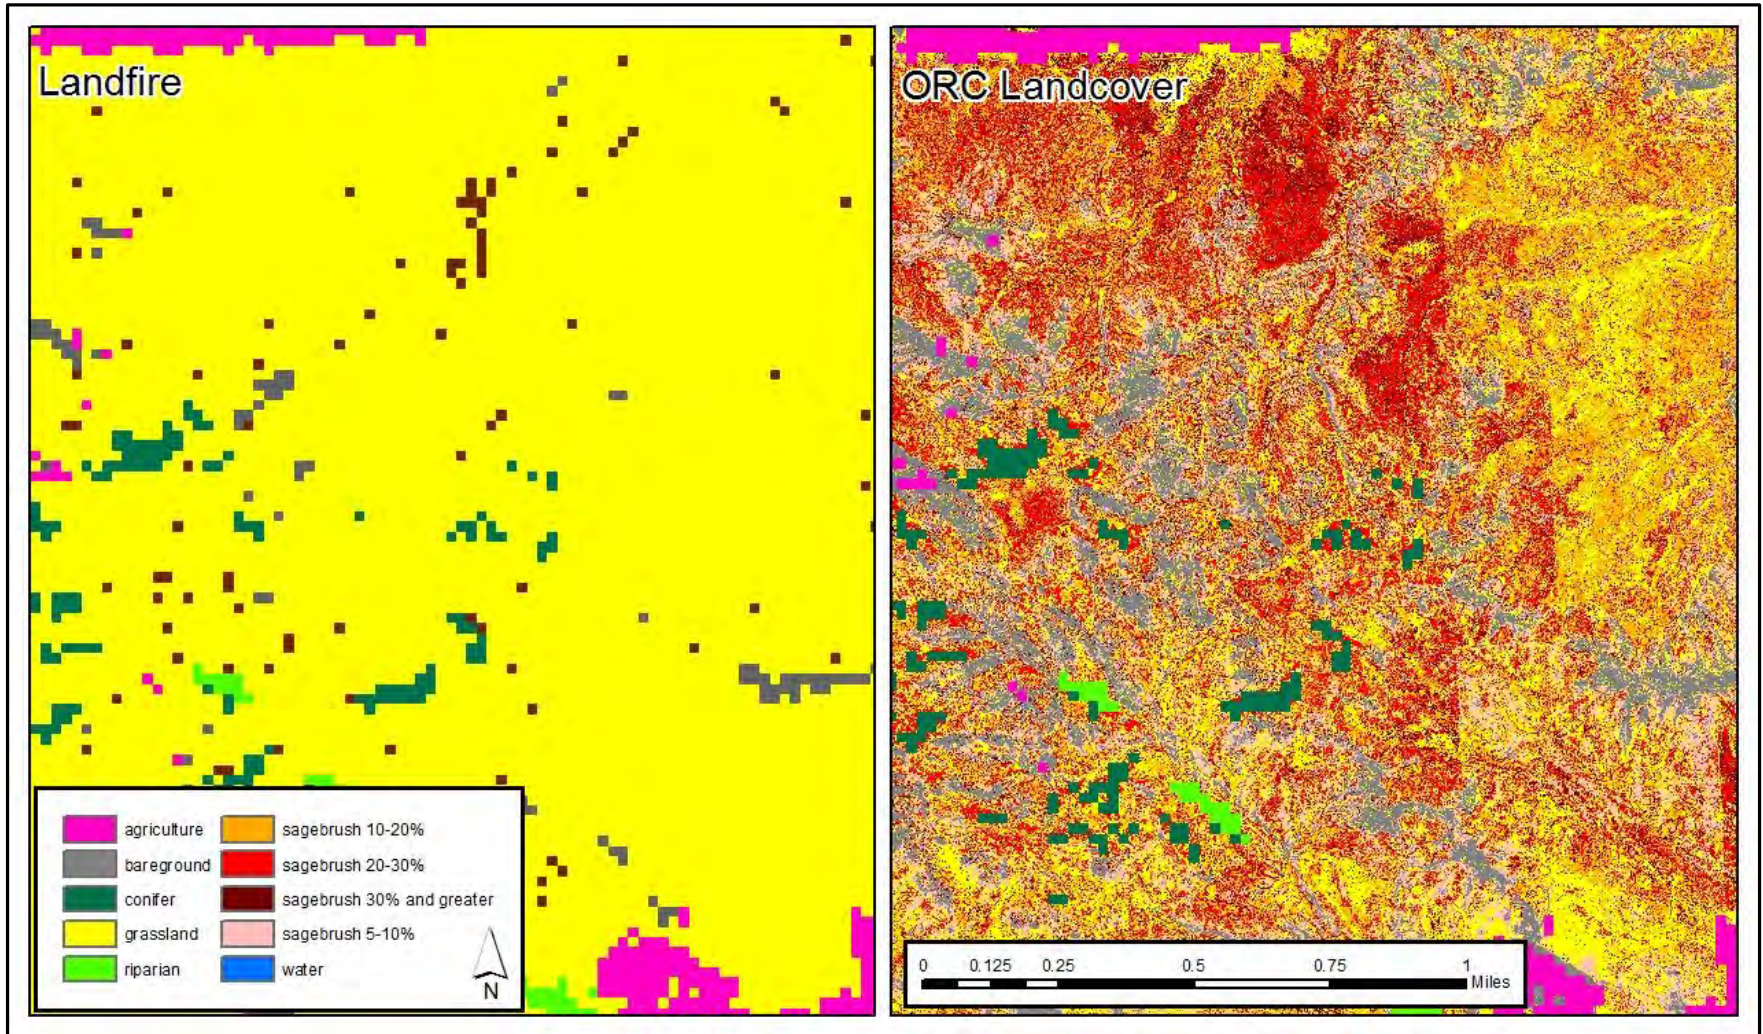

Figure 3. Landfire vs. ORC Landcover

For landcover types not associated with sagebrush and grassland (including riparian, conifer, and agriculture), the Landfire dataset was used for the landcover map. Water bodies were acquired from the 2003 Tiger file obtained from the Montana Natural Resource Information System (Montana NRIS). ORC mapped 1,481,063 acres within the WPA. Table 1 lists the acreage and percent of each landcover class. Figure 4 is the dominant landcover map. This map shows the geographic distribution of the landcover types, including the four sagebrush classes.

Table 1. Acres of Dominant Landcover

<b>Landcover</b>	<b>Acres</b>	<b>Percent</b>
Grassland	536,934	36%
Sagebrush 5-10%	203,161	14%
Sagebrush 10-20%	166,794	11%
Sagebrush 20-30%	197,806	13%
Sagebrush > 30%	57,048	4%
Bare ground	91,918	6%
Agriculture	161,803	11%
Riparian	53,238	4%
Water	2,255	0%
Conifer	9,738	1%
<b>Total</b>	<b>1480695</b>	<b>100%</b>

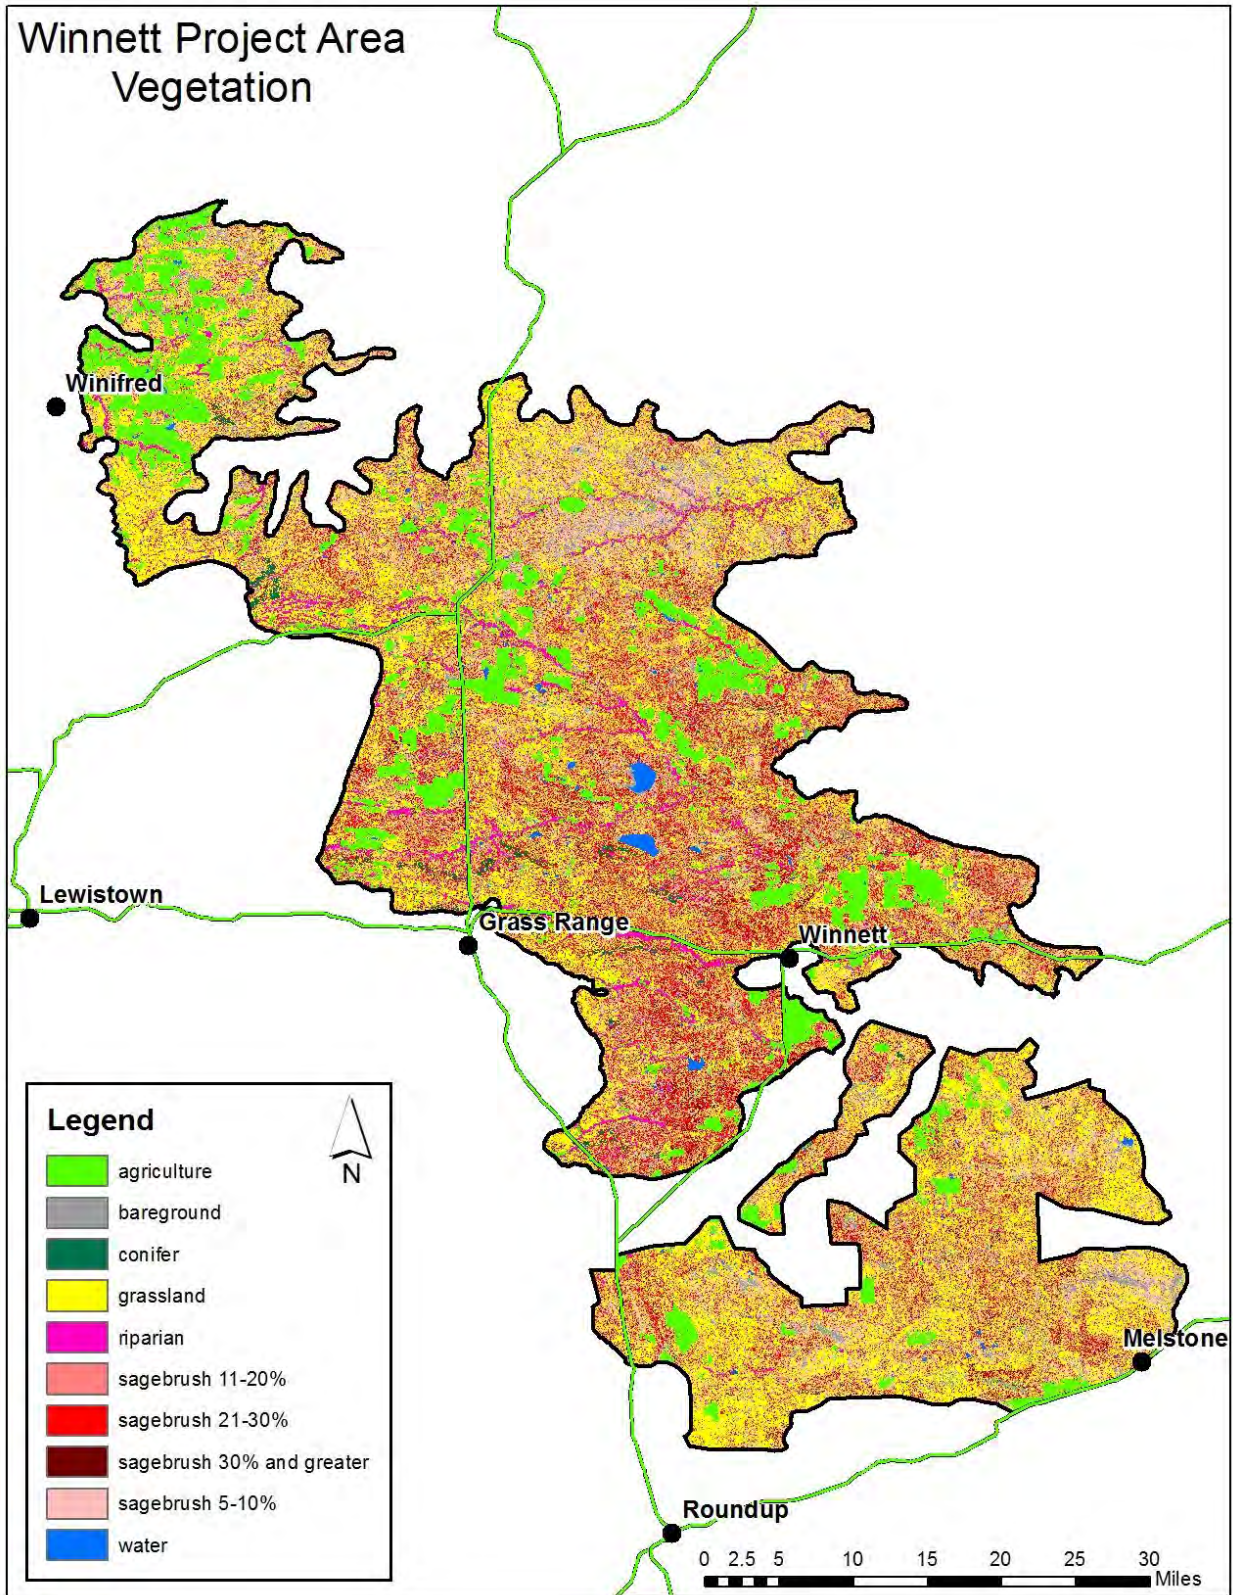

Figure 4. Dominant Landcover

Sage-grouse are sagebrush obligates but seasonally optimize the use of a landscape based on nutritional, cover, and security needs. Percent sagebrush cover offers important seasonal advantages to sage-grouse. Low and moderate density sagebrush with high diversity can be good early brood rearing habitat because of high insect densities while high-density sagebrush is preferred when nutrition demands are lowest and cover very important.

Grass height has been shown to be important to increased nest success and population growth in a Montana study (Taylor et al. 2011). Precipitation, grazing, and rangeland health determine grass height annually. Our methodology cannot measure grass height directly but does measure bare ground. Bare ground is a very important indicator of rangeland health and the effectiveness of precipitation. When bare ground is within the standard for the range site then infiltration of precipitation is within a normal range. Annual weather condition cannot be affected by management but bare ground can be. As bare ground is decreased then plant growth, length of green vegetation period, and duration of stream flow can be optimized for the site potential. Thus, measuring bare ground and being able to detect its change is very important in knowing how management is affecting habitat.

Cropland and riparian areas can serve as important late brood rearing areas to provide green plants, which is especially important in drought years. Sage-grouse prefer to use the edges of cropland near sagebrush cover. Spatial diversity and mixing of important different sage-grouse habitat conditions within a few miles can be positive for sage-grouse because it can minimize their movement to meet their seasonal needs and minimize mortality due to predation.

Our fine scale spatially explicit map shows the intermixing of these dominant landcover types and resource managers can infer what areas would be best for preservation, improvements, and where it would most advantageous to convert agriculture into habitat to enhance sage-grouse population. Converting large blocks of sagebrush to agricultural production is the largest threat to sage-grouse population in the State of Montana.

## Continuous Cover Samples and Maps

ORC's continuous cover mapping product denotes the percent cover of bare ground, herbaceous, and shrub cover over the entire project area. The process began with the collection of many ground samples in the summer of 2013 across the landscape using the GBVP platform. The GBVP images were then classified into the four basic ground cover components of bare ground, herbaceous, shrub, and litter cover. Next, a correlation was developed between the GBVP samples and NAIP imagery. The NAIP imagery covered the entire project area. These steps created a continuous cover map for the project area. The following dialog describes the individual steps of this process and strengths of the relationships developed between the imagery (Sant et al. 2014).

A total of 260 GBVP images were acquired and analyzed for the WPA. The GBVP platform consisted of a camera ten to twelve feet above the ground that took a picture that was approximately 6m by 7m. High precision GPS marked the center point of the of the GBVP image. Figure 5 is a photo showing the GBVP platform.

Figure 5. The GBVP Platform

The resulting photograph had a pixel resolution of 2mm resulting in 18 million sample points per GBVP image. Each pixel in the image was then categorized into bare ground, litter, shrub, and herbaceous cover. Figure 6 is an example of a GBVP image and its classification.

Figure 6. GBVP Image and Its Classification

NAIP imagery was flown at nearly the same time as the GBVP points collected for the WPA in the summer of 2013. A strong correlation was developed between the GBVP imagery and the 2013 NAIP imagery using Classification and Regression Tree (CART) analysis. The correlation was used to create a 1m assessment of the basic continuous cover groups across the WPA. To assess the accuracy of the continuous cover products 20% of the GBVP samples were withheld from the model and then compared to the predicted continuous cover values. Table 2 lists the R<sup>2</sup> values of these samples for the continuous cover types across the WPA.

Table 2. Correlation Coefficient (R<sup>2</sup>) of Withheld GBVP to 1m NAIP Modeled Continuous Cover

	R <sup>2</sup>
<b>Bare ground</b>	0.84
<b>Herbaceous</b>	0.73
<b>Shrub</b>	0.67
<b>Average</b>	0.75

The accuracy of the shrub continuous cover was slightly below ORC’s target level of having an R<sup>2</sup> above 0.70. Extensive ground-truthing of the shrub product determined that it was generally very accurate. The discrepancies were limited to transition areas between shrub and grasslands, riparian areas, and agricultural areas. Note the high level of detail of the shrub continuous cover in Figure 7. The polygon indicates a sagebrush removal treatment that was seeded to crested wheatgrass. This treatment that is a few years old generally shows sagebrush cover as being between 1 and 5%. Note the error in the line of the outside perimeter of the treatment.

Figure 8 illustrates the accuracy of the herbaceous and bare ground continuous cover mapping. Roads show up in the low herbaceous category (1-10%) and high bare ground category (80-100%). Drainage ways that likely are dominated by riparian vegetation tend to be classified in the greater than 80% category for herbaceous cover and the less than 10% category of bare ground.

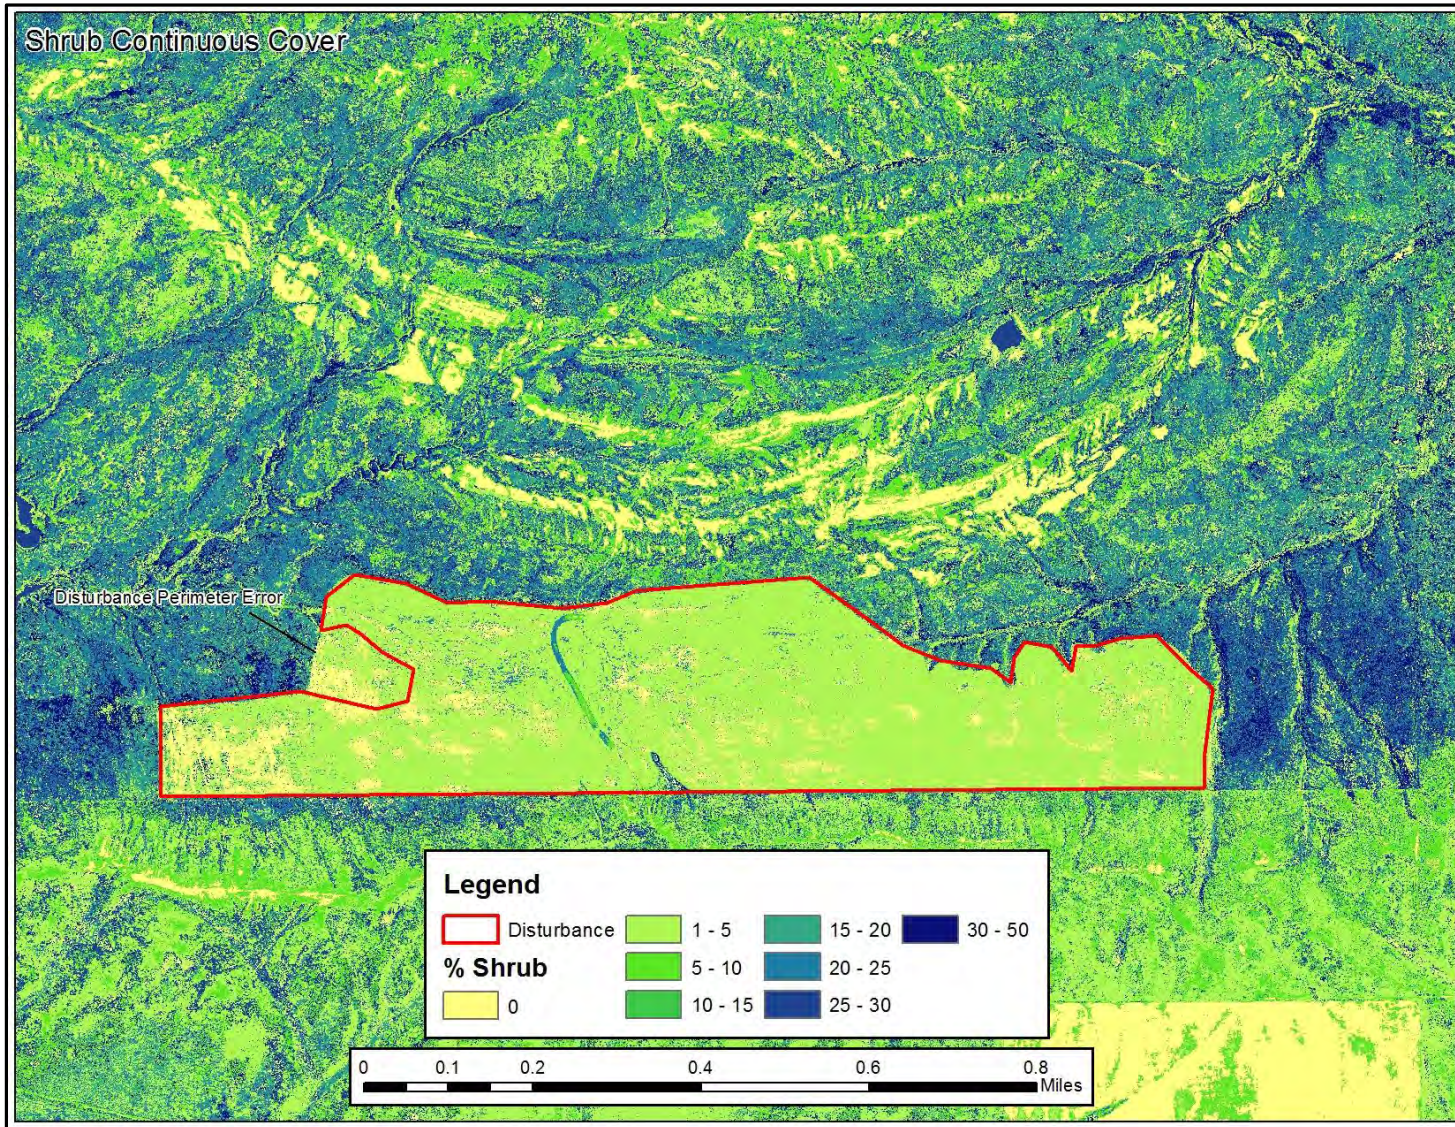

Figure 7. Shrub Continuous Cover Example

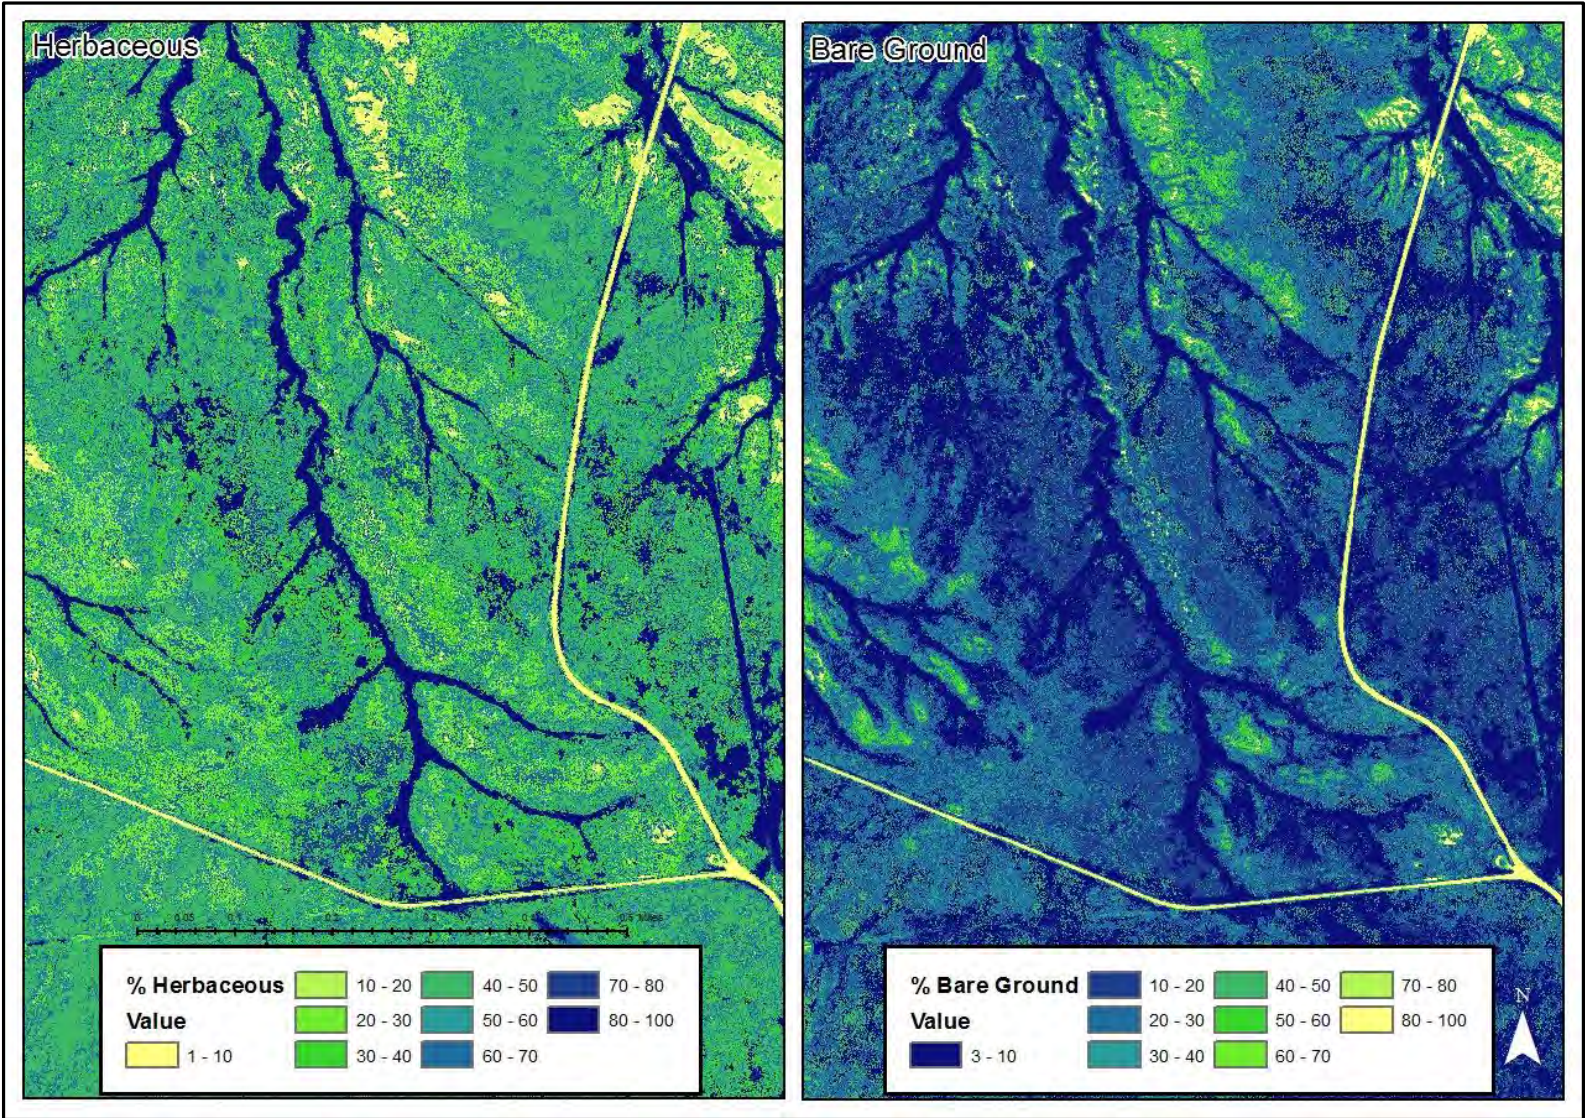

Figure 8. Herbaceous and Bare Ground Continuous Cover

## Riparian Assessment

The riparian deliverable was an assessment of condition and trend over time on 32 stream miles. The stream segments were determined by Mathew Comer, Wildlife Biologist, Lewistown District BLM. The location and names of these streams are shown in Figure 9. Even though 32 stream miles were specified in the contract, ORC determined that there were actually 46 stream miles that were part of the analysis. The following section briefly describes the analysis process with maps and charts of the results.

Figure 9. Riparian Analysis Location

To compare changes of riparian vegetation over time, it was first necessary to approximate topographically where there is elevated site potential along the drainages. ORC calls this area the Potential Riparian Area (PRA). For the purposes of this report, the PRA is the area along the drainage where there is potential to have a seasonal water table or areas that have significantly deeper soils which could support vegetation that needs more soil moisture throughout the growing season.

ORC delineated the PRA using 1m NAIP Color Infrared (CIR) imagery and a combination of self-learning software and visual interpretation. The purpose of the remotely delineated PRA was to ensure geographic consistency of measured vegetation through time within the PRA. This allows for precise temporal analysis of condition and trend of the PRA.

The PRA was then divided into reaches. Stream reaches were defined and partitioned by changes in geomorphological conditions (e.g., gradient, stream substrate, and valley shape) and/or by pasture boundaries. Within these stream reaches, the ground cover conditions of the PRA were analyzed using the 2009 NAIP imagery. The amount of riparian vegetation, water, upland vegetation, and bare ground within each reach is indicative of how well the reach's PRA is functioning. Riparian vegetation during the late summer indicates a greater amount of soil moisture while upland vegetation and bare ground indicates a lack of soil moisture. Figure 10 illustrates the PRA in the left hand frame, bright red is indicative of riparian vegetation. The right hand frame also depicts the PRA as well as the riparian classification. Note the middle reach has considerably less riparian vegetation than the reaches around it.

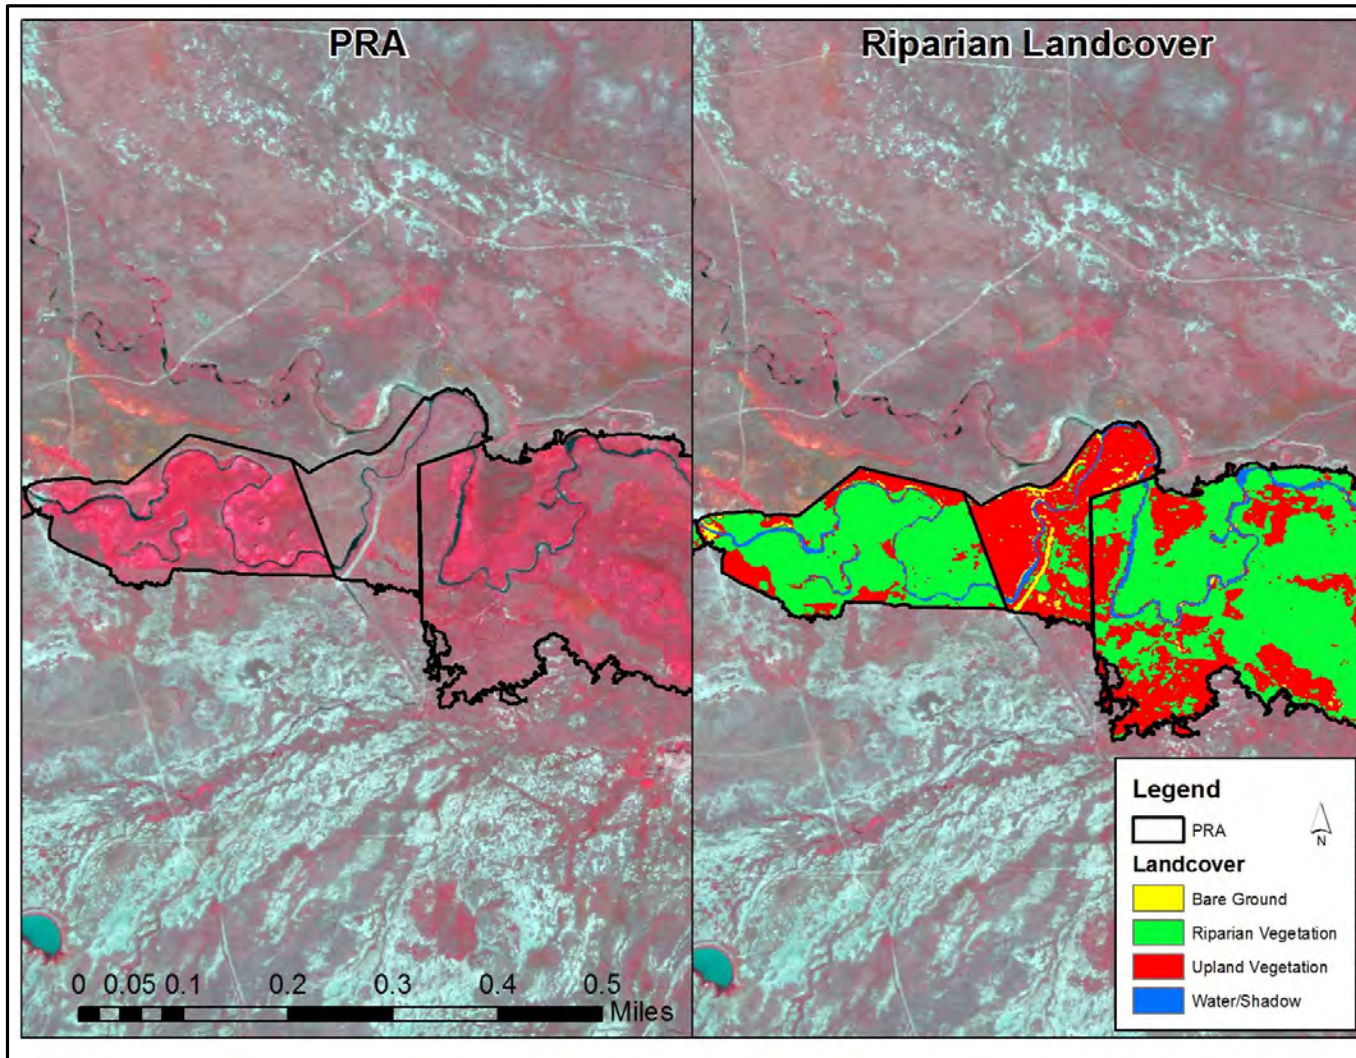

Figure 10. PRA and Landcover Example (Lower Ford Creek)

Figure 11 illustrates the results of the 2009 NAIP riparian analysis on all of the streams. The percent of riparian vegetation within each reach is shown as a three class graduated color map of 0-20%, 21-40%, and 41-100% riparian vegetation. The three classes are likely correlated to the BLM's Proper Function and Condition (PFC) assessment categories. However, without historical PFC data to fine tune the model to fit the PFC assessment there is possibly error in this assumption. Upper and Lower Ford Creek have a lot of riparian vegetation and the other creeks have less riparian vegetation.

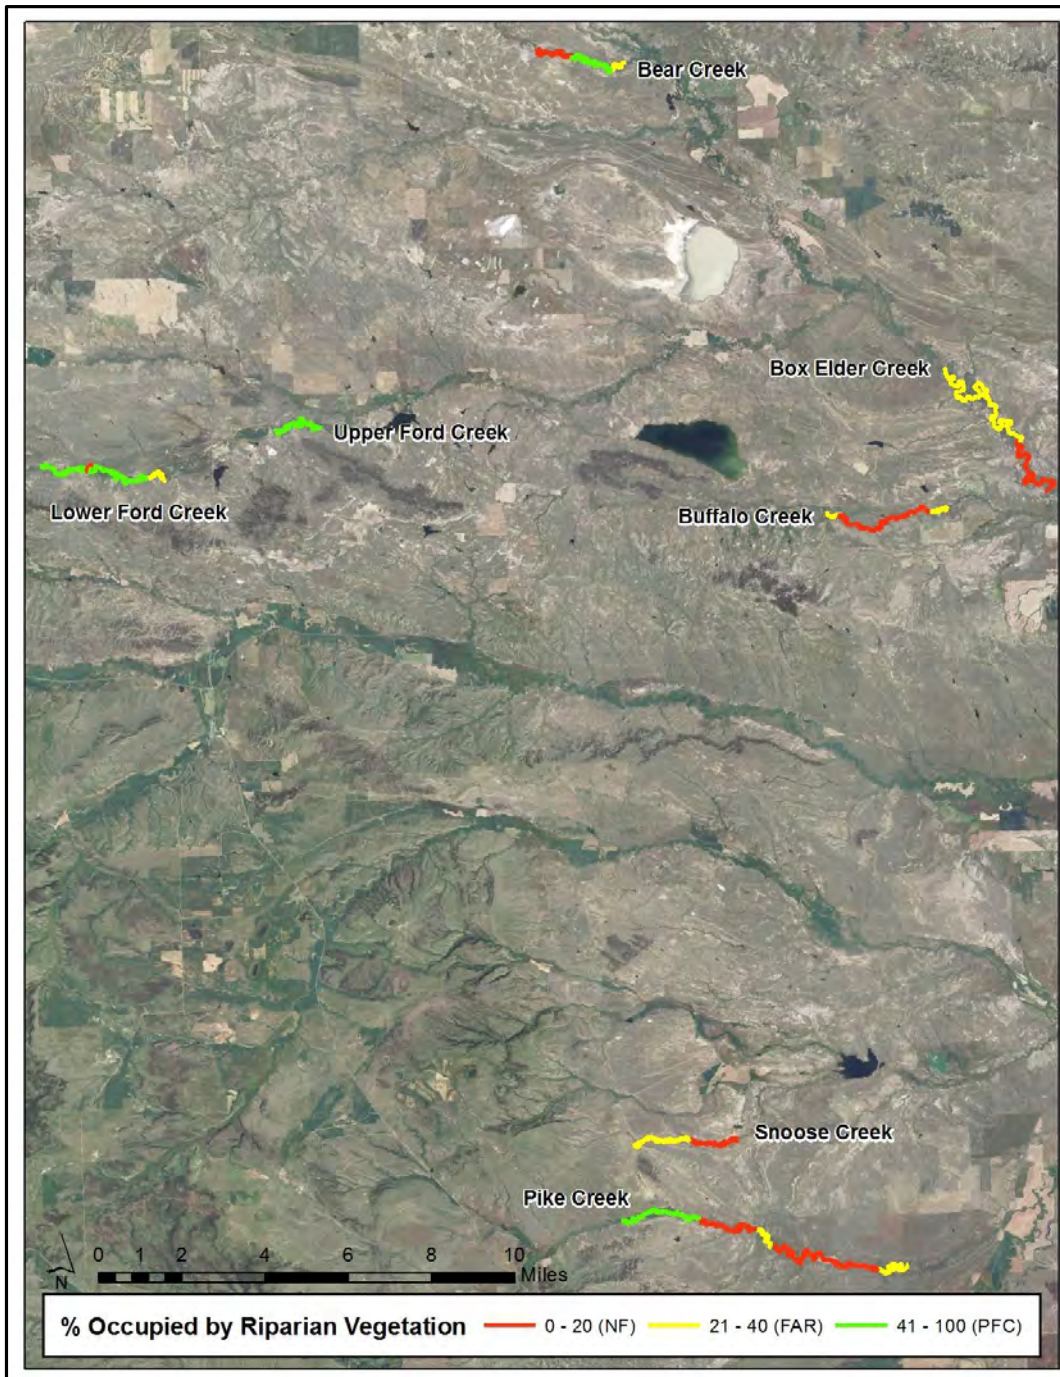

Figure 11. Analysis of Riparian Areas with 2009 NAIP Imagery

The 1m NAIP imagery analysis of riparian areas above is very accurate and precise in its depiction of riparian vegetation. What it is lacking is the ability to assess condition and trend of riparian areas over time. In order to determine condition and trend over time, it was necessary to use Landsat 30m imagery. Using the NAIP classification as the training dataset, a model was developed with 30m Landsat imagery (Booth et al. 2012). This model had an  $R^2$  value of 0.85 meaning the Landsat depiction of riparian vegetation was very similar to the NAIP depiction. Using 38 cloud free images from 1975-2011, the condition and trend of all of the riparian reaches were analyzed. Figure 12 shows the number of reaches in each of the three categories described above in each analyzed year. Note that the number of reaches in the 40-100% category has been drastically reduced after 1993 versus before 1993. This figure suggests that there was a climatic disturbance in 1993 that negatively affected a high percent of the stream reaches. These reaches still have not fully recovered. This reduction in their condition could have had negative effects of sage-grouse late brood rearing habitat.

Figure 12. Condition and Trend of Riparian Areas 1976-2011

## **Areas of Accumulation**

Areas of accumulation on uplands are sites that have a higher potential for overall plant production compared to surrounding areas. These are usually wetter places but cannot really be considered riparian areas. Vegetative responses to management changes will likely show up in these areas first. If habitat improvements were ever considered, these areas would likely have more response because of their site potential. Figure 13 shows the NAIP imagery and the areas of accumulation deliverable. Note the reddish areas in the NAIP imagery in the left hand frame are where the areas of accumulation are and are correlated to the yellow in the right hand frame which is the estimated location of areas of accumulation.

Figure 13. Area of Accumulation Example

## An Assessment of Sagebrush Cover and Trend over Time

The assessment of sagebrush cover was limited to an area of 25,000 acres. The analyzed area was determined by Matthew Comer, Wildlife Biologist, Lewistown District BLM. Figure 14 shows the location of the analyzed area. Within the analyzed area there was a large proportion of agricultural lands. These areas were masked out for the analysis. The inset of Figure 12 illustrates the extent of the masked out agricultural lands.

Figure 14. Temporal Mapping Location

To assess sagebrush cover change through time it was necessary to use 30m Landsat imagery. The methodology for processing and analyzing the imagery is discussed in length in Sant (2014). Cloud free high quality imagery is necessary to determine changes in cover over time. For the WPA, Landsat imagery was acquired in late June or early July from 1986, 1993, 2004, 2009, and 2013. Figure 15 illustrates the sagebrush cover in each of the analyzed years. Generally, there are only modest changes with slight ebbs and flows in sagebrush cover over this time period. This is what you would expect to see as sagebrush cover is usually fairly static. The one exception is in the Southwest corner where in 2004 sagebrush looks like it is reduced and then comes back in 2009 and 2013.

Even though it was not specified in the deliverables bare ground and herbaceous cover maps were also provided along with the sagebrush cover maps. The bare ground and herbaceous maps show a lot more year to year variability as would be expected as herbaceous matter is highly variable based on if and when it rains. ORC believes the sagebrush, herbaceous, and bare ground maps to be representative of conditions within the analysis area. However, with no historical ground data to check the accuracy of these predictive maps no assurance of accuracy can be made.

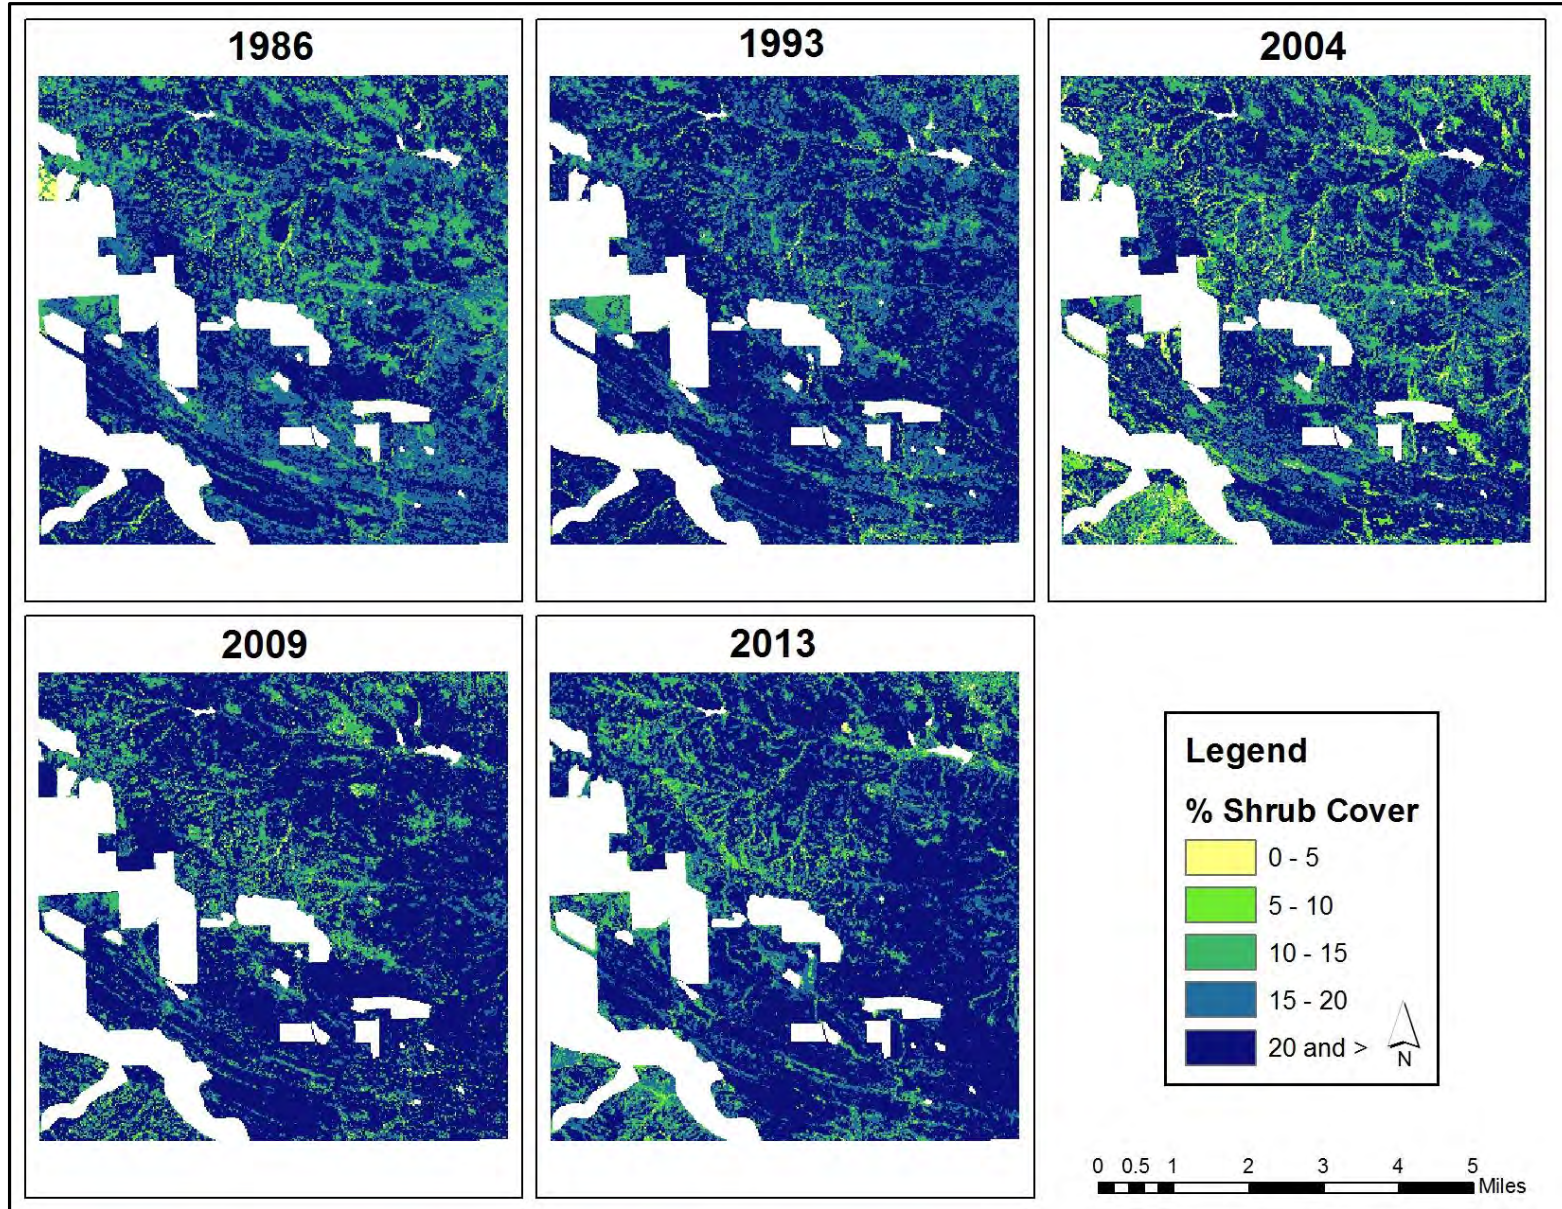

Figure 15. Temporal Analysis of Sagebrush Cover

## Follow-up monitoring

Monitoring is the key component in adaptive management. Adaptive management is an iterative process of making an initial assessment (which is what this project is), making management changes based on that assessment, and then monitoring the results of that management action. Because of the necessity of future monitoring a write-up of how to proceed with future monitoring was requested as one of the deliverables. The procedures and information for consistent follow-up monitoring to produce the same results for the WPA are described in this section.

There are two processes with different levels of cost and accuracy that can be employed for future upland monitoring. The first process uses 30m Landsat imagery. This process is similar to what was used to provide the temporal products for this project. The fine scale data collected in 2013 can be leveraged to 30m Landsat data and then modeled into the future for each successive year when there are high quality cloud free images available. In order to ensure the accuracy and precision of this information, some level of field ground truthing should be incorporated. This could include line transects, ocular estimates, or known treatments that cover 100m<sup>2</sup>. This process is fairly cost efficient with a limited amount of ground sampling. Because it is based on 30m Landsat imagery, it is less precise geographically.

The second process repeats the method used to create the 1m continuous cover products for this project. The GBVP images would be re-taken at the same locations and then reclassified to determine their current cover conditions. This process would need to be timed so it occurred within the same growing season of a NAIP flight. NAIP imagery is acquired for each state roughly every three years. The GBVP classifications would then be used to create new 1m continuous cover maps for the WPA with the current cover conditions. This process is more expensive because it includes much more extensive ground sampling. Because it is based on 1m NAIP imagery, it is much more precise geographically.

Using GBVP imagery as the most basic unit of sampling is advantageous over any other kind of monitoring as it preserves the assessment in the photograph. For example the conditions of a specific line transect can never be perfectly repeated. Sun angle, wind velocity, and simply how the transect falls means the line transect can never be read exactly the same again. The GBVP image captures and preserves ground conditions as they are at that precise moment. This image can then be revisited and analyzed differently with advanced technology or for other resource questions that may arise. Additionally, these photos are far more efficient in sampling landscapes and much more precise in determining ground cover than line transects (Pilliod and Arkle 2013).

Follow-up efforts in riparian monitoring are generally very cost effective, precise, and timely. Because the PRAs have been created for this project all that is needed for future monitoring of these same riparian areas is imagery. Because the extent of the PRA does not change, landcover changes within the PRA can be compared over time. Future monitoring can be accomplished with 30m Landsat imagery using the same techniques described above. Additionally, new classification can be made within the PRA for every NAIP image acquisition. If NAIP imagery

is not available in a specific year, 1m satellite imagery (e.g., Ikonos, Quickbird, Pleides) can be purchased along riparian areas for a very reasonable cost.

## Geographic Database

All of the data collected and created for the WPA were organized and placed on an external hard drive which contains geographic databases that can be accessed via ESRI ArcGIS products. Figure 16 is a visual diagram of the organization of the structure. Following the diagram is an in-depth description of each of the pieces of the geographic database. Note that some of the deliverables call for 30m products. Because of the timing and available imagery for this project, all upland products were delivered at the 1m scale instead. The 1m scale data being more accurate, precise, and descriptive of the WPA than 30m data would have been. Metadata for each geospatial file can be accessed in ESRI ArcMap under the description tab.

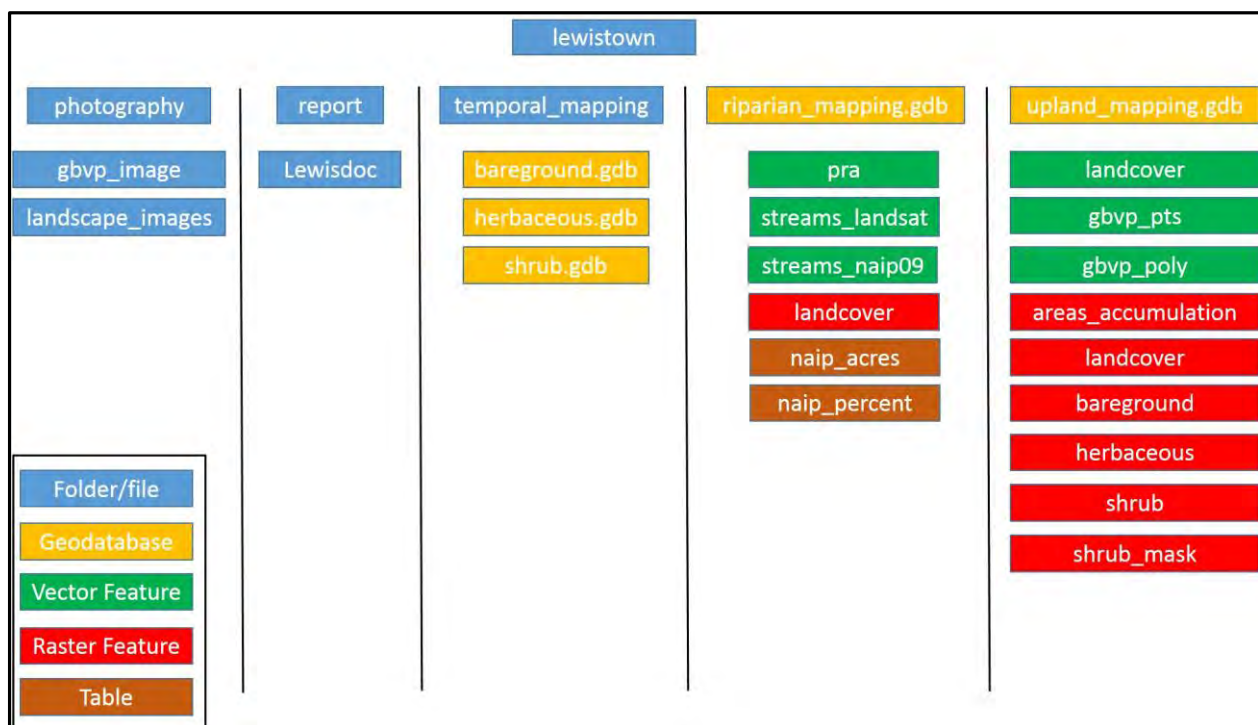

Figure 16. Geographic Database Schematic

**Photography**-This folder contains the landscape and GBVP photographs taken for the project

- Gbvp\_images-GBVP images in .tif format. These images are named to coordinate with the gbvp\_pts and gbvp\_poly features.
- Landscape images-A landscape photograph was taken at each sample site with an obvious landmark in the background. These images are in .jpg format and are named to coordinate with the gbvp\_pts and gbvp\_poly features.

**Report**-This folder contains this report in .doc and .pdf format

**Temporal\_mapping**-This folder contains three ESRI file geodatabases labeled bareground, herbaceous, and shrub.

- Bareground.gdb-There are five raster datasets within this geodatabase. They are bg86, bg93, bg04, bg09, and bg13. Each is a 30m resolution representation of bare ground for the year associated with the raster's name. To visualize in ESRI ArcMap, symbolize by value.
- Herbaceous.gdb-There are five raster datasets within this geodatabase. They are herb86, herb93, herb04, herb09, and herb13. Each is a 30m resolution representation of herbaceous cover for the year associated with the raster's name. To visualize in ESRI ArcMap, symbolize by value.
- Shrub.gdb-There are five raster datasets within this geodatabase. They are shrub86, shrub93, shrub04, shrub09, and shrub13. Each is a 30m resolution representation of shrub cover for the year associated with the raster's name. To visualize in ESRI ArcMap, symbolize by value.

**Riparian\_mapping.gdb**-The datasets contained in this ESRI file geodatabase describe riparian conditions with current (2009) and temporal (1975-2013) analysis.

- PRA-A vector polygon dataset that geographically depicts the PRA and reaches of each analyzed stream. The tabular data associated with this feature dataset includes the name of the reach and how many acres are in that reach's PRA.
- Landcover-A 1m resolution raster dataset that depicts the landcover within the PRA of all of the analyzed streams derived from the 2009 NAIP. The landcover classification includes riparian vegetation, bare ground, upland vegetation, and water/shadow. To visualize in ESRI ArcMap, symbolize by landcover.
- Streams\_naip09-A vector line dataset that geographically depicts the stream and reaches of each analyzed stream. There is a relationship between this feature and the tables named naip\_acres and naip\_percent. These tables contain the information derived from the 2009 NAIP classification. When streams\_naip09 is visualized in ESRI ArcMap, each reach can be clicked on with the inquire tool and the percent and acreage of the classification will be displayed in the results window.
- Streams\_landsat-A vector line dataset that geographically depicts the stream and reaches of each analyzed stream. The tabular data for this feature dataset includes the percent riparian vegetation of that reach's PRA derived from the 30m Landsat imagery.

**Upland\_mapping.gdb**-The datasets contained in this ESRI file geodatabase include the field samples and the continuous cover deliverables.

- Project\_area-A polygon feature that geographically depicts the WPA.
- Gbvp\_poly-A polygon feature that geographically depicts the footprint of the GBVP image. The tabular data includes the percent cover of bare ground, litter, herbaceous, and shrub cover within the footprint. The GBVP photo can also be accessed either through the table or by using the inquire tool.
- Gbvp\_pts-A point feature that geographically depicts the center point of the GBVP image. The tabular data includes the percent cover of bare ground, litter, herbaceous, and shrub cover within the footprint. The landscape photo can also be accessed either through the table or by using the inquire tool.

- Landcover-A 1m depiction of the landcover for the WPA. This dataset was derived from the 2013 NAIP imagery. To visualize landcover in ESRI ArcMap, symbolize by landcover
- Shrub-A 1m depiction of the shrub cover for the WPA. This dataset was derived from the 2013 NAIP imagery. To visualize shrub cover in ESRI ArcMap, symbolize by value. This dataset represents the shrub cover estimate for the entire WPA.
- Shrub\_mask-A 1m depiction of the shrub cover for the WPA. This dataset was derived from the 2013 NAIP imagery. To visualize shrub cover in ESRI ArcMap, symbolize by value. This dataset represents the shrub cover estimate but has had agricultural, riparian, and conifer landcover areas masked out to represent 0% shrub cover.
- Herbaceous-A 1m depiction of the herbaceous cover for the WPA. This dataset was derived from the 2013 NAIP imagery. To visualize herbaceous cover in ESRI ArcMap, symbolize by value. This dataset represents the herbaceous cover estimate for the entire WPA.
- Bareground-A 1m depiction of the bare ground for the WPA. This dataset was derived from the 2013 NAIP imagery. To visualize bare ground in ESRI ArcMap, symbolize by value. This dataset represents the bare ground estimate for the entire WPA.
- Areas\_accumulation-A 1m depiction of the areas of accumulation for the WPA. This dataset was derived from the 2013 NAIP imagery.

## **Conclusions**

The deliverables from this project can be correlated to current sage-grouse population data. New relationships can then be discovered between vegetative conditions and sage-grouse population trends. This can lead to future management changes. With ORC's relatively inexpensive technology to acquire and assess vegetative conditions, it can be repeated after five or ten years. Success of management can be evaluated so that concerned publics can learn, communicate, and develop new ideas to enhance sage-grouse populations and ranching economics.

JIm,

Here is the corrected guidance for Idaho. I think this may be the only one. See you Friday.

Hi BLM-ID,

In coordinating with FS, we noticed that the GRSG guidance document you received was missing one piece of direction. I have added the following bullet point to your SFA guidance :

"· Do Include Forest Service Lost River Mountains North (~5,000 acres) Area and South Area (~6,000 acres)– these areas will be treated as PHMA, with the SFA management actions for this FS-land."

I've also attached a map that specifically identifies these two areas for your reference (please ignore all the other identified areas on the map with regard to the above bullet point).

I have reattached the guidance for purposes of version control, but this is the only change you will see in it. Sorry about the oversight, and thanks a lot as always. Let me know if you have any questions.

--

# Surface Management Agency of Non ADPP Habitat on BLM Surface/ Subsurface Management within DRAFT FWS Areas of Significance/Sagebrush Focal Areas

## - North Central Idaho

### Legend

-  FWS Areas of Significance / Sagebrush Focal Areas
- Surface Management Agency**
-  Non-Habitat, Bureau of Land Management
-  Non-Habitat, US Fish and Wildlife Service
-  Non-Habitat, Forest Service
-  Non-Habitat, National Park Service
-  Non-Habitat, Bureau of Reclamation
-  Non-Habitat, State
-  Non-Habitat, Private
-  Non-Habitat, Other/Undetermined
-  ADPP Habitat or Non-Habitat Outside of BLM Surface/ Subsurface Management

**Data Sources:**  
**Subsurface Estate:** Acquired from BLM WY State Office for MT/ND/SD, WY, CO, UT, and Southern ID in August 2014. \*Only surface estate is used for classification in NV, OR and CA.  
**Surface Management Agency:** Downloaded from BLM Geocommunicator on December 13th, 2013 verified as current on March 6th, 2014.  
**BLM Administrative Draft Proposed Plan Habitat Category Data:** Submitted by individual BLM EISs between March 5th, 2014 and December 2nd, 2014.  
**FWS Areas of Significance:** Data provided by FWS, accompanying Memorandum FWS/AES/058711 (10/27/2014).

## North-Central Idaho

IDM71\_0001372

***BLM-IDAHO***

**Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)**

**January 30, 2015**

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

***Issue:***

**Development in Highly Important Landscapes**

***Direction:***

As more specifically provided in this guidance, the ADPP will include Sagebrush Focal Areas (SFA), consisting of the BLM and FS-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. In the Special Status Species Section of Chapter 2, include the following management action drop in language (for the Proposed Plan only):

*“Designate Sagebrush Focal Areas (SFA) as shown on Map X (x acres). SFAs will be managed as PHMA, with the following additional management:*

- 1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.*
- 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.*

- 3) *Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."*

**The NOC will provide updated shapefiles that delineate the SFAs.**

Except as otherwise provided below, the ADPP will provide that all BLM- and FS-managed lands (including subsurface) within SFAs will be allocated and managed as PHMA and include the management actions above.

- *Do Not Include the following in SFA Management*
  - Hawley Mountain WSA (ID), Shoshone WSA (ID), Cedar Buttes WSA (ID), Lower Salmon Falls Creek (ID), Little Jack Wilderness (ID), Bruneau-Jarbidge Wilderness (ID) in non-habitat – The current management in these areas is generally protective of GRSG. As applicable, these will continue to be managed so as not to impair their suitability for preservation as wilderness, or under the terms of the Wilderness Act to preserve wilderness character.
    - To the extent that these areas were analyzed for contingent management as general or priority habitat, the ADPP will include contingent allocations and management direction that would apply in the event that Congress releases the areas from WSA status
  - Non-habitat areas outside Little Jack and Bruneau-Jarbidge Wilderness and Salmon Falls Creek ACEC which were previously shown within the SFA –These areas will not be managed as PHMA or SFA.
- Do Include Forest Service Lost River Mountains North (~5,000 acres) Area and South Area (~6,000 acres)– these areas will be treated as PHMA, with the SFA management actions for this FS-land.
- Do Include Donkey Hills ACEC –In order to consolidate parcels for protection as SFAs, this area will be treated as PHMA and included for SFA management.
- *Do Not Include Other Agency Land in SFA Management* – while lands managed by other agencies will be shown on the SFA maps, BLM ADPP decisions will not be applied to them.
- *Do Not Include Private/State Lands in SFA Management* – while private lands may be within the SFA boundaries, ADPP decisions will not be applied to them, but may apply to Federal subsurface underlying such lands as provided below.
- *Subsurface Estate:*
  - Under private/state lands: subsurface estate in PHMA and GHMA should be treated as PHMA with SFA management actions.

- Under other Federal lands: subsurface state should be treated as PHMA with SFA management actions if it is not already withdrawn (such as in Refuges or Parks) and PHMA or GHMA management was analyzed in the DEIS.

Additional direction/drop in language for the ADPPs on SFAs will be forthcoming.

**Issue:**

**Direction:**

**Mitigation**

The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:**

**Direction:**

**Mapping**

Not Applicable

**Issue:**

**Direction:**

**Disturbance**

Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance (see Attachment II).

Planning units will include the following land use plan actions within their ADPPs that states:

- a. If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid*

*existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*

- b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

**Issue:**

**Direction:**

**Vegetation Objectives**

The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*

**Issue:**

**Direction:**

**Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas,*

*including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

***Issue:***

***Direction:***

**Mineral Materials (Salable Minerals)**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

***Issue:***

***Direction:***

**High-voltage Transmission and Major Pipeline ROWs and Corridors**

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that

are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservations measures.”*

**Issue:** Coal Suitability  
**Direction:** Not Applicable in Idaho

**Issue:** Fluid Mineral Resources (Including Geothermal)  
**Direction:** All ADPPs will include the following as a conservation objective:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Issue:** No Surface Occupancy (NSO) Exception Language  
**Direction:** Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral

leases at the time of leasing only and may not be applied to existing fluid mineral leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*“No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action’s impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.”*

**Issue:**

**Direction:**

**Adaptive Management**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

***Issue:***

***Direction:***

**Application of Lek Buffers**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA and PHMA (see Attachment IV) through this drop-in Chapter 2 language:

*“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review ([Open File Report 2014-1239](#)) in accordance with Appendix X.”*

Allocation Direction

\*Southwest Montana will follow the allocations designated for the MT ADPP

## Attachment I

# GREATER SAGE-GROUSE RMPA/FEIS TEMPLATE LANGUAGE FOR ADDRESSING MITIGATION

[ ] = Instructions

[ ] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

## Chapter 1 - Introduction

[Nothing new to add to EIS]

## Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

## Mitigation

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- **Compensatory Mitigation Siting**
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain*

*the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
  
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
  
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
  
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

### **Additional Information/Formulas**

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU:

$$\text{is ur an Percen ag} \\ = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left( \frac{\text{Acre of ive Habitat within h}}{\text{Acre within h}} + 0.3 \right)} \right) \times 100$$

Disturbance Calculations for Project Analysis Areas (PAAs):

$$\text{is ur an Percen ag} \\ = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^{1,2}}{\text{Acres within the PAA} * \left( \frac{\text{Acre of } \text{ive Habitat within h PA}}{\text{Acre within h PA}} + 0.3 \right)} \right) \times 100$$

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2.

Project analysis area (PAA) method for permitting surface disturbance activities:

1. Determine potentially affected occupied leks by placing a four-mile buffer around the project boundary as defined by the proposed area of physical disturbance related to the project. All occupied leks within this buffer will be considered affected by the proposed project.
2. Next place a four mile boundary around each of the occupied leks identified in item 1, above.
3. The polygon formed by the merging and dissolving of polygons from step 1 and 2 creates the Project Analysis Area (PAA) for surface disturbance activities.
4. Map existing disturbances within the analysis area or use locally available spatial data. Use of digitized NAIP imagery is recommended.
5. Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
6. Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
7. Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
8. If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>
<b>Energy (oil &amp; gas)</b>	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300

Other developed rights-of-way		X	

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales		
		Broad/Mid (Populations)	Intermediate (BSU)	Local/Project (Seas. Hab.)
Habitat Degradation	Unit:	WAFWA Populations	Biologically Significant Unit	Project/Local Habitat Area <sup>6</sup>

<b>ACRONYMS</b>				
PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit				
EVT = Existing Vegetation Type                      BpS = Areas of Biotic Potential				
<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.				
<sup>2</sup> Westwide data will be used only if state or local data are not available.				
<sup>3</sup> This footnote was removed from the table. January 2015.				
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.				
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management				
<sup>6</sup> The project analysis area will be based on a 4-mile radius polygon around the project area combined with a 4-mile buffer around any leas within the project boundary in PHMA (Idaho methodology).				
<sup>7</sup> See Table 2				

## Attachment III

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment IV

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

### **Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Attachment V

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

  - linear features (roads) within 3.1 miles of leks
  - infrastructure related to energy development within 3.1 miles of leks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis.

  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

The Idaho plan delineates three management zones – **Core, Important and General**. These management zones represent a continuum of management restrictions/protections for greater sage-grouse (GRSG) and are foundational to the adaptive management strategy contained within the ADPP.

**Core Management Zones**: These represent the most restrictive management direction within these areas and are consistent with the national policy team direction or goes beyond that direction in its protection of GRSG.

- **73% of the breeding males**
- 65% of the occupied leks
- 66% of the USFWS priority areas for conservation (PACs).

**Important Management Zones**

- **22% of the breeding males**
- 20% of the occupied leks (+/-)
- 33% of the PAC areas
- plus over 1 million additional acres supporting 4% of the breeding males outside of PAC areas.

**Core and Important Management Zones support approximately 95% of the population in Idaho.**

General Management Zones contain less than 5% of the population and represent the least intact and least productive habitats for GRSG.

**Any proposed development within Important Management Zones would be required to meet the following Anthropogenic Disturbance Development Criteria:**

- a. The project does not result in a net loss of GRSG habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant Conservation Area; and
- b. The project cannot reasonably be achieved, technically or economically, outside of this management area; and
- c. The project is co-located within the footprint for existing infrastructure, to the extent practicable. In the event co-location is not practicable, the siting should best reduce cumulative impacts and/or impacts on other high value natural, cultural, or societal resources; and
- d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation;
- e. The project complies with the applicable RDFs as described; and
- f. The project would not exceed the disturbance threshold

**Subject:** Idaho's 3 Mgmt Zones

## National Greater Sage-Grouse Idaho & Southwestern Montana Sub Region The Strength of 3-Management Zones

*The Idaho Plan has 3-Management Zones: Core, Important and General. Core and Important Management Zones are collectively referred to as Priority Management Zones which encompass 94% of the leks and 97% of the breeding males in Idaho. Delineation of these zones will retain and protect sagebrush cover and GRSG habitat (consistent with Wisdom et al. 2011, Aldridge et al. 2008, and Knick et al. 2000) through appropriate prioritization and protective measures within the most critical habitats (Core) and across broader intact habitat areas (Important).*

**Core Management Zones (CMZ)** are delineated to protect large unfragmented, contiguous landscapes from anthropogenic disturbance and to focus wildfire reduction (suppression activities and fuels treatments) associated with the two key meta-populations within the subregion (Garton et al. 2011). These areas represent strongholds for populations in Idaho and encompass all the seasonal habitats necessary to support approximately 77% of the breeding males in Idaho, which represents and exceeds the State of Idaho's population objective for the species.

**Important Management Zones (IMZ)** are delineated to encompass high-quality habitat adjacent to and connecting areas of CMZ providing for migration corridors and connectivity among breeding areas, which also support populations and habitat independent of the CMZ (20% of the breeding males).

3-Management Zones are a foundational component of the Idaho Plan which directly supports and is critical to the adaptive management strategy and ongoing support of State partners who monitor populations to support evaluation of adaptive population triggers necessary to respond to the threats present in the subregion.

The Priority Management Zones protect the two key meta-populations in the subregion (Garton et al. 2011) through retention and protection of sagebrush cover and sage-grouse habitat that exceeds areas delineated as Priority Areas for Conservation (PACs) with appropriate habitat prioritization, responsive adaptive management and adequate protective measures to meet and exceed the objectives described in the COT Report; effectively protecting nearly 95% of Idaho's breeding male population.

3-Management Zones responsively address the primary threats of wildfire and invasive species present in the subregion.

**Wildfire:** Each year, on average, 350K acres burn on Idaho BLM lands. Suppression resources catch and suppress 98% of all fires and prevent them from developing into large conflagrations capable of destroying vast swaths of sagebrush vegetation. Delineation of 3-Management Zones provides a graduated prioritization strategy during times of multiple fire ignitions when suppression resources are fully allocated and cannot attend to all starts – this is when the 2% of fires not caught quickly have the opportunity to spread unrestrained. 3-Management Zones provide land managers a prioritization framework to focus suppression resources on fires most threatening to GRSG and their most critical habitats (Core Management Zones).

3-Management Zones provide the foundation for a responsive adaptive management strategy.

**Wildfire:** In the event habitat or population losses exceed a specified threshold, other acres of intact and functioning habitat will be re-prioritized for suppression at the trade-off of those acres recently burned and no longer providing habitat values, at least in the short-term.

**Development:** In the event habitat or population losses exceed a specified threshold, other acres of intact and functioning habitat will be further restricted from new development.

3-Management Zones appropriately address the significantly lower threat of development present in the subregion.

**Development:** Existing development, when added to projected development, is low, averaging around 0.5% in the subregion. In addition there is minimal mineral potential, natural topographic fragmentation, and relative remoteness of the landscapes. The restrictive conservation measures including the disturbance cap coupled with the stringent development criteria associated with proposals effectively pushes development to areas outside Priority Management Zones.

3-Management Zones have been developed and supported through a broad coalition of stakeholders: BLM, Forest Service, USFWS, the State of Idaho and through extension of the State's Task Force – Idaho Power, Idaho Conservation League, Idaho Cattlemen's Association, The Nature Conservancy and county officials. All of these stakeholders are currently fully committed to a successful outcome for GRSG. This coalition is actively supporting development of the State's management approach (including Rural Fire Protection Associations) for State and private lands within Idaho, consistent with the federal lands approach. Elimination of the 3-Management Zones would likely erode commitment of the coalition, alienate the State of Idaho, and effectively eliminate any chance of extending additional protections to State and private lands through State and County leadership and authority, resulting in a decidedly unfavorable outcome for GRSG in Idaho.

Lauren, Johanna had me review the current vs new version. Everything in the new version for Idaho is correct. I wanted to point out that we will be applying buffers rdfs etc to anything open in general. I have a meeting now and will review the Montana decisions in an hour. Jon

Stephanie –

I created this for clarity. The first table shows the allocation decisions, what is currently in the issues paper, and how it should be corrected for Idaho. The second table is for the SW Montana piece....I just took the allocation for Montana that are currently in their column.

I have NOT run this through Jonathan Beck or John Carlson....but if my understanding of all of this is correct, this is the way it needs to be.

Hope this helps.

Lauren

Below is the proposed language. We have discussed with planners and Aaron and Sarah in the SOL office and recommend that this statement be included in the Adaptive Management portion of the plan, as well as be highlighted in the executive summary.

Every two years the BLM shall review the State of Montana's GRSG Habitat Conservation Program. If the BLM finds that the State of Montana is implementing a GRSG Habitat Conservation Program that is effectively conserving the GRSG, the BLM will review the these management goals, objectives, and actions to determine whether amendment of this plan is appropriate to achieve consistent management across all lands regardless of ownership.

OK. I thought I understood from Ed that you already had some proposed to the language below which is what prompted my ask. I would say this:

(1) to the extent we can place this as close to the front in the plan, that is so long as it doesn't interfere with the plan operation of which you all are a better judge.

(2) I discussed with him that we might reference broader objectives and not as the measure, he was open to that. Would that overall objective be to maintain and/or increase GSG abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem.

On Tue, Apr 21, 2015 at 12:02 PM, Lueders, Amy <[alueders@blm.gov](mailto:alueders@blm.gov)>

i have forwarded the language to Stephanie and have pasted it below. The questions Ed and I have discussed are:

1. Is the proposed plan location the most appropriate spot for it in the plan (does it more cleanly fit in the adaptive management section or elsewhere)
2. Do we want to reference to WY as the measure of success or to our conservation objectives?

Proposed MT language  
Goal 1

Objective 5 - promote the effective and seamless protection of GRSG and its habitat by seeking to achieve consistent management across all lands regardless of ownership

Every two years the BLM shall review the State of Montana's GRSG Habitat Conservation Program. If the BLM finds that the State of Montana is implementing a GRSG Habitat Conservation Program that is comparable in its scope, operation, and effect to the State of Wyoming's Core Area Strategy, the BLM will review its management goals, objectives, and actions to determine whether amendment of this plan is appropriate to to achieve consistent management across all lands regardless of ownership.

**Subject:** Re: NSO exception language - double checking

Noreen (& Jim),

We are square on those two issues. There is another Montana issue I wanted you and Jim aware of although I don't want to put more stuff on your plate. I was on a call with Jamie this afternoon and she reminded me the Tim Baker was hoping to have a chat with FWS and Jim about the Montana Executive Order. Tim asked me and Jim when he was back here in December what they could do to improve their plan. I said they need to talk to you and your ES state director. If you all haven't chatted yet he may want to next week. I hope the Governor will continue to advance and strengthen his plan. Enjoy your evening.

Noreen,

I copied Chris and Steph on the response for continuity. The copy that I am working from for the Friday conference call with the Task Force has the word "Federal". Also, there is no Montana exception shown to the NSO without exception in the stronghold. So, I think we are on the same page. We will be

sharing the final version with our SDs at 10:30 eastern. I will send to you all then so you can share with your folks before the Task Force call. If you and Chris want to talk before then, I have time tomorrow. Might be good. ed

<[noreen\\_walsh@fws.gov](mailto:noreen_walsh@fws.gov)> wrote:

Ed, could I trouble you to double check an issue that I think we have resolved regarding exception language for NSO?

My personal notes follow and the portion in red is what I think may have been lost in your final docs:

*Remaining discussion has been around the exception language for exception to NSO. Direction set at 11/25/14 meeting, new language provided in 12/19/14 document. Two remaining issues needed final decision:*

- 1. The following edit needs to occur to ensure final language is consistent with our agreement from 11/25/14: "... or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid **FEDERAL** oil and gas lease existing as of the date of this RMP..."*
- 2. In discussions on 12/19/14, BLM indicated a change in that they now wanted to include NSO with exceptions in the MT stronghold area. FWS Director has indicated this is not recommended by FWS. **Final BLM decision as stated on 12/22/14: Agreed to reinsert the word federal and to keep NSO without exception in MT stronghold.***

I'm not sure, but if you could double check that the word federal was reinserted, I would appreciate it.

Thanks,  
Noreen

Jim, Here is the Montana EO. On page 6 in paragraphs 26 and 27, the language covers the intent related to projects. (eg, "deemed sufficient to demonstrate the project will not cause declines in sage grouse populations.")

STATE OF MONTANA  
OFFICE OF THE GOVERNOR  
EXECUTIVE ORDER No. 10-2014

---

**EXECUTIVE ORDER CREATING THE MONTANA SAGE GROUSE OVERSIGHT  
TEAM AND THE MONTANA SAGE GROUSE HABITAT CONSERVATION  
PROGRAM**

---

**WHEREAS**, the Greater Sage grouse (*Centrocercus urophasianus*) is an iconic species that inhabits much of the sagebrush-grassland habitats in Montana;

**WHEREAS**, thanks to concerted efforts of wildlife managers, private landowners, and others, the State of Montana currently enjoys viable and widespread populations of the species, the second largest abundance of Greater Sage grouse among western states;

**WHEREAS**, the United States Fish and Wildlife Service (USFWS) has determined that the Greater Sage grouse species is warranted for listing as a threatened or endangered species under the Endangered Species Act of 1973(ESA), but is precluded by other higher priority species;

**WHEREAS**, the United States District Court for the District of Idaho ruled on February 2, 2012 that the USFWS must re-evaluate the status of the Greater Sage grouse by September 30, 2015;

**WHEREAS**, the United States Secretary of the Interior has invited Montana and other western states to develop state-specific programs to conserve the Greater Sage grouse species and preclude the need to list under the ESA;

**WHEREAS**, the development of a state strategy in Montana will be critical in demonstrating to the USFWS that the species does not warrant federal protection under the ESA;

**WHEREAS**, the development of a state-specific strategy will enable the Bureau of Land Management (BLM) and U.S. Forest Service (USFS) to incorporate relevant elements from the strategy into their land use plans and environmental analyses;

**WHEREAS**, because of the sound management practices and ongoing efforts of private landowners, approximately half of Greater Sage grouse habitat in Montana involves private property, and maintaining the species will require effective conservation strategies across property ownerships;

**WHEREAS**, the State of Montana has management authority over Greater Sage grouse populations in Montana;

**WHEREAS**, the State of Montana, in collaboration with stakeholders, developed and adopted a state Greater Sage grouse plan in 2005, pertaining to sage grouse population responses to large-scale changes in habitat;

**WHEREAS**, the listing of the Greater Sage grouse could have a significant adverse effect on the economy of the State of Montana;

**WHEREAS**, new science, information and data continue to emerge regarding the habitats and behaviors of the Greater Sage grouse;

**WHEREAS**, in February 2013 Governor Bullock created the Greater Sage grouse Habitat Conservation Advisory Council (Council), to gather information, and bring stakeholders and experts together in a public process to recommend conservation measures to address the primary and secondary threats to the Greater Sage grouse (hereafter sage grouse) in Montana, and a state-wide strategy to preclude the need to list the sage grouse under the ESA, and to bring those recommendations to the Governor no later than January 31, 2014;

**WHEREAS**, in preparing its recommendations, the Council reviewed the 2005 Montana Sage Grouse Conservation Plan, BLM Interim Memorandum Guidance, National Technical Team Report, USFWS Conservation Objectives Team Report (COT), relevant scientific information, and other existing strategies and information, held ten multi-day public meetings in Helena, accepted broad and diverse public comment on draft recommendations, and conducted seven public hearings around the state;

**WHEREAS**, the Council formally presented its recommendations and advice to the Governor on January 29, 2014;

### **Creation of the Montana Sage Grouse Oversight Team and the Montana Sage Grouse Habitat Conservation Program**

1. There is created a Montana Sage Grouse Oversight Team (MSGOT), attached to the Governor's Office. The initial composition of MSGOT shall include the Directors of the Departments of Fish, Wildlife and Parks, Environmental Quality, Natural Resources and Conservation, and Transportation, the Executive Director of the Montana Board of Oil and Gas Conservation, a representative of the Rangeland Resources Committee, and a member of the Governor's Office.
2. The function of MSGOT will be to oversee the administration of the Montana Sage Grouse Habitat Conservation Program (Program). This will include, among other tasks: supervision of the Program Manager, staying abreast of emerging science and developing appropriate guidance, reviewing and troubleshooting the consultation process, providing input to funding requests for research and land management projects, and recommending to the Governor further improvements to the Program.
3. The role of the Program and MSGOT is to: provide guidance to, exchange information with, seek input from, and consult with state agencies and other instruments of state government

during permitting and other authorizations, or during consultation, or technical, financial, or other assistance for non-regulated activities; administration of the Conservation Strategy (including application of the Density Disturbance Calculation Model); serve as the principal point of contact for the interested public and stakeholders regarding the Conservation Strategy; and oversee administration of the Sage Grouse Stewardship and Conservation Fund, designed to promote voluntary and cooperative habitat conservation and beneficial land management practices (if approved by the Legislature). Nothing in this Order in any way creates, adds to, or expands the regulatory authority of any state agency.

4. During the initial startup of the Program, MSGOT shall focus its efforts on the following tasks: setting up the Program, including hiring staff and creating protocols for operation; working with state agency and Program staff to educate state agencies and other instruments of state government regarding the Program and the provisions of this Order (Conservation Strategy); address such other issues as are delineated in this Order and attachments and as may arise during startup. The Department of Fish, Wildlife and Parks shall provide necessary staff assistance for the MSGOT (until such time as key Program staff are hired).
5. All meetings of the MSGOT shall be open to the public, with public notice and participation, consistent with Montana law.
6. During the initial startup of the Program, the Department of Fish, Wildlife and Parks shall, as practical, use this Conservation Strategy and professional judgment in applying this Strategy when commenting on state activities that have the potential to impact sage grouse.
7. MSGOT shall report to the Governor further improvements in the Program that are necessary, and it is anticipated that a subsequent Executive Order will fully implement all aspects of the Program and transition to mandatory review and consultation (“effective date”).
8. The staffing for the Program is as follows: Program Manager; GIS Manager; GIS Technician, two Biologists, and support for seasonal work. The Departments of Fish, Wildlife and Parks, Environmental Quality, and Natural Resources and Conservation shall provide legal assistance to the Program as necessary. During the initial Program startup, each agency shall allocate such additional staff resources as are necessary. After the Program and GIS Managers are hired, MSGOT may choose to contract with other state agencies for services in lieu of hiring staff.
9. Management by state agencies shall give priority to the maintenance and enhancement of sage grouse habitats in Core Population and Connectivity Areas identified in Attachment A. Absent substantial and compelling information, the Core Population Areas (Core Areas) in Attachment A should not be altered for at least 5 years.
10. MSGOT shall develop incentives to accelerate or enhance required reclamation in habitats in and adjacent to Core Areas, including but not limited to stipulation waivers, funding for enhanced reclamation, and other strategies. Incentives shall result in net benefit to, and not cause declines in, sage grouse populations.

11. Where possible, MSGOT shall develop incentives to encourage new land uses and activities in General Habitat to occur in a manner that minimizes impacts to sage grouse populations and habitats.
12. Where appropriate, and to minimize or streamline the process associated with implementation of this Conservation Strategy, MSGOT should consider recommending for adoption best management practices that can be self-implemented in place of MSGOT or Program review.
13. MSGOT shall develop a comprehensive program that provides for appropriate mitigation, including compensatory mitigations (financial, off-set, or off-site). All new land uses or activities shall follow the sequencing provisions required herein (avoid, minimize, reclaim). Mitigation shall be required for all activities that are subject to agency review, approval, or authorization, even if the impacts are indirect or temporary. A variety of mitigation tools may be used, including conservation banks, habitat exchanges, and approved conservation plans.
14. Predators can be a threat to localized sage grouse populations and an impediment to efforts to protect sage grouse. Predators have always preyed upon sage grouse, and the best way to minimize this impact is to provide good quality habitat in sufficient quantity. In addition to generally implementing this Conservation Strategy, Attachment B contains specific recommended practices for minimizing the effects of predators on sage grouse.
15. While it is unlikely that predator control is a long-term solution to a general range-wide decline in populations of sage grouse, it may provide beneficial short-term relief to localized decreases in sage grouse populations. For example, the U.S. Fish and Wildlife Service (USFWS) recently granted a permit to the State of Idaho for the lethal removal of ravens in three specific locations to evaluate the impacts of predation on sage grouse. If such localized circumstances are found to exist, MSGOT should involve diverse stakeholders to explore public-private opportunities for field research to examine the predator-prey relationship, the effects of habitat disturbance, and the feasibility and efficacy of a predator management plan.

### **General Principles**

16. Valid rights are legal rights or interests that are associated with a land or mineral estate and cannot be divested from that estate until that interest expires, is relinquished, or acquired. Existing rights shall be recognized and respected, including those associated with state trust lands.
17. Approximately 64% of sage grouse habitat in Montana is in private ownership. Montana's private landowners care about the future of sage grouse and manage their lands productively in this regard. State agencies are directed to work collaboratively with private landowners (and local governments) to maintain and enhance sage grouse habitats and populations, and to the greatest extent possible shall use non-regulatory measures that reflect unique localized conditions, including soils, vegetation, development type, predation, climate and other local realities. Voluntary incentives designed to conserve sagebrush habitat and grazing lands

within identified sage grouse Core Areas and General Habitat areas on private and state lands will be created and encouraged.

18. The success of this Conservation Strategy depends on state and federal agencies, including the U.S. Fish and Wildlife Service, Bureau of Land Management, U.S. Forest Service, Natural Resource Conservation Service, and other federal agencies, working collaboratively to maintain and enhance sage grouse habitats and populations.
19. Funding, assurances (including efforts to develop Candidate Conservation Agreements and Candidate Conservation Agreements with Assurances, etc.), habitat enhancement, reclamation efforts, mapping and other associated proactive efforts to assure viability of sage grouse in Montana shall be focused and prioritized to occur in Core Areas. Formal voluntary agreements between private and federal regulatory entities to address the conservation needs of sage grouse shall be entitled to deference.
20. Fire suppression efforts in Core Areas shall be prioritized, recognizing that other local, regional, and national suppression priorities may take precedent. Coordination among all fire-fighting units is required to implement fire prevention, suppression, and rehabilitation management as detailed in Attachment C. The Department of Natural Resources and Conservation shall follow these recommendations as resources and circumstances allow, and will request cooperation and collaboration from federal agencies on rehabilitation projects after wildfire. Public and firefighter safety remains the number one priority for all fire management activities.
21. MSGOT, Program staff, and all state and federal agencies shall strive to maintain consistency with this Conservation Strategy, recognizing that adjustments may be necessary based upon local conditions and limitations.
22. MSGOT shall regularly reevaluate the effectiveness of this Conservation Strategy, at a minimum annually, as new science, information and data emerge regarding the habitats and behaviors of sage grouse, and shall recommend such changes as are appropriate.

#### **Application of the Conservation Strategy to Land Uses and Activities**

23. Existing land uses and activities shall be recognized and respected by state agencies, and those existing prior to the effective date of the Program will not be managed under the stipulations of this Conservation Strategy. Examples of existing activities include oil and gas, mining, agriculture, processing facilities, power lines, housing, operations and maintenance activities of existing energy systems within a defined project boundary, (i.e., ROW), and other uses that were in place prior to the effective date of the Program. Provided these uses and activities are within a defined project boundary (such as a recognized federal oil and gas unit, drilling and spacing unit, mine plan, subdivision plat, etc.) they may continue within the existing boundary, even if they exceed the stipulations of this Conservation Strategy.
24. New land uses or activities in Core Areas shall be avoided when possible. New developments or land uses permitted or authorized within Core Areas shall minimize impacts

on suitable habitat, and reclaim and restore any disturbance (and mitigation as appropriate). This analysis shall be documented by Program staff for each new activity or use. A similar sequence (avoid, minimize, reclaim/restore) shall also be applicable in General Habitat, under less rigorous standards to be developed by MSGOT.

25. It is recognized that in some locations new uses or activities associated with valid rights, such as some mineral rights, may be in substantial conflict with the stipulations of this Conservation Strategy, and that reasonable exceptions to the Strategy may be necessary. Similarly, the expansion of existing uses and activities not otherwise subject to this Conservation Strategy may necessitate reasonable exception. In all cases the sequencing, stipulation, and mitigation provisions of this Conservation Strategy shall be the benchmark for evaluating such uses or activities and developing alternative operating scenarios.
26. New land uses or activities within Core Areas shall be authorized, approved, or conducted only when it can be demonstrated that the project will not cause declines in sage grouse populations.
27. Land uses or activities that follow the sequencing requirements of this Conservation Strategy (including mitigation as appropriate) and that are consistent with the stipulations set forth in Attachment D shall be deemed sufficient to demonstrate that the project will not cause declines in sage grouse populations.
28. Proposals to deviate from standard stipulations or utilize exceptions from standard stipulations will be considered by the Program (with review by MSGOT) and the appropriate land management and permitting agencies, with input from the Department of Fish, Wildlife and Parks, and the United States Fish and Wildlife Service.
29. A petition may be filed with MSGOT to create a Special Management Area, where planned land uses or activities associated with valid rights cannot be implemented after evaluation against the sequencing, stipulation, and mitigation provisions of this Conservation Strategy. The requirements and objectives for this process are contained in Attachment E, and MSGOT shall recommend such additional requirements and objectives as necessary.
30. Montana's private landowners are currently managing their lands in a responsible manner, and it is not coincidence that such a high percentage of productive sage grouse habitat is found on private land. It is critical that existing land uses and landowner activities continue to occur in Core Areas and General Habitat, particularly agricultural activities on private lands. Many uses or activities on private lands are not subject to state agency review, approval, or authorization. Only those projects occurring after the effective date of the Program which state agencies are vested with discretion by state or federal statute to review, approve, or authorize are subject to consistency review. This Conservation Strategy in no way creates, adds to, or expands the regulatory authority of any state agency.
31. Attachment F contains a list of existing land uses and landowner activities that are exempt from this Conservation Strategy.

32. Livestock grazing is the most widespread type of land use across sagebrush country. Proper livestock management is a critical tool for providing and maintaining high quality sage grouse habitat, and recommended best practices are contained in Attachment G.
33. The Governor's Executive Budget Fiscal Years 2016-2017 will include a proposal for a Sage Grouse Stewardship and Conservation Fund, designed to, among other objectives, promote and fund voluntary incentive-based non-regulatory programs and practices on private land to conserve sage grouse habitat (if approved by the Legislature).
34. Program staff and state agencies shall adhere to the stipulations contained in this Conservation Strategy when reviewing or providing consultation, or technical, financial, or other assistance for non-regulated activities.
35. The Program staff, before submitting its final recommendation to a state agency for any use or activity it has reviewed, shall comply with the provisions of the Private Property Assessment Act, Title 2, Chapter 10, Part 1, MCA.
36. State Trust Lands are held in trust as provided in The Enabling Act, and the management of those lands is vested in the State Land Board. The Department of Natural Resources and Conservation (DNRC) is directed to bring this Conservation Strategy before the Board for its consideration, with a request that the Board adopt this Strategy or otherwise determine the appropriate application of this Strategy to the management of State Trust Lands in Core or Connectivity Areas, or General Habitat.
37. Cropland conversion and sagebrush eradication on native range are particular threats to sage grouse. The DNRC is directed to bring before the State Land Board for its consideration a prohibition of these two activities on State Trust Lands in Core and Connectivity Areas and General Habitat, with criteria for waivers. The requested prohibitions should be contingent on similar action by federal agencies for lands on which they control the surface rights. The requested prohibition on cropland conversion should also be contingent on commitments by state and federal agencies to work cooperatively with the Bureau of Indian Affairs and tribal governments to address cropland conversion of sage grouse habitat on tribal lands.
38. On State Trust Lands the DNRC will work cooperatively with lessees to maintain healthy sagebrush shrub, native grass, and forb communities on State Trust grazing lands in Core and Connectivity Areas. DNRC shall develop additional lease evaluation criteria to be used for these lands, consistent with the recommendations in Attachment G. The criteria should establish rangeland characteristics that will ensure responsible grazing management practices, consistent with maintaining and improving habitat for sage grouse, while providing for working rangelands. DNRC should also develop a corrective action program for leases that fail to meet the criteria. The criteria and corrective action program shall be brought before the State Land Board for approval.
39. Exotic annual grasses and other invasive plants, and shrubs and trees, alter habitat suitability for sage grouse by reducing or eliminating native forbs and grasses essential for food and cover. Non-native annual grasses also facilitate an increase in mean fire frequency. As

resources allow, state agencies should prioritize the eradication of cheatgrass and Japanese brome in Core Areas, through improved management practices, appropriate herbicide treatments, and biological controls. The Montana Department of Agriculture should review the appropriateness of listing Japanese brome (*Bromus japonicus*) as a regulated species (priority #3) in Montana, and report to MSGOT the results of its evaluation.

40. The hunting of sage grouse is managed by the Department of Fish, Wildlife and Parks (FWP) through the Montana Fish and Wildlife Commission. A framework for conservation action to manage hunting and the viability of sage grouse populations is outlined in the Management Plan and Conservation Strategies for Sage Grouse in Montana – Final (Rev. 2-1-2005, pp. 54-55). That framework shall continue in effect and guide Department and Commission action until such time as the Department or Commission finds that a different approach is warranted. The Program shall consult with FWP when reviewing sage grouse issues in a permit application or other authorization for a use or activity in a Core or Connectivity Area, or General Habitat.
41. State agencies shall report to the Office of the Governor by no later than January 31, 2015, and annually thereafter detailing their actions to comply with this conservation strategy.

#### **DURATION**

This Executive Order is effective immediately and remains in effect until it is rescinded or superseded by subsequent Executive Order.

**NOW, THEREFORE, I, STEVE BULLOCK**, Governor of the State of Montana, by the authority vested in me under the laws and Constitution of the State of Montana, do hereby create the Montana Sage Grouse Oversight Team and the Montana Sage Grouse Habitat Conservation Program.

Given under my hand and the Great Seal of the State of Montana, this 9<sup>th</sup> day of September, 2014.

  
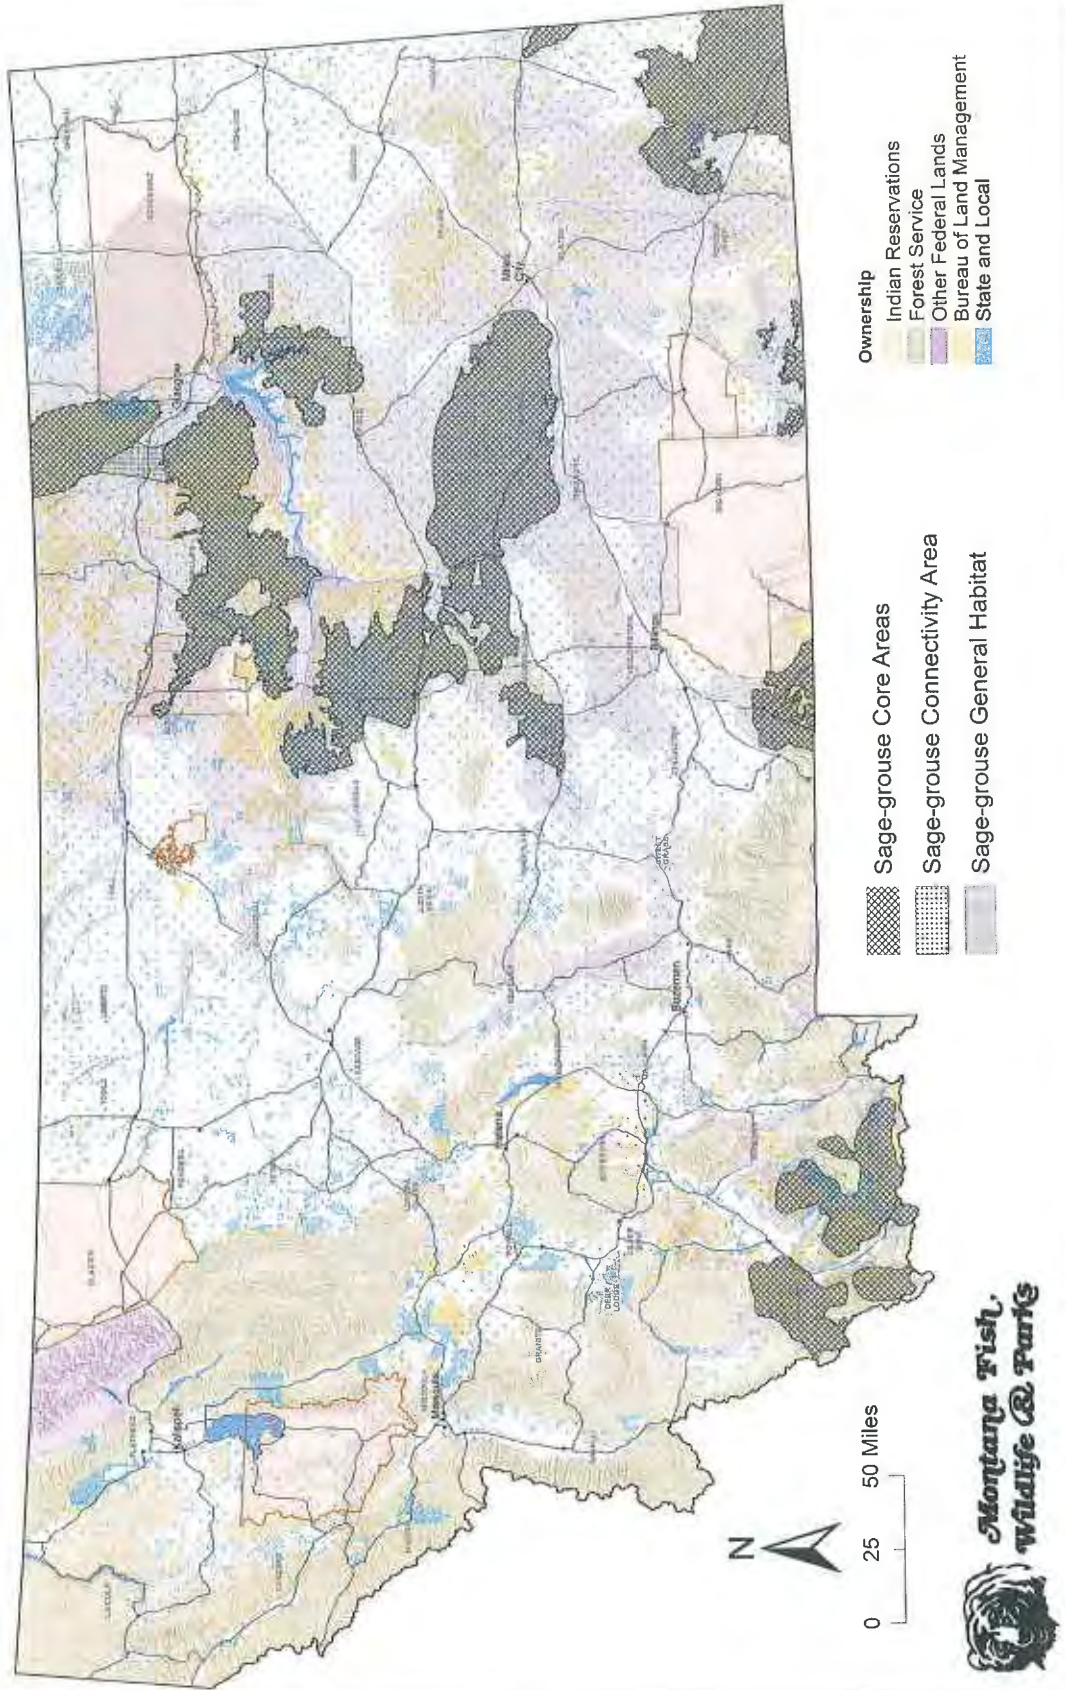

\_\_\_\_\_  
STEVE BULLOCK, Governor

ATTESTED:

  
\_\_\_\_\_  
LINDA McCULLOCH, Secretary of State

# Sage-grouse Conservation Areas in Montana

## Attachment B

### RECOMMENDED PRACTICES TO MINIMIZE EFFECTS OF PREDATORS

- a. Eliminate or minimize external food sources for ravens and small mammals, particularly dumps, landfills, waste transfer facilities, and road kill.
- b. Remove abandoned farmhouses, barns, building debris piles, and other structures that harbor mammalian predators.
- c. Provide adequate buffers (up to 4.0 miles from leks) between placement of new tall structures and nesting and brood-rearing habitat to minimize or eliminate the subsidy of predators. Bury power lines, when economically feasible.
- d. Remove abandoned tall structures, such as fence posts, power line poles, and cell towers that can serve as perching structures for aerial predators.
- e. Apply habitat management practices (e.g., grazing management and vegetation treatments) that improve sage grouse nesting habitat thus decreasing the effectiveness of predators.
- f. Develop strategies for specific, selective, and if needed, assertive short-term predator control based on biological assessments appropriate to local conditions, especially in instances where a sage grouse population has declined from exotic conditions, such as West Nile Virus.
- g. Request the State use localized predator control when permanent anthropogenic features are documented to contribute to unnatural numbers of predators that are reducing local sage grouse populations, and where the impacts from these permanent features will not be eliminated or minimized enough to stabilize the local sage grouse population.
- h. Research and monitor the effects of predator control to determine causal connections with sage grouse survival; modify control strategies accordingly.
- i. Encourage local government to help with small mammal predator control during sage grouse breeding, nesting, and brood-rearing season.

## Attachment C

### RECOMMENDATIONS FOR WILDFIRE PREVENTION, RESPONSE, AND REHABILITATION

Wildfire temporarily or permanently eradicates sagebrush habitat. Fire, both lightning-caused and human-caused, is a primary risk to sage grouse, not only by deteriorating and often eliminating habitat, but also by increasing future fire frequencies through the promotion of fire-prone vegetation, especially invasive grasses. The replacement of native perennial bunchgrass communities by invasive annuals is a primary contributing factor to increasing fire frequencies in the sagebrush ecosystem. The following recommendations are designed to reduce the potential for fire in sagebrush systems, suppress fires that do ignite, and (re)establish sagebrush and native species in areas that do burn.

- a. Prevention (Pre-fire):
  1. Broaden DNRC, Volunteer Fire Departments, and all fire-fighting unit awareness by providing maps of sage grouse habitat and copies of these recommendations, including every county fire-fighting office.
  2. Prioritize eradication of cheatgrass and Japanese brome and/or address management practices, acquire funding for appropriate herbicide treatments, and explore biological controls.
  3. During high-risk fire seasons, reduce risk of human caused fires as authorized by statute.
- b. Suppression (Fire -Public and firefighter safety remains the number one priority for all fire management activities):
  1. Prioritize initial attack with the goal of immediate suppression in Core Areas, and secondarily in Connectivity Areas and General Habitat, including use of fire retardants and other appropriate tools.
  2. Improve coordination between state agencies (e.g., DNRC) and Montana Association of Counties on all fire suppression activities.
  3. Request federal partners mirror the initial attack program of DNRC.
  4. Prioritize outreach from DNRC to private operators regarding initial attack in sagebrush areas.
  5. Carefully consider the use of backfires within Core and Connectivity Areas and General Habitat to minimize the potential for escape and further damage to sage grouse and sagebrush habitats (a tactical decision made in the field).

6. Identify and establish defensible fire lines in areas where: effectiveness is high; fire risk is likely; and, negative impacts from these efforts (e.g., fragmentation) are minimized. Avoid use of any vegetative stripping in healthy, unfragmented habitats, unless fire conditions and local ecological conditions so warrant.
- c. Rehabilitation (Post-fire):
1. Use available tools to prevent (re)establishment of cheatgrass and Japanese brome, as necessary.
  2. Ensure most successful restoration strategies are being implemented that (re)establish native sage grouse habitat; develop handbook of methods for most appropriate restoration strategies.
  3. Identify funding options for restoration implementation.
  4. Use locally available seeds where it is most likely to be effective and in areas of high need.
  5. Prioritize Core Areas over sagebrush areas outside of Core Areas for restoration efforts.
  6. Verify that all seeding in Core Areas is certified by an independent contractor as weed-free and free of cheatgrass and Japanese brome.
  7. Explore establishing a state seed bank, if viability of seeds can be maintained; evaluate use of local seed sources (i.e., seed orchards). Report to MSGOT.
  8. Ensure post-fire monitoring for successful reestablishment of sagebrush communities.

## Attachment D

### STIPULATIONS FOR USES AND ACTIVITIES

#### *REVIEW PROCESS*

**Point of Contact:** The first point of contact for addressing sage grouse issues in a permit application or other authorization for a use or activity in a Core or Connectivity Area, or General Habitat, should be the Montana Sage Grouse Habitat Conservation Program (Program). Project proponents need to have a thorough description of their project and identify the potential effects on sage grouse prior to submitting an application to the permitting agency (details such as draft project area, habitat maps and any other information will help to expedite the project). Project proponents should contact the Program at least 45-60 days prior to submitting their application. More complex projects will require more time. The Program has a role of consultation, recommendation, and facilitation, and has no authority to either approve or deny the project. The purpose of the initial consultation with the Program is to become familiar with the project proposal and ensure the project proponent understands the sequencing, stipulation, and mitigation provisions, and implementation process.

**Maximum Disturbance Process:** Uses and activities in Core Areas will be evaluated within the context of maximum allowable disturbance (disturbance percentages, location and number of disturbances) of suitable sage grouse habitat within the area affected by the project. The maximum disturbance allowed will be analyzed via a Density/Disturbance Calculation Tool (DDCT) process, similar to that currently utilized by the State of Wyoming. Unsuitable habitat occurring within the project area will not be included in the disturbance cap calculations. Existing disturbances shall be included.

**Process Deviations and Exceptions:** Any proposals for deviations from these stipulations, undefined activities, or exceptions must demonstrate that the proposed activities will not cause declines in sage grouse populations in core areas. Proposals to deviate from standard stipulations or utilize exceptions from standard stipulations will be considered by the Program (with review by MSGOT) and the appropriate land management and permitting agencies, with input from the Department of Fish, Wildlife and Parks, and the United States Fish and Wildlife Service.

**Permitting/Authorization:** The complete analysis package developed by consultation and review outlined herein will be forwarded to the appropriate reviewing or permitting agency. The Program recommendations will be included, as will other recommendations from project proponents and other appropriate agencies.

**Requirements for Gravel Pits:** MSGOT shall review the procedural and substantive permitting requirements contained in state law relating to gravel pits, and shall consider the need for further adjustments to these stipulations to accommodate those requirements while still protecting sage grouse, and shall recommend any further adjustments to these stipulations that may be appropriate.

**Excepted Activities:** A list of existing land uses and landowner activities that are not subject to these stipulations is provided in Attachment F.

## ***CORE AREA STIPULATIONS***

Sage grouse Core Areas were delineated as areas of highest conservation priority. These stipulations are designed to maintain existing levels of suitable sage grouse habitat by regulating uses and activities (hereafter activities) in Core Areas to ensure the maintenance of sage grouse abundance and distribution in Montana. The following stipulations apply to all new activities in Core Areas:

- 1. Surface Disturbance:** Surface disturbance will be limited to 5% of suitable sage grouse habitat averaged across the area affected by the project. The DDCT process will be used to determine the level of disturbance (and the relevant area). Distribution of disturbance may be considered and approved on a case-by-case basis, with a goal of consolidating disturbance. Unsuitable habitat should be identified in a seasonal and landscape context, on a case-by-case basis, outside the NSO buffer around leks. This will incentivize proponents to locate projects, where technically feasible, in unsuitable habitat to avoid creating additional disturbance acres. Acres of development in unsuitable habitat are not considered disturbance acres. The primary focus should be on protection of suitable habitats and protection from habitat fragmentation. The calculation of total percent disturbance shall include all existing disturbance (including wildfire), authorized but yet to be implemented activities, and proposed activities that are under consideration by the appropriate reviewing or permitting agency.
- 2. Surface Occupancy:** Within 0.6 miles of the perimeter of active sage grouse leks there will be no surface occupancy (NSO) for new activities. NSO, as used in these recommendations, means no surface facilities including roads shall be placed within the NSO area. Other activities may be authorized with the application of appropriate seasonal stipulations, provided the resources protected by the NSO are not adversely affected. For example, and absent such adverse effects, underground utilities and geophysical exploration are permissible if conducted in accordance with seasonal stipulations.
- 3. Seasonal Use:** As authorized by permitting agency or agencies, activities (production, maintenance, and emergency activity exempted) will typically be prohibited from March 15 – July 15 outside of the NSO perimeter of an active lek and within 2 miles of that perimeter in Core Areas where breeding, nesting, and early brood-rearing habitat is present. Discretionary maintenance and production activity will not occur between the hours of 4:00 - 8:00 am and 7:00 - 10:00 pm between March 15 – July 15. In areas used as winter concentration areas, exploration and development activity will be prohibited December 1 – March 15. Activities may be allowed during seasonal closure periods as determined on a case-by-case basis. Activities in unsuitable habitat also may be approved year round on a case-by-case basis.
- 4. Transportation:** Locate main roads used to transport production and/or waste products > 2 miles from the perimeter of active sage grouse leks. Locate other roads used to provide facility site access and maintenance > 0.6 miles from the perimeter of active sage grouse leks. Construct roads to minimum design standards needed for production activities.

5. **Pipelines:** Bury pipelines and restore disturbed area with native grasses, forbs and shrubs to achieve cover, species composition, and life form diversity commensurate with the surrounding plant community or desired ecological condition to benefit sage grouse and replace or enhance sage grouse habitat. Seed mixes should include two native forbs and two native grasses with at least one bunchgrass species. Landowners should be consulted on desired plant mix on private lands. The operator is required to control noxious and invasive weed species, including cheatgrass. Co-locate pipelines with roads, transmission lines, and other linear features, when possible.

6. **Overhead Power Lines and Communication Towers:** Use topographic screening and bury new lines when economically feasible, if not; locate overhead lines at least 0.6 miles from the perimeter of occupied sage grouse leks. If siting of overhead power lines is necessary within 2.0 miles of important breeding, brood-rearing, and winter habitat, follow the most current version of the Avian Power Line Interaction Committee guidelines to minimize collision potential and raptor perch sites or bury a portion of the line. Co-locate all new power lines with roads, existing power lines, or other linear features when possible.

Follow USFWS Best Management Practices for tall structures when erecting new communication towers. Locate new communication towers at least 0.6 miles from the perimeter of occupied sage grouse leks.

Anti-collision measures should be installed within 0.6 mile of the perimeter of known sage grouse concentration areas such as leks and winter ranges, where icing conditions are unlikely to occur. If effective perch preventers are identified, they should be installed within 0.6 mile of known concentration areas.

Burying existing overhead lines that have been identified as contributing to a decline in sage grouse populations will be considered as a mitigation option.

Electric utilities, including electric cooperatives, are working with the Avian Power Line Interaction Committee (APLIC), which includes federal agencies and state wildlife agencies to develop a set of Best Management Practices (BMPs) to guide construction, operation, and maintenance activities in sage grouse habitats. When this document is finalized and approved for use, it should be incorporated in this Conservation Strategy.

7. **Noise:** New noise levels from construction activities, at the perimeter of an active lek, should not exceed 10 dBA above ambient noise (existing activity included), from 6:00 p.m. to 8:00 a.m. during the initiation of breeding (March 1 – July 15), unless a site-specific noise level is agreed upon by the project proponent and Program. MSGOT shall review the emerging science on this issue, including the work being conducted regarding this issue in the State of Wyoming, and shall recommend any further adjustments in this stipulation that may be appropriate.

8. **Vegetation Removal:** Vegetation removal will be limited to the minimum disturbance required by the project. All topsoil stripping and vegetation removal in suitable habitat will occur between July 16 and March 14 in areas that are within 4.0 miles of an active

lek. Initial disturbance in suitable habitat between March 15 and July 15 may be approved on a case-by-case basis.

- 9. Sagebrush Eradication and Treatments:** Sagebrush eradication is considered disturbance and will contribute to the 5% disturbance factor, unless approved by MSGOT. Sagebrush treatments that maintain sagebrush canopy cover at or above 30% total canopy cover within the treated acres will not be considered disturbance. In stands with less than 30% cover, treatment should be designed to maintain or improve sagebrush habitat. Treatments to enhance sagebrush-grassland will be evaluated based upon the existing habitat quality and the functional level post-treatment. Restored sagebrush grassland habitats that provide effective cover and food for sage grouse should be recognized as part of the habitat base. This serves as an incentive for restoring and protecting converted habitats.
- 10. Wildfire and Prescribed Burns:** Following wildfire, it is recommended that landowners implement a management plan consistent with the rehabilitation practices in Attachment C, with a goal of returning the area to functional sage grouse habitat. The Program and MSGOT should stay abreast of evolving science regarding post-fire rehabilitation in order to advise landowners. This is specific to wildfire and not intended for other incentive or mitigation situations. The Program should be consulted in advance for any proposal to conduct prescribed burns in sagebrush habitat. Prescribed burns should be prohibited unless it can be demonstrated that they will either result in no loss of habitat or be beneficial to sage grouse habitat. Burnouts, backfires, and all other public safety measures are appropriate for fighting wildfires.
- 11. Monitoring/Adaptive Response:** Proponents of new projects are expected to coordinate with the Program and the permitting agency to determine which leks need to be monitored and what data should be collected and reported. Generally, monitoring plans should include an evaluation of affected leks as well as reference leks for control purposes. If declines in affected leks (using a three-year running average during any five-year period relative to trends on reference leks) are determined to be caused by the project, the operator will propose adaptive management responses to increase the number of birds. If the operator cannot demonstrate a restoration of bird numbers to baseline levels (established by pre-disturbance surveys, reference surveys and taking into account regional and statewide trends) within three years, operations will cease until such numbers are achieved. In the interim, the operator, permitting agency, and the Program will create additional adaptive management efforts to restore sage grouse population numbers and baseline numbers, as well as restore project operations. Natural occurrences and their effects on sage grouse and sagebrush habitat will be considered in all cases. The MSGOT shall review the work being conducted around this issue by the State of Wyoming and the U.S. Fish and Wildlife Service, and shall recommend any further adjustments to this stipulation that may be appropriate.
- 12. Reclamation:** Except for reclamation prescribed for coal mines under MSUMRA/SMCRA and their implementing regulations and permits, reclamation should re-establish native grasses, forbs and shrubs during interim and final reclamation to

achieve cover, species composition, and life form diversity commensurate with the surrounding plant community or desired ecological condition to benefit sage grouse and replace or enhance sage grouse habitat. Seed mixes should include two native forbs and two native grasses with at least one bunchgrass species. Where sagebrush establishment is prescribed, establishment is defined as meeting the standard prescribed in the individual reclamation plan. Landowners should be consulted on desired plant mix on private lands. The operator is required to control noxious and invasive weed species, including cheatgrass.

- 13. Conifer Expansion:** For government agencies managing sagebrush in Core Areas, there should be a “no net conifer expansion” policy adopted, with criteria for approve waivers. This policy can be enacted through management plans and their implementation; stipulations in permits, leases, and licenses; and similar mechanisms. Conifer removal should be done manually, unless other methods can be shown to remove conifers without significantly impacting sagebrush. Where conifer encroachment is an issue near leks, land managers should ensure that all conifers are removed within at least 0.6 miles of leks.
- 14. Rangelands:** Rangelands on State Trust Lands will be managed in accordance with criteria to be developed by the Department of Natural Resources and Conservation, consistent with the recommendations in Attachment G, and taking into consideration the existing management practices of the lessee on surrounding non-state lands.
- 15. Existing Activities:** Areas already disturbed or approved for development within Core Areas prior to the effective date of the Program are not subject to sage grouse stipulations with the exception that existing operations may not initiate activities resulting in new surface occupancy within 0.6 miles of an active sage grouse lek. Any existing disturbance will be counted toward the calculated disturbance cap for a new proposed activity. The level of disturbance for existing activity may exceed 5%.

#### ***INDUSTRY-SPECIFIC STIPULATIONS within Core Areas***

The following industry-specific stipulations are applicable in addition to the general stipulations, and in the event of conflict, these specific stipulations control.

- 1. Oil and Gas:** Well pad densities are not to exceed an average of 1 per square mile (640 acres), and suitable habitat disturbed not to exceed 5% of suitable habitat within the DDCT. As an example, the number of well pads within a 2.0 mile radius of the perimeter of an active sage grouse lek should not exceed 11, distributed preferably in a clumped pattern in one general direction from the active lek.
- 2. Mining:**
  - a. For development drilling or ore body delineation drilling on tight centers, (approximately 50'x50') the disturbance area will be delineated by the external limits of the development area. For a widely-spaced disturbance pattern (greater

than 50' x 50'), the actual disturbance footprint will be considered the disturbance areas.

- b. Sage grouse monitoring results will be reported in the mine permit annual report, and to the Program. Pre-disturbance surveys will be conducted as required by the appropriate regulatory agency.
- c. The number of active mining development areas (e.g., operating equipment and significant human activity) are not to exceed an average of one area per square mile (640 acres) within the DDCT. An active mining development area is any single mine site or series of contiguous mine sites that will be mined in a continuous, cast-back fashion.
- d. Surface disturbance and surface occupancy stipulations will be waived when implementing underground mining practices that are necessary to protect the health, welfare, and safety of miners, mine employees, contractors and the general public. The mining practices include but are not limited to bore holes or shafts necessary to: 1) provide adequate oxygen to an underground mine; 2) supply inert gases or other substances to prevent, treat, or suppress combustion or mine fires; 3) inject mine roof stabilizing substances; and 4) remove methane from mining areas. Any surface disturbance or surface occupancy necessary to access the sites to implement these mining practices will also be exempt from any stipulation.
- e. Mining permits will include requirements for mitigation, including, where appropriate, off-site mitigation that enhances or promotes sage grouse genetic diversity, critical habitat, connectivity, and population viability.

### **3. Coal Mining:**

- a. Coal mining operations will be allowed to continue under the terms and conditions included in permits issued by the Montana Department of Environmental Quality under the authority of the Montana Strip and Underground Mine Reclamation Act (MSUMRA) and the federal Surface Mining Control and Reclamation Act (SMCRA) and imposed by those statutes' implementing state and federal regulations.
- b. Coal mining operations are generally governed by MSUMRA and SMCRA under this Conservation Strategy, and those laws are the mechanisms by which this Conservation Strategy is applied to coal mining operations. This Strategy shall not preclude federal leasing.
- c. New coal mining operations, including expansions into or within Core Areas, requires permitting under MSUMRA/SMCRA.

- 4. **Wind Energy:** Wind energy development should be avoided in sage grouse core areas. An exception may be made if it can be demonstrated by the project proponent using the

best available science that the development will not cause a decline in sage grouse populations.

### ***GENERAL HABITAT STIPULATIONS***

The health of General Habitat areas is a critical element in the effort to maintain the abundance and distribution of sage grouse in Montana. Development scenarios in General Habitat are more flexible than in Core Areas, but should still be designed and managed to maintain populations, habitats, and essential migration routes, since this Conservation Strategy requires habitat connectivity and movement between populations in Core Areas. In all General Habitat areas, the following stipulations apply:

1. **Surface Occupancy:** Within 0.25 miles of the perimeter of an active sage grouse lek there will be no surface occupancy (NSO).
2. **Surface Disturbance:** There are no specific surface disturbance limits in General Habitat. However, as a standard management practice surface disturbance should be minimized, through measures such as co-locating new and existing structures. Structures and associated infrastructure will be removed and areas reclaimed.
3. **Seasonal Use:** Activities (production and maintenance activity exempted) will be prohibited from March 15 – July 15 within 2.0 miles of an active lek where breeding, nesting, and early brood-rearing habitat is present. Discretionary maintenance and production activity will not occur between the hours of 4:00 - 8:00 am and 7:00 - 10:00 pm between March 15 – July 15. In areas used as winter concentration areas, exploration and development activity will be prohibited December 1 – March 15. Activities may be allowed during seasonal closure periods as determined on a case-by-case basis. This stipulation may be modified or waived for areas of unsuitable habitat. Any deviations from this stipulation for unsuitable habitat will be determined by the applicable permitting agency in coordination with the Program.
4. **Overhead Power Lines and Communication Towers:** New overhead power lines and communication towers will be located outside of General Habitat when possible. Where avoidance is not possible, develop a route or siting location that uses topography, vegetative cover, site distance, etc., to effectively protect identified sage grouse habitat in a cost-efficient manner. If siting of overhead power lines is necessary within 2.0 miles of important breeding, brood-rearing, and winter habitat, follow the most current version of the Avian Power Line Interaction Committee guidelines to minimize collision potential and raptor perch sites or bury a portion of the line. Site new lines in existing corridors wherever practicable.
5. **Noise:** New noise levels from construction activities, at the perimeter of an active lek, should not exceed 10 dBA above ambient noise (existing activity included), from 6:00 p.m. to 8:00 a.m. during the initiation of breeding (March 1 – July 15), unless a site-specific decibel level is agreed upon by the project proponent and Program. MSGOT shall review the emerging science on this issue, including the work being conducted

regarding this issue in the State of Wyoming, and shall recommend any further adjustments in this stipulation that may be appropriate.

6. **Vegetation Removal:** Vegetation removal as part of permitted activities will be limited to the minimum disturbance required by the project.
7. **Sagebrush Treatments:** Treatments to enhance sagebrush-grassland will be evaluated based upon the existing habitat quality and the functional level post-treatment. Restored sagebrush grassland habitats that provide effective cover and food for sage grouse should be recognized as part of the habitat base. This serves as an incentive for restoring and protecting converted habitats.
8. **Wildfire and Prescribed Burns:** Suppression of wildfire in General Habitat will be emphasized, recognizing that other local, regional, and national suppression priorities may take precedent. Public and firefighter safety remains the number one priority for all fire management activities. The Program should be consulted in advance for any proposal to conduct prescribed burns in sagebrush habitat. Prescribed burns should be prohibited unless it can be demonstrated that they will either result in no loss of habitat or be beneficial to sage grouse habitat. Burnouts, backfires, and all other public safety measures are appropriate for fighting wildfires.
9. **Reclamation:** Reclamation should re-establish native grasses, forbs, and shrubs during interim and final reclamation. The goal of reclamation is to achieve cover, species composition, and life form diversity commensurate with the surrounding plant community or desired ecological condition to benefit sage grouse and replace or enhance sage grouse habitat to the degree that environmental conditions allow. Landowners should be consulted on the desired plant mix on private lands. The operator is required to control noxious and invasive plant species, including cheatgrass (*Bromus tectorum*) and Japanese brome (*Bromus japonicus*).
10. **Rangelands:** When possible, rangelands on State Trust Lands should be managed consistent with the recommendations in Attachment G, taking into consideration the existing management practices of the lessee on surrounding non-state lands.
11. **Oil and Gas, Mining:** Encourage development in incremental stages to stagger disturbance and design schedules that include long-term strategies to localize disturbance and recovery within established zones over a staggered time frame. Remove facilities and infrastructure and reclaim when use is completed, including for exploration activities.
12. **Other Mining:**
  - a. Sage grouse monitoring results will be reported in the mine permit annual report, and to the Program. Pre-disturbance surveys will be conducted as required by the appropriate regulatory agency.

- b. Surface occupancy stipulations will be waived when implementing underground mining practices that are necessary to protect the health, welfare, and safety of miners, mine employees, contractors and the general public. The mining practices include but are not limited to bore holes or shafts necessary to: 1) provide adequate oxygen to an underground mine; 2) supply inert gases or other substances to prevent, treat, or suppress combustion or mine fires; 3) inject mine roof stabilizing substances; and 4) remove methane from mining areas. Any surface disturbance or surface occupancy necessary to access the sites to implement these mining practices will also be exempt from any stipulation.
- c. Mining permits will include requirements for mitigation, including, where appropriate, off-site mitigation that enhances or promotes genetic diversity, critical habitat, connectivity, and population viability.

### **13. Coal Mining:**

- a. Coal mining operations are generally governed by MSUMRA and SMCRA under this Conservation Strategy, and those laws are the mechanisms by which this Conservation Strategy is applied to coal mining operations. This Strategy should not preclude federal leasing.
- b. Conservation measures will be developed for coal mining operations on a case-by-case basis via the terms and conditions included in permits issued by MDEQ under the authority of the Montana Strip and Underground Mine Reclamation Act (MSUMRA) and in compliance with the federal Surface Mining Control and Reclamation Act (SMCRA).

**14. Wind Energy:** New wind energy developments are not recommended within 4.0 miles of the perimeter of active sage grouse leks, unless it can be demonstrated that the development cannot reasonably meet this setback and will not cause a decline in sage grouse populations. Any development must adhere to the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines*, and project developers should work cooperatively with agencies, utilities, and landowners to use topography, vegetative cover, site distance, etc. to effectively protect identified sage grouse habitat.

### ***CONNECTIVITY HABITAT STIPULATIONS***

Connectivity habitat includes those areas that provide important linkages among populations of sage grouse, particularly between Core Areas or priority populations in adjacent states and across international borders. Only one sage grouse connectivity area has been identified (Montana-Saskatchewan Connectivity Area in Valley County). Research continues, based on genetics work, to better define the composition of other possible priority Connectivity Areas. MSGOT shall study and recommend the stipulations that are necessary in Connectivity areas to prevent a decline in sage grouse populations. In the interim, the Valley County Connectivity area shall be subject to the stipulations for General Habitat.

## Attachment E

### Special Management Areas

A petition may be filed with the Program to create a Special Management Area (SMA), where planned land uses or activities associated with valid rights cannot be implemented after evaluation against this Conservation Strategy.

1. Petitions may be submitted to the Program to create a new SMA. The Petition shall be submitted by the project developer (holder of valid rights).
2. The Petition shall contain: a geographic description of the area proposed to be created and a detailed description of the number and location of the sage grouse lek(s) within the area; an evaluation of how the creation of the proposed SMA would impact the Core Area function relative to the sage grouse; and, an explanation of the rationale for the creation of the SMA.
3. The Petitioner shall submit a proposed conservation plan (including plans for off-set mitigation) and shall work in cooperation with both the Program and reviewing/permitting agency to develop an acceptable plan to be submitted to the MSGOT for review. The conservation goal of the plan is to maintain and restore seasonal sage grouse habitats that support viable sage grouse populations. As industrial activities subside, these populations are expected to expand into vacant functional habitats.
4. All applicable Core Area stipulations will apply to the SMA until the conservation plan has been recommended for approval by MSGOT and subsequently approved by the appropriate agency. The conservation plan will follow the mitigation framework developed by MSGOT and shall include a noise abatement stipulation, a strategy for restoration/reclamation within the Core Area(which results in a long-term reduction in surface disturbance), a proposal for off-set mitigation, and a monitoring component using peer-reviewed scientific methods that is designed to monitor sage grouse populations, the impact of development, and restoration efforts on sage grouse populations, and provide feedback if adjustments are needed in the conservation plan to reduce impacts on sage grouse populations.
5. In evaluating whether to recommend approval of the creation of the new SMA, the MSGOT shall consider how the creation of an SMA will impact the habitat and population of sage grouse both within the Core Area and on a statewide basis.
6. MSGOT shall evaluate the need for a cap on the number of sage grouse impacted by SMAs (i.e., the population of sage grouse impacted by all SMAs may not exceed a specific population, measured by the number and size of leks impacted or a similar population metric), and shall make a recommendation in this regard.
7. The MSGOT must develop a process where designated SMAs can be reclassified. This process should be based on metrics measuring the quantity and quality of sage grouse

habitat restored and/or reclaimed, as well as the documented use of that habitat by sage grouse.

MSGOT should recommend such additional requirements and objectives as necessary.

## Attachment F

### EXEMPT ACTIVITIES

The following existing land uses and landowner activities are exempt from compliance with this strategy:

- a. Existing animal husbandry practices (including branding, docking, herding, trailing, etc.).
- b. Existing farming practices (excluding conversion of sagebrush/native range to cropland agriculture).
- c. Existing grazing operations that meet rangeland health standards or utilize recognized rangeland management practices (for example, allotment management plans, Natural Resource and Conservation Service grazing plans, prescribed grazing plans, etc.).
- d. Construction of agricultural reservoirs and aquatic habitat improvements less than 10 surface acres and drilling of agriculture and residential water wells (including installation of tanks, water windmills, and solar water pumps) more than 0.6 miles from the perimeter of a lek in Core Areas and more than 0.25 miles from a lek in General Habitat or Connectivity Areas. Within 0.6 miles of a lek in Core Areas and within 0.25 miles of a lek in General Habitat or Connectivity Areas, no review is required if construction does not occur March 15 – July 15 and construction does not occur on the lek. All water tanks shall have bird escape ramps.
- e. Agricultural and residential electrical distribution lines more than 0.6 miles from a lek in Core Areas and 0.25 miles from a lek in General Habitat or Connectivity Areas. Within 0.6 miles of a lek in Core Areas and within 0.25 miles of a lek in General Habitat or Connectivity Areas, no review is required if construction does not occur between March 15 – July 15 and construction does not occur on the lek. Raptor perching deterrents shall be installed on all poles within 0.6 or 0.25 miles, respectively, from leks, if they are proven to be effective according to Avian Power Line Interaction Committee guidance. Other management practices, such as vegetation screening and anti-collision measures, should be applied to the extent possible. Routine maintenance of existing power lines conducted between July 16 – March 14 is also an exempt activity.
- f. Pole fences. Wire fences if fitted with visibility markers where high potential for sage grouse collisions has been documented.
- g. Irrigation (excluding the conversion of sagebrush/grassland to new irrigated lands). Tribal lands under existing and future state water compacts.
- h. Spring development if the spring is protected with fencing and enough water remains at the site to provide mesic (wet) vegetation.

- i. Herbicide and pesticide use except for in the control of sagebrush and associated native forbs. Grasshopper/Mormon cricket control following Reduced Agent-Area Treatments (RAATS) protocol.
- j. County road maintenance.
- k. Production and maintenance activities associated with existing oil, gas, communication tower, and power line facilities in compliance with approved authorizations.
- l. Low impact cultural resource surveys.
- m. Emergency response.

## Attachment G

### RECOMMENDATIONS FOR RANGE AND DISEASE (West Nile) MANAGEMENT

The following recommendations outline voluntary management practices for private lands to maintain or enhance sage grouse populations and habitats. Whenever possible, adherence to these recommendations is encouraged.

#### Range Management

Livestock grazing is the most widespread type of land use across the sagebrush biome. Although improper livestock management, as determined by local ecological conditions, may have negative impacts on sage grouse seasonal habitats, proper livestock management is a critical tool for providing and maintaining high quality sage grouse habitat. Range management structures and fences necessary for proper grazing management can also be placed or designed to be neutral or beneficial to sage grouse. The following recommendations are intended to support grazing management as a tool for providing quality sage grouse habitat.

- a. Landowners in sage grouse Core and Connectivity Areas and General Habitat are encouraged to adopt the Sage grouse Initiative grazing practices and range management recommendations, including:
  1. Rotating livestock to different pastures, while resting others to establish a diversity of habitat types.
  2. Changing seasons of use within pastures to ensure all plants have the ability to reproduce.
  3. Leaving residual cover (grass from the past season) to increase hiding and nesting cover for sage grouse.
  4. Managing the frequency and intensity of grazing to sustain native grasses, wildflowers, and shrubs.
  5. Managing livestock access to water to ensure healthy livestock and healthy watersheds.
- b. Range management structures should be designed and placed to be neutral or beneficial to sage grouse.
- c. Structures that are currently contributing to negative impacts to either sage grouse or their habitats should be removed or modified to remove the threat.
- d. Mark fences that are in high risk areas for collision with permanent flagging or other suitable device to reduce sage grouse collisions.
- e. Identify and remove unnecessary fences.

- f. Placement of new fences and livestock management facilities (including corrals, loading facilities, water tanks, and windmills) should consider their impact on sage grouse and, to the extent practicable, be placed at least 0.6 miles from active leks.

### **Disease Management (West Nile virus)**

West Nile virus was a new source of mortality for sage grouse, particularly in low and mid-elevation populations, from 2003 – 2007. If there is a West Nile virus outbreak that significantly reduces sage grouse populations, the MSGOT should look at a local site-specific strategy for enhancing the sage grouse population. Elimination of anthropogenic-created habitat for the mosquito vectors of West Nile virus is an important conservation measure for sage grouse, and the following recommendations are intended to further this objective.

- a. Construct ponds to reduce prevalence of mosquitoes that transmit West Nile virus consistent with current BLM guidance (see, A Report on National Sage grouse Conservation Measures, Appendix C: BMPs for how to make a pond that won't produce mosquitoes that transmit West Nile virus).
- b. Manage ponds to reduce prevalence of mosquitoes that transmit West Nile virus.
- c. Other management actions to reduce prevalence of mosquitoes that transmit West Nile virus include erection of bat houses, and managing containers, wood piles, and tire storage facilities that harbor breeding or overwintering mosquitoes and/or larvae.

## Attachment H

### DEFINITIONS

Suitable Habitat – is within the mapped occupied range of sage grouse, and:

1. Generally has 5% or greater canopy cover of sagebrush, where “sagebrush” includes all species and sub-species of the genus *Artemisia*. This excludes mat-forming subshrub species such as *A. frigida* (fringed sagewort) and *A. pedatifida* (birdfoot sage). Sagebrush canopy cover may be less than 5% when complimented by other shrubs suitable for sage grouse cover requirements; or
2. Is moist meadow containing forbs suitable for brood-rearing within 300 yards of suitable sagebrush cover (as defined above). Introduced species such as alfalfa may be very important on these sites where native forbs are not available.

Vegetation monitoring to determine habitat suitability will follow the Habitat Assessment Framework, available at [http://www.blm.gov/pgdata/etc/medialib/blm/wo/Communications\\_Directorate/public\\_affairs/sage\\_grouse\\_planning/documents.Par.23916.File.dat/SG\\_HABITATASESSMENT0000669.pdf](http://www.blm.gov/pgdata/etc/medialib/blm/wo/Communications_Directorate/public_affairs/sage_grouse_planning/documents.Par.23916.File.dat/SG_HABITATASESSMENT0000669.pdf)

Unsuitable Habitat – is land within the historic range of sage grouse that did not, does not, nor will not provide sage grouse habitat due to natural ecological conditions such as badlands or canyons.

Surface Disturbance – includes any conversion of formerly suitable habitat to grasslands, croplands, mining, well pads, roads, or other physical disturbance that renders the habitat unusable for sage grouse.

Lek Status -

- Active - Data supports existence of lek. Supporting data defined as 1 year with 2 or more males lekking on site followed by evidence of lekking within 10 years of that observation.
- Inactive - A confirmed active lek with no evidence of lekking for the last 10 years. Requires a minimum of 3 survey years with no evidence of lekking during a 10 year period.
- Extirpated - Habitat changes have caused birds to permanently abandon a lek as determined by the biologists monitoring the lek.
- Unconfirmed - Possible lek. Sage grouse activity documented. Data insufficient to classify as active status.

Valid Right(s) – legal “rights” or interest that are associated with land or mineral estate and that cannot be divested from the estate until that interest expires, is relinquished, or acquired.

Habitat Exchange - an efficient, effective approach to wildlife conservation in America, developed in partnership by private landowners, industry, environmental groups, academics and

government. In a Habitat Exchange, landowners and industry are given financial incentives to conserve wildlife habitat. Landowners benefit by earning revenue from credit sales and developers benefit by meeting conservation objectives or regulatory requirements with less red tape.

**Attachments:** Miles City\_WO\_Memo\_5-20-14.docx; WO response to MT Rationale\_6\_10\_14.docx

Hi Stephanie and Ed,

Last summer, we reached out to the BLM to ensure that they were following the April 2014 NPT allocation guidance. During this time, we (WO) did not catch any inconsistencies (particularly as it relates to compliance with fluid minerals in GH) in MT. Attached is a memo from BLM MT (for Miles City) to AD-200, in addition to the WO follow-up from that memo.

So - I am guessing something was incorrectly modified when we were making changes to the national allocation table between October and January. It certainly could have been an error on my part.

## INFORMATION MEMORANDUM FOR THE ASSISTANT DIRECTOR, RESOURCES AND PLANNING

FROM: Jamie Connell, State Director, BLM Montana, 406 896-5012

SUBJECT: Miles City RMP Revision: Sage-Grouse Allocation Decisions and Conservation

DATE: May 23, 2014

### I. INTRODUCTION

The Miles City Field Office RMP Revision (MCFO RMP) planning area consists of 3.3 million acres of Bureau of Land Management and U.S. Forest Service (FS) surface estate and about 11.4 million acres of federal mineral estate in Management Zone I. Approximately 19 million acres of the land surface is private or state-owned. BLM surface estate encompasses over 800,000 acres of Priority Habitat and 1.4 million acres of General Habitat. For national context, the MCFO RMP planning area contains approximately 0.07 percent of the range-wide Priority Habitat and 0.04 percent of the range-wide General Habitat. Identified potential widespread threats include habitat loss, fragmentation, and deterioration of habitat resulting from infrastructure development, energy development, conversion of sagebrush habitats to nonnative species or agriculture, and conifer invasion. Given the highly fragmented nature of land ownership across the Priority Habitat areas within the planning area, factors outside of the BLM/FS management authority may determine actual sage-grouse population trajectories.

### II. BACKGROUND

The Administrative Draft Proposed Plan (ADPP), developed in coordination with and supported by Federal and state partners, addresses the objectives of the Conservation Objectives Final Report (COT Report) and required policies and directives. Throughout the RMP process, the BLM has coordinated with the U.S. Fish and Wildlife Service (FWS) and the State of Montana to conserve Greater Sage-Grouse (GRSG) - from the analysis of the management situation to the development of the ADPP. The FWS provided the final COT threat assessment table as part of their public comments and BLM held subsequent meetings with the FWS to discuss, clarify and resolve issues identified in the table. The FWS primary concern was the need for additional clarity concerning the conservation measures within the document. The BLM has addressed all the concerns presented in the table and provided additional clarity of conservation measures in the plan.

The cross-jurisdictional concerns associated with the Miles City planning effort concern habitats that span the borders with North Dakota and Wyoming. There were slight differences in how the three states mapped habitat. No GRSG habitat exists on FS lands within the planning area. The Governor of Montana has yet to issue a planned Sage-Grouse Conservation Executive Order that will outline how the State of Montana will address GRSG conservation; therefore, it is not possible at this time to fully determine how the ADPP will compare with the potential State regulatory mechanisms or management actions to protect and conserve GRSG and GRSG habitats.

### III. POSITION of INTERESTED PARTIES

The State of Montana manages GRSG and their habitats, and the BLM has engaged the state in the development of the ADPP. The ADPP limits disturbance density and intensity in Priority Habitat. The mitigation strategy (avoid, minimize, compensate) applies to all occupied GRSG habitat. Further, the ADPP includes an adaptive management strategy that includes both soft and hard triggers. Thus, all Priority Habitat managed by the BLM is protected from impacts associated with right-of-way, fluid minerals, and mining developments. The ADPP (which applies to federal lands), when coupled with the pending Executive Order from the Governor of Montana (which is anticipated to apply to all land whenever a state authorization is required), provides cooperative landscape-level management for the conservation of GRSG which transcends ownership boundaries. This illustrates the added value of engaging all stakeholders and governmental partners in long-term, range-wide GRSG conservation efforts, particularly in landscapes with mixed and fragmented land ownership patterns.

Key land use allocations are as follows:

#### **Renewable Energy**

Rights-of-way (ROWs) associated with wind energy are excluded in Priority Habitat and avoided in General Habitat. Solar energy ROWs are managed the same as other ROWs (see below under Other ROW's). All ROW developments proposed in Priority Habitat must meet the surface disturbance limits, mitigation, and other conservation measures.

#### **High-Voltage Transmission Lines and Major Pipeline Rights-of-Way**

These types of ROW actions were not separated in any alternative in the draft plan. These ROW actions would be addressed the same as other ROWs (see below under Other ROWs).

#### **Other (Minor) Rights-of-Way**

The ADPP avoids all rights-of-way in Priority Habitat. All ROW developments proposed in Priority Habitat must meet goals and objectives for Priority Habitat, surface disturbance limits, mitigation, and other conservation measures. In General Habitat, the ADPP imposes mitigation measures and conservation actions on ROW proposals.

#### **Fluid Minerals**

The ADPP eliminated surface disturbance associated with oil and gas development through a No Surface Occupancy (NSO) stipulation in Priority Habitats with strict waiver, modification, and exception criteria.

General Habitat is "open" with constraints including NSO stipulations near leks and Controlled Surface Use stipulations to protect breeding activities and winter concentration areas.

#### **Non-Energy Leasables**

There are no known deposits or the potential for the development of non-energy leasables in the planning area and management actions for non-energy leasables were therefore included in the "Alternatives Considered, but not Analyzed" portion of the document.

**Mineral Materials**

The draft RMP did not separate free use and commercial use permits for mineral materials in any alternative in the draft plan. Priority Habitat will remain Open for mineral material sales. All mineral material sales proposed in Priority Habitat must meet goals and objectives for Priority Habitat, surface disturbance limits, mitigation, and other conservation measures. General Habitat is open for mineral material sales and all mineral material sales proposed in General Habitat must meet goals and objectives for General Habitat, mitigation, and other conservation measures.

**Disturbance**

The ADPP imposes a 3 percent disturbance cap in Priority Habitat. The disturbance calculation uses fine-scale mapping using 1-meter resolution and takes into account disturbance on all lands and arising from all activities which remove sagebrush habitat, including agriculture, vegetation treatments, and wildfire. The draft state plan also proposes to limit disturbance in Priority Habitat, however the draft state plan proposes a 5 percent disturbance cap.

<b>Allocations/Disturbance</b>	<b>Consistent with National Policy Team Recommendations</b>	<b>Alternative Measures and Rationale</b>
Solar/Wind ROWs	<b>PH</b> – Yes <b>GH</b> – Yes	<ul style="list-style-type: none"> <li><i>Solar was not considered separately in any alternative in the draft because there is no potential for commercial solar (not considered threat) – it would be included in general ROWs – avoidance for PH.</i></li> </ul>
High-Voltage Transmission Lines and Major Pipeline ROWs	<b>PH</b> – Yes <b>GH</b> – No	<ul style="list-style-type: none"> <li><i>ROW decisions were not separated into major and minor categories in any alternative in the draft RMP.</i></li> </ul>
Other (Minor) ROW and Land Use Authorizations	<b>PH</b> – Yes <b>GH</b> - Yes	<ul style="list-style-type: none"> <li><i>Mixed ownership pattern – potential result of exclusion in PH would be to push development onto better GRSG habitat on private (essential to maintain cooperation with state/private to effectively manage for best GRSG habitat).</i></li> </ul>
Fluid Minerals	<b>PH:</b> Yes <b>GH</b> – Yes	<ul style="list-style-type: none"> <li><i>Existing leases within habitat, if developed will have Mitigation measures and conservation actions applied as Conditions of Approval (COAs) for the decision record.</i></li> </ul>
Non-energy Leasables	<b>PH</b> – No <b>GH</b> - No	<ul style="list-style-type: none"> <li><i>Included in the "Alternatives Considered but not Analyzed" section of the RMP.</i></li> <li><i>No known occurrence of non-energy leasables is found in the planning area.</i></li> </ul>
Mineral Materials	<b>PH</b> – No <b>GH</b> - Yes	<ul style="list-style-type: none"> <li><i>The draft RMP did not separate free use and commercial use permits for mineral materials</i></li> </ul>

		<p><i>in any alternative in the draft plan. Priority Habitat will remain Open for mineral material sales. All mineral material sales proposed in Priority Habitat must meet goals and objectives for Priority Habitat, surface disturbance limits, mitigation, and other conservation measures. General Habitat is open for Mineral Material sales and all Mineral Material sales proposed in General Habitat must meet goals and objectives for General Habitat, mitigation, and other conservation measures.</i></p>

RE: Allocation Memo

Date: June 9, 2014

At this time our focus is on the allocation piece and future discussions will occur regarding disturbance and how it is measured as well as the adaptive management strategy.

Concerns related to LUP Objective for Priority Habitat:

- At this time, we recommend that the footnote related to the use of the Density and Disturbance Calculation Tool (DDCT) process be removed.

Concerns related to the Action Suitability Screen and Mitigation Process

- It is unclear how the screening process that will be used for implementation level activities is beneficial for the Greater Sage-grouse vs. simply applying the NPT recommended allocation to Priority and General Habitats.
- As part of the screening process, there is a list of 5 questions to be answered before a project is approved in sage-grouse habitat. It is unclear who will be making the final determination on the responses to these questions and whether this process is consistent with the Mitigation Framework that the other sub-regions will be using?

Concerns related to Allocation Matrix

*South Dakota Revision*

- Not closing PH to mineral materials - The rationale for deviating from the NPT allocation recommendations revolves around the fact that a project may be better suited on public lands if there is better suited habitat on private (where the development would be pushed to if Federal lands are closed). It is unclear if there is some level of assurance that if BLM does not propose closing PH to mineral materials, then there are protective measures in place on private lands to prevent additional disturbance.

*Miles City Revision*

- Not excluding solar developing in PH and closing PH to non-energy leasables and mineral materials - the rationale for not carrying forward these NPT allocation recommendations was due to the fact that the measure was not analyzed in the draft or was not an issue for that planning area. Did the draft revisions analyze a conservation based alternative which excluded ROWs, closed non-energy leasables, and closed mineral material development from occupied sage-grouse habitat?

*Hi-Line Revision*

- Same comment as South Dakota in regards to mineral materials in PH.

*Billings Revision*

- Same comment as Miles City in regards to non-energy leasables in PH.

*Lewistown Amendment*

- Same comment as Miles City in regards to mineral materials in PH.

*North Dakota Amendment*

- The additional rationale provided did not include additional justification as to why North Dakota is not applying an adaptive management strategy or the 3% disturbance.
- It is also unclear how BLM Montana plans to decrease the 18% disturbance that already exists in the planning area and where this figure was originated from.

**WO Recommendations:** While the WO understands the constraints associated with the scattered land ownership pattern in Montana/Dakotas, it is unclear how it is biologically sound to use the screening process versus the NPT allocation recommendations. It is recommended that BLM Montana/Dakotas consider using the NPT allocation recommendations.

**Subject:** Another Question from ID

For the BSU map, we stated that it should show BSU boundaries and PHMA within it (all lands). The monitoring framework makes no mention of conducting disturbance analysis on anything but PHMA within BSUs and I believe the addition of this BSU maps was to illustrate where disturbance calcs would occur. Diane stated that their BSUs are a "subset of PHMA and IHMA". Should she include the IHMA in her BSU map?

Thanks,  
Anthony

From the ROD:

The BLM will also work with the state of Idaho in setting priorities for the review and processing of grazing permits/leases in SFAs consistent with the methodology recommended by the State of Idaho in its proposed plan for the management of BLM-administered lands in the state.

In the ARMPA, Grazing Section, Management Decisions (new language underlined):

**MD LG 15:** The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. Management and conservation action prioritization will occur at the Conservation Area (CA) scale and be based on GRSG population and habitat trends: Focusing management and conservation actions first in SFAs followed by areas of PHMA outside SFA. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (e.g., fire) and legal obligations.

**MD LG 17:** Allotments within SFAs, followed by those within PHMAs, and focusing on containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks can include monitoring for actual use, utilization, and use supervision. Management and conservation action prioritization will occur at the Conservation Area (CA) scale and be based on GRSG population and habitat trends: Focusing management and conservation actions first in SFAs followed by areas of PHMA outside SFA.

**Subject:** Idaho state plan- IMPORTANT

When I was last in Idaho, we agreed with the state of Idaho and the state's two lead legislators to include in the Idaho plan some language to further prioritize reviews of grazing permits in SFAs to first give emphasis to areas where SG population declines had occurred. Tim Murphy was to send us that language for review before he put it in the plan. This was only to occur in Idaho given their unique capacity to monitor SG populations on a localized basis per Connelly.

I do recall seeing that language referenced under the "unique" aspects of the plans portion of the GB ROD for Idaho. Last sentence, second paragraph.

Could you please track this down today? It needs to be in the Idaho plan and I would like to see what it says having led the conversation in Boise.

Thanks.

Jim

Steve

Here is the document we shared previously that was given to us by the State of Idaho (Tom Perry) on March 3 that outlines the State's concerns. As I indicated on the phone, our plan does address ecological site potential. The 7" stubble height pertains to perennial grass height in nesting and early brood rearing habitat.

3/3/15

## STATE OF IDAHO'S CONCERNS WITH THE NATIONAL DIRECTION

- **Sage-Grouse Focal Areas: Idaho is not inclined to support this proposal.**
  - The current map is the product of significant negotiations not only between the Governor's Sage-Grouse Task Force, but also with the relevant federal agencies.
  - The U.S. Fish and Wildlife Service (Service) concurred with the State's map on April 10, 2013, and since that time, discussions between Idaho and the federal agencies has resulted in an increase in the Core Habitat Zone.
  - The Core Habitat Zone (CHZ) effectively conserves 65% of the active leks occupied by approximately 73% of the males attending those leks. The State believes that no additional conservation benefit will result from this new designation.
  - Adding these focal areas effectively creates a fourth zone for the State of Idaho. The zonal approach with the adaptive management triggers is a key feature to mitigate against the impacts of wildfire. Creating a fourth zone will complicate and frustrate this scheme.
  - The mineral withdrawal recommendation is problematic to the State – we need to better understand the potential impact to industry.
  - At a minimum, the State will not support any designation of a focal area that is outside the CHZ unless such designation is informed by a previous management action (e.g., wilderness study area).
  - There are proposed focal areas that do not meet the best-of-the-best designation.
  
- **Merging of the Important Habitat Zone (IHZ) with the General Habitat Zone (GHZ)**
  - The State is concerned about the National Direction's lack of attention to Idaho's three-zone approach, specifically; the direction does not mention the impact of these recommendations on the IHZ.
  - Briefly, and as it relates to infrastructure development, the CHZ is the most restrictive and generally prohibits most new infrastructure development subject to a narrowly tailored exemption process; the IHZ permits new infrastructure development subject to certain criteria, mitigation and best management practices; the GHZ is open without any specific programmatic restriction for sage-grouse unless prohibited by the current RMP.
  - The IHZ has two key roles: provide a "savings account" in the event of a large-scale wildfire in the CHZ and a reasonable pathway for new infrastructure siting.

- If the national direction blurs the distinction between the CHZ/IHZ or IHZ/GHZ or effectively shrinks the amount of habitat in that zone, the adaptive triggers and the overall structure of the Governor’s plan ceases to exist.
- **Additional Requirements for the GHZ**
  - The purpose of the GHZ is to encourage the siting of infrastructure thus avoiding conflict with the key habitat in the other two zones.
  - The Department of Fish and Game estimates that only 5% of Idaho’s sage-grouse population is found within this zone.
  - Adding a “blanket lek buffer” to this zone is inconsistent with the Governor’s plan and the best available science (specifically, the USGS Report only provides a recommendation; and local science should be utilized by land managers).
  - At a minimum and based on the best available science, BLM should reject this recommendation at the programmatic level, and instead apply it where necessary and appropriate at the project-scale.
- **Grazing – The State has some significant concerns with this new approach**
  - “The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within the SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and Land Health Standards and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.”
    - This standard potentially deviates from the Governor’s proposal in several important respects:
      - Lack of detail surrounding the “specific thresholds”
      - No mention of the adaptive management triggers/process.
      - No mention of tying this analysis to the ecological site potential of the allotment.
      - No mention of ensuring that change to a permit must be accompanied by appropriate special and temporal monitoring.
      - “Defined Response” – sets up an “if/then” scenario that does not provide the flexibility to address unique rangeland concerns.
      - Inclusion of language about assessing range improvements (creation of buffers for range improvement should not be done at the programmatic level; will frustrate the ability to find creative solutions to potential grazing issues).

Brent – The only suggestion that I would give you for change is your #1. I would use the Utah language “o In PPMA, limit noise from discretionary activities to not exceed 10 decibels above ambient sound levels at occupied leks from 2 hours before to 2 hours after sunrise and sunset during breeding season; support the establishment of ambient baseline noise levels for PPMA habitat area leks.”

The “(Patricelli et al. 2010, Blickley et al. In preparation)” is old science and was updated with new info in 2013. I believe that Quincy’s language reflects that. Quincy – if I am wrong, correct me please!!

Again....thanks!

Lauren

Lauren,

OK – my oversight. When I saw the Forest Service language I responded with the similar RDF we have incorporated into our plan. Here are all the RDFs for noise that line up with the direction Quincy has reiterated. So we do have all of that direction that we talked about included in our RDF section.

1. Limit noise to less than 10 decibels above ambient measures (20-24 dBA) at sunrise at the perimeter of a lek during active lek season (Patricelli et al. 2010, Blickley et al. In preparation).
2. Require noise shields when drilling during the lek, nesting, brood-rearing, or wintering season.
3. The BLM/Forest Service would work with proponents to limit project related noise where it would be expected to reduce functionality of habitats in Core and Important Management Zones.
4. The BLM/Forest Service would evaluate the potential for limitation of new noise sources on a case-by-case basis as appropriate.
5. Limit noise sources that would be expected to negatively impact populations in Core and Important Management Zones and continue to support the establishment of ambient baseline noise levels for occupied leks in Core Management Zones.
6. As additional research and information emerges, specific new limitations appropriate to the type of projects being considered would be evaluated and appropriate limitations would be implemented where necessary to minimize potential for noise impacts on

**Subject:** Re: FW: noise restriction

All,

In the Portland FFM meeting I brought up the noise issue that FWS had raised in their comments on the Utah DEIS. All the other Great Basin sub-regions said that nobody brought up this issue on the DEIS. The decision by all the Great Basin managers was to defer the noise issue to the Rocky Mountain region and consider their input.

In the Denver FFM I again brought up the noise issue that FWS had raised on the Utah DEIS. As with the Portland meeting, all the Rocky Mountain sub-regions said that it hadn't been brought up in their efforts. However, WY had gone through extensive discussions with the Governor's office and FWS regarding the noise issue, so the action from all the Rocky Mountain managers was for a small group made up of Rocky Mountain PMs and bios to review the comments and literature related to noise and make recommendations for all the sub-regions to consider and apply.

We did so and provided the conclusions of the literature review and discussions in a summary dated March 7th. That summary was provided to all the Great Basin PMs for review/questions/concerns. It was discussed on one of the weekly PM call (see meeting notes from March 11th). No issues were raised at the time, so the direction was for everyone was to apply it (again, see the meeting notes from March 11th). As of that moment, there should have been consistency across the entire project area for this issue.

I've re-attached the summary notes. I have more detail about the other discussions, if anybody's interested. While we didn't say "use this language" we did provide an example and concluded that folks should add similar language. For example, in Utah, we revised the language slightly and included the following:

- Noise Restrictions:

- In PPMA, limit noise from discretionary activities to not exceed 10 decibels above ambient sound levels at occupied leks from 2 hours before to 2 hours after sunrise and sunset during breeding season; support the establishment of ambient baseline noise levels for PPMA habitat area leks.
- Work with project proponents to limit project related noise in other PPMA habitats and seasons where it would be expected to reduce functionality of habitats that support associated GRSG populations.
- As additional research and information emerges, specific new limitations appropriate to the type of projects being considered would be evaluated and appropriate measures would be implemented where necessary to minimize potential for noise impacts on PPMA GRSG population behavioral cycles.

This addresses both the NTT specific RDF while also addressing the broader issue of potential noise effects in areas other than leks.

Hope this helps.

**Subject:** noise restriction

Hi – Just finishing up a fun week in bustling Bismarck as we kick off our Dakota Prairie Grassland effort. Looking forward to some cooler, drier nights (and days) in CO!

I'm finalizing our draft plan amendment and would like some thoughts about were the BLM landed on the noise issue. Here's our language:

*During breeding, nesting, and brood rearing periods (table 1) from 6:00 pm to 9:00 am noise from new anthropogenic disturbances should be limited to less than 10 decibels above ambient levels of 20-24 decibels measured at sunrise at a distance of 0.6 mile from the perimeter of an occupied lek.*

I'm aware of the "team" efforts to wrestle this issue down and have also had some email convos with Pat, but we'd like to be as similar to the BLM as possible and have some concerns about our ability to implement.

Thanks!

Madelyn Dillon

# Greater Sage-grouse Land Use Plan Amendments

## Conference Call Summary

**PURPOSE:** Discuss Noise Issues for the GRSG planning process and discuss potential stipulations

**DATE AND TIME:** March 7, 2014; 11:30 – 12:30 (MST)

**LOCATION:** Conference Call/Meeting

**ATTENDANCE:**

On the phone:

- Pam Murdock – WY BLM
- Erin Jones – CO BLM
- Jenny Morton – WY BLM
- Quincy Bahr – UT BLM
- Renee Chi – UT BLM

**SUMMARY:**

- It is apparent from the literature that there are effects of noise from development activities on GRSG.
- Some literature experimentally establishes a strong relationship between noise at the lek and lek attendance.
- Some literature describes possible impacts from noise in areas away from the lek, specifically in nesting and early brood-rearing habitat.
- Some general wildlife literature establishes that noise can increase stress at various points in a species' life-cycle. However, there is no known GRSG literature that specifically identifies a relationship between noise in seasonal winter habitat and population impacts.
- In a recent publication, the key researcher for effects of noise on GRSG noted that “we do not yet know whether limiting noise to 10 dB above ambient is appropriate for protecting sage-grouse. However, we recommend continuing to use the 10 dB threshold as an interim measure, combined with appropriate measures of ambient (i.e., 16 to 20 dBA)” (Patricelli et. al. 2013).
- The land use plan amendments/revisions include restrictions/stipulations on land uses and density/disturbance restrictions for core/PPMA (NSO, 1/640, % cap, etc.). These are especially focused around leks and adjacent nesting and early brood-rearing habitats.
- While such restrictions/stipulations do not specifically address noise, they restrict/stipulate the activities generally responsible for noise, and therefore indirectly ameliorate impacts from noise by restricting activities near leks and applying density stipulations in the remainder of core/PPMA. If land uses meet the land use/density and distance restrictions (NSO, 1/640, % cap), there would be protection from the noise-emitting activities.

- Several Wyoming BLM amendments and revisions have general language related to noise. The following is from the preferred alternative for the 9-Plan Amendment DEIS:

The BLM/Forest Service would work with proponents to limit project related noise where it would be expected to reduce functionality of habitats that support core and connectivity habitat area populations.

The BLM/Forest Service would evaluate the potential for limitation of new noise sources on a case-by-case basis as appropriate.

BLM/Forest Service's near-term goal would be to limit noise sources that would be expected to negatively impact core habitat area sage-grouse populations and to continue to support the establishment of ambient baseline noise levels for occupied core habitat area leks.

As additional research and information emerges, specific new limitations appropriate to the type of projects being considered would be evaluated and appropriate limitations would be implemented where necessary to minimize potential for noise impacts on sage-grouse core population behavioral cycles.

As new research is completed, new specific limitations would be coordinated with the WGFD and partners.

Noise levels at the perimeter of the lek should not exceed 10 dBA above ambient noise.

- Additionally, BLM Wyoming and its partners are in the process of developing a more detailed noise mitigation strategy that would be applied during implementation when certain conditions are met. When those conditions are met, the strategy would include requiring modeling the landscape to determine how sound would disperse. A site-specific noise mitigation strategy may also be considered by the applicant that could include a Noise Mitigation Plan.
- In the Utah and Colorado planning efforts, the only language in the DEIS related to sound restrictions is the lek-based stipulations to be applied during the breeding season.
- CO BLM noted that their DEIS does not have any noise language outside the NTT RDF language contained in an appendix. There is concern that adding new restrictions related to noise may not be possible within the range of alternatives considered in the DEIS.
- UT BLM initially was considering adding a requirement for noise modeling and, if needed at the site-specific level, a noise mitigation plan. However, they share concerns related to adding new requirements/restrictions that were not analyzed in the Draft EIS, were not identified during scoping, or raised by the FWS or other internal partners during administrative reviews of the DEIS.

#### **Conclusion:**

- Given the lack of specificity in existing literature combined with the existence of stipulations on activities that result in noise issues, the team concluded that adding language similar to that in the WY 9-Plan would address the issue in the RMP, while setting the stage to address it at the site-specific level as needed.

We did not exclude wilderness from planning decisions if they were habitat. We displayed the most restrictive management that a WSA or a wilderness would apply to the land but they area still shown as PIG or SFA. The reason we should not exclude the new wilderness areas is because there are management actions that apply to PIG and SFA that are not covered by the wilderness designation. For example, we graze in wilderness and the management actions associated with grazing in PIG and SFA would apply to grazing management in the wilderness area.

The released WSA are still habitat and designated as PIG and SFA so I think they will conserve GRSG habitat. I updated the numbers in the attached. Jon

Hi Jon,

Sorry to keep bugging you today, but I was just asked to plug something into the ROD noting that the designation of the Jerry Peak Wilderness, release of the WSAs, and the land conveyances from HR 1138 do not impact our decision to approve the IDswMT ARMPA. Do you happen to know if the the new wilderness, former WSAs, and the area for conveyance are within the decision space for the ARMPA? I cannot find maps associated with this law anywhere.

Thanks,

Anthony is correct. Not having National edgematched boundaries to start with are causing the gaps and even overlaps in compiled data we see now. The acres are not large, but gaps could be problematic if the area is depicted as non-habitat when it is habitat or maybe SFA as well, and a "project" includes area in the "gap". The largest gap affecting Idaho is the one between Idaho and Nevada, but there is also small ones between Idaho and Oregon. If the "gaps" are fixed/cleaned-up, would it require that states edit local data to match ?

The EIS boundary Idaho used was provided by the NOC, with minor editing top remove areas in Nevada that were identified as being part of Nevada's EIS and adding the Raft River Unit in Utah. The Idaho GRSG habitat and SFA layers seem to match

Hi Paul,

The gaps are due to the EIS boundaries (in general) and a known issue with NV's habitat mapping effort that introduced a gap along the northern border (habitat was not mapped there). The slivers and gaps you see are the direct result of not having national level planning boundaries with matched edges and each state/EIS delineating habitat on their own. Cleaning them up would likely take a combination of your ideas...particularly with how to address projects crossing these EIS boundaries.

I am, however, concerned about your reference to Idaho's habitat and SFA data being OK. These national level data are simply a compilation of what was provided by each EIS...in other words, they should be the "state scale" datasets. Do you have a different habitat delineation dataset from what was provided to the NOC?

If so, we really should get this sorted out ASAP. If not and you view the EIS boundary data (also provided by each EIS in coordination with the Planning shop) along with the habitat, I suspect the vast majority are due to gaps in the boundary (NV being the exception).

**Subject:** GIS data and GRSG maps

Hi Anthony

We've noticed on the national GIS layers for GRS habitat (PHMA, GHMA) and SFAs, there are some slivers of 500 m to 1 km or so, between ID and UT, ID and NV, ID and OR and OR, NV.

Are there plans to clean these up? When we use the state scale data (e.g., Idaho's habitat and SFA data, along with the state boundary we use in GIS), the boundaries are clean, without slivers at the state line. So for local project implementation we're fine.

Wondering if the slivers in the national data set are going to be problematic? Options appear to be to 1) dissolve the slivers into the surrounding matrix on each state's side of the line, or 2) a directive that says something to that effect for dealing with small slivers. Thoughts?

Hi BLM-ID,

In coordinating with FS, we noticed that the GRSG guidance document you received was missing one piece of direction. I have added the following bullet point to your SFA guidance :

"· Do Include Forest Service Lost River Mountains North (~5,000 acres) Area and South Area (~6,000 acres)—these areas will be treated as PHMA, with the SFA management actions for this FS-land."

I've also attached a map that specifically identifies these two areas for your reference (please ignore all the other identified areas on the map with regard to the above bullet point).

I have reattached the guidance for purposes of version control, but this is the only change you will see in it. Sorry about the oversight, and thanks a lot as always. Let me know if you have any questions.

# Surface Management Agency of Non ADPP Habitat on BLM Surface/ Subsurface Management within DRAFT FWS Areas of Significance/Sagebrush Focal Areas

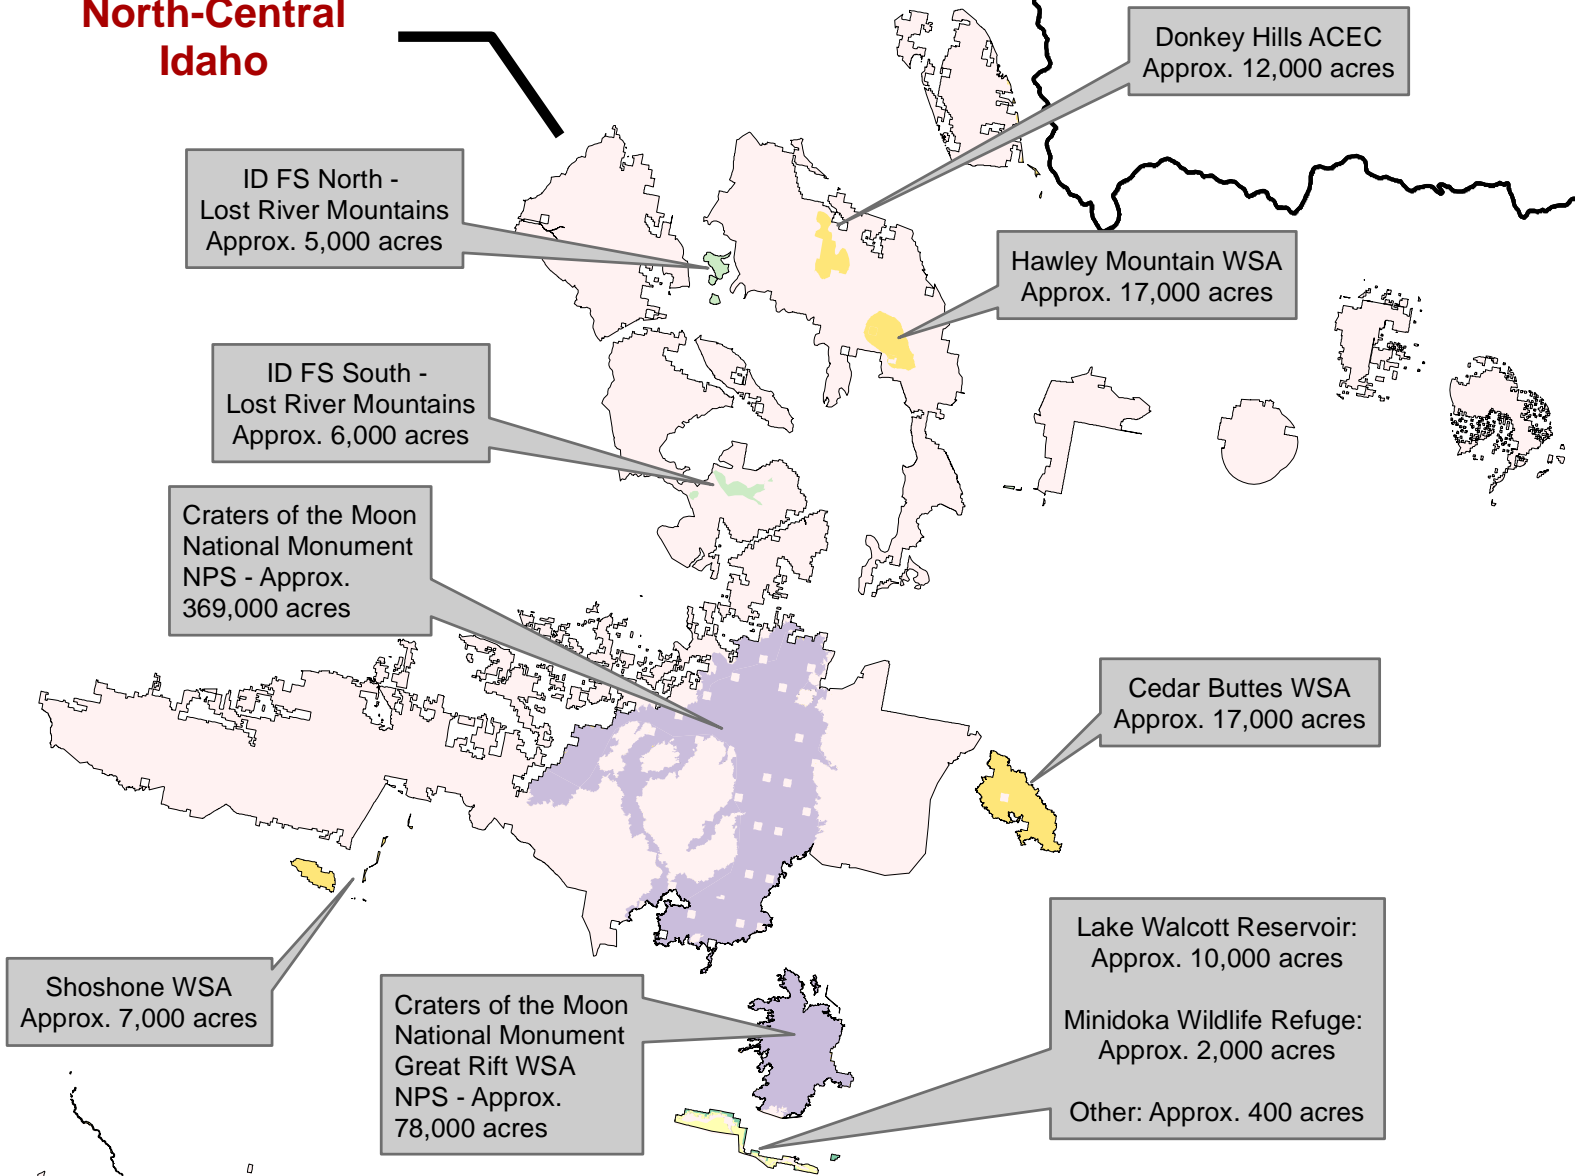

## - North Central Idaho

### Legend

-  FWS Areas of Significance / Sagebrush Focal Areas
- Surface Management Agency**
-  Non-Habitat, Bureau of Land Management
-  Non-Habitat, US Fish and Wildlife Service
-  Non-Habitat, Forest Service
-  Non-Habitat, National Park Service
-  Non-Habitat, Bureau of Reclamation
-  Non-Habitat, State
-  Non-Habitat, Private
-  Non-Habitat, Other/Undetermined
-  ADPP Habitat or Non-Habitat Outside of BLM Surface/ Subsurface Management

**Data Sources:**  
**Subsurface Estate:** Acquired from BLM WY State Office for MT/ND/SD, WY, CO, UT, and Southern ID in August 2014. \*Only surface estate is used for classification in NV, OR and CA.  
**Surface Management Agency:** Downloaded from BLM Geocommunicator on December 13th, 2013 verified as current on March 6th, 2014.  
**BLM Administrative Draft Proposed Plan Habitat Category Data:** Submitted by individual BLM EISs between March 5th, 2014 and December 2nd, 2014.  
**FWS Areas of Significance:** Data provided by FWS, accompanying Memorandum FWS/AES/058711 (10/27/2014).

## North-Central Idaho

***BLM-IDAHO***

**Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)**

**January 30, 2015**

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

***Issue:***

**Development in Highly Important Landscapes**

***Direction:***

As more specifically provided in this guidance, the ADPP will include Sagebrush Focal Areas (SFA), consisting of the BLM and FS-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. In the Special Status Species Section of Chapter 2, include the following management action drop in language (for the Proposed Plan only):

*“Designate Sagebrush Focal Areas (SFA) as shown on Map X (x acres). SFAs will be managed as PHMA, with the following additional management:*

- 1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.*
- 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.*

- 3) *Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."*

**The NOC will provide updated shapefiles that delineate the SFAs.**

Except as otherwise provided below, the ADPP will provide that all BLM- and FS-managed lands (including subsurface) within SFAs will be allocated and managed as PHMA and include the management actions above.

- *Do Not Include the following in SFA Management*
  - Hawley Mountain WSA (ID), Shoshone WSA (ID), Cedar Buttes WSA (ID), Lower Salmon Falls Creek (ID), Little Jack Wilderness (ID), Bruneau-Jarbidge Wilderness (ID) in non-habitat – The current management in these areas is generally protective of GRSG. As applicable, these will continue to be managed so as not to impair their suitability for preservation as wilderness, or under the terms of the Wilderness Act to preserve wilderness character.
    - To the extent that these areas were analyzed for contingent management as general or priority habitat, the ADPP will include contingent allocations and management direction that would apply in the event that Congress releases the areas from WSA status
  - Non-habitat areas outside Little Jack and Bruneau-Jarbidge Wilderness and Salmon Falls Creek ACEC which were previously shown within the SFA –These areas will not be managed as PHMA or SFA.
- Do Include Forest Service Lost River Mountains North (~5,000 acres) Area and South Area (~6,000 acres)– these areas will be treated as PHMA, with the SFA management actions for this FS-land.
- Do Include Donkey Hills ACEC –In order to consolidate parcels for protection as SFAs, this area will be treated as PHMA and included for SFA management.
- *Do Not Include Other Agency Land in SFA Management* – while lands managed by other agencies will be shown on the SFA maps, BLM ADPP decisions will not be applied to them.
- *Do Not Include Private/State Lands in SFA Management* – while private lands may be within the SFA boundaries, ADPP decisions will not be applied to them, but may apply to Federal subsurface underlying such lands as provided below.
- *Subsurface Estate:*
  - Under private/state lands: subsurface estate in PHMA and GHMA should be treated as PHMA with SFA management actions.

- Under other Federal lands: subsurface state should be treated as PHMA with SFA management actions if it is not already withdrawn (such as in Refuges or Parks) and PHMA or GHMA management was analyzed in the DEIS.

Additional direction/drop in language for the ADPPs on SFAs will be forthcoming.

**Issue:**

**Direction:**

**Mitigation**

The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:**

**Direction:**

**Mapping**

Not Applicable

**Issue:**

**Direction:**

**Disturbance**

Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance (see Attachment II).

Planning units will include the following land use plan actions within their ADPPs that states:

- a. If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid*

*existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*

- b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

**Issue:**

**Direction:**

**Vegetation Objectives**

The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*

**Issue:**

**Direction:**

**Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas,*

*including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

***Issue:***

***Direction:***

**Mineral Materials (Salable Minerals)**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

***Issue:***

***Direction:***

**High-voltage Transmission and Major Pipeline ROWs and Corridors**

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that

are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservations measures.”*

**Issue:** Coal Suitability  
**Direction:** Not Applicable in Idaho

**Issue:** Fluid Mineral Resources (Including Geothermal)  
**Direction:** All ADPPs will include the following as a conservation objective:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Issue:** No Surface Occupancy (NSO) Exception Language  
**Direction:** Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral

leases at the time of leasing only and may not be applied to existing fluid mineral leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*“No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action’s impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.”*

**Issue:**

**Direction:**

**Adaptive Management**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

***Issue:***

***Direction:***

**Application of Lek Buffers**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA and PHMA (see Attachment IV) through this drop-in Chapter 2 language:

*“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review ([Open File Report 2014-1239](#)) in accordance with Appendix X.”*

Allocation Direction

\*Southwest Montana will follow the allocations designated for the MT ADPP

## Attachment I

# GREATER SAGE-GROUSE RMPA/FEIS TEMPLATE LANGUAGE FOR ADDRESSING MITIGATION

[ ] = Instructions

[ ] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

## Chapter 1 - Introduction

[Nothing new to add to EIS]

## Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

## Mitigation

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- Compensatory Mitigation Options
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- Compensatory Mitigation Siting
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- Compensatory Mitigation Project Types and Costs
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- Compensatory Mitigation Compliance and Monitoring
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain*

*the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
  
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
  
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
  
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

### **Additional Information/Formulas**

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU:

$$\begin{aligned} & \text{Disturbance Percentage} \\ & = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100 \end{aligned}$$

Disturbance Calculations for Project Analysis Areas (PAAs):

$$\text{Disturbance Percentage} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^{12}}{\text{Acres within the PAA} * \left( \frac{\text{Acres of Effective Habitat within the PAA}}{\text{Acres within the PAA}} + 0.3 \right)} \right) \times 100$$

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2.

Project analysis area (PAA) method for permitting surface disturbance activities:

1. Determine potentially affected occupied leks by placing a four-mile buffer around the project boundary as defined by the proposed area of physical disturbance related to the project. All occupied leks within this buffer will be considered affected by the proposed project.
2. Next place a four mile boundary around each of the occupied leks identified in item 1, above.
3. The polygon formed by the merging and dissolving of polygons from step 1 and 2 creates the Project Analysis Area (PAA) for surface disturbance activities.
4. Map existing disturbances within the analysis area or use locally available spatial data. Use of digitized NAIP imagery is recommended.
5. Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
6. Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
7. Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
8. If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales		
		Broad/Mid (Populations)	Intermediate (BSU)	Local/Project (Seas. Hab.)

**ACRONYMS**

PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit  
 EVT = Existing Vegetation Type              BpS = Areas of Biotic Potential

<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.  
<sup>2</sup> Westwide data will be used only if state or local data are not available.  
<sup>3</sup> This footnote was removed from the table. January 2015.  
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.  
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management  
<sup>6</sup> The project analysis area will be based on a 4-mile radius polygon around the project area combined with a 4-mile buffer around any lands within the project boundary in PHMA (Idaho methodology).  
<sup>7</sup> See Table 2

## Attachment III

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment IV

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

**Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Attachment V

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

  - linear features (roads) within 3.1 miles of leks
  - infrastructure related to energy development within 3.1 miles of leks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis.

  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

Cc: Ethan Ellsworth &lt;eellsworth@blm.gov&gt;

Brent/Jon,

Ann Moser sent a one pager describing triggers and the significance description they propose. I edited it with the current wording of the ADPP for the triggers (since they had morphed since the Alt E wording), and she was ok with it. See attached. This is mainly for the file, however wording needs to be inserted into the Plan (currently pages 26-27 of ADPP) as follows (or similar):

"Significance is defined by the 90% confidence interval around the current 3-year average of  $\lambda$  to evaluate whether  $\lambda$  is significantly less than 1.0. If the 90% confidence interval is less than and does not include 1.0, then  $\lambda$  is significantly less than 1.0. The  $\lambda$  and variance will be calculated following Garton et al. (2011)."

Garton, E. O., J. W. Connelly, J. S. Horne, C. A. Hagen, A. Moser, and M. A. Schroeder. 2011. Greater sage-grouse population dynamics and probability of persistence. *Studies in Avian Biology* 38: 293-382.

### **Adaptive Triggers:**

The Idaho and Southwestern Montana Proposed Plan (Plan) describes soft and hard habitat and population triggers as follows:

#### Habitat:

5.7. AM-7: Adaptive Regulatory Criteria for **Hard Habitat Triggers** are defined as:

- A 20 percent loss of Key Habitat within the biologically significant unit (BSU) (Appendix G) of the PHMA of a CA when compared to the 2011 baseline (the BSU is defined as the nesting and wintering habitat within a Priority and Important Habitat Management Areas (separately) within a Conservation Area, inclusive of all ownerships); or
- A 20 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline.

5.8. AM-8: Adaptive Regulatory Criteria for **Soft Habitat Triggers** are defined as:

- A 10 percent loss of Key Habitat within the BSU of the PHMA of a CA when compared to the 2011 baseline; or
- A 10 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline.

#### Population:

5.9. AM-9: Adaptive Regulatory Criteria for **Hard Population Triggers** are defined as:

A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within PHMA within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline; or  
A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within IHMA within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline.

5.10. AM-10: Adaptive Regulatory Criteria for **Soft Population Triggers** are defined as:

A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within PHMA within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011; or  
A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within IHMA within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011.

#### **Definition of “Significance” for Hard Population Trigger:**

The Governor’s Alternative (E) did not define criteria for “significantly less than 1.0”. For purposes of the Plan, IDFG proposes to use a 90% confidence interval around the current 3-year average of  $\lambda$  to evaluate whether  $\lambda$  is significantly less than 1.0. If the 90% confidence interval is less than and does not include 1.0, then  $\lambda$  is significantly less than 1.0. The  $\lambda$  and variance will be calculated following Garton et al. (2011). A 90% confidence interval is justified because:

1. Under a 90% confidence interval the probability of making a false conclusion is 10%, however, the error will be on the conservative side; i.e., the error would benefit the sage-grouse population.
2. The  $\lambda$  criteria would not be used alone; as stated in the ADPP,  $\lambda$  would be used in concert with trend in maximum number of males.

Garton, E. O., J. W. Connelly, J. S. Horne, C. A. Hagen, A. Moser, and M. A. Schroeder. 2011. Greater sage-grouse population dynamics and probability of persistence. *Studies in Avian Biology* 38: 293-382.

**RE: Question on sagegrouse**

1 message

Brent Ralston &lt;bralston@blm.gov&gt;

Tue, Nov 11, 2014 at 7:43 PM

To: Jeffery Foss &lt;jfoss@blm.gov&gt;, Paul Makela &lt;pmakela@blm.gov&gt;

Cc: Timothy Murphy &lt;tmurphy@blm.gov&gt;, Ethan Ellsworth &lt;ellsworth@blm.gov&gt;, Scott Hoefler &lt;shoefler@blm.gov&gt;, Jonathan Beck &lt;jmbeck@blm.gov&gt;

Jeff,

Yes, I have talked with the Tribe at the Wings and Roots venue about two issues: 1) the noise concern and the sonic booms which are suspected by the Tribe as causing mortality of chicks while developing within the egg; and 2) concern over the use of chaff and flares. The first occasion was in July 2012 where they raised the concern over military overflights. After that meeting I chatted with Paul regarding any know literature regarding this activities effects of mortality to sage-grouse and at that point there wasn't any that we found. I also spoke with Carl Rudeen at the Mountain Home Air Force Base and he shared the EA that the Base had done. The use of chaff and flares is a use authorized by FAA & FCC (as described in IB 2001-030) and evaluated in NEPA conducted by the Mountain Home Air Force Base (March 29, 2010 Environmental Assessment).

The bottom line is that BLM does not have any authority or say in military overflights which is authorized by the FAA or the use of chaff and flares which are also authorized by the FAA & FCC.

At the September 2012 Wings and Roots meeting I communicated that the GRSG EIS was not the appropriate venue to address this concern and that BLM did not have the authority – that the Tribes should coordinate/consult with the Air Force over these issues. That caused a small reaction that quickly blew entirely out of sorts with Doug (the facilitator) indicating that I had single-handedly destroyed the working relationship that previously existed and that he would be contacting Mike Poole and Tom Dyer to express this concern.

At this meeting I had also shared out preliminary alternatives, including the Governor's Alternative. After the initial reaction, Gary, who had been leafing through the material, brought up that we were indeed addressing noise, in that we had a management action specific to noise levels around leks. We talked about those management actions and that they would be applied to BLM authorized activities. That seemed to mollify the concern and the reaction seemed to blow over as I left with everything back on good terms. In addition we acknowledged the lack of any specific scientific studies relating to chick mortality and sonic booms and that this may be something for the Tribe with assistance from university researchers to develop a study to investigate.

In my subsequent meetings with Wings and Roots the concern over noise; i.e. sonic booms and mortality of chicks in the eggs; has come up at least two other time as more of an FYI for BLM without recognition that we have previously vetted this issue at the meeting previously and without any overt need for further BLM follow-up.

At my most recent meeting this came up again in the form of Ted 'telling a story' about his grandmother experience that jets flying above and the associated sonic boom would kill chicken chicks in the eggs. This seems to be the root of the concern without any scientific studies that would support this.

We will identify the sound concern in the EIS acknowledging the concern and the discussions and the need for further investigation but there will not be any discussion in effects analysis since that is an effect that cannot be verified and described for effects. For the chaff concern we will identify that concern as well in the cumulative effects description and reference the effects as described in the Air Force EA.

From IB 2001-030:

N. The BLM will work cooperatively with the military to minimize any effects from the use of chaff and flares. The BLM has no legal authority to regulate the use of chaff and flares or the military use of chaff and flares above public lands regulated by the FAA and FCC. In the environmental hazards management case the use of chaff and flares over public lands is considered the valid use of a product(s) for its intended purpose. (Note See "Definitions and Acronyms" attachment for explanation of the terms "chaff" and "flares.")

Discussion: Chaff and flares properly dispersed in accordance with military policy and procedures over public land have minimal to no impact. Improperly dispersed chaff or chaff canisters which malfunction can have clumps of chaff on the ground and all chaff releases leave plastic caps that degrade at a relatively low rate. Chaff consists of aluminum coated fibers similar in size to human hair. To be effective, chaff is normally dropped at altitudes above 12,000 feet above mean sea level (MSL) and chaff is most often carried aloft in upper level winds for great distances (hundreds of miles). Properly dispersed chaff disperses so that it is non-detectable on the ground. There is no recent study on the effects of chaff condensation, although additional study is recommended. There are no known negative environmental or health effects from the use of chaff.

Properly dispersed flares travel less distance in the upper winds than chaff and burn out prior to hitting the ground, but may leave small amounts of debris. Wildfires have been known to start from unburned low level use of flares.

The use of chaff and flares near Congressionally designated areas or special management areas where the lands are managed so that the land and its community of life untrammelled by man and where man himself is a visitor who does not remain", e.g., wilderness areas, wilderness study areas, and wild segments of wild and scenic rivers is an area of concern. In these areas, the release of chaff and flares below the authorized altitudes could potentially cause impacts that may not be in keeping with the Congressional designation of the areas.

Where chaff and flares are being dispersed in the proximity of special management areas, the impacts of improperly dispersed chaff and flares need to be considered. BLM and military cooperation is paramount in meeting the intent of Congress relative to the management of special management areas.

Tim,

Regarding military over flights and GRSG, there is not a lot of info, but some. The attached Word document contains a section I copy/pasted from the June 2012 Mountain Home Air Force Base "Integrated Natural Resource Management Plan" that acknowledged a temporary response by GRSG could occur, and low level flights could cause stress. However in the mitigation bullets they state that "Flight activities are dispersed across MOA airspace to reduce associated noise."

I am unable to locate other recent literature on the subject at this time, however the 2010 FWS 2010 Finding references timing limitations to military flights, at the Yakima Training Center in Washington, and says: "Leks have a 1-km (0.6-mi) buffer where all training is excluded, and aircraft below 91.4 m (300 ft) are restricted from midnight to 9 am from March 1 to May 15 (Stinson et al. 2004, p. 32)."

I am following up with a few colleagues. I will let you know if I find more.

Paul

Subject: Question on sagegrouse

Tim, another thought I have besides cultural resources monitoring post fire is has anyone studied the effects of the air force on sage grouse nesting/egg hatching I have heard stories from elders saying it has effected egg hatching in their chickens. As the air force operates over the entire strong hold for sage grouse northern Nevada, southern Idaho, and eastern Oregon. Just another thought  
Thanks  
Buster Gibson ,Vice-Chairman Shoshone-Paiute Tribes

To: James Kenna <jkenna@blm.gov>, Jerome Perez <jperez@blm.gov>, Juan Palma <jpalma@blm.gov>, Ruth Welch <rwelch@blm.gov>, Amy Lueders <alueders@blm.gov>, Donald Simpson <dsimpson@blm.gov>, Howard Hedrick <hhedrick@blm.gov>, Jamie Connell <jconnell@blm.gov>, Karen Mouritsen <Kmourits@blm.gov>, Michael Nedd <mnedd@blm.gov>, Ronald Dunton <rdunton@blm.gov>, Timothy Murphy <tmurphy@blm.gov>  
Cc: Edwin Roberson <eroberso@blm.gov>, Steven Ellis <sellis@blm.gov>, Neil Kornze <nkomze@blm.gov>

Attached and pasted below is the proposed language for discussion on the conference call today regarding use of the USGS buffer report.

#### BLM Proposal:

The lek buffer-distance (interpreted range-lower) identified in the USGS Review (Open File Report 2014-1239) will be included in all ADPPs as a Required Design Feature (RDF) in both PHMA and GHMA (except for WY, due to their "core area" approach). This RDF will require the use of these lek buffers for linear features, energy development, tall structures, low structures, general surface disturbance, and noise and related disruption activities.

The buffer RDF must be applied to BLM-authorized activities as follows, as appropriate for the project being analyzed:

#### For all PHMA:

*Ann C. preparing lang. mods. to clarify implementation level analysis/screening*

Require the use of the lower interpreted range lek buffer-distances identified in the USGS report *Conservation Buffer Distance Estimates for Greater Sage-Grouse—A Review* [1], or best available science, when analyzing, developing conditions of approval, and authorizing activities in PHMA to ensure appropriate protection of habitat. At a minimum, this includes applying the following specifications as applicable:

Locate linear features at least 3.1 miles from leks

Site infrastructure related to energy development at least 3.1 miles from leks.

- Site tall structures (e.g., communication or transmission towers) at least 2 miles from leks.

• Site low structures (e.g. rangeland improvements) at least 1.2 miles from leks.

- Site all other surface disturbance not associated with linear features, energy development, tall structures, or low structures at least 3.1 miles from leks.

- Site noise and related disruption activities (including those that do not result in habitat loss) at least 0.25 miles from leks.

*use in NEPA process analysis/screening/decision-making USE Best Avail. Science*

*Analyze these buffers when analyzing projects*

**For all GHMA:**

*This RDF must be applied to all BLM-authorized activities unless the BLM, through site-specific analysis, determines that: (1) the RDF is not applicable to the site-specific conditions; or (2) the BLM can demonstrate that an alternative RDF or management approach achieves the appropriate level of protection.* NEPA

*local line officer  
decision w/ FWS/F+G*

Hi All –

Can't find Joe to send this forward, so I am doing it for him in order to be prepared for our call tomorrow on Great Basin Projected Development at 10:00 Pacific Time. Joe sent out four files yesterday for our discussion tomorrow....but this table has been updated for our discussion. Please replace the table sent out yesterday entitled "Copy of TEDS TABLE 2 SUMMARY NUMBERS FWS" with the table above.

Thanks,  
Lauren

**Subject:** Fwd: Draft Discretionary Action Criteria/Screen  
**Attachments:** Discretionary action screen and mitigation process. DFT 9-22-14.docx

I'm taking a quick look at this Brent. I'm thinking that this maybe one of those items that we asked or told to add to the EIS at some point. Thought I would give you a heads up and that you might be able to work through your chain to see if we could learn anymore. My initial concern at this point is that it may conflict with the criteria that we already have in place, but some simple semantics may make it complimentary.?? We have until early next week to get back to Pat regarding comments/concerns. As I'll be out fishing, you may need to coordinate with Kathleen and Katie if we have concerns. I'll be in today and tomorrow morning if you would like to discuss.

Katie - please take a look and give me your thoughts as well.

Thanks,  
Jason

Hi everyone -

This is a product of the Rocky Mountain Federal Family meeting that we have been asked to provide input on. Its a screen that is being proposed for use in case of a project proposal located in important (PAC, PH, core, etc.) sage-grouse habitats. While the issue arose in the RM side of things, it may be used more widely.

Jeff Berglund helped BLM MT draft this, but we aren't certain all of his concerns have been 100% resolved. His primary caution with our review is that the goals and objectives, which this screen relies heavily

on, have yet to be defined. Therefore we only have part of the package (we decided it was like having a recipe but not knowing what the recipe was for). So, to assist with our review we can use the goal of sage-grouse conservation and maintaining or increasing affected populations.

BLM needs comments by Oct. 3, so I would like to get comments back by to me by Oct. 1 (the good news is its relatively short). That will allow time for consolidation and resolution of any potential conflicting concerns. If multiple folks are reviewing from the same office, please only send one set of comments.

Thank you -  
pat

# DRAFT

## DISCRETIONARY ACTION CRITERIA AND MITIGATION PROCESS

The BLM/USFS will ensure that any activities or projects in greater sage-grouse habitats would: 1) only occur in compliance with [insert plan name] greater sage-grouse goals and objectives for priority and general management areas; and 2) maintain neutral or positive greater sage-grouse population trends and habitat by avoiding, minimizing, and offsetting unavoidable impacts while striving for net conservation gain at the scale of this land use plan and within greater sage-grouse population areas, State boundaries, and WAFWA Management Zones through the application of mitigation for implementation-level decisions. The mitigation process will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy, while also following Secretary of the Interior Order 3330 and consulting BLM, FWS and other current and appropriate mitigation guidance. If it is determined that residual impacts to greater sage-grouse from implementation-level actions would remain after applying avoidance and minimization measures to the extent possible, then compensatory mitigation projects will be used to offset residual impacts, or the project may be denied if necessary to achieve the goals and objectives for priority and general management areas in the [insert plan name].

To ensure that impacts from activities proposed in sage-grouse priority and general management areas are appropriately mitigated, the BLM will apply mitigation measures and conservation actions and potentially modify the location, design, construction, and/or operation of proposed land uses or activities to comply with statutory requirements for environmental protection. The mitigation measures and conservation actions [reference RDF/BMP appendix] for proposed projects or activities in these areas will be identified as part of the National Environmental Policy Act (NEPA) environmental review process, through interdisciplinary analysis involving resource specialists, project proponents, government entities, landowners or other Surface Management Agencies. Those measures selected for implementation will be identified in the Record of Decision (ROD) or Decision Record (DR) for those authorizations and will inform a potential lessee, permittee, or operator of the requirements that must be met when using BLM-administered public lands and minerals to mitigate, per the mitigation hierarchy referenced above, impacts from the activity or project such that sage-grouse goals and objectives are met. Because these actions create a clear obligation for the BLM to ensure any proposed mitigation action adopted in the environmental review process is performed, there is assurance that mitigation will lead to a reduction of environmental impacts in the implementation stage and include binding mechanisms for enforcement (CEQ Memorandum for Heads of Federal Departments and Agencies 2011).

To achieve the goals and objectives for priority and general management areas in the [insert plan name], the BLM will assess all proposed land uses or activities such as road, pipeline, cell tower, or powerline construction, fluid and solid mineral development, range improvements, and recreational activities proposed for location in sage-grouse priority and general management areas in a step-wise manner. The following steps identify a screening process for review of proposed activities or projects in these areas. This process will provide a consistent approach regardless of the administrative location of the project and ensure that authorization of these projects, if granted, will appropriately mitigate impacts and be consistent with the LUP goals and objectives for sage-grouse. The following steps provide for a sequential screening of proposals. However, Steps 2-6 can be done concurrently.

### Step 1 – Determine Proposal Adequacy

This screening process is initiated upon formal submittal of a proposal for authorization for use of BLM lands. The actual documentation of the proposal would include at a minimum a description of the

<sup>1</sup>Impacts to Greater Sage-Grouse could include loss or disturbance of nesting or wintering habitat as well as disruption of breeding activities at the lek site.

location, scale of the project and timing of the disturbance. The acceptance of the proposal(s) for review would be consistent with existing protocol and procedures for each type of use.

#### Step 2 – Evaluate Proposal Consistency with LUP Prescriptions

This initial review should evaluate whether the proposal would be allowed as prescribed in the Land Use Plan. For example, some activities are prohibited (e.g., excluded, closed, withdrawn, etc.) in sage-grouse habitat, such as wind developments in priority management areas. If the proposal is for an activity that is specifically prohibited, the applicant should be informed that the application is being rejected since it would not be allowed, regardless of the design of the project. Otherwise, proceed to Step 3.

#### Step 3 – Determine Projected Sage-Grouse Population and Habitat Impacts

Determine if the project will have a direct, indirect, or cumulative impact on sage-grouse population or habitat (priority or general management areas). This will include:

- Reviewing greater sage-grouse management area and habitat delineation maps.
- Reviewing current science / literature.
- Reviewing the sage-grouse effects analysis in the LUP EIS, and similar effects analyses
- Reviewing USGS Open File Report 2013-1098 (the ‘Baseline Environment Report’) which identifies areas of direct and indirect effects for various anthropogenic activities.
- Consultation with State Wildlife Agency biologists.
- Evaluating consistency with (at a minimum) State sage-grouse regulations, Executive Orders, etc.
- Or other methods needed to provide an accurate assessment of impacts.

If the proposed project or activity would not have a negative direct or indirect impact on either the habitat or population, document the findings in the NEPA analysis and proceed with the appropriate process for review, decision and potential implementation of the project. Otherwise, proceed to Step 4.

#### Step 4 – Determine Proposal Consistency with Disturbance Limitations

If the proposed activity could have a direct or indirect impact on sage-grouse habitat or population, evaluate whether the projected disturbance from the activity would exceed the limit on the amount of disturbance allowed within the activity or project area (DDCT process). If current disturbance within the activity area or the anticipated disturbance from the proposed activity exceeds this threshold, the project should be deferred until such time as the amount of disturbance within the area has been reduced below the threshold through completed, monitored and verified restoration or management actions. If the project can be relocated so as to not have an impact on sage-grouse habitat or population, not exceed the disturbance cap, and still achieve objectives of the proposal, relocate the proposed activity and proceed with the appropriate process for review, decision and potential implementation. This step does not consider redesign of the project to reduce or eliminate direct and indirect impacts, but rather authorization of the project in a physical location that will not impact greater sage-grouse habitat or population.

#### Step 5 – Determine Authority and Apply Avoidance and Minimization Measures to Comply with Sage-Grouse Goals and Objectives

If the preliminary review of the proposal concludes that there may be impacts to sage-grouse habitat or population and the project cannot be effectively relocated to avoid these impacts, evaluate whether the agency, within agency’s rules and/or regulations, has the authority to modify or deny the project. If the

agency does not have the discretionary authority to modify or deny the proposal, proceed with the authorization evaluation process (NEPA) and work with the proponent to include appropriate mitigation elements that minimize impacts to sage-grouse habitat and populations and achieve compliance with sage-grouse objectives to the maximum extent possible under existing authority, including application of offset mitigation (Step 6) as allowable. Where the agency has the discretionary authority to modify or deny the proposal, proceed with the authorization evaluation process (NEPA) and include appropriate mitigation requirements that minimize impacts to sage-grouse habitat and populations to the extent possible and achieve compliance with sage-grouse objectives. Mitigation measures will often include a combination of several items such as lek buffers and timing of disturbance, noise restrictions, design modifications of the proposal, site disturbance restoration, post project reclamation, etc.

#### Step 6 – Apply Compensatory Mitigation or Reject / Defer Proposal

If the agency has the discretionary authority to deny the project and after careful screening of the proposal (Steps 1-5) has determined that direct and indirect impacts cannot be eliminated through avoidance or minimization, evaluate the proposal to determine if compensatory mitigation can be used to fully offset the remaining adverse impacts (while striving for conservation gain) and achieve sage-grouse goals and objectives. If the impacts cannot be effectively mitigated to these standards, reject or defer the proposal. Conditions resulting in this situation could include but are not limited to:

- The current population or habitat trends within the [insert appropriate scale of measurement] is downward and additional impacts, whether offset or not, could lead to further decline of the species population or habitat.
- The proposed offset mitigation is inadequate in scope or duration, has proven to be ineffective or is unproven (e.g., high risk) in terms of science-based approach.
- The project would impact habitat that has been determined to be a limiting factor for species sustainability.
- Other site specific information and analysis that determined the project would lead to a downward or negative change in the current species population trend or habitat and not comply with sage-grouse goals and objectives.

If, following application of available impact avoidance and minimization measures the project can be mitigated to fully offset (while striving for conservation gain) impacts to the species and comply with sage-grouse goals and objectives, proceed with the design of the mitigation plan, and NEPA analysis for the project.

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy to address greater sage-grouse impacts within that Zone. The WAFWA Management Zone Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the Zone's boundaries. Subsequently, the BLM [name of Field Office]/USFS [name of Forest]'s NEPA analyses for implementation-level decisions, which have the potential to impact greater sage-grouse, will include analysis of mitigation recommendations from the relevant WAFWA Management Zone Regional Mitigation Strategy(ies).

Implementation of the Regional Mitigation Strategy may involve managing compensatory mitigation funds, implementing compensatory mitigation projects, certifying mitigation/conservation banks, and reporting on the effectiveness of those projects. These types of mitigation implementation actions may be most effectively managed at the State-level, in collaboration with partners. BLM State Office/USFS

Region may find it most effective to enter into an agreement with a State-level program administrator (e.g. a NGO, a State-level entity) to help manage these aspects of mitigation. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The Appendix [X] provides additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

Attached you will find some info that I put together to try decipher differences between the IDSWMT ADPP and the MT GRSG Conservation Plan. This was not easy as the two documents are written so diffidently and the IDSWMT ADPP has so many appendices. I did my best to find what I could, but I am sure others have noted other concerns it they have take the time to review both documents also. Sorry for the late notice, let me know if you have questions.

**1005 Selway Drive**  
**Dillon, MT 59725**  
**ph: 406-683-8000**  
**fax: 406-683-8066**

The following list is a few things I noticed in the MT GRSG conservation plan that may not be consistent with the ADPP:

- Stip #1, pg. 14. the 5% surface disturbance - wildfire IS included.
- Stip #2 pg. 14, NSO of 0.6 miles from lek including roads.
- Stip #3, pg. 14. seasonal use TL outside NSO are not consistent with dates and times used in Appendix B of IDSWMT ADPP. (pg 12 of the ADPP appendix)
- Stip #4, pg. 14. transportation, locate new roads 0.6 miles from leks, - the IDSWMT ADPP uses a BMP > 0.8 miles from nesting habitat for new paved or high traffic gravel roads??.
- Stip #6, pg. 15. overhead powerline siting > 0.6 miles and - IDSWMT used RDF not allowed <600meters, and BMP of 2 miles from lek in appendix A but Appendix B pg 4 of 17 states BMP of no new roads within .8 miles of leks.
- Stip #7, pg. 15. no noise increase over 10dBA above ambient, IDSWMT has an RDF of no repeated or sustained disturbance (ie. no noise level increase identified) For fluid mineral development RFD of 10 decibel increase above ambient is used. (pg. 7 appendix A)
- Stip #9 pg. 16. Sagebrush Eradication and Treatments, not sure what is included in "treatments", appears to be habitat restoration?
- Stip #10 pg. 16, Prescribed burns prohibited - no sagebrush habitat types identified that may be more suited to use of fire. Wildfires are included in the 5% disturbance cap. – IDSWMT ADPP habitat treatments, wildfire and conifer expansion are not included in the 5% disturbance. (pg. 5 appendix G)
- Stip # 11 pg.16. Monitoring and adaptive Response. – Uses a population trigger and the operator is to propose the adaptive management response?? - IDSWMT ADPP uses uses habitat based Adaptive Management.
- Stip #13 pg. 17. No net conifer expansion and recommends manual methods, and removal of all conifers <0.6 miles from leks.
- Stip #15, pg 17. Existing activities/disturbances are not subject to stipulations but the disturbance is calculated towards the disturbance cap and existing disturbance may exceed 5%.

General Habitat stip #1 Pg 19 NSO of 0.25 miles. – IDSWMT ADPP Appendix B (pg 3 of 17) lists research that states .25 and .6 buffers are not sufficient and uses a 2 mile buffer for structures in the anthropogenic catch all on pg. 8 of 17 (appendix C?)

\*Also of note in the MT GRSG Habitat Plan there is Lek Status definitions on pg 28 – not consistent with ID SWMT occupied lek definition.

These are just a few things that I have noticed, (some of which may not be an issue but probably need discussion.) There may be more that others have picked up on if they have reviewed both documents.

I think we need to review the following from the 96 page ADPP appendix. RDF/BMP's (11 pages) and the Buffer and Restriction tables (17 pages), and Appendix G for ID (H for MT?) (21 pages long.) to make sure they are consistent with the rest of MT.

Should discuss the Appendix J “Lands no longer available for disposal”

Kurt,

Here is that email and here is the grazing language that we talked about.

- 1.1. RM-8: PHMA & IHMA - When an allotment becomes vacant or grazing preference is relinquished, consider voluntary retirement of the allotment or grazing preference in whole or in part, or converting the area to a forage reserve/buffer when doing so would maintain or enhance sage-grouse habitat. GHMA - When an allotment becomes vacant or grazing preference is relinquished, consider converting it to a forage reserve/buffer to use during fire rehabilitation or restoration efforts elsewhere, when such actions would result in a net benefit to GRSB habitat and other priority resources.

**Subject: GrSG Key Issue Paper and Agenda for Monday**

Dear Sage-grouse SDs, Mike and Ron,

I am getting ready to go home for the day and wanted to send you the agenda and some more reading material for our discussions on Monday.

Joe sent you out three papers yesterday for your review. I have attached a paper that includes the 12 key remaining issues that were discussed last week in our meeting with the states representatives in Denver. The paper highlights each issue and provides either the direction we will proceed with or recommendations for discussion and decision. The paper also has 5 attachments including: a Disturbance white paper, GrSG Land use plan objectives guidance, guidance for incorporating GrSG RMP decisions into grazing authorizations, an updated draft planning schedule, and a paper on the roles and responsibilities for a GrSG strike team process with steps to get us to the ROD. The discussion in the morning will help us prepare for the afternoon meeting.

As the first agenda shows, we will discuss these on Monday morning between 9 and 12. Then we will go to lunch and meet up with Sarah, Jim and Bret. The afternoon provide time for Sarah and Jim to discuss the status of the one-on-one meetings with the states; to share with Sarah, Jim and Bret where BLM is with the 12 remaining key issues; and to have a discussion about next steps. This is where we will discuss the planning schedule, strike teams, our approach on the input into the conservation efforts data base and stakeholder outreach.

Hopefully Sarah, Jim and Bret will be able to hang around for dinner and some social time with our ELT members before returning to DC. But that is not the end of our fun GrSG day. Amy and I want to meet with you all again after dinner for a discussion related to Plan Implementation. Our resources DSDs met a few weeks ago on this and we need to discuss some key aspect of implementation and begin to make some key decisions about approaches. On Monday morning we will hand out some information developed by the DSDs to help us focus our discussion on what the plan implementation workload will be and to help us discuss how to organize it. I know that you all will be tired at the end of the day. Unfortunately there's no rest in sight for a while. Monday will help us insure we are all in alignment and on the page as we move to completion of our proposed plans, then to the signing of the RODs and finally to implementing the plans effectively across the range.

Thank you all for all you and your teams have done to date. See you Monday. ed

GREATER SAGE GROUSE MEETING  
NATIONAL CONSERVATION TRAINING CENTER  
SHEPHERDSTOWN, WV  
OCTOBER 20, 2014  
BLM/DOI Coordination  
1:00pm – 5:00pm

Meeting objective : To discuss BLM's approach on the remaining GRSG key issues and reach agreement on a path forward and next steps.

October 17, 2014

## GRSG Planning - Key Remaining Issues

- Issue: Disturbance  
Direction: Per the original April 2014 NPT guidance on disturbance, all states will use the 3% disturbance cap, with the exception of WY which is 5%. See [Attachment 1](#) for the appropriate scales, methodology for calculating disturbance, and recommended ADPP drop-in language.
- Issue: Mitigation  
Direction: 1) Consistent with the Mitigation Framework which is to be incorporated into all ADPPs as an appendix, the following language should also be incorporated as a proposed plan management action under Special Status Species (GRSG) (excluding Wyoming ADPPS):
- “A net conservation gain to the greater sage-grouse will be achieved by implementing restoration conservation actions outlined in this proposed plan [or amendment], applying a no net unmitigated loss standard for authorized land uses in all GRSG habitat [mention all areas that make up GRSG habitat: PHMA, GHMA, IHMA, and/or Core], and, strategically siting compensatory mitigation actions, via a WAFWA Management Zone Regional Mitigation Strategy as part of a mitigation program in order to achieve cumulative benefits (as outlined in [Appendix X]).”
- As defined in the Mitigation Framework Appendix – “No net unmitigated loss means that impacts from implementation level actions will fully offset to benefit the species. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”
- Issue: Adaptive Management (Highlighted Areas = other potential options/recommendations to consider)  
Recommendation: 1. Wyoming BLM: All remaining WY ADPPs will follow the NPT Adaptive Management guidance and sideboards (WY BLM has proposed Buffalo, Bighorn Basin, and the WY 9 Plan ADPPs to incorporate the Wyoming GRSG Adaptive Management Plan that has been developed by the BLM, FS, USFWS, and WGFD and is also being applied to the Lander planning area). BLM WY’s hard trigger response is provided below:
- “Upon determination that a hard trigger has been tripped, the BLM and FS will immediately defer issuance of permits for new actions with the potential to adversely affect Greater Sage-Grouse. Within 14 days of a determination that a hard trigger has been tripped, the Adaptive Management Working Group will convene and initiate an assessment to determine the causal factor or factors (hereafter called the causal factor

October 17, 2014

assessment). The management agency (BLM and/or FS) and adaptive management group will implement an interim response strategy to direct management until causal factors and appropriate responses can be determined. Recommendations of the adaptive management working group will be implemented immediately through the means most appropriate to the agencies in question. This may include cessation of activities or implementation of measures analyzed in this EIS, if supported by the best available science. The causal factor assessment will be completed within 180 days of initiation. Once the causal factor assessment is completed by the Adaptive Management Working Group, the interim response strategy will be modified appropriately. If a causal factor or factors cannot be identified, the interim response strategy shall stay in place until such time a long-term management or planning document can be implemented.”

2. Idaho BLM: will maintain the adaptive management strategy outlined in their DEIS, as a result of their three tiered habitat approach (PHMA, GHMA, and IHMA).

3. All other sub-regions are to follow the NPT Adaptive Management Guidance and Sideboards.

4. Inconsistencies related to varying adaptive management triggers and responses across jurisdictional boundaries will be resolved by the WAFWA Manage Zone Working Groups.

Issue: Vegetation Objectives

Direction: 1) Establish and incorporate vegetative objectives into all ADPPs that do not currently have them, following FS Table 2-6 (habitat objectives). See [Attachment 2](#) for specific guidance and table template.  
2) Vegetation objects that relate directly to Special Statuse Species (SS) should be in the SS section of the ADPP and pure vegetative objectives should be in the Vegetation section of the document.

Issue: Livestock Grazing Modifications

Direction: 1) The following should be included in the Livestock Grazing section of the ADPPs.

- The BLM will prioritize the modification of grazing permits within GRSG habitat. In setting priorities, areas not meeting land use plan vegetation objective and/or Land Health Standards will take precedence.
- The NEPA analysis for proposed modification of livestock grazing permits/leases will include a range of alternatives that allows the authorizing officer to make adjustments to livestock grazing

October 17, 2014

without conducting additional NEPA and issuance of a proposed/final grazing decision.

- Allotments within GRS habitat will be prioritized for annual review to ensure compliance with the terms and conditions within the grazing permits. When BLM conducts monitoring at a minimum, actual use, utilization, and use supervision data will be collected.

2) See [Attachment 3](#) as to how BLM will incorporate GSGR decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

Issue:

High-voltage Transmission and Major Pipeline ROWs and Corridors

Direction:

1) All sub-regions will apply the recommended NPT allocation guidance for PHMA and GHMA.

2) For sub-regions that have planned priority transmission lines that traverse their planning area (TransWest Express, Gateway South, Gateway West, and Boardman to Hemingway), they will apply the following language as a management action in your sub-regional ADPP:

“Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high voltage transmission line ROWs. All authorizations in these areas must comply with the RDFs and avoidance criteria presented in [\[insert citation here\]](#) of this document. The BLM is currently processing an application for [\[Insert name of transmission project\]](#) and the NEPA review for this project is well underway. This project will include GRS mitigation measures that the BLM is in the process of analyzing through the project’s NEPA review process, therefore these projects would not be subject to the following avoidance criteria and RDFs outlined in this document [\[list the criteria/RDFs\]](#).”

3) UT will not designate corridors (will use WY model, closing all of the PHMA in question except for the route of an existing powerline).

Issue:

Mineral Materials (Salable Minerals)

Direction:

The original NPT Allocation language related to mineral materials has been modified. The following management action should be applied to all ADPPs as follows:

“PHMAs will be closed to new mineral material sales. However, these areas would remain “open” to free use permits and the expansion of existing active pits, only if the following criteria is met:

- the activity is within the BSU and project area disturbance cap;

October 17, 2014

- the activity is subject to no net unmitigated loss;
- the activity applies all applicable required design features; and
- the activity clears the specific sub-regional screening criteria.”

With the exception of Wyoming ADPPs, all other sub-regions will adopt the above this modified NPT guidance language as a management action.

Issue: No Surface Occupancy (NSO) Exception and Modification Language  
Direction: Sub-regional ADPPs for both the Rocky Mountain and Great Basin will include the following NSO language into their ADPPs:

“A modification or exception may only be considered where the proposed action is determined to be in non-habitat, the area is not used by GRSG, and the proposed action would not have direct, indirect, or cumulative effects to GRSG or its habitat. The determination would be made by the BLM in consultation with a team of agency GRSG experts, including an expert from the state wildlife agency, USFWS, and BLM/FS. The State Director must have received a determination before approving any modification or exception. All modifications or exceptions must be approved by the State Director.

Issue: Fluid Mineral Resource Allocation (Including Geothermal)  
Direction: SMART from the START – All ADPPs will include the conservation objective for leasing and development outside of PHMAs, similar to what was included in the Lander ROD:

“In order to avoid surface-disturbing activities in PHMAs, priority will be given to leasing and development of oil and gas and other mineral resources outside of PHMAs, subject to applicable stipulations and valid existing rights. When analyzing leasing and authorizing development of oil and gas and other mineral resources in PHMAs, subject to applicable stipulations for the conservation of greater sage-grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for greater sage-grouse.”

Issue: Coal Suitability  
Direction: 1) ADPPs cannot "close" areas to coal leasing to protect Sage-grouse without going through the suitability process. The suitability determinations in the previous plan (existing management) – and any open/closed allocation decisions for coal leasing based on past determinations – would remain in place.  
2) Sub-regions will include a management action that states:

October 17, 2014

“At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the application area is “suitable” or “unsuitable” for coal leasing. During this process, portions of the application area may not be considered for leasing if leasing is proposed in PHMAs or GHMAs and is likely to have a direct, indirect, or cumulative effect on GRSG or its habitat .”

Issue: Mapping

Direction: 1) NV (in agreement with the State) will use the Coates map to redraw the PACs.  
2) UT will manage non-habitat (Opportunity Areas) as PHMA. All habitats in PACs will be managed as PHMA. Anthro and West Tavaputs will be managed as PHMA.

Issue: Buffers

Direction: Best available science – USGS is currently in the process of facilitating a literature review of the science associated with all buffers identified in the plans. This literature review will be followed by a peer review process. If a buffer distance is not supported by the best available science, this information will be considered in the relevant plan revision or amendment when undergoing WO strike team review.

Issue: Schedule

Direction: Final ADPP allocation data needs to be submitted to the NOC no later than October 31<sup>st</sup>.

For the full proposed GRSG Planning Schedule, see [Attachment 4](#).

Issue: GRSG Washington Office Strike Team

Direction: GRSG strike team will include a consistency review team that reviews the documents prior to Washington Office review/kick-off. This team will also participate in development of the Record of Decisions. See [Attachment 5](#) for GRSG Strike Team Roles and Responsibilities. The GRSG Washington Office Strike Team will:

- Ensure National Policy Team guidance and management direction is consistently incorporated into the GRSG Proposed Plans/Amendments
- Ensure that the Proposed Plans/Amendments include the appropriate conservation framework and objectives
- Ensure the plans collectively result in a cohesive federal land management conservation strategy for the GRSG
- Ensure consistency with the Record of Decisions

Issue: Plan Consistency

Recommendation: 1) All ADPP amendments will use the Chapter 2 Template provided to the State Directors on October 1, 2014.  
2) The ADPP revisions will use a consistent approach for consolidating all related GRSG proposed management actions in one similar location in the ADPPs. WO-210, BLM Wyoming, and BLM Montana are in the process of developing this approach.

## Attachment 1 – Disturbance White Paper

### Greater Sage -Grouse (GRSG) Land Use Plan Disturbance Cap

#### Purpose

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER data in the land use plans and the use of the west-wide sagebrush availability and habitat degradation estimates for the Priority Habitat Management Areas in each population for management purposes as the LUPs are being implemented.

#### Guidance

- I. Planning units (except in Wyoming) will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. If the 3% anthropogenic disturbance cap is exceeded on all lands (regardless of ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.
  - b. If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to valid existing rights).
- II. Use of west-wide habitat degradation data well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use west-wide data at a minimum and/or locally collected disturbance data as available for the anthropogenic disturbance types listed in Table 1.
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 8 additional features that are

October 17, 2014

considered threats to sage-grouse (see below) using 1 meter resolution NAIP imagery. Use local data if available.

- b) Existing disturbance will be calculated in Wyoming using the Density and Disturbance Calculation Tool (DDCT). This tool along with the State of Wyoming's Core Area Strategy allows for the use of a 5% disturbance cap.
- IV. Fire-burned and habitat treatment areas will not be included in the project scale disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
- V. Planning units are directed to include a cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area.
- Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments))
- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the proposed plans/ FEISs. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.

Additional Information/Formulas

Disturbance Calculations for the BSUs and for the Project Analysis Areas:

- For the BSUs: % Disturbance = (combined acres of the 12 degradation threats\*) ÷ (acres of all lands within the PHMA s in a BSU) x 100.
- For the Project Analysis Area: % Disturbance = (combined acres of the 12 degradation threats \* plus the 8 site scale threats\*\*) ÷ (acres of all lands within the project analysis area) x 100.

\* see Table 3 \*\* see Table 2

Project analysis area method for permitting surface disturbance activities:

- Draw the project analysis area polygon which consists of a 4 mile buffer around the proposed project footprint plus areas intersected by any 4 mile buffers from nearby leks or mapped seasonal habitats.
- Digitize disturbances, include burned areas if deemed acceptable, from NAIP imagery or use locally available data.
- Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
- Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
- Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

Degradation Type	Subcategory	Data Source	Direct Area of Influence	Area Source
Energy (oil & gas)	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300
	Power Plants	Platts (power plants)	5.0ac (2.0ha)	BLM WO-300

### Background

In the USFWS’s 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse’s habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

INTERNAL WORKING DOCUMENT – NOT FOR DISTRIBUTION  
October 17, 2014

- Measure 1: Sagebrush Availability (percent of sagebrush per unit area)
- Measure 2: Habitat Degradation (percent of human activity per unit area)
- Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 8 types of features that are threats to sage-grouse will be used in the project analysis areas.

## Attachment 2: Greater Sage-Grouse (GRSG) Land Use Plan Vegetation Objectives

### Greater Sage -Grouse (GRSG) Land Use Plan Vegetation Objectives

After reviewing the vegetation objectives from the current ADPPs and recognizing the wide variation between objectives in the plans, and due to the concern by the FWS about consistency across the land use plans, the following describes a process to gain consistent objectives across the range of sage-grouse while recognizing the unique ecological sites and vegetation characteristics in the planning areas.

#### Purpose

- I. Provide the planning units with template language for a land use planning vegetation objective to be incorporated into the administrative draft proposed plans (ADPP).
- II. Provide guidance on the use of a template for Greater Sage-Grouse (GRSG, sage-grouse) habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on the use of the vegetation and sage-grouse habitat objectives during land health assessments.

#### Background

Vegetation objectives from the current ADPPs have been reviewed and were found to have a wide variation among the plans. Some ADPPs contain vegetation and habitat objectives similar to the direction and template provided above. Some ADPPs contain measurable objectives based on mapped conditions within the planning area. Some ADPPs make a commitment to develop specific objectives through the NEPA process for permit renewals. Several ADPPs refer to using the standards in the Sage-Grouse Habitat Assessment Framework as their objectives and it is recognized that the HAF gives the BLM the tools to make informed decisions about the suitability of sage-grouse habitat through interpretation of the relationships between all the habitat measures and objectives as well as other factors and uses appropriate measures at appropriate scales. This wide variation in vegetation objectives will make it very difficult for the FWS to be able to look across the range. The direction contained in this guidance will resolve this issue.

#### Guidance

- I. Planning units will include the following land use plan vegetation objectives within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:
  - a. In all Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover (Aldridge et al. 2008, Doherty et al. 2010, Wisdom et al. 2011). Maintain ecological processes as described in BLM Technical Reference 1734-6 “Interpreting Indicators of Rangeland Health” (Pellant et al. 2005) to sustain these habitats.

INTERNAL WORKING DOCUMENT – NOT FOR DISTRIBUTION

October 17, 2014

BLM has identified lands across the range of sage-grouse capable of producing 10-30% sagebrush canopy cover. The Final EIS will identify the Priority Habitat Management Areas and will include an objective to maintain the desired condition of 10-30% sagebrush canopy cover in a minimum of 70% of those lands.

- II. Planning units will populate the attached template to provide fine- and site-scale vegetation objectives for sage-grouse life history stages based on the ecology in your region. This template should be included in the Special Status Species section of the ADPP. Provide appropriate peer-reviewed science to support the habitat values for the indicators.

Fine- and site-scale sage-grouse habitat suitability indicators for seasonal habitats are identified in the Sage-Grouse Habitat Assessment Framework (HAF). The HAF has incorporated the Connelly et al. (2000) sage-grouse guidelines as well as many of the core indicators in the AIM strategy (Toevs et al. 2011). There may be a need to develop adjustments to height and cover or other site suitability values described in the HAF; any such adjustments should be ecologically defensible. To foster consistency, however, adjustments to site suitability values at the local scale should be avoided unless there is strong, scientific justification for making those adjustments. That justification should be provided. WAFWA Management Zone adjustments must be supported by regional plant productivity and habitat data for the floristic province. If adjustments are made to the site-scale indicators, they must be made using data from the appropriate seasonal habitat designation (breeding/nesting, brood-rearing, winter) collected from sage-grouse studies found in the relevant area and peer-reviewed by the appropriate wildlife management agency(ies) and researchers

ATTRIBUTE	INDICATORS	DESIRED CONDIT ION	Refer ence
<b>BREEDING AND NESTING</b> (Seasonal Use Period March 1-June 15 )			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover

	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
WINTER <sup>1</sup> (Seasonal Use Period November 1 -February 28 )			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. Field offices are to conduct land health assessments at the watershed or comparable, larger scale and use the LUP vegetation objective and the sage-grouse habitat objectives to determine if GRSG habitat is meeting the desired condition.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (IIRH, Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in sage-grouse habitat, the BLM should collect the sage-grouse habitat-specific data to inform the HAF indicators that may not have been collected using the IIRH or the Core Indicators methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment 3: Incorporating GSGR RMP Decisions into Grazing Authorizations

### Incorporating GSGR RMP Decisions into Grazing Authorizations

#### Purpose

The purpose is to provide recommended ADPP language and outline the process for prioritizing the modification of grazing permits/leases, provide for adjusting livestock grazing within the terms and conditions of permits, and accomplish annual compliance monitoring within GRS habitat.

#### Background

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with either:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Appropriation authority (Section 411, PL 113-76-for permits that the BLM is unable to fully process before their expiration).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The rider relieves the BLM’s renewal processing workload while allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015”. The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

October 17, 2014

The BLM may modify terms and conditions of a permit or lease following consultation, cooperation, and coordination<sup>2</sup> with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public. Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record, and interested public who is affected by the proposed actions, terms or conditions, or modifications relating to applications, permits and agreements (including range improvement permits), or leases.

A. Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:

- The BLM will prioritize the modification of grazing permits within GRSG habitat. In setting priorities, areas not meeting land use plan vegetation objective and/or Land Health Standards will take precedence.
- The NEPA analysis for proposed modification of livestock grazing permits/leases will include a range of alternatives that allows the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA and issuance of a proposed/final grazing decision.
- Allotments within GRSG habitat will be prioritized for annual review to ensure compliance with the terms and conditions within the grazing permits. When BLM conducts monitoring, at a minimum, actual use, utilization, and use supervision data will be collected.

Process for Modifying Grazing Permits to Meet GRSG RMP Amendments/Revisions Objectives

If an evaluation area includes GRSG habitat that will require the modification of a grazing permit, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

BLM will develop criteria to prioritize the workload to modify grazing permits (fully processed or rider) within GRSG habitat. In setting priorities, areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential examples for prioritizing permit modifications could include:

- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet land use plan GRSG Special Status Species habitat objectives?
- Is there data that indicates that land use plan GRSG Special Status Species habitat objectives are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

The NEPA analysis will include adaptive management options when the GRSG Special Status Species habitat objectives are not being met. The NEPA analysis on the proposed modification of the

---

<sup>2</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

October 17, 2014

permit/lease should include a range of alternatives that allows the authorized officer to make the following adjustments to livestock grazing without additional NEPA or issuance of a proposed/final grazing decision. Implementation of management actions to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

B. Annual Compliance Monitoring of Modified Grazing Permits.

Allotments within GRSG habitat will be prioritized for annual monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Actual Use
- Utilization
- Use Supervision

## Attachment 4 – National GRSG Planning Schedule

### Schedule Assumptions

1. Modifications made to the ADPPs from roll-up and state meetings will not impact sub-regions from being able to submit their final ADPP data to the NOC by October 31, 2014.
2. All ADPP data submitted to the NOC by October 31, 2014 has been properly QAed/QCed by the BLM States.
3. The WO has the capacity to review all 15 Draft FEISs in 2 weeks.
4. Smooth Protest Resolution process.
5. No appeals from the governor’s consistency review.
6. All plans will go forward with informal Section 7 Consultation (30 days). If formal Section 7 Consultation is need, 135 days would be needed. This consultation would be initiated between steps 9 and 10.

National GRSG Planning Schedule			
Key Milestones are highlighted in red			
Step #	Roll-up/Planning 12 Step Process	Dates	Assumptions/Notes
1	Sub region sends memo to AD 200 for review	Complete	
2	AD 200 reviews memo and contacts sub regional SD.	Complete	
2a	Sub regions send ADPP data to the NOC.	Complete	
3	NOC completes WAFWA MZ Tier II CEA MZ tables	ON HOLD	NOC needs 1 month
3a	NOC completes WAFWA MZ Roll up land use allocation maps	Complete	
3b	EMPSi completes Tier II CEA MZ analysis and sends analysis to sub-regions	ON HOLD	6-10 weeks
4G	Great Basin Federal Family Roll up review meetings	Complete	
4R	Rocky Mountain Federal Family Roll up review meetings	Complete	
5	Meeting with States on Final Federal Plans (Face-to-Face)	10/13/14 to 10/17/14	
6	Final Resolution of Federal Plans (State Director’s meeting)	10/20/14	
7	Secretaries of DOI and USDA Briefing	10/22/14	
	Sub-regions complete ADPP and Chapter 2	10/31/14	
	Sub-regions re-send ADPP data to the NOC, reflecting changes from FFM s, discussions with the States, and from interagency leadership briefings	10/31/14	
3	NOC completes WAFWA MZ Tier II CEA MZ tables	11/21/14	3 weeks  Assumes all data has been appropriately QAed/QCed
3b	EMPSi completes Tier II CEA MZ analysis and sends analysis to sub-regions	11/21/14 to 1/2/15	6 weeks
	Direct and Indirect impact analysis is completed for the proposed plan	10/31/14 to 12/3/14	5 weeks
	BLM/FS ID-teams review of impact analysis (for those planning efforts using contractors only)	12/3/14 to 12/17/14	2 weeks
	BLM/FS ID-teams review CEA	1/2/15 to 1/16/15	
	BLM/Contractors compile, format, tech edit, and QA PLUPA/FEIS	1/2/15 to 1/16/15	2 weeks
	EMPSi revises CEAs	1/17/15-1/27/15	

INTERNAL WORKING DOCUMENT – NOT FOR DISTRIBUTION  
October 17, 2014

	Consistency Review Strike Team Reviews all 14 Draft FEISs.	1/19/15 to 1/26/15	1 week
	BLM/FS ID-teams respond to potential issues from Consistency Review Strike Team.  BLM/Contractors incorporate CEAs and make modifications for WO Review versions of the FEIS.	1/26/15 to 1/30/15	1 week
	Submit briefing packet to WO/WO Review Kick-off Briefing	2/2/15	
8	WO Review (CONCURRENT COOPERATING AGENCY REVIEW)	2/2/15 to 2/13/15	2 weeks
	BLM Consolidate/filter all WO BLM/FS & SOL/OGC comments	2/16/15 to 2/18/15	2 days
8a	Sub-regions respond to WO review comments	2/18/15 to 2/25/15	1 week
8b	WO resolves any pending concerns that arise out of the WO Review	2/25/15 to 2/27/15	2 days
	BLM/Contractors make modifications in Public Review versions of the FEIS.	2/27/15 – 3/5/17	1 week
9	<del>National Policy Team Briefing</del>	3/3/15

## Attachment 5: GRSG Strike Team Roles and Responsibilities

### Greater Sage Grouse Strike Team Roles and Responsibilities

The Greater Sage Grouse (GRSG) Strike Team (ST) is being established to ensure the following outcomes are achieved with the National GRSG Conservation Strategy:

- Ensure National Policy Team guidance and management direction is consistently incorporated into the GRSG Proposed Plans/Amendments
- Ensure that the Proposed Plans/Amendments include the appropriate conservation framework and objectives
- Ensure the plans collectively result in a cohesive federal land management conservation strategy for the GRSG
- Ensure consistency with the Record of Decisions

1). GRSG Core Team – The Core Team is responsible for overall project coordination and to ensure the conservation strategy outcomes are achieved. The Core team is also responsible for coordination with the other GRSG teams, which include the Regional Project Managers, Ad Hoc, WO Planning Review and Protest teams.

GRSG Core Team	
Stephanie Carmen vice Kathy Stangl	BLM National SG Coordinator
Joe Stout	BLM Division Chief, Decision Support, Planning and NEPA
Matthew Magaletti	BLM WO Planning and Environmental Analyst
Steve Small	BLM Division Chief, Wildlife Conservation
Vicki Herren	BLM NOC, Wildlife Biologist
Frank Quamen	BLM NOC, Wildlife Biologist, Geospatial Analyst
Kurt Wiedenmann	BLM Liaison to ASLM
Aaron Moody	SOL
Sarah Shattuck	SOL

2). GRSG Regional Project Managers

GRSG Regional Project Managers	
Lauren Mermejo	BLM Great Basin Project Manager
Johanna Munson	BLM Rocky Mountain Project Manager
Glen Stein	Forest Service Project Manager

3). GRSG Ad Hoc Team – The Ad Hoc team will add capacity and expertise in the areas of communications, web support, planning and applied science. The team will also provide recommendations for solutions to unique situations. Specific deliverables include an internal/external communication plan.

INTERNAL WORKING DOCUMENT – NOT FOR DISTRIBUTION  
October 17, 2014

GRSG Ad Hoc Team	
Mitch Snow	BLM Communications/PAO
TBD	(Writer/Editor/Web Master) Ed is working with Celia, NOC and NIFC
David Batts	EMPSI
Gordon Toevs	BLM, WO AIM Coordinator
Tom Rinkes	BLM, Retired Wildlife Biologist
Mike Pellant	BLM, Retired

4). GRSG Consistency Review Team – The consistency team will be responsible for reviewing all the Administrative Draft Proposed Plans (ADPP) prior to the larger WO review. Specifically, the team will focus on consistent incorporation of National Policy Team, Federal Family meeting and other Washington Office guidance. This team will also be responsible for drafting the Record of Decisions.

GRSG Consistency Review Team	
Review Prior to formal WO Review	
Matthew Magaletti	BLM WO Planning and Environmental Analyst
Lauren Mermejo	BLM Great Basin Project Manager
Johanna Munson	BLM Rocky Mountain Project Manager
EMPSi	TBD
Glenn Stein	Forest Service Project Manager
Development of the Records of Decisions (RODs)	
Matthew Magaletti	BLM WO Planning and Environmental Analyst
Lauren Mermejo	BLM Great Basin Project Manager
Johanna Munson	BLM Rocky Mountain Project Manager
EMPSi	TBD
Glenn Stein	Forest Service Project Manager
Aaron Moody	SOL
Sarah Shattuck	SOL
ASLM Representative	TBD

5). GRSG WO Planning Review Team – The WO Planning Review Team members and procedures are included in Attachment 2.

6). GRSG WO Protest Team – The BLM WO Division of Decision Support, Planning and NEPA is responsible for resolving all land use planning protests. The GRSG Plans and Amendments are subject to a 30-day public protest period. The BLM must resolve all public protests before each GRSG Plan can be approved. The Forest Service will be adopting the BLM's protest resolution process to satisfy their regulatory requirements. The team will develop a protest resolution strategy.

GRSG WO Protest Team	
Michael Hildner	BLM Colorado State Office, Planning and Environmental Analyst (Proposed)
Team members	TBD
Forest Service Team members	TBD

WO GREATER SAGE-GROUSE ADMINISTRATIVE PROPOSED RMP/RMP  
 AMENDMENT AND FINAL EIS REVIEW PROTOCOL

As mentioned in the Land Managers’ Decision Document GRSG-4, the Washington Office Greater Sage-grouse Strike Team has been tasked with “reviewing the Greater Sage-Grouse RMP Amendment EISs and the relevant Greater Sage-Grouse sections of the ongoing RMP amendments and/or revisions to ensure that applicable conservation measures have been considered, as per the requirements the NTT Report and IM No. 2012-044.” The WO review will take approximately two weeks to complete. Prior to the review, you will receive an email and invitation to the WO GRSG Strike Team Kick-off Review Briefing, where the State/Field Office will brief the WO reviewers on the A-PRMP/FEIS. This Kick-off Briefing will initiate the two week WO GRSG Strike Team review period. All comments should be placed on the WO Comment Review Form, which will be linked to the Kick-off Briefing email invitation. Please email your completed comment forms to Matthew Magaletti ([mmagalet@blm.gov](mailto:mmagalet@blm.gov)) at the end of the review period.

- I. What the W O GRSG Strike Team will be looking for during their review of the A-PRMP revision or amendment

Basic RMP Review Procedures	Responsibility
Ensure that the RMP amendment/revision alternatives/proposed management actions are consistent with your program area’s laws, regulations, and policy, and are of sufficient quality to support implementation of BLM programs. WO review should focus on high-level issues concerning national policy and standards. Feel free to use Appendix C of the Land Use Planning Handbook to verify what constitutes an appropriate LUP decision for your program area.	All programs
Review “Alternatives Considered but Not Fully Analyzed” to ensure that rationale for eliminating alternatives is clear and consistent with BLM policy.	All programs
Ensure that chapter 3 and 4 uses accepted criteria, indicators, benchmarks, and methods for analysis, and describes the affected environment clearly and consistently with national policy. Please note that the planning efforts associated with GRSG are focusing on portraying the amelioration of threats to the GRSG and have used baseline information from the USGS’s Baseline Environmental Report (BER), which was conducted specifically for this effort.	All programs
Review Procedures Unique to the GR SG Review	
Are all of the proposed actions presented in the A-PRMP/FEIS sufficiently protective of GRSG such as to contribute to reducing the need to list the species under the Endangered Species Act (per IM-2012-044)?	WO-230
Are all of the BMPs addressed in the NTT Report carried forward as Required Design Features (per GRSG-7)? Focus your review on the RDFs that are specific to your program area.	All programs
Were public comments submitted on the DEIS adequately responded to in the A-PRMP/FEIS (focus specifically on the FWS/State agency comments)? Focus your review on the responses relative to your program area.	All programs
Were all unresolved issues identified during the first regional reviews addressed (per GRSG-14)?	WO-210
Does the A-PRMP/FEIS contain the following consistent National GRSG Planning Strategy components:	WO-210 & WO-230

INTERNAL WORKING DOCUMENT – NOT FOR DISTRIBUTION

<p>If the document includes Forest Service units – is this clearly articulated throughout the document?</p>	<p style="text-align: center;">WO-210</p>

II. Next Steps after the WO has submitted comments back to the BLM State Office:

WO-210 will consolidate all of the WO GRSG Strike Team comments and will submit them to the State/Field Office. The State/Field Office will then be responsible for sending back to the WO the WO Comment Review Form with their responses on how they addressed your concerns. Once the responses are sent to WO-210, you will receive an email asking you to verify whether or not your concerns have been addressed appropriately. If your concerns have been addressed and the associated revisions to the ADRMP/APRMP have been made, please email Matthew Magaletti ([mmagalet@blm.gov](mailto:mmagalet@blm.gov)) within 48 hours from receiving the email. If no email is sent to the WO, WO-210 will assume that your concerns have been adequately addressed. WO-210 will notify the State/Field Office that all of the concerns have been resolved and the State/Field office will begin scheduling a briefing with the GRSG National Policy Team (NPT). At the NPT briefing, the NPT members will make the recommendation on whether or not the PRMP can be presented to the BLM Director.

Mr. Beck,

EPA's comments on the Final EIS and Proposed Plan for Idaho and Southwestern Montana Sub-Regional Sage-Grouse are attached.

Thank you again for your time two weeks ago to discuss the Proposed Plan.

Erik Peterson

Boise, Idaho 83709

Dear Mr. Beck:

The EPA has reviewed the BLM and Forest Service's Idaho and Southwestern Montana Greater Sage-Grouse Proposed Land Use Plan Amendment and Final Environmental Impact Statement (FEIS) (EPA Project Number 13-0039-BLM FEIS). Our review was conducted in accordance with the EPA responsibilities under the National Environmental Policy Act and Section 309 of the Clean Air Act.

We applaud your efforts to amend land use plans with regulatory mechanisms that will avoid continued degradation of greater sage-grouse habitat because, according to information cited in the FEIS, if current trends in wildfire, populations and habitat activities continue, populations of sage-grouse in Management Zone IV (most of Idaho and parts of Montana, Utah, Nevada and Oregon) are estimated to decline by 55 percent between 2007 and 2037, and by 66 percent in MZ II (Wyoming and parts of Idaho, Utah and Colorado).<sup>1</sup> Land use plan amendments are a necessary part of efforts to reverse these negative population trends.

**Responsiveness to our Draft EIS comments**

Our primary concern with the Draft Land Use Plan Amendments/EIS (DEIS) was the relatively smaller amount of greater sage-grouse (GRSG) habitat provided by the most protective management designation in Alternative E - one of the DEIS's co-preferred alternatives. By increasing the amount of GRSG habitat receiving the most protective management designation by 295,800 acres, the Proposed Plan is partially responsive to our primary environmental concern.

We also recommended a more precautionary approach to adaptive management. While the FEIS maintains a reaction based approach - increasing protection when monitoring shows habitat and population declines - we appreciate the FEIS's additional adaptive management information. Improvements to the adaptive management and monitoring appendices help to increase the likelihood that the proposed adaptive management strategy will be effective.

The FEIS includes responsive information on our other DEIS comments, relating to: fire management, grazing, infrastructure, consistency with conservation criteria, and Areas of Critical Environmental Concern.

---

<sup>1</sup> FEIS, p. 1-19

In the interest of further improving the Proposed Plan between now and the Record of Decision, we offer the following recommendations.

**Increase or maintain the amount of Priority Habitat Management Area in the Final Plan**

Our primary environmental concern about the relative amount of GRSG habitat receiving the most protective designation largely remains. This concern remains because the FEIS's Proposed Plan provides the most protective designation for 1,367,200 fewer acres of Priority Areas for Conservation compared to Alternative D.<sup>2</sup> Priority Areas for Conservation are described in the COT report as, "...key habitats that are essential for sage-grouse conservation".<sup>3</sup>

To address our primary environmental concern, we reiterate our recommendation for the final Plan to increase or maintain the current amount of Priority Habitat Management Area (PHMA). Strong protections for key habitat increases the likelihood that the highest level objective, a neutral or positive population trend, can be achieved.

**Establish a goal or monitoring measure for Rangeland Fire Protection Associations**

Habitat loss and fragmentation due to increased occurrence of wildfire is one of the primary threats to GRSG within the Idaho and Southwestern Montana Sub-region.<sup>4</sup> Overall, we believe that the Proposed Plan's management for Wildfire Preparedness/Prevention, Wildfire Suppression, and Fuels Management will help to alleviate this primary threat. To improve fire related management, particularly response times, we suggest you consider establishing a goal and monitoring measure for Rangeland Fire Protection Associations.

Rangeland Fire Protection Associations take advantage of quick initial attack that ranchers can provide; satisfy ranchers' interest in being active participants and managers of safety concerns; and enhance efforts to protect sage grouse habitat. A stated goal - based on the general principal that what we measure, matters - could include a goal of 100 percent of GRSG PHMA habitat with established Rangeland Fire Protection Associations.

**Clarify the anthropogenic disturbance calculation for Idaho**

We appreciate the anthropogenic disturbance cap because we believe it will help to avoid and minimize another primary threat to GRSG in Idaho and Southwestern Montana - human development. The human development threat includes impacts from the construction and operation of transmission lines, pipelines, roads and other development as defined in the EIS.

To reduce potential confusion on how the disturbance calculation is made in Idaho, we recommend that the Record of Decision (ROD) or final adaptive management document include clarifying information on how fire, invasives or other non-anthropogenic disturbances, are accounted for. We believe clarifying information is necessary because FEIS Appendix G appears to present fire effects both as being excluded and included in the calculation.<sup>5</sup> Excluding the fire effects would increase risk to GRSG by

---

<sup>2</sup> See FEIS, Table 4-16

<sup>3</sup> U.S. Fish and Wildlife Service, Dear Interested Reader introduction to the Greater Sage-grouse Conservation Objectives: Final Report, available online at: <http://www.fws.gov/greatersagegrouse/documents/COT-Report-with-Dear-Interested-Reader-Letter.pdf>

<sup>4</sup> FEIS, p. 1-13

<sup>5</sup> "Areas that are not sage-grouse seasonal habitats, or are not currently supporting sagebrush cover (e.g., due to wildfire), are not excluded from the acres of PHMA in the denominator of the formula." (FEIS, p. G-5)

potentially over-estimating actual GRSG habitat. Including the fire effect would be more protective for GRSG because the disturbance cap is measured as a proportion of actual habitat.<sup>6</sup> Addressing this recommendation could be as simple as more clearly differentiating the Idaho equation from the Southwestern Montana equation.

**Address implementation certainty for adaptive management**

To increase the likelihood that management responses will be implemented and effective, we recommend that the ROD or final adaptive management document include additional information on potential implementation level actions to consider in the event that hard trigger criteria are met. FEIS Appendix G includes a list of actions to consider in the event that soft trigger criteria are met.<sup>7</sup> Please address whether that same list also applies to hard triggers.

A major adaptive management response is to increase protections by managing Important Habitat Management Areas as Priority Habitat Management Areas. Other management responses to consider that are listed in FEIS Appendix G, and which we believe may be both necessary and difficult to implement, depend on increasing or reallocating resources.

For actions which depend on increasing resources, we recommend that the ROD, or final adaptive management document, include additional information on the certainty of adequate resources for full implementation.

For actions that depend on reallocating resources, we recommend that the ROD or final adaptive management document include additional information on the certainty that all necessary parties will approve, and that the BLM will be able to implement, the re-direction of resources based on GRSG monitoring information.

If you have questions regarding our comments, please contact me at (206) 553-1601 or by electronic mail at [reichgott.christine@epa.gov](mailto:reichgott.christine@epa.gov) , or Erik Peterson at (206) 553-6382 or [peterson.erik@epa.gov](mailto:peterson.erik@epa.gov).

Sincerely,

Christine B. Reichgott, Manager  
Environmental Review and Sediment Management Unit

---

<sup>6</sup> "The Idaho calculation does consider the effect fire has on the habitat and includes loss of habitat from fire as part of the calculation by weighting the denominator based on the actual habitat available to the GRSG." (FEIS, p. G-15)

Information Bulletin No. ID-2015-001

To: Idaho Bureau of Land Management (BLM) Leadership Team

From: Idaho State Director

Subject: Idaho Southwestern Montana Greater Sage-Grouse (GRSG) Administrative Draft  
Proposed Plan (ADPP)

**DD: 10/24/2014**

Since December 2011, the BLM has been leading an effort to incorporate conservation measures as regulatory mechanisms into existing BLM and United States Forest Service (USFS) land use plans in response to the US Fish and Wildlife Service (USFWS) March 2010 finding on GRSG. The Idaho and Southwestern Montana sub region amendments are an integral component of the BLM National GRSG Planning Strategy and encompass the relevant BLM district and field offices and the National Forests which manage GRSG habitat within the sub region. Each BLM district has provided technical and specialist support to the Sub Regional Interdisciplinary Team (Team). This Team is composed of staff from the BLM, USFS, USFWS, Natural Resource Conservation Service, Idaho Department of Fish and Game, Montana Fish, Wildlife and Parks, and the Idaho Office of Species Conservation. Together this Team has worked collaboratively to develop a Draft Environmental Impact Statement with five (5) alternatives analyzed in detail, which identified two (2) alternatives as co-preferred – one developed by the Team and one developed by the State of Idaho for lands within the State of Idaho.

This Team has continued on to develop the attached Administrative Draft Proposed Plan (ADPP). The ADPP is the result of significant collaboration between the Federal, state and local partners, augmentation and refinement to respond to the USFWS Conservation Objectives Team Report (March 2013), coordination and direction with the BLM, Forest Service and USFWS National Policy Team, regional coordination involving the Department of the Interior, Western Association of Fish and Wildlife Agencies and the Western Association of Governors. The ADPP represents the culmination of this coordination. It contains direction that is consistent with the USFWS Conservation Objectives Team Report and the National Policy Team Guidance. Many of the management actions reflect direction that is national or regional in scope with limited or no flexibility for local or sub regional adjustment; other management actions are more specific to the Idaho and Southwestern Montana effort with a greater flexibility for refinement.

Representatives of your staff have been involved throughout the development of this ADPP and their input has served to identify issues and concerns, as well as provide suggestions and solutions to resolve many of those concerns.

The ADPP reflects a shift of management in GRSG habitats and will lead to changes in the way the BLM does business in those areas. As the amendment effort moves closer to conclusion the Team is focusing more energy on implementation consideration and direction. A preliminary Implementation Guide is being developed, a draft of which will be included in the Final Environmental Impact Statement and is intended to be finalized after release of the final amendment decision(s). To help develop this guide a series of BLM and USFS staff workshops are contemplated and will likely occur early in calendar year 2015 for each BLM district office area. These workshops will step through the potential planning decisions and discuss approaches and processes for implementation that will be used to develop the final guide. We encourage your review and understanding of the ADPP, in preparation for those meetings. If you, or your staff, have questions or substantive comments on the ADPP, please contact Brent Ralston, Greater Sage-Grouse Planning Lead, prior to October 24, 2014.

The participation and involvement of your staff has been a significant factor in success of this effort thus far. Revision of 29 land use plans across 11 million Federal acres within the sub region has been a massive undertaking, and the contributions of your staff have come at the expense of other work on the district. The amendment effort is nearing completion and the even more important job of implementation is looming. Your continued support and attention to helping develop the Implementation Guide will be instrumental to ensure the success of on-the-ground actions to conserve GRSG into the future.

## **Idaho and Southwestern Montana Recommendation for Proposed Plan Amendment**

### **1. Summary Description of the Proposed Plan (Plan)**

The Proposed Plan represents a management strategy to address Greater Sage-grouse, their habitat and associated threats within the Idaho and Southwestern Montana Subregion. The Plan has been developed through a coordinated partnership of BLM, Forest Service, the States of Idaho and Montana and the US FWS.

The Plan incorporates appropriate conservation measures to conserve, enhance, and restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat. The Plan is also consistent with the objectives described in the USFWS Conservation Objectives Team Report (USFWS 2013) to: ‘Conserve sage-grouse so that it is no longer in danger of extinction or likely to become in danger of extinction in the foreseeable future...’ through ‘Maintaining viable, connected, and well-distributed populations and habitats across [the range of GRSG], through threat amelioration, conservation of key habitats, and restoration activities’.

To achieve these objectives the Plan includes a combination of: Goals and Objectives including vegetation/habitat management objectives to be applied during project development and implementation (Table 3); land allocation decisions (Table 1); delineation of five Conservation Areas (Map 1) to support evaluation of the adaptive management strategy and 3% anthropogenic disturbance cap; delineation of Priority, Important and General Habitat Management Areas (Map 2) with associated program management direction; a mitigation framework and strategy; development of Wildfire and Invasive Species Assessments; and associated monitoring to support these decisions.

<sup>1</sup> The Idaho and Southwestern Montana Subregion includes portions of Idaho, Montana and Utah. Where differences exist between direction for Idaho and Montana or between BLM and Forest Service, those are noted in the table and within the management action section. The lands within Utah are part of the Sawtooth National Forest and are managed as such; therefore direction for these lands in Utah is the same as that described for the Sawtooth National Forest in Idaho.

## **2. Goals and Objectives**

- 2.1. GOAL-1: Maintain and/or increase the abundance, distribution and connectivity of GRSG by conserving, enhancing and restoring GRSG habitat to maintain resilient populations by reducing, eliminating or minimizing threats to GRSG habitats.
- 2.2. GOAL-2: Provide for the needs of GRSG and their habitat while also providing for resource uses in accordance with the agencies' direction for multiple use and sustained yield as described in FLPMA and the NFMA.
- 2.3. GOAL-3: Manage anthropogenic development and human disturbance to minimize the likelihood of adverse population level effects on GRSG.
- 2.4. GOAL-4: Reduce the risk of West Nile Virus or other disease outbreaks from BLM and USFS management actions.
- 2.5. Management Area (MA) - Objective (OBJ)-1: Maintain a resilient population of GRSG in Idaho and Southwestern Montana.
- 2.6. MA-OBJ-2: Designate GRSG management areas and associated management to maintain a resilient population and to designate strategically located adjacent areas to provide a buffer from unpredictable habitat loss such as wildfire to the resilient population areas.
- 2.7. MA-OBJ-3: Identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain GRSG population persistence.
- 2.8. Vegetation (VEG)-OBJ-1: Reconnect and expand areas of higher native plant community integrity/rangeland health to increase the extent of high quality habitat and, where possible, to accommodate the future effects of climate change.
- 2.9. VEG-OBJ-2: Increase the amount and functionality of seasonal habitats by:
  - a. Increasing canopy cover and average patch size of sagebrush in perennial grasslands.
  - b. Increasing the amount, condition and connectivity of seasonal habitats.
  - c. Protecting or improving GRSG migration/movement corridors.
  - d. Reducing conifer encroachment within GRSG seasonal habitats.
  - e. Improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats.
  - f. Reducing the extent of annual grasslands within and adjacent to Priority and Important Habitat Management Areas.Decadal treatment objectives by population area are identified in Table 2.
- 2.10. Habitat Management (HM)-OBJ-1: Maintain or make progress toward at least 70% of lands within PHMAs and IHMAs capable of producing sagebrush at 10-30% canopy cover and conifers absent to uncommon within 1.86 miles of occupied leks.
- 2.11. HM-OBJ-2: Incorporate GRSG Seasonal Habitat Objectives (Table 3) into the design of projects or activities, as appropriate, based on site conditions and ecological potential, unless achievement of fuels management objectives require additional reduction in sagebrush cover to meet strategic protection of GRSG habitat and conserve habitat quality for the species; unless at least one of the following conditions can be demonstrated and documented in the NEPA analysis associated with the specific project:

A specific objective is not applicable to the site-specific conditions of the project or activity;

An alternative objective is determined to provide equal or better protection for GRSG or its habitat (based on appropriate scientific findings); or Analysis concludes that following a specific objective would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.

- 2.12. FUEL-OBJ-1: Design fuel treatments to restore, enhance, or maintain GRSG habitat.
- 2.13. WHB-OBJ-1: Manage wild horse and burro population levels within the established AML ranges to maintain or enhance GRSG habitat.

**Table 2. Acres of Treatment within a 10-Year Period to Achieve Vegetation Objectives<sup>2</sup>**

Population Area	Mechanical Conifer Treatment	Mechanical Sage	Prescribed Fire	Annual Grass Treatment
Bear Lake Plateau		1000		
East Idaho Uplands	6000		9000	1000
S Central Idaho/N Snake River and Mountain Valleys	4000	14000	11000	162000

	Sagebrush height <sup>8</sup>	
	Arid sites <sup>3</sup>	12-31 inches (30-80cm)
	Mesic sites <sup>4</sup>	16-31 inches (40-80cm)
	Predominant sagebrush shape <sup>13</sup>	Predominantly spreading shape <sup>5</sup>
	Perennial grass cover <sup>2,8,13</sup>	
	Arid sites <sup>3</sup>	≥10%
Mesic sites <sup>4</sup>	≥15%	
Perennial grass height <sup>8,9,11,13</sup>	<u>Adequate nest cover</u>	
Perennial forb cover <sup>2,8</sup>		
Arid sites <sup>3</sup>	≥5%	
Mesic sites <sup>4</sup>	≥10%	
Perennial forb availability <sup>13</sup>	Preferred forbs are common with several species present <sup>6</sup>	
<b>LATE BROOD-REARING/SUMMER<sup>1</sup> (July-October)<sup>1</sup> (Apply to all habitat outside of nesting/breeding and winter)</b>		
Cover and Food	Seasonal habitat extent <sup>8</sup>	>40% of the summer/brood habitat meets recommended brood habitat characteristics where appropriate (relative to ecological site potential, etc.)
	Sagebrush canopy cover <sup>2,8,</sup>	10-25%
	Sagebrush height <sup>8,</sup>	16 to 32 inches (40-80cm)
	Perennial grass canopy cover <sup>2,8</sup>	>15%
	Upland and riparian perennial forb availability <sup>2,13</sup>	Preferred forbs are common with several preferred species present <sup>6,</sup>
	Riparian meadow habitat condition	Proper Functioning Condition <sup>13</sup>
<b>WINTER<sup>1</sup> November-March<sup>1</sup> (Apply to areas of known or likely winter-use)</b>		
Cover and Food	Seasonal habitat extent <sup>8</sup>	>80% of the wintering habitat meets winter habitat characteristics where appropriate (relative to ecological site, etc.).
	Sagebrush canopy cover above snow <sup>2,8,13</sup>	>10%
	Sagebrush height above snow <sup>8</sup>	>10 inches (>25cm)
<b>NOTES AND REFERENCES</b>		
<p><sup>1</sup> Seasonal dates can be adjusted by local unit according to geographic region.</p> <p><sup>2</sup> Absolute cover is the actual recorded cover and can exceed 100% when recorded across all species and all layers. It is not relative cover, which is the proportions of each species, and equals 100%. Note that cover is reported for only those species (e.g., sagebrush, preferred forbs) that are sampled to determine suitability of habitat for sage-grouse. Overall cover at the site will be greater than that sampled for sage-grouse habitat, due to other species present.</p> <p><sup>3</sup> Arid corresponds to the 10 – 12 inch precipitation zone; <i>Artemisia tridentata wyomingensis</i> is a common big sagebrush sub-species for this type site (Stiver et al. <i>In Press</i>).</p> <p><sup>4</sup> Mesic corresponds to the ≥12 inch precipitation zone; <i>Artemisia tridentata vaseyana</i> is a common big</p>		

sagebrush sub-species for this type site (Stiver et al. *In Press*).

<sup>5</sup>Collectively the indicators for sagebrush (cover, height, and shape), perennial grass and perennial forb (cover, height and/or availability) represent the desired condition range for nesting/early brood rearing habitat characteristics, consistent with the breeding habitat suitability matrix identified in Stiver et al. *In Press*.

Sagebrush plants that are more tree or columnar-shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. *In Press*). Some sagebrush plants are naturally columnar (e.g., Great Basin big sagebrush), and a natural part of the plant community. However, a predominance of columnar shape arising from animal impacts may warrant management investigation or adjustments at site specific scales.

<sup>6</sup> Preferred forbs are listed in Stiver et al. *In press* . Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred.

### **3. Coordination**

- 3.1.** CC-1: Collaborate, coordinate and utilize cooperative planning efforts to implement and monitor activities to achieve desired conditions and to maximize the utilization of available funding opportunities. Coordination efforts could include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups, public lands permit holders and non-governmental organizations.
- 3.2.** CC-2: Develop a cooperative MOU between the BLM, Forest Service and State of Idaho to establish the State of Idaho as a cooperating agency during implementation of the final decision. The MOU would identify responsibilities, role and interaction of the BLM, FS and Task Team. Montana BLM will participate as appropriate on Montana's Sage-grouse Oversight Team to facilitate coordinated and implementation of BLM's final decision and Montana's forthcoming sage-grouse conservation strategy.
- 3.3.** CC-3: The BLM and Forest Service would consider any recommendations from the Governor of Idaho as a result of evaluation completed by the Sage-Grouse Implementation Task Force.
- 3.4.** CC-4: The BLM and Forest Service would coordinate with the State of Idaho and Montana and the Idaho Sage-Grouse Implementation Task Force and Montana Sage-grouse Oversight Team regarding proposed management changes, the implementation of conservation measures, mitigation, and site-specific monitoring, related to adaptive management and livestock grazing (Appendix O).
- 3.5.** CC-5: Upon completion of the Record of Decision the BLM will develop an Implementation Guide for BLM District and Field Offices to define and describe consistent application of the allocations, management actions, required design features, and etc. that are contained within the final plan.
- 3.6.** CC-6: At the state level, BLM and Forest Service would coordinate with IDFG, MFWP, USFWS, and other conservation partners in collaborative efforts with adjacent states (Oregon, Nevada, Utah, Montana, Wyoming) in GRSG MZs IV and II to evaluate GRSG habitat and population status and trends and make appropriate recommendations for GRSG conservation at broader scales.
- 3.7.** CC-7: At the state level, BLM and Forest Service would coordinate with appropriate WAFWA Sage-grouse Technical Committee to develop consistent population and habitat monitoring approaches that facilitate GRSG conservation at the MZ scale.
- 3.8.** CC-8: All prescribed burning would be coordinated with state and local air quality agencies to ensure that local air quality is not significantly impacted by BLM and Forest Service activities.

#### 4. Greater Sage-Grouse Management Areas

- 4.1. Management Area (MA)-1: Designate five GRSG Conservation Areas within the sub-region to form the geographic basis for achieving population objectives; evaluating the disturbance density and adaptive regulatory triggers; and tailor adaptive management responses. These conservation areas are depicted in Map 1. These areas are referred to as Mountain Valleys, Desert, West Owyhee, Southern and Southwestern Montana Conservation Areas.

##### Conservation Area Description:

Mountain Valleys Conservation Area – generally located north of the Snake River Plain, and includes habitat in west-central population area. It extends west from Rexburg, north and west of Highway 33 to Howe, north and west of Highway 33/22 to Arco, north and west of Highway 26/20/93 to Carey, north and west of Highway 20 west to Hill City, north and west of Highway 20 to the Dylan Karaus Road, west to Canyon Creek. Canyon Creek to the confluence with the Snake River form the western boundary.

Desert Conservation Area – located north of the Snake River and south of the Mountain Valleys Conservation Area. It extends from the confluence of Canyon Creek and the Snake River, eastward to Idaho Falls. The Snake River and Henry's Fork form the eastern boundary.

West Owyhee Conservation Area – located south of the Snake River and west of the Bruneau River.

Southern Conservation Area – located south of the Snake River and east of the Bruneau River, including East Idaho uplands and Bear Lake Plateau, and the Utah portion of the Sawtooth National Forest in Box Elder County.

Southwestern Montana – located in southwestern Montana - encompassing the Dillon and Butte BLM Field Office boundaries.

Additionally, sage-grouse habitats in the Desert and West Owyhee CAs are relatively contiguous, while those in the Mountain Valleys and Southern CAs tend to be more fragmented due to topography, elevational and land use differences.

- 4.2. MA-2: Within each Conservation Area (CA) designate GRSG Habitat Management Areas: Priority, Important and General Habitat Management Areas (Map 2). **Priority Habitat Management Areas (PHMAs)** focus on conserving the two key meta-populations in the sub-region. These meta-populations consist of a large aggregation of interconnected breeding subpopulations of GRSG that have the highest likelihood of long-term persistence. The PHMA encompasses areas with the highest conservation value to GRSG, based on the presence of larger leks, habitat extent, important movement and connectivity corridors and winter habitat. Priority Habitat Management Areas include adequate area to accommodate continuation of existing land uses and landowner activities. **Important Habitat Management Areas (IHMAAs)** contain additional high value habitat and populations that provide a

management buffer for the PHMA, connect patches of PHMA. The IHMA encompasses areas of generally moderate to high conservation value habitat and/or populations and in some CAs includes areas beyond those identified by USFWS as necessary to maintain redundant, representative and resilient populations (Priority Areas for Conservation (PACs)). The IHMAs are typically adjacent to PHMAs but generally reflect somewhat lower GRSG population status and/or reduced habitat value due to disturbance, habitat fragmentation or other factors. There are no IHMAs designated within the Southwestern Montana CA. **General Habitat Management Areas (GHMAs)** encompass habitat that is outside of PHMAs or IHMAs. It is generally characterized by more marginal habitat and few, if any, occupied leks or other important seasonal use areas.

- 4.3. MA-3: Delineate PHMA and IHMA to encompass 90% of the breeding males in Idaho.
- 4.4. MA-3: Annually prioritize Conservation Areas at the state scale considering results of the annual adaptive regulatory trigger evaluations relative to implementation of restoration and mitigation activities.
- 4.5. MA-4: Prioritize activities and mitigation to protect, enhance and restore GRSG habitats (i.e. suppression activities, fuels management activities, vegetation treatments, invasive species treatments, etc.) first by Conservation Area, if appropriate (CA under adaptive management or at risk of engaging adaptive management), followed by Priority Habitat Management Areas, then Important Habitat Management Areas then General Habitat Management Areas within the Conservation Areas. Local priority areas within these areas will be further refined as a result of completing the GRSG Wildfire and Invasive Species Habitat Assessments as described in Appendix D. This could include projects outside GRSG habitat when those projects would provide a benefit to GRSG habitat. Priority restoration and mitigation areas are restoration areas identified on the Key Habitat map (R1, R2, R3 and Recent Burn) within nesting and wintering areas in Priority and Important Habitat Management Areas.
- 4.6. MA-5: The management area map and biologically significant unit baseline map would be re-evaluated in conjunction with plan evaluation processes (i.e. approximately every 5 years). This re-evaluation could indicate the need to adjust Priority, Important or General Habitat Management Areas or the habitat baseline. These adjustments could occur upon completion of the appropriate analysis (plan amendment) to review the allocation decisions based on the map.
- 4.7. MA-6: The functionality and capability of GRSG habitat within the project area would be assessed during project-level NEPA analysis within the management area designations (Priority, Important, General) and appropriate updates to the Key Habitat map would occur. Areas without the potential and capability to provide GRSG habitat would be identified, areas with the potential to provide GRSG habitat would be appropriately classified on the Key Habitat map. Project proposals and their effects would be evaluated based on the habitat and values affected.
- 4.8. MA-7: Idaho BLM will annually update the Key Habitat map as described in Appendix F, in order to reflect habitat changes resulting from wildfire, succession, and vegetation treatments that occurred or were observed since the last update. Updates to the map will also occur if it is determined that mapping errors or omissions have occurred, or that radio-telemetry studies indicate that sage-grouse are

consistently utilizing an area. Updates are also intended to capture recommendations by the field offices, sage-grouse Local Working Groups (LWG), or agency partners in sage-grouse conservation.

- 4.9.** MA-8: Areas of habitat outside of delineated management areas identified during the Key habitat update process would be evaluated during site specific NEPA for project level activities and GRSG required design features (Appendix A), seasonal timing restrictions (Appendix B) and buffers (Appendix C) would be included as part of project design. These areas would be further evaluated during plan evaluation to determine whether they should be included as Priority, Important or General Habitat Management Areas.

DRAFT

## **5. Adaptive Management**

- 5.1. Adaptive Management (AM)-1: Idaho: Use hard and soft population and habitat triggers, evaluated within a Conservation Area, to determine an appropriate management response.
- 5.2. AM-2: Utilize monitoring information collected through the Monitoring Framework Plan (Appendix E) to determine when adaptive regulatory triggers have been met.
- 5.3. AM-3: Idaho: BLM and Forest Service would maintain GRSG habitat information, through use of the Key Habitat map or latest sagebrush/vegetation map, which would be used to track and identify habitat changes to assess the habitat trigger in the adaptive management approach. Key habitat map updates are made each winter by BLM in coordination with the FS and Idaho Department of Fish and Game (IDFG), using the process described in Appendix F.
- 5.4. AM-4: BLM and Forest Service would utilize population information collected and maintained by the Idaho Department of Fish and Game to track and identify population changes to assess the population trigger in the adaptive management approach...
- 5.5. AM-5: Twice each year the applicable monitoring information would be reviewed to determine if any adaptive management criteria have been met.
- 5.6. AM-6: Adaptive regulatory triggers would be individually calculated across all ownerships within the biologically significant units (BSU). The BSU is defined as the Idaho Department of Fish and Game modeled nesting and wintering habitat within Priority and Important Habitat Management Areas within a Conservation Area. The sagebrush component of the BSU is represented by the key habitat within the BSU.
- 5.7. AM-7: Adaptive Regulatory Criteria for Hard Habitat Triggers are defined as:
  - A 20 percent loss of Key Habitat within the biologically significant unit (BSU) (Appendix G) of the PHMA of a CA when compared to the 2011 baseline (the BSU is defined as the nesting and wintering habitat within a Priority and Important Habitat Management Areas (separately) within a Conservation Area, inclusive of all ownerships); or
  - A 20 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline.
- 5.8. AM-8: Adaptive Regulatory Criteria for Soft Habitat Triggers are defined as:
  - A 10 percent loss of Key Habitat within the BSU of the PHMA of a CA when compared to the 2011 baseline; or
  - A 10 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline.
- 5.9. AM-9: Adaptive Regulatory Criteria for Hard Population Triggers are defined as: A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within PHMA within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline; or A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within IHMA within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline.
- 5.10. AM-10: Adaptive Regulatory Criteria for Soft Population Triggers are defined as:

A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within PHMA within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011; or

A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within IHMA within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011.

- 5.11. AM-11: When any of the Adaptive Regulatory Criteria for Soft Triggers have been met the Implementation Team would evaluate causal factors and recommend additional potential implementation level activities Appendix G.
- 5.12. AM-12: When any of the Adaptive Regulatory Criteria for Hard Triggers have been met then PHMA management actions would be applied to the IHMA within that CA.
- 5.13. AM-13: If an adaptive regulatory trigger is tripped and livestock grazing is identified as a probable limiting factor then adjustments would follow the Adaptive Grazing Management Response described in Appendix G.
- 5.14. AM-14: Remove any adaptive management response when the habitat or population information shows a return to or an exceedance of baseline values within the associated CA.
- 5.15. **Montana Adaptive Management:**

## **6. Anthropogenic Disturbance**

- 6.1.** Anthropogenic Disturbance (AD)-1: Limit anthropogenic disturbance to 3 percent as calculated within the biologically significant unit (BSU) (Map 3). The BSU is defined as the nesting and wintering habitat within Priority and Important Habitat Management Areas within a Conservation Area, inclusive of all ownerships for evaluation. Anthropogenic disturbance excludes habitat disturbance from wildfire and fuels management activities and includes activities described in Table X. For Idaho this disturbance is measured by direct footprint or by ROW width for linear features (powerlines, pipelines and roads). For Montana this disturbance is measured utilizing the Disturbance Density Calculation Tool process described in Appendix H.
- 6.2.** AD-2: New anthropogenic disturbances within Priority or Important Habitat Management Areas within a CA where the disturbance cap is already exceeded from any source or where the proposed development would result in the cap being exceeded would not be allowed until enough habitat has been restored to maintain the area under this cap (subject to valid existing rights).
- 6.3.** AD-3: Priority Habitat Management Area: Anthropogenic Disturbance Exception Criteria. In order to avoid surface-disturbing activities in Priority Habitat Management Areas, priority will be given to development (including ROWs, fluid minerals and other mineral resources subject to applicable stipulations) outside of Priority Habitat Management Areas. When authorizing development in Priority Habitat Management Areas, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. In addition to the Priority and Important Habitat Management Area Anthropogenic Disturbance Development Criteria (AD-4), the following criteria must all be met in the project screening and assessment process:
- a. The population trend for the GRSG within the associated Conservation Area is stable or increasing over a three-year period and the population levels are not currently engaging the adaptive management triggers (this applies strictly to new authorizations; renewals and amendments of existing authorizations would not be subject to this criteria when it can be shown that long-term impacts from those renewals or amendments would be substantially the same as the existing development);
  - b. The development with associated mitigation would not result in a net loss of GRSG Key habitat and mitigation would provide a net conservation benefit to the respective Priority Habitat Management Area;
  - c. The project would not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA (the project would be outside Key habitat in areas not meeting desired habitat conditions or the project would provide a benefit to habitat areas that are functioning in a limited way as habitat);
  - d. Cannot be reasonably accomplished outside of the Priority Habitat Management Area; or can be either: 1) developed pursuant to a valid existing authorization; 2) is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade) ; or 3) is co-located within the footprint of existing infrastructure (i.e. powerlines) (proposed actions would not increase the 2011 authorized footprint and associated impacts more than fifty percent (50%), depending on industry practice.

- e. Development could be implemented adhering to the required design features (RDF) described in Appendix A;
  - f. The project would not exceed the disturbance cap (AD-1).
  - g. The project has been reviewed by the State Implementation Team and recommended for consideration by the Idaho Governor.
- 6.4.** AD-4: Priority and Important Habitat Management Areas: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:
- a. The project cannot reasonably be achieved, technically or economically, outside of this management area; and
  - b. The project siting and/or design should best reduce cumulative impacts and/or impacts on GRSG and other high value natural, cultural, or societal resources; this may include co-location within the footprint for existing infrastructure, to the extent practicable; and
  - c. The project does not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA; and
  - d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
  - e. The project complies with the applicable RDFs as described in Appendix A.
  - f. The project would not exceed the disturbance cap (AD-1).
- 6.5.** AD-5: Co-locating new infrastructure within existing ROWs and maintaining and upgrading ROWs is preferred over the creation of new ROWs or the construction of new facilities in all management area. Colocation for various activities is defined as:
- Communication Sites – The installation of new equipment/facilities on or within or adjacent to existing authorized equipment/facilities or within a communication site boundary as designated in the Communication Site Plan.
- Electrical Lines – Installation of new rights-of-way (ROWs) adjacent to current ROWs boundaries, not necessarily placed on the same power poles.
- Other Rights-of-Way – The installation of new rights-of-way (ROWs) within the existing footprint of an approved ROW boundary or adjacent to an approved ROW boundary.
- Designated Corridors – The installation of new rights-of-way within the existing corridor or adjacent to the existing corridor.
- 6.6.** AD-6: Incorporate required design features (RDFs) as described in Appendix A in the development of project or proposal implementation, reauthorizations or new authorizations and suppression activities, as conditions of approval into any post-lease activities and as best management practices for locatable minerals activities, to the extent allowable by law, unless at least one of the following conditions can be demonstrated and documented in the NEPA analysis associated with the specific project:
- A specific RDF is not applicable to the site-specific conditions of the project or activity;

- A proposed design feature or BMP is determined to provide equal or better protection for GRSG or its habitat; or
  - Analysis concludes that following a specific RDF would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.
- 6.7. AD-7: Conduct implementation and project activities, including construction and short-term anthropogenic disturbances consistent with seasonal habitat restrictions described in Appendix B.
- 6.8. AD-8: Required Design Features and seasonal habitat restrictions would not be required for emergency or short-term activities necessary to protect and preserve human life or property.
- 6.9. AD-9: Incorporate appropriate buffers into implementation and project design to avoid and minimize impacts to GRSG described in Appendix C.

Airports
Military Ranges (ground based?)
Hydropower plants
Recreation Areas (Developed)

<sup>3</sup> Taken from Table 6 – GRSG Monitoring Framework.

## **7. Mitigation**

- 7.1. Mitigation (MIT)-1: BLM and USFS would establish an inter-agency GRSG Conservation Board at the state level (both Idaho and Montana) to oversee GRSG Conservation.
- 7.2. MIT-2: The BLM and USFS, in coordination with the GRSG Conservation Board would develop a State Mitigation Strategy. In Idaho this strategy would be consistent with the Idaho Mitigation Framework (Appendix I).
- 7.3. MIT-3: Mitigate impacts from anthropogenic developments (Appendix G Table G-1) to GRSG habitats to a net conservation benefit (benefits more birds) by first avoidance of impacts, minimizing impacts and then compensating for impacts.
- 7.4. MIT-4: Mitigate anthropogenic development (Appendix G Table G-1) impacts to a no net loss of Key habitat standard (Appendix I) through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix I), referred to as no unmitigated loss.
- 7.5. MIT-5: Mitigate anthropogenic development (Appendix G Table G-1) impacts to GRSG habitat through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix I).
- 7.6. MIT-6: Consistent with regulations for minerals activities, require a full reclamation bond specific to the site when surface disturbing activities are proposed. Ensure reclamation bonds are sufficient to cover costs to fully rehabilitate lost GRSG habitat. Base the reclamation costs on the assumption that contractors for the BLM will perform the work. Areas are considered fully rehabilitated when they meet the conditions described in Table 3.

## **8. Wildfire Preparedness/Prevention**

- 8.1. Wildfire Preparedness (WFP)-1: Support development and implementation of Rangeland Fire Protection Associations (RFPAs) in coordination with the State of Idaho.
- 8.2. WFP-2: Develop a consistent approach to fire restrictions within GRSG habitat through the existing coordinated inter-agency approach to fire restrictions based upon National Fire Danger Rating System thresholds (fuel conditions, drought conditions, and predicted weather patterns).
- 8.3. WFP-3: Annually incorporate into existing fire management plans results and updates from the Wildfire and Invasive Species Habitat Assessments (FIAT Assessments) described in Appendix D, to communicate/explain the resource value of GRSG habitat, including fire prevention messages and actions to reduce human-caused ignitions.
- 8.4. WFP-4: Continue to participate with the Wildland Fire Leadership Council, a cooperative, interagency organization dedicated to achieving consistent implementation of the goals, actions, and policies in the National Fire Plan and the Federal Wildland Fire Management Policy.
- 8.5. WFP-5: Continue annual coordination meetings held between cooperating agencies that have fire suppression responsibilities. Incorporate Rangeland Fire Protection Associations and other stakeholders into this coordination. Discuss priority suppression areas and distribute maps showing priority suppression areas at both the Conservation Area and the local office levels as based on the adaptive management strategy and FIAT Assessments.
- 8.6. WFP-6: Ensure firefighter personnel receive annual orientation regarding GRSG habitat and sagebrush management issues as related to wildfire suppression.
- 8.7. WFP-7: As part of the FIAT Assessments, identify roads, trails, and recreational use areas with high frequency of human caused fires within or adjacent to the Priority or Important Habitat Management Areas. Consider these areas during annual fire restriction evaluations, and as appropriate, through site specific management.
- 8.8. WFP-8: Coordinate with Federal, State and local jurisdictions on fire and litter prevention programs to reduce human caused ignitions.
- 8.9. WFP-9: Implement activities identified within the FIAT Assessments.

## **9. Wildfire Suppression**

- 9.1.** WFS-1: Complete Wildland Fire and Invasive Species Assessments (FIAT Assessments) as described within Appendix D and incorporate results into appropriate Fire Management Plans as they are completed. FIAT Assessments are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of priority areas/treatment opportunities for fuels management, fire management, and restoration. These FIAT Assessments identify priority areas and describe strategies for fuels management, suppression and restoration activities.
- 9.2.** WFS-2: As part of the FIAT Assessments incorporate a wildfire response time analysis focusing on response time to identified priority areas within Priority and Important Habitat Management Areas or on those fires that have the potential to impact Priority and Important Habitat Management Areas. Incorporate findings into Unit Initial Attack program
- 9.3.** WFS-3: As part of the FIAT Assessment incorporate a water capacity analysis for suppression purposes, including potential private water sources. Provide water availability to respond to fire in or threatening PHMA and IHMA during initial attack.
- 9.4.** WFS-4: During high fire danger conditions, stage initial attack and secure additional resources closer to priority areas identified in the FIAT Assessments, based on anticipated fires and weather conditions, with particular consideration of the West Owyhee, Southern and Desert Conservation Areas to ensure quicker response times in or near GRSG habitat after considerations and placement of resources to protect human life and property.
- 9.5.** WFS-5: Utilize a full range of fire management strategies and tactics through strategic wildfire suppression planning consistent with appropriate management response and within acceptable risk levels, to achieve resource objectives for GRSG habitat consistent with land use plan direction. Utilizing both direct and indirect attack as appropriate to limit the overall amount of GRSG habitat burned. This could include suppressing fires in intact sagebrush habitats; limiting fire growth in General Habitat Management Areas when suppression resources are available or managing wildfire for resource benefit in areas of conifer (juniper) encroachment.
- 9.6.** WFS-6: Suppression priorities: Firefighter and public safety followed by property are the highest priority for protection during suppression activities. Maintaining GRSG habitat will be prioritized immediately after human life and property, commensurate with threatened and endangered species habitat or other critical habitats to be protected.
- 9.7.** WFS-7: Ensure close coordination with federal and state firefighters including the Rangeland Fire Protection Associations during suppression activities.

## **10. Fuels Management**

- 10.1.** FM-1: Design and implement fuels treatments that would reduce the potential start and spread of unwanted wildfires and provide anchor points or control lines for the containment of wildfires during suppression activities with an emphasis on maintaining, protecting, and expanding sagebrush ecosystems and successfully rehabilitated areas and strategically and effectively reduce wildfire threats in the greatest area.
- 10.2.** FM-2: Enhance (or maintain/retain) sagebrush canopy cover and community structure to match expected potential for the ecological site and consistent with GRSG habitat objectives unless fuels management objectives requires additional reduction in sagebrush cover to meet strategic protection of GRSG habitat. Closely evaluate the benefits of the fuel management treatments against the additional loss of sagebrush cover on the local landscape in the NEPA process.
- 10.3.** FM-3: Apply appropriate seasonal restrictions for implementing vegetation and fuels management treatments according to the type of seasonal habitats present. Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality. Ensure chemical applications are utilized where they would assist in success of fuels treatments. Strategically place treatments on a landscape scale to prevent fire from spreading into Priority Habitat Management Areas or WUI.
- 10.4.** FM-4: Develop a fuels continuity and management strategy to expand, enhance, maintain and protect GRSG habitat informed by the FIAT Assessments completed as described in Appendix D.
- 10.5.** FM-5: When developing the fuels management strategy as part of the FIAT Assessment described in Appendix D consider up-to-date fuels profiles; land use plan direction; current and potential habitat fragmentation; sagebrush and GRSG ecological factors; active vegetation management steps to provide critical breaks in fuel continuity where appropriate; incorporate a comparative risk analysis with regard to the risk of increased habitat fragmentation from a proposed action versus the risk of large scale fragmentation posed by wildfires if the action is not taken.
- 10.6.** FM-6: Fuel treatments will be designed through an interdisciplinary process to expand, enhance, maintain, and protect GRSG habitat which considers a full range of cost effective fuel reduction techniques, including: chemical, biological (including grazing and targeted grazing), mechanical and prescribed fire treatments.
- 10.7.** FM-7: Existing and proposed linear ROWs could be considered for use and maintenance as vegetated fuel breaks in appropriate areas (this activity may or may not be part of the ROW permit or the responsibility of the permit holder, in cases where this activity is considered part of mitigation for project design then it would be appropriately included as part of the ROW permit and the responsibility of the permit holder for development and maintenance).
- 10.8.** FM-8: Fuel breaks would incorporate existing vegetation treatments (seedings) or be located adjacent to existing linear disturbance areas where appropriate. Fuel breaks should be placed in areas with the greatest likelihood of compartmentalizing a fire and/or to foster suppression options to protect existing intact habitat.
- 10.9.** FM-9: Strategically pre-treat areas to reduce fine fuels consistent with areas and results identified within the Wildfire and Invasive Species Assessments..

- 10.10.** FM-10: Protect seeding efforts from subsequent fire events.
- 10.11.** FM-11: Targeted grazing as a fuels treatment to adjust the vegetation conditions to reduce the potential start and spread of unwanted wildfires may be implemented within existing grazing authorizations if feasible such as through temporary non-renewable authorizations, or through contracts, agreements or other appropriate means separate from existing grazing authorizations and permits.
- 10.12.** FM-12: Targeted grazing to achieve fuels management objectives should conform to the following criteria:
- Targeted grazing should be implemented strategically on the landscape, and directly involve the minimum footprint and grazing intensity required to meet fuels management objectives.
  - Allow conformance to the applicable Standards for Rangeland Health and Guidelines for Livestock Grazing Management (Idaho or Montana) at the assessment scale.
  - Where feasible and applicable coordinate with the grazing permittee to strategically reduce fuels through livestock management within the Mandatory Terms and Conditions of the applicable grazing authorizations
- 10.13.** FM-13: Prioritize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low or non-economical, nonnative seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime. When reseeding, use fire resistant native and nonnative species, as appropriate, to provide for fuel breaks.
- 10.14.** FM-14: Maintain effectiveness of fuels projects, including fuel breaks, to ensure long-term success, including persistence of seeded species and/or other treatment components while maintaining the integrity of adjacent vegetation.

**11. Wildfire Restoration/Rehabilitation – Emergency Stabilization and Rehabilitation**

- 11.1.** ESR-1: Utilize the findings and Restoration/Rehabilitation Strategy developed as part of the FIAT Assessment process described in Appendix D to determine if GRSG rehabilitation actions are needed, based on ecological potential, and direct emergency stabilization and rehabilitation (ESR) (BLM) or Burned Area Emergency Restoration (BAER) (FS) actions after fire.
- 11.2.** ESR-2: Incorporate GRSG Habitat Management Objectives into ESR/BAER plans based on site potential and in accordance with the Restoration/Rehabilitation Strategy developed as a result of the FIAT Assessments.
- 11.3.** ESR-3: Provide adequate rest from livestock grazing to allow natural recovery of existing vegetation and successful establishment of seeded species. New seedings should not be grazed until at least the end of the second growing season, and longer as needed to allow plants to mature and develop robust root systems which will stabilize the site, compete effectively against cheatgrass and other invasive annuals, and remain sustainable under long-term grazing management. Adjust other management activities, as appropriate, to meet ES&R objectives.
- 11.4.** ESR-4: Adjust, as appropriate, livestock management on adjacent unburned areas to mitigate the effect of the burn on local GRSG populations.

## 12. Habitat Restoration and Vegetation Management

- 12.1. VEG-1: Implement habitat rehabilitation or restoration projects in areas that have potential to improve GRSG habitat using a full array of treatment activities as appropriate, including chemical, mechanical and seeding treatments.
- 12.2. VEG-2: Implement vegetation rehabilitation or manipulation projects to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat based on FIAT Assessments, HAF assessments, other vegetative assessment data and local, site specific factors that indicate sagebrush canopy cover or herbaceous conditions do not meet habitat management objectives (i.e. is minimal or exceeds optimal characteristics). This may necessitate the use of prescribed fire as a site preparation technique to remove annual grass residual growth prior to the use of herbicides in the restoration of certain lower elevation sites (e.g., Wyoming big sagebrush) but such efforts will be carefully planned and coordinated to minimize impacts to sage-grouse seasonal habitats.
- 12.3. VEG-3: Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success (Richards et al. 1998). Non-native seeds may be used as long as they support GRSG habitat objectives (Pyke 2011) to increase probability of success, when adapted seed availability is low or to compete with invasive species especially on harsher sites.
- 12.4. VEG-4: Implement management changes in restoration and rehabilitation areas, as necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat and to ensure long-term persistence of improved GRSG habitat (Eiswerth and Shonkwiler 2006). Management changes could be considered during livestock grazing permit renewals, travel management planning, and renewal or reauthorization of rights-of-way.
- 12.5. VEG-5: Consider establishing seed harvest areas that are managed for seed production (Armstrong 2007) to provide a reliable source of locally adapted seed to use during rehabilitation and restoration activities.
- 12.6. VEG-6: Allocate use of native seed to GRSG or ESA listed species habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from ESR (BLM) and/or BAER (Forest Service) projects outside of Priority or Important Habitat Management Areas to those inside it. Where probability of success or native seed availability is low, nonnative seeds may be used as long as they meet GRSG habitat conservation objectives (Pyke 2011). Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the highest priority for rehabilitation efforts.
- 12.7. VEG-7: During land health assessments evaluate the compatibility of existing nonnative seedings for GRSG habitat to keep as a component of a grazing system, development of a forage reserve, or to be used as a fuelbreak (Davies et al. 2011) or during restoration development. If nonnative seedings do not contribute to a grazing system, are not suitable for a forage reserve, and are not suitable fuelbreaks, evaluate the nonnative seedings in and adjacent to PHMA to determine if they should be diversified with or converted to native grasses, forbs, and shrubs, including sagebrush.
- 12.8. VEG-8: Utilize conifer (juniper) removal treatments to reduce the extent of conifer encroachment areas in sagebrush habitats. Prioritize treatments closest to occupied

sage-grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and tools like VDTT and FIAT assessments to help refine the location for specific priority areas to be treated. Refrain from using prescribed fire and conducting removal projects in old-growth juniper stands. Old-growth juniper trees are characterized by rounded tops and spreading canopies, often containing dead limbs and/or spike tops, large branches near the base of the tree, as well as furrowed, fibrous bark, and are typically host to arboreal lichens. Leader growth in the upper quarter of the tree is usually less than one inch. These trees are generally distributed on rock outcrop or rubble land soils, or other soils with coarse fragments in the soil-surface and/or slopes over 12-25%, where juniper vegetation type is the climax plant community (IDFG 2000; Miller et al 2005; USDI and USGS 2007).

- 12.9.** VEG-9: Avoid using prescribed fire in Greater Sage-Grouse habitat unless evaluation of site-specific conditions demonstrate that there would be a net benefit for sage-grouse. If prescribed fire is used in Greater Sage-Grouse habitat, include an analysis in the NEPA document that indicates how Greater Sage-Grouse goals and objectives will be addressed and met by its use, why alternative techniques were not selected, and a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized.
- If prescribed fire is to be used at the implementation level, at a minimum, the burn plan will indicate how land use plan objectives would be addressed and met and why alternative techniques were not selected.
  - Avoid prescribed fire as a vegetation or fuels treatment in Wyoming big sagebrush or other xeric sagebrush species, or in areas with a potential for post-fire exotic annual dominance. However, after other treatment opportunities have been explored and as site-specific variables allow, prescribed fire could be used in these areas to meet specific fuels objectives that would maintain, improve, or restore Greater Sage-Grouse habitat (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities).
  - Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality.

**13. Invasive Species**

- 13.1. Invasive Species (INV)-1: Incorporate results of the FIAT Assessments into projects and activities addressing invasive species.
- 13.2. INV-2: Implement noxious weed and invasive species control using integrated vegetation management actions per national guidance and local weed management plans for Cooperative Weed Management Areas in cooperation with State and Federal agencies, affected counties, and adjoining private lands owners.
- 13.3. INV-3: Conduct integrated weed management actions for noxious and invasive weed populations that are impacting or threatening GRSG habitat quality using a variety of eradication and control techniques including chemical, mechanical and other appropriate means.
- 13.4. INV-4: Require project proponent (projects described in Table X and which are included in the anthropogenic disturbance cap evaluation) to ensure that noxious weeds and invasive species caused as a result of the project are treated to eliminate establishment on the disturbed project construction areas for at least 3 years.

DRAFT

**14. Lands and Realty / Infrastructure**

- 14.1. Lands and Realty (LR)-1: Priority: Designate and manage Priority Habitat Management Areas as ROW avoidance areas, consistent with AD-3 and subject to RDFs, buffers and seasonal timing restrictions (Appendix A, B & C). Important: Designate and manage Important Habitat Management Areas as ROW avoidance areas, consistent with AD-4 and subject to RDFs, buffers and seasonal timing restrictions. General: Designate and manage General Habitat Management Areas as open with proposals subject to RDFs, buffers and seasonal timing restrictions.
- 14.2. LR-2: Priority: Designate and manage Priority Habitat Management Areas as exclusion areas for utility scale (20 MW) Wind and Solar testing and development, nuclear and hydropower energy development. Important: Designate and manage Important Habitat Management Areas as avoidance areas for Wind and Solar testing and development, nuclear and hydropower development. General: Designate and manage General Habitat Management Areas as open for Wind and Solar testing and development and nuclear and hydropower development subject to RDFs, buffers and seasonal timing restrictions.
- 14.3. LR-3: Priority: Development of commercial service airports and facilities (as defined by FAA 2014 – publically owned airports that have at least 2,500 passenger boardings each calendar year and receive scheduled passenger service) would not be allowed within Priority Habitat Management Areas. Important and General Habitat Management Areas are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 14.4. LR-4: Priority: Development of new or expansion of existing landfills would not be allowed within Priority Habitat Management Areas. Important and General Habitat Management Areas are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 14.5. LR-5: Consistent with LR-2, LR-3 and LR-4, Rights-of-way for development of new or amended ROWs and land use authorizations in PHMA would only be considered when consistent with the Anthropogenic Disturbance Exception Criteria (AD-3); Rights-of-way for development of new or amended ROWs and land use authorizations in IHMA could be considered consistent with the Important Habitat Management Area Anthropogenic Disturbance Development Criteria. (AD-4). General: New ROW and land use authorizations could be considered.
- 14.6. LR-6: If the project is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade) - the existing transmission line must be removed and area rehabilitated within a specified amount of time after the new line is installed and energized.
- 14.7. LR-7: Existing designated corridors, including Section 368 Corridors, will remain Open (subject to the ongoing settlement agreement).
- 14.8. LR-8: Process unauthorized use. If the use is subsequently authorized, it would be authorized consistent with direction for the Management Areas within which it is located and the RDFs, buffers and seasonal timing restrictions. If the use is not subsequently authorized the site would be reclaimed by removing these features and rehabilitating the habitat.
- 14.9. LR-9: Land use authorizations that are temporary (less than 3 years) in nature would be subject to seasonal or timing restrictions and mitigation requirements regarding habitat loss as needed.

- 14.10.** LR-10: New ROW applications for water facilities (ditches, canals, pipelines), or amendments to existing water facilities which include additional structures to improve fish passage or benefits to fisheries (new diversions, fish screens) would be allowed on a case-by-case bases subject to RDFs to reduce impacts to GRSG habitat and mitigation requirements regarding GRSG habitat loss as needed.
- 14.11.** LR-11: When a ROW grant expires and is not requested to be renewed, is relinquished, or terminated, the lease holder would be required to reclaim the site by removing overhead lines and other infrastructure and to eliminate avian predator nesting opportunities provided by anthropogenic development on public lands associated with the now void ROW grant (e.g., remove powerline and communication facilities no longer in service).
- 14.12.** LR-12: Work with existing ROW holders to retrofit existing towers and structures consistent with RDFs described in Appendix A.
- 14.12.1.** LR-13: Lands within Priority, Important or General Habitat Management Areas for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands will provide a net conservation benefit to the Greater Sage-Grouse or (2) the agency can demonstrate that the disposal of the lands will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse. Land tenure adjustments would be subject to the following disposal, exchange, and acquisition criteria, which include retaining lands with GRSG habitat. Retention of areas with GRSG would reduce the likelihood of habitat conversion to agriculture, urbanization, or other uses that would remove sagebrush habitat and potentially impact sensitive plants. Criteria:
- a. Lands within Priority, Important and General Habitat Management Areas would not be available for disposal through sale (Appendix J).
  - b. Acquire habitat within Priority and Important Habitat Management Areas, when possible (i.e. willing landowner), and retain ownership of habitat within all Areas, except if a land exchange would allow for additional or more contiguous federal ownership patterns.
  - c. Lands within Priority, Important and General Habitat Management Areas would be retained unless exchange of those lands would increase the extent or provide for connectivity of Priority or Important Habitat Management Areas.
  - d. Evaluate potential land exchanges containing historically low-quality GRSG habitat that may be too costly to restore in exchange for lands of higher quality habitat, lands that connect seasonal GRSG habitats or lands providing for threatened and endangered species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of Priority Habitat Management Areas. Higher priority will be given to exchanges for those in-tact areas of sagebrush that will contribute to the expansion of sagebrush areas within Priority Habitat Management Areas currently in public ownership. Lower priority would be given to other lands that would promote enhancement in the Priority and Important Habitat Management Areas.
  - e. Identify lands for acquisition that increase the extent of or provide for connectivity of Priority Habitat Management Areas.

## 15. Minerals

### 15.1. Fluid Minerals

- 15.1.1.** Fluid Minerals (FLM)-1: Idaho: Areas within Priority Habitat Management Areas and Important Habitat Management Areas would be open to mineral leasing and development and geophysical exploration subject to no surface occupancy with a limited exception (FLM-3). General Habitat Management Areas would be open to mineral leasing and development and geophysical exploration subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations. Montana: Areas within Priority Habitat Management Areas would be open to leasing subject to no surface occupancy. No waivers, exceptions or modifications would be allowed unless approved by the State Director. General Habitat Management Areas would be open to leasing subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.
- 15.1.2.** FLM-2: FLM-7: Parcels nominated for lease in Priority or Important Habitat Management Areas would be evaluated prior to lease offering to determine if development is feasible when buffers and seasonal timing restrictions are applied. Parcels which do not meet the criteria would not be offered for lease.
- 15.1.3.** FLM-3: Priority and Important Habitat Management Areas: A lease waiver, exception or modification to the NSO stipulation may be considered where a portion of the proposed lease is determined to be in non-greater sage-grouse habitat, the area is not used by Greater sage-grouse, or it would not have direct, indirect or cumulative effects to Greater sage-grouse or its habitat. The determination would be made by a team of interagency Greater sage-grouse experts, including an expert from the state wildlife agency, USFWS and the BLM. Waivers, by regulation, require a 30-day public review (43 CFR ????.??). All exceptions must be approved by the State Director. In the event a waiver, exception or modification were allowed development would still be subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.

#### **Waivers, Exceptions and Modifications (WEMs)** (Source IM-2008-032)

A waiver is a permanent exemption from a lease stipulation, the stipulation would no longer apply anywhere within the lease. Waivers require a 30-day public review and are approved and signed by the State Director.

An exception is a one-time exemption for a particular site within the lease; exceptions are determined on a case-by-case basis; the stipulation continues to apply to all other sites within the lease. An exception is a limited type of waiver.

A modification is a change to the provisions of a lease stipulation, either temporarily or for the term of the lease. Depending on the specific modification, the stipulation may or may not apply to all sites within the lease to which the restrictive criteria are applied.

- 15.1.4.** FLM-4: Incorporate required design features and best management practices appropriate to the management area as conditions of approval when post leasing activity is proposed into any post-lease authorizations.
- 15.1.5.** FLM-5: Complete a Master Development Plan on leases where a producing field is proposed to be developed.

- 15.1.6.** FLM-6: Encourage unitization when deemed necessary for proper development and operation of an area (with strong oversight and monitoring). The unitization must be designed in a manner to minimize adverse impacts on GRSG according to the Federal Lease Form, 3100-11, Sections 4 and 6.
- 15.1.7.** FLM-7: Issue Written Orders of the Authorized Officer (43 CFR 3161.2) requiring reasonable protective measures consistent with the lease terms where necessary to avoid or minimize effects to GRSG populations or habitat.
- 15.2. Locatable Minerals**
- 15.2.1.** Locatable Minerals (LOC)-1: Lands would remain open to locatable mineral entry in all management areas.
- 15.2.2.** LOC-2: Apply reasonable and appropriate required design features and best management practices as Conditions of Approval to prevent unnecessary or undue degradation of GRSG habitat when a Plan of Operations is submitted for BLM or FS approval, in accordance with 43 CFR 3809.411(d)(2) (or 36 CFR 228.5(a)(3) on National Forest System lands).
- 15.3. Salable Minerals**
- 15.3.1.** Salable Minerals (SAL)-1: Priority: No new site authorizations would be approved. Important: New site authorizations could be considered provided the Anthropogenic Disturbance Development Criteria (AD-4) can be met, and subject to RDFs, buffers and seasonal timing restrictions. Sales from existing community pits within PHMA and IHMA would be subject to seasonal timing restrictions. General: Open to new site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing sites Open to new sales subject to seasonal timing restrictions.
- 15.3.2.** SAL-2: Restore salable mineral pits no longer in use to meet GRSG habitat management objectives.
- 15.3.3.** SAL-3: Require reclamation bonding that would require restoration of GRSG habitat on new site authorizations for mineral material pits in IHMA (this would not apply to free use permits issued to a government entity such as a county road district, but would apply to non-profit entities).
- 15.4. Non-Energy Solid Mineral Leasable Minerals**
- 15.4.1.** Non Energy Leasables (NEL)-1: Priority, Important and General Habitat Management Areas: Areas within Know Phosphate Leasing Areas (KPLAs) will remain open to leasing subject to standard stipulations. PHMA areas outside KPLAs are closed to leasing and prospecting. IHMA areas outside of KPLAs are open to prospecting and subsequent leasing provided the Anthropogenic Disturbance Development Criteria (AD-4) and the anthropogenic disturbance cap (AD-1) can be met. RDFs, buffers and seasonal timing restrictions shall be applied to prospecting permits. Exceptions to closures in PHMA and IHMA may be made for lease modifications and fringe leases where valid existing rights may be affected. General Habitat Management Areas: Lands outside KPLAs are available for prospecting and subsequent leasing and initial mine development subject to RDFs, buffers, timing restrictions (seasonal and daily) and standard stipulations.
- 15.4.2.** NEL-2: Require seasonal and daily timing restrictions in undeveloped non-energy mineral leases when exploration activities or initial mine development is proposed (e.g. exploration drilling, timber removal, shrub clearing, etc.) as conditions of approval.
- 15.4.3.** NEL-3: Include RDFs as conditions of approval to mine plans in undeveloped non-energy mineral leases for exploration activities or initial mine development.

**15.5. Mineral Split Estate**

**15.5.1. Mineral Split Estate (MSE)-1: BLM Owns Mineral Estate – non-federal surface owner:** In coordination with surface owner, apply stipulations, conservation measures, and design features consistent with those applied to BLM- and Forest Service-administered lands in the management area.

**15.5.2. MSE-2: BLM owns surface – non-federal mineral estate owner:** Recommend to the state regulatory entity and mineral estate owner that timing restrictions, COAs, and buffer restriction be applied around occupied leks, when concurring to the approval of authorizations for mineral-related surface disturbance on lands with GRSG habitat.

DRAFT

## **16. Range Management/Livestock Grazing**

- 16.1.** Range Management (RM)-1: Maintain existing areas designated as available or unavailable for livestock grazing. Existing active AUMs for livestock grazing within the planning area would not be changed at the broad scale, though the number of AUMs available on an allotment may be adjusted based on site-specific conditions to meet management objectives during term permit renewals, AMP development, or other appropriate implementation planning. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, and season of use in accordance with applicable regulations.
- 16.2.** RM-2: Prioritize BLM land health assessments and processing of BLM grazing permits consistent with management area prioritization (MA-4), unless other higher priority considerations exist such as threatened, endangered and proposed species habitat that livestock grazing could affect. Where possible, conduct land health assessments at the watershed, or other meaningful landscape-scale.
- 16.3.** RM-3: Where opportunities exist, coordinate with other land managers to encourage livestock operations that utilize mixed federal, private and/or state land to be managed at the landscape scale to benefit GRSG and their habitat across land ownerships.
- 16.4.** RM-4: PHMA & IHMA: During the land health assessment process, identify the type(s) of seasonal habitat the assessed areas are capable of supporting. Utilize the habitat assessment framework, (Stiver et al. 2014 as amended/replaced) or other BLM or Forest Service approved methodology, in accordance with current policy and guidance to determine whether vegetation structure, condition and composition are meeting GRSG habitat objectives including riparian and lentic areas (HM-OBJ-2; Table 2). Use appropriate Ecological Site Descriptions, reference sheets and state and transition models to inform desired habitat conditions and expected responses to management changes for the land unit being assessed.
- 16.5.** RM-5: When modifying grazing management, analyze indirect effects to habitat, including changes in fuel loading and wildfire behavior.
- 16.6.** RM-6: When livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives following consultation, cooperating and coordination with permittees and interested publics, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential modifications include, but are not limited to, changes in:
- 1) Season or timing of use;
  - 2) Numbers of livestock;
  - 3) Distribution of livestock use;
  - 4) Duration and/or level of use;
  - 5) Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011);
  - 6) Voluntary measures such as temporary non-use; and
  - 7) Grazing schedules (including rest or deferment).
- 16.7.** RM-7: Where opportunities exist, establish forage reserves to facilitate restoration and rehabilitation efforts in sage-grouse habitat areas.
- 16.8.** RM-8: PHMA & IHMA - When an allotment becomes vacant or grazing preference is relinquished, consider voluntary retirement of the allotment or grazing preference in whole or in part, or converting the area to a forage reserve/buffer when doing so

would maintain or enhance sage-grouse habitat. GHMA - When an allotment becomes vacant or grazing preference is relinquished, consider converting it to a forage reserve/buffer to use during fire rehabilitation or restoration efforts elsewhere, when such actions would result in a net benefit to GRSG habitat and other priority resources.

- 16.9.** RM-9: PHMA & IHMA - Where practical, design pasture rotations to utilize non-native perennial grass seedings and/or annual grasslands, during GRSG nesting season annually or periodically.
- 16.10.** RM-10: Evaluate the locations where salt/supplements are placed. In coordination with the permittee, have salt/supplements placed in areas which would reduce impacts to GRSG habitat (e.g., existing disturbed areas).
- 16.11.** RM-11: Incorporate RDFs into Terms and Conditions for crossing permits to limit disturbance of occupied leks when trailing livestock across BLM- and Forest Service-administered lands in the spring. Work with permittees in locating over-nighting, watering and bedding locations to minimize impacts to seasonal habitats.
- 16.12.** RM-12: Design any new structural range improvements, following cooperation, consultation and coordination with permittees, to minimize and/or mitigate effects to GRSG habitat. Any new structural range improvements are subject to RDFs (Appendix A). Structural range improvement in this context, include, but are not limited to: fences, exclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments.
- 16.13.** RM-13: During the land health assessment and grazing permit renewal process, evaluate existing livestock management range improvements with respect to their effect on GRSG habitat. Consider removal of projects that are not needed for effective livestock management, are no longer in working condition, and/or negatively affect GRSG habitat, with the exception of functional projects needed for management of habitat for other threatened, endangered or proposed species or other sensitive resources.
- 16.14.** RM-14: Prioritize removal, modification or marking of fences or other structures in areas of high collision risk following cooperation, consultation and coordination with permittees to reduce the incidence of GRSG mortality due to fence strikes (Stevens et al. 2012).

**17. Wild Horses and Burros**

- 17.1. Wild Horse and Burro (WHB)-1: Develop or amend BLM Herd Management Area Plans to incorporate GRSG habitat objectives and management considerations for all BLM HMAs) and Forest Service Wild Horse Territories.
- 17.2. WHB-2: When evaluating AML on HMAs within PHMA and IHMA, evaluate indicators that address structure/condition/composition of vegetation and measurements specific to achieving GRSG habitat objectives.
- 17.3. WHB-3: Utilize interdisciplinary land health assessments in HMAs containing GRSG habitat to determine whether vegetation characteristics are meeting appropriate seasonal habitat objectives.
- 17.4. WHB-4: PHMA: Do not expand HMAs. IHMA: Analysis of proposed additions to existing HMA boundaries should consider the direct, indirect and cumulative impacts on GRSG habitat, including the need for additional infrastructure such as boundary fencing, and consider alternative areas outside of PHMA and IHMA.
- 17.5. WHB-5: Prioritize gathers and population growth suppression techniques in HMAs within Priority and Important Habitat Management Areas, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Additional prioritization would be given for HMAs that are near AML or where a reduction would serve the most beneficial purpose.

## 18. Travel Management

- 18.1. Travel Management (TM) -1: Limit off-highway vehicle motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails in areas where travel management planning has not been completed or is in progress. This excludes areas previously designated as open through a land use plan decision or currently under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices. Upon completion of travel management plans the designation would change to limited to designated roads, primitive roads and trails.

An off-highway vehicle is any motorized vehicle capable of, or designed for, travel on or immediately over land, water, or other natural terrain, excluding: (1) Any nonamphibious registered motorboat; (2) any military, fire, emergency, or law enforcement vehicle while being used for emergency purposes; (3) any vehicle whose use is expressly authorized by the authorized officer, or otherwise officially approved; (4) Vehicles in official use where official use is use by an employee, agent, or designated representative of the Federal Government or one of its contractors, in the course of his employment, agency, or representation.; and (5) any combat or combat support vehicle when used in times of national defense emergencies (43 CFR 8340.0 5).

- 18.2. TM-2: Temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use).

Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.

- 18.3. TM-3: Develop Travel Management Plans for each Field Office as described in the BLM Travel Management Handbook 8342.1 and according to the travel management planning guidelines (Appendix K).

- 18.4. TM-4: During subsequent travel management planning design and designate a travel system to minimize adverse effects on GRSG. Locate areas and trails to minimize harassment of wildlife or significant disruption of wildlife habitats. Give special attention to protect endangered or threatened species and their habitats. Allow for route upgrade, closure of existing routes, and creation of new routes to help protect habitat and meet user group needs, thereby reducing the potential for pioneering

unauthorized routes. The emphasis of the comprehensive travel and transportation planning within Priority Habitat Management Areas would be placed on having a neutral or positive effect on GRSG habitat. Individual route designations would occur during subsequent travel management planning efforts.

- 18.5.** TM-5: Conduct road maintenance activities to avoid disturbance during specific times at different seasons – see seasonal and timing restrictions section.

DRAFT

**19. Recreation**

- 19.1. REC-1: Manage existing recreation uses and sites to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, buffers and seasonal restrictions.
- 19.2. REC-2: Do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) within PHMAs and IHMAs unless the development would have a neutral effect or be beneficial to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.); or the new construction replaces existing facilities and reduces impacts from the existing facilities as in TM-4, or unless the development is required for visitor safety or resource protection.

DRAFT

**20. Monitoring**

- 20.1.** Monitoring (MON)-1: Annually complete a review of FIAT Assessment implementation efforts within GRSG habitat with appropriate USFWS and state agency personnel.
- 20.2.** MON-2: Annually monitor the effectiveness of fuels treatment projects.
- 20.3.** MON-3: Monitor invasive vegetation post vegetation management treatment
- 20.4.** MON-4: Monitor project construction areas for noxious weed and invasive species for at least 3 years, unless control is achieved earlier.
- 20.5.** MON-5: Use lek, nesting and winter habitat maps and key habitat map (updates) to annually assess GRSG population and habitat status in the context of the adaptive management triggers.
- 20.6.** MON-6: Continue to support updates to the Key Habitat map to track vegetation changes in relation to GRSG habitat on a yearly basis, until such a time this process is replaced. The process used to update the Key Habitat Map is described in Appendix F.
- 20.7.** MON-7: Monitor GRSG habitat as described in the monitoring framework plan (Appendix E) in coordination with IDFG and MT FWP.

**Appendix H – Montana Anthropogenic Disturbance Process**

**Appendix I – Mitigation**

**Appendix J – Lands No Longer Available for Disposal**

**Appendix K – Travel Management Planning Guidelines**

**Appendix L – Functioning of Boards**

**DRAFT**

## Appendix A – Required Design Features

The following required design features (RDFs) are included for consideration and use based upon review of current science and effects analysis (circa 2014) (Table A-1). These may be reviewed during project evaluation and updated through plan maintenance as new information and updated scientific findings become available.

The table is organized by program area grouping the RDFs most relevant to that program. All relevant RDFs, regardless of which program they are grouped under, should be considered during project evaluation and applicable RDFs should be applied during implementation, with the exception that they would be implemented as best management practices for locatable minerals activities, to the extent allowable by law. The table identifies the specific measure (numbered) and its appropriate application – as an RDF – required all the time everywhere; or as an RDF required when the applicable resources are present. In some cases the RDFs may not all be appropriate based on local conditions and would be assessed in the appropriate site specific NEPA analysis, these all should be considered and where determined to be beneficial to achieving GRSG habitat objectives included as part of the site specific project. In other cases additional project design criteria or best management practices could be incorporated into project implementation to address site specific concerns not fully addressed by the RDFs described here.

**Table A-1. Required Design Features**

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
<b>General</b>		
1. Solicit and consider expertise and ideas from local landowners, working groups, and other federal, state, county, and private organizations during development of projects.		X
<b>Wildfire Suppression</b>		
2. Compile district-level information into state-wide sage-grouse tool boxes. Tool boxes will contain maps, listing of resource advisors, contact information, local guidance, and other relevant information for each district, which will be aggregated into a state-wide document.	X	
3. Provide localized maps to dispatch offices and extended attack incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics. The Fire Planning and Fuels Management Division (FA-600) hosts a webpage containing up-to-date maps, instruction memoranda, conservation measures, BMPs, and spatial data specific to fire operations and fuels management/sage-grouse interactions. These resources can be accessed at: <a href="http://web.blm.gov/internal/fire/fpfm/sg/index.html">http://web.blm.gov/internal/fire/fpfm/sg/index.html</a> . Additional BLM sage-grouse information can be found at: <a href="http://www.blm.gov/wo/st/en/prog/more/fish_wildlife_and/sage-grouse-conservation.html">http://www.blm.gov/wo/st/en/prog/more/fish_wildlife_and/sage-grouse-conservation.html</a> .	X	
4. Assign a resource advisor with sage-grouse expertise, or who has access to sage-grouse expertise, to all extended attack fires in or near sage-grouse habitat areas. Prior to the fire season, provide	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
training to sage-grouse resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals. Involve state wildlife agency expertise in fire operations through: <ul style="list-style-type: none"> <li>• instructing resource advisors during preseason trainings;</li> <li>• qualification as resource advisors;</li> <li>• coordination with resource advisors during fire incidents;</li> <li>• contributing to incident planning with information such as habitat features or other key data useful in fire decision making</li> </ul>		
5. At the onset of an emerging wildland fire the Agency Administrators and Fire Management Officers will engage a local Resource Advisor to assess sage-grouse habitat that may be affected by the fire or suppression activities.	X	
6. If complexity of the wildland fire warrants the activation of an Incident Management Team, locally refined information regarding important sage-grouse habitat will be relayed during in brief and continually throughout the incident.		X
7. On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas.		X
8. As appropriate, utilize existing fuel breaks, such as roads or discrete changes in fuel type, as control lines in order to minimize fire spread.		X
9. During periods of multiple fires, ensure line officers are involved in setting priorities.	X	
10. To the extent possible, locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas, heli-bases, etc.) in areas where physical disturbance to sage-grouse habitat can be minimized. These include disturbed areas, grasslands, near roads/trails or in other areas where there is existing disturbance or minimal sagebrush cover.	X	
11. Power-wash all firefighting vehicles, to the extent possible, including engines, water tenders, personnel vehicles, and all-terrain vehicles (ATV) prior to deploying in or near sage-grouse habitat areas to minimize noxious weed spread.	X	
12. Minimize cross-country vehicle travel during fire operations in sage-grouse habitat.	X	
13. Minimize burnout operations in key sage-grouse habitat areas by constructing direct fireline whenever safe and practical to do so.	X	
14. Utilize retardant, mechanized equipment, and other available resources to minimize burned acreage during initial attack.	X	
15. As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.		X
16. Adequately document fire operation activities in sage-grouse habitat for potential follow-up coordination activities.	X	
<b>Fuels Management</b> Unless otherwise specified as part of the land use plan consider the full array of fuels management		

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
treatment types (prescribed fire, mechanical, chemical and biological) when implementing the following RDFs.		
17. Where applicable, design fuels treatment objectives to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit sage-grouse habitat.	X	
18. Provide training to fuels treatment personnel on sage-grouse biology, habitat requirements, and identification of areas utilized locally.	X	
19. Use burning prescriptions which minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of annual grass invasion).	X	
20. Ensure proposed sagebrush treatments are planned with full interdisciplinary input pursuant to NEPA and coordination with state fish and wildlife agencies, and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.	X	
21. Where appropriate, ensure that treatments are configured in a manner that promotes use by sage-grouse.	X	
22. Where applicable, incorporate roads and natural fuel breaks into fuel break design.		X
23. Power-wash all vehicles and equipment involved in fuels management activities, prior to entering the area, to minimize the introduction of undesirable and/or invasive plant species.	X	
24. Design vegetation treatments in areas of high fire frequency which facilitate firefighter safety, reduce the potential acres burned, and reduce the fire risk to sage-grouse habitat. Additionally, develop maps for sage-grouse habitat which spatially display existing fuels treatments that can be used to assist suppression activities.	X	
25. Give priority for implementing specific sage-grouse habitat restoration projects in annual grasslands, first to sites which are adjacent to or surrounded by Priority Habitat Management Areas or that reestablish continuity between Priority Habitat Management Areas. Annual grasslands are a second priority for restoration when the sites are not adjacent to Priority Habitat Management Areas, but within Important Habitat Management Areas. The third priority for annual grassland habitat restoration projects are sites within General Habitat Management Areas. The intent is to focus restoration outward from existing, intact habitat.	X	
26. As funding and logistics permit, restore annual grasslands to a species composition characterized by perennial grasses, forbs, and shrubs or one of that referenced in land use planning documentation.	X	
27. Emphasize the use of native plant species, especially those from a warmer area of the species' current range, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.	X	
28. Remove standing and encroaching trees within at least 110 yards of occupied sage-grouse leks and other habitats (e.g., nesting,		X

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
wintering and brood rearing) to reduce the availability of perch sites for avian predators, as resources permit.		
29. Protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas.		X
30. Reduce the risk of vehicle- or human-caused wildfires and the spread of invasive species by installing fuel breaks and/or planting perennial vegetation (e.g., green-strips) paralleling road rights-of-way.		X
31. Strategically place and maintain pre-treated strips/areas (e.g., mowing, herbicide application, etc.) to aid in controlling wildfire, should wildfire occur near PHMA or priority restoration areas (such as where investments in restoration have already been made).	X	
32. Design treatments to provide a break in fuel continuity in large, at-risk, expanses of continuous sagebrush. Use local knowledge of fire occurrence, spread patterns, and habitat values at risk to determine the proper placement and size of the fuel break.	X	
33. Use existing agreements with local, county, and state road departments to improve and maintain existing fuel breaks during routine road maintenance. Examples include: blading, mowing, disking, grading, and spraying roadside vegetation.		X
34. Form partnerships with linear right-of-way holders to maintain fuel breaks, which reduce fuel continuity and serve to protect at-risk landscapes.		X
35. Use existing NEPA documentation and authorities, where possible, when conducting road right-of-way maintenance. In many instances, existing authorizations for roads or linear rights-of-way contain provisions for maintenance activities that could be implemented and incorporated into a vegetation and habitat protection strategy without requiring additional NEPA analysis. Document this with a Determination of NEPA Adequacy (DNA).		X
36. Enter into agreements with road departments which may help fund the construction and maintenance of fuel breaks adjacent to roads, as funding permits.		X
37. Spatially depict the locations of existing and planned fuel breaks in a landscape fuel break map and label each vegetation polygon for reference. Offices will make these maps available to suppression resources for use in fire operations.	X	
<b>Vegetation Treatment</b>		
38. Utilize available plant species based on their adaptation to the site when developing seed mixes. (Lambert 2005; VegSpec).	X	
39. Utilizing the warmer component of a species' current range when selecting native species for restoration when available (Kramer and Havens 2009).		X
40. Reduce annual grass densities and competition through herbicide, targeted grazing, tillage, prescribed fire, etc. (Pyke 2011).		X
41. Reduce density and competition of introduced perennial grasses using appropriate techniques to accomplish this reduction (Pellant and Lysne 2005).		X

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
42. Utilize techniques to introduce desired species to the site such as drill seeding, broadcast seeding followed by a seed coverage technique, such as harrowing, chaining or livestock trampling, and transplanting container or bare-root seedlings.		X
43. Assess existing on-site vegetation to ascertain if enough desirable perennial vegetation exists to consider techniques to increase on-site seed production to facilitate an increase in density of desired species.		X
44. Use site preparation techniques that retain existing desirable vegetation.	X	
45. Use "mother plant" techniques or planting of satellite populations of desirable plants to serve as seed sources.		X
46. Utilize post-treatment control of annual grass and other invasive species.	X	
47. Utilize new tools and use of new science and research as it becomes available.	X	
<p>48. Give higher priority to vegetation rehabilitation or manipulation projects that include:</p> <ul style="list-style-type: none"> <li>• Sites where environmental variables contribute to improved chances for project success (Meinke et al. 2009).</li> <li>• Areas where seasonal habitat is limiting GRSG distribution and/or abundance (wintering areas, wet meadows and riparian areas, nesting areas, leks, etc.).</li> <li>• Re-establish sagebrush cover in otherwise suitable GRSG with consideration to local needs and conditions using the general priorities in the following order: <ul style="list-style-type: none"> <li>• Recently burned native areas</li> <li>• Native grassland with suitable forb component</li> <li>• Nonnative grassland with suitable forb component</li> <li>• Recently converted annual grass areas</li> <li>• Native grassland</li> <li>• Nonnative grassland</li> </ul> </li> <li>• Where desirable perennial bunchgrasses and/or forbs are deficient in existing sagebrush stands, use appropriate mechanical, aerial or other techniques to re-establish them. Examples include but are not limited to, use of a Lawson aerator with seeding, harrow or chain with seeding, drill seeding, hand planting plugs, aerial seeding or other appropriate technique.</li> <li>• Cooperative efforts that may improve GRSG habitat quality over multiple ownerships.</li> <li>• Projects that may provide connectivity between suitable habitats or expand existing good quality habitats.</li> <li>• Projects that address conifer encroachment into important GRSG habitats. In general the priority for treatment is 1) Phase 1 (<math>\leq 10\%</math> conifer cover), 2) Phase 2 (10-30%), and 3) Phase 3 (<math>&gt; 30\%</math>).</li> </ul>	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
<ul style="list-style-type: none"> <li>Replacing stands of annual grasses within otherwise good quality habitats with desirable perennial species. Other factors that contribute to the importance of the restoration project in maintaining or improving GRSG habitat.</li> </ul>		
49. When conduction vegetation treatments in areas inhabited or potentially inhabited by slickspot peppergrass ( <i>Lepidium papilliferum</i> ) follow the conservation measures in the applicable conservation agreement (revised August 2014).		X
<b>Lands and Realty</b>		
50. Where technically and financially feasible, bury distribution powerlines and communication lines within existing disturbance.		X
51. Above-ground disturbance areas would be seeded with perennial vegetation as per vegetation management.	X	
52. Place infrastructure in already disturbed locations where the habitat has not been fully restored.		X
53. Cluster disturbances, operations (fracturing stimulation, liquids gathering, etc.) and facilities as close as possible.		X
54. Co-locate linear facilities within one mile of existing linear facilities.		X
55. Micro-site linear facilities to reduce impacts to sage-grouse habitats.	X	
56. Locate staging areas outside the Priority Habitat Management Areas to the extent possible.	X	
57. Consider collocating powerlines, flowlines and pipelines under or immediately adjacent to a road or adjacent to other pipelines first, before considering co-locating with other ROW.		X
58. Restrict the construction of tall facilities and fences to the minimum number and amount needed.	X	
59. Use free standing structures where possible, to limit the use of guy wires. Where guy wires are necessary and appropriate bird collision diverters would be used, if doing so would not cause a human safety risk.	X	
60. Place new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors.		X
61. Construction and development activities should conform to seasonal restrictions.	X	
<b>Fluid Mineral Leasing</b>		
62. Use directional drilling and/or multi well-pads to reduce surface disturbance.	X	
63. Apply a phased development approach with concurrent reclamation.	X	
64. Place liquid gathering facilities outside of PHMAs. Have no tanks at well locations within PHMAs to minimize truck traffic and perching and nesting sites for ravens and raptors.	X	
65. Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use (Lyon and Anderson 2003).		X
66. Site and/or minimize linear ROWs or SUAs to reduce disturbance to sagebrush habitats.	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
67. Design or site permanent structures which create movement (e.g. pump jack) to minimize impacts to GRSG.	X	
68. Equip tanks and other above-ground facilities with structures or devices that discourage nesting of raptors and corvids.		X
69. Control the spread and effects of non-native plant species (Gelbard and Belnap 2003, Bergquist et al. 2007, Evangelista et al. 2011). (E.g. by washing vehicles and equipment.)		X
70. Restrict pit and impoundment construction to reduce or eliminate threats from West Nile virus (Doherty 2007).		X
<p>71. Remove or re-inject produced water to reduce habitat for mosquitoes that vector West Nile virus. If surface disposal of produced water continues, use the following steps for reservoir design to limit favorable mosquito habitat:</p> <ul style="list-style-type: none"> <li>• Overbuild size of ponds for muddy and non-vegetated shorelines.</li> <li>• Build steep shorelines to decrease vegetation and increase wave actions.</li> <li>• Avoid flooding terrestrial vegetation in flat terrain or low lying areas.</li> <li>• Construct dams or impoundments that restrict down slope seepage or overflow.</li> <li>• Line the channel where discharge water flows into the pond with crushed rock.</li> <li>• Construct spillway with steep sides and line it with crushed rock.</li> <li>• Treat waters with larvicides to reduce mosquito production where water occurs on the surface</li> </ul>		X
72. In PHMA, limit noise from discretionary activities to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before to 2 hours after sunrise and sunset during breeding season.	X	
73. Require noise shields when drilling during the lek, nesting, brood-rearing, or wintering season.		X
74. The BLM/Forest Service would work with proponents to limit project related noise where it would be expected to reduce functionality of habitats in Priority and Important Habitat Management Areas.	X	
75. The BLM/Forest Service would evaluate the potential for limitation of new noise sources on a case-by-case basis as appropriate.	X	
76. Limit noise sources that would be expected to negatively impact populations in Priority and Important Habitat Management Areas and continue to support the establishment of ambient baseline noise levels for occupied leks in Priority Habitat Management Areas.	X	
77. As additional research and information emerges, specific new limitations appropriate to the type of projects being considered would be evaluated and appropriate limitations would be	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
implemented where necessary to minimize potential for noise impacts on sage-grouse core population behavioral cycles.		
78. As new research is completed, new specific limitations would be coordinated with the IDFG and MT FWP and partners.	X	
79. Fit transmission towers with anti-perch devices (Lammers and Collopy 2007).		X
80. Require sage-grouse-safe fences.		X
81. Locate new compressor stations outside Priority Habitat Management Areas and design them to reduce noise that may be directed towards Priority Habitat Management Areas.	X	
82. Clean up refuse (Bui et al. 2011).	X	
83. Locate man camps outside of priority sage-grouse habitats.	X	
84. Consider using oak (or other material) mats for drilling activities to reduce vegetation disturbance and for roads between closely spaced wells to reduce soil compaction and maintain soil structure to increase likelihood of vegetation reestablishment following drilling.		X
85. Use only closed-loop systems for drilling operations and no reserve pits.	X	
86. Cover (e.g., fine mesh netting or use other effective techniques) all drilling and production pits and tanks regardless of size to reduce sage-grouse mortality.	X	
<b>Roads</b>		
87. Utilize existing roads, or realignments of existing routes to the extent possible.	X	
88. Design roads to an appropriate standard no higher than necessary to accommodate their intended purpose.	X	
89. Do not issue ROWs or SUAs to counties on newly constructed energy or mineral development roads, unless for a temporary use consistent with all other terms and conditions included in this document.	X	
90. Establish speed limits on BLM and FS system roads to reduce vehicle/wildlife collisions or design roads to be driven at slower speeds.		X
91. Coordinate road construction and use among ROW or SUA holders.	X	
92. Construct road crossings at right angles to ephemeral drainages and stream crossings.		X
93. Use dust abatement on roads and pads.	X	
94. Close and reclaim duplicate roads by restoring original landform and establishing desired vegetation.		X
<b>Roads Specific to Priority and Important Habitat Management Areas</b>		
95. Locate roads to avoid priority areas and habitats as described in the Wildfire and Invasive Species Assessments.	X	
96. Establish trip restrictions (Lyon and Anderson 2003) or minimization through use of telemetry and remote well control (e.g., Supervisory Control and Data Acquisition).	X	
97. Restrict vehicle traffic to only authorized users on newly constructed routes (using signage, gates, etc.)	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
<b>Reclamation Activities</b>		
98. Include objectives for ensuring habitat restoration to meet sage-grouse habitat needs in reclamation practices/sites (Pyke 2011).	X	
99. Address post reclamation management in reclamation plan such that goals and objectives are to protect and improve sage-grouse habitat needs.		X
100. Maximize the area of interim reclamation on long-term access roads and well pads, including reshaping, topsoiling and revegetating cut-and-fill slopes.	X	
101. Restore disturbed areas at final reclamation to the pre-disturbance landforms and desired plant community.	X	
102. Irrigate interim reclamation if necessary for establishing seedlings more quickly.		X
103. Utilize mulching techniques to expedite reclamation and to protect soils.		X
<b>Grazing Required Design Features</b>		
104. Avoid building new wire fences within 2 km of occupied leks (Stevens 2011). If this is not feasible, ensure that high risk segments are marked with collision diverter devices or as latest science indicates.	X	
105. Place new, taller structures, including corrals, loading facilities, water storage tanks, windmills, out of line of sight or at least one kilometer (preferably 3 km) from occupied leks, where such structures would increase the risk of avian predation.	X	
106. Utilize temporary fencing (e.g., ESR, drop down fencing) where feasible and appropriate to meet management objectives.		X
107. Fence wetlands (e.g., springs, seeps, wet meadows and/or riparian areas) where appropriate, to maintain or foster progress toward Proper Functioning Condition and to facilitate management of sage-grouse habitat objectives. Where constructing fences or exclosures to improve riparian and/or upland management, incorporate fence marking or other BMPs/RDFs as appropriate.		X
108. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), livestock trailing will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6:00 p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse. Over-nighting, watering and sheep bedding locations on public lands must be at least 1 km from occupied leks during the lekking season to reduce disturbance from sheep, human activity and guard animals.	X	
109. Work with permittees in locating sheep over-nighting, watering and sheep bedding locations to minimize impacts to sage-grouse seasonal habitats.	X	
110. When trailing livestock during the lekking or nesting season, use roads or existing trails, to the extent possible to reduce disturbance to roosting, lekking or nesting sage-grouse.		X
111. Design new spring developments in GRSG habitat to maintain or enhance the free flowing characteristics of springs and wet		X

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
meadows. Modify developed springs, seeps and associated pipelines to maintain the continuity of the predevelopment riparian area within priority GRS habitat where necessary.		
112. Install ramps in new and existing livestock troughs and open water storage tanks to facilitate the use of and escape from troughs by GRS and other wildlife.		X
<b>West Nile Virus Required Design Features</b>		
113. Construct water return features and maintain functioning float valves to prohibit water from being spilled on the ground surrounding the trough and/or tank and return water to the original water source, to the extent practicable.	X	
114. Minimize the construction of new ponds or reservoirs except as needed to meet important resource management and/or restoration objectives.	X	
115. Develop and maintain non-pond/reservoir watering facilities, such as troughs and bottomless tanks, to provide livestock water.	X	
116. For most spring developments or wells, mosquito breeding habitat usually is not an issue. Flowing cold (less than 50° Fahrenheit) water and steep sides of the stock tanks are not conducive for egg laying or larvae production. If flows are low, the water is warm, or moss production is an issue in the tank, mosquito breeding habitat could exist in the tank.	X	
117. Maintenance of healthy wetlands at spring sources helps control mosquitoes and their larvae by providing habitat for natural predators such as birds, dragonflies and amphibians. Protecting the wetland at the spring source with a fence is an option to consider.		X
118. Clean and drain stock tanks before the season starts. If never cleaned or drained, many tanks will fill with silt or debris causing warmer water and heavy vegetation growth conducive to mosquito reproduction.		X
119. Draining tanks after the period of use is completed, particularly in warmer weather, also reduces potential habitat by eliminating stagnant standing water.		X
120. Maintain a properly functioning overflow to prevent water from flowing onto the pad and surrounding area, to eliminate or minimize pooling of water that is attractive to breeding mosquitoes.	X	
121. Clean or deepen overflow ponds to maintain colder temperatures to reduce mosquito habitat.		X
122. Install and maintain float valves on stock tank fill pipes to minimize overflow	X	
123. Harden stock tank pads to reduce tracks that can potentially hold water where mosquitoes may breed.	X	
124. Build ponds with steep shorelines to reduce shallow water (>60 cm) and aquatic vegetation around the perimeter of impoundments to deter colonizing by mosquitos (Knight et al. 2003, cited in NTT report page 61).	X	
125. Consider removing and controlling trees and shrubs to reduce		X

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
shade and wind barriers on pit and reservoir shorelines if not needed for wildlife, fish, or recreational values.		
126. Impoundments that remain accessible to livestock and wildlife can cause tracking and nutrient enrichment from manure which can create favorable mosquito breeding habitat. Where this is a concern, it may be desirable to fence the reservoir and pipe the water to a tank.		X
127. Construct dams or impoundments that minimize down-slope seepage or overflow. Seepage and overflow results in down-grade accumulation of vegetated shallow water areas that support breeding mosquitoes.		X
128. On ponds and reservoirs with enough depth and volume, introduce native fish species, which feed on mosquito larvae.		X
129. Line the overflow of a dam's spillway with crushed rock and constructing the spillway with steep sides to preclude the accumulation of shallow water and vegetation to reduce mosquito habitat.		X
130. Where an existing reservoir has filled with silt, consider cleaning to reduce shallow water habitat conducive to mosquito reproduction.		X
131. During confirmed West Nile virus outbreaks in sage-grouse habitat, consider larvicide applications.		X
<b>Travel Management Required Design Features</b>		
132. Designate or design routes to direct use away from priority areas identified in Wildfire and Invasive Species Assessments and still provide for high-quality and sustainable travel routes and administrative access, legislatively mandated requirements, and commercial needs	X	
<b>Recreation Required Design Features</b>		
133. Direct use away from GRSG priority areas as described in the Wildfire and Invasive Species Assessments.	X	
134. Eliminate or minimize external food sources for corvids.		X

**Appendix B – Seasonal Timing Restriction**

During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6:00 p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse.

DRAFT

<b>Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary</b>			
<b>Impacts</b>	<b>Causes<sup>1</sup></b>	<b>Minimization Measures Seasonal/Timing Restrictions &amp; Buffers</b>	<b>Rationale</b>
<b>Incidental disturbance to individual GRSG within all habitat types during all seasons</b>			
	Public or administrative activities that include incidental foot, aerial, horseback, or other similar travel.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Livestock grazing activities (except where specifically noted below).	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Public vehicle travel not otherwise restricted in Travel Management Plans; or administrative vehicle travel on existing routes for maintenance of existing infrastructure, facilities, or vegetation projects; or non-organized/non-permitted activities.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
<b>Loss (i.e. death) of nests/eggs, chicks and/or adults that may occur within the nesting<sup>4</sup> habitat during the nesting season</b>			
	Anthropogenic activities such as the use of heavy equipment <sup>2</sup> or	BMP Priority, Important, General: Avoid these activities within nesting	Application of the seasonal nesting habitat restriction would avoid and

<b>Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary</b>			
<b>Impacts</b>	<b>Causes<sup>1</sup></b>	<b>Minimization Measures Seasonal/Timing Restrictions &amp; Buffers</b>	<b>Rationale</b>
	targeted grazing in nesting habitat <sup>3</sup> for: 1) implementation of fuels/vegetation/habitat restoration management projects, 2) infrastructure construction or maintenance, 3) geophysical exploration activities; 4) organized motorized recreational events	habitat during the nesting <sup>3</sup> season.	minimize the loss of nests/chicks/hens. This is a BMP since the impact is loss of individual grouse and is small scale and not population-scale. Disallowing infrastructure maintenance or construction in nesting habitat outright may not be realistic as an RDF. Impacts may be able to be offset via appropriate mitigation.
	Bedding Sheep & Associated Camps	BMP: Priority, Important, General: During the nesting season, locate bedding areas and camps outside of sagebrush areas <sup>3</sup> .	Application of the seasonal nesting habitat restriction would avoid/minimize the loss of nests/chicks by focusing bedding and camps in areas not meeting nest habitat characteristics for sagebrush cover (i.e., use areas less than 15% canopy cover).
	Fences	Existing Fences:  RDF: Priority and Important; BMP for General- Where consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management, move, modify (e.g. lay down fences) or mark existing fences to reduce collision risk within areas that have a high	Application of these measures would avoid/minimize the loss of birds to fence strikes.

<b>Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary</b>			
<b>Impacts</b>	<b>Causes<sup>1</sup></b>	<b>Minimization Measures Seasonal/Timing Restrictions &amp; Buffers</b>	<b>Rationale</b>
		probability of fence strikes (per Stevens et al. 2012 model or latest science).	
		New Fences:  RDF: Priority and Important; BMP for General- Do not construct new fences within areas of high collision risk unless marked or modified, consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management .	
<b>Permanent functional or physical loss of a lek or declining attendance at lek<sup>4</sup></b>			
	Unleased fluid minerals	Stipulation: Priority, Important, General: Do not allow wells, pads, facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek.  Stipulation: Priority, Important, General: Limit average well pad density to no more than 1 per 640 acres within nesting <sup>3</sup> and winter <sup>3</sup> habitat.	This impact may have a population level effect and trip a population trigger therefore we recommended this be an RDF. Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended as far as 1.6 km from grouse leks. The 1/640 density per based on consideration of 1) Harju et al. (2010) who found pad density of

## Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			1.54 pad/sq km (1 pad/247 ac) had 13-74% lower attendance at leks and 2) Doherty (2008 page iii and 79) who noted potential impacts from oil and gas development were indiscernible at ~1 well/640 acres. IDswMT biology team recommended a more conservative approach to minimize risk of tripping a population trigger, hence the 1/640.
	Commercial solar development	<p>RDF: Priority-No commercial solar development.</p> <p>RDF: Important- Do not allow new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek<sup>4</sup>.</p> <p>BMP-General: Avoid new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek<sup>4</sup>.</p>	No specific literature available relative to solar development. Recommended buffer is based on recent literature (Harju et al 2010) that 0.6 or 0.25 mile buffers are not. The 2 mile buffer is consistent with Connelly et al. 2000 regarding energy facilities (page 978).
	Roads	BMP: Priority, Important, General: Do not construct new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of leks <sup>4</sup> .	Patricelli et al. 2012 (Recommendations for interim protections in WY) recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. We apply it

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			here as a lek-centric BMP because we may need to construct a road near a lek (perhaps for fire operations/access or to allow access to private lands or per ROW need). If we buffer roads in the Priority or Important Areas via a large lek buffer, it may lead to disturbance of a much larger area of nesting habitat in the course of avoiding the lek and buffers. The BMP would at least allow for siting to avoid the lek, and reducing road noise near the lek, without compromising broader landscapes.
	Commercial/ industrial Pipelines (oil, gas, slurry, and similar)	BMP: Priority, Important, General. Minimize removal of sagebrush within 0.6 miles of leks <sup>4</sup> .	<p>Application of this measure is designed to minimize loss of sagebrush in the vicinity of the lek. The main concern was with loss of sagebrush in vicinity of lek, that is used by GRSG for cover. The 0.6 mile buffer is based on rationale in the Colorado GRSG Conservation Plan as below:</p> <p>BACKGROUND                      INFORMATION: From Colorado GRSG Conservation Plan                      Appendix B: [Lek Habitat (March</p>

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			through mid-May) - The basis and rationale for the first radius, 0.6 miles from a lek (Fig. B-1), is developed by summarizing data from 5 separate studies of daytime movements of adult male sage-grouse during the breeding season (Carr 1967, Wallestad and Schladweiler 1974, Rothenmaier 1979, Emmons 1980, Schoenberg 1982), because daytime movements of adult male GRSG during the breeding season do not vary greatly. Wallestad and Schladweiler (1974) found daily movements of adult males ranged between 0.2 and 0.8 miles from leks, with a maximum cruising radius of 0.9 - 1.2 miles. Ellis et al. (1987) reported that dispersal flights of male GRSG (to day-use areas) ranged from 0.3 – 0.5 miles, with the longest flights ranging from 1.2 – 1.3 miles. Carr (1967) recorded a cruising radius for male GRSG that ranged from 0.9-1.1 miles. Rothenmaier (1979) found that 60-80% of male GRSG locations were within 0.6 - 0.7 miles of a lek. Emmons (1980) reported

<b>Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary</b>			
<b>Impacts</b>	<b>Causes<sup>1</sup></b>	<b>Minimization Measures Seasonal/Timing Restrictions &amp; Buffers</b>	<b>Rationale</b>
			<p>that male dispersal distances to day-use areas of 0.1 miles were common and that 67% of all use areas were greater than 0.3 miles from the lek. In addition, Schoenberg (1982) found that male daily movements averaged 0.6 miles, but ranged from 0.02 - 1.5 miles.</p> <p>Male GRSG activity patterns during the breeding season include strutting during the early morning hours, feeding and loafing during the day, and roosting on the lek during the night. Grouse attending the lek do not always roost on the exact location where the strutting occurs the next morning. Occasionally (this is lek-dependent), grouse roost in adjacent sagebrush cover.</p> <p>Ultimately, male GRSG require an open area for strutting, and sagebrush immediately adjacent for feeding and loafing. Sagebrush adjacent to the lek is also used as escape cover from predators or other types of disturbance. Female GRSG that attend the lek also use</p>

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			<p>the area in this zone in the same fashion as do males (Patterson 1952, Barnett and Crawford 1994, Coggins 1998).]</p> <p>Study locations noted above: Carr-Colorado; Wallestad and Schladweiller- Montana; Emmons-Colorado; Schoenberg- Colorado; Rothenmaier –unable to locate Univ. WY Thesis but study area not defined.</p>
	Miscellaneous anthropogenic structures/ activities (e.g., corrals, water windmills, apiaries, signs, informational kiosks, etc.)	BMP Priority, Important, General: Avoid human activities or placement of new structures as noted within 2 miles (3.2 km) mi of a lek <sup>4</sup> or ensure they are out of the viewshed of the lek.	This is a catch all to reduce impact of miscellaneous structures where possible (some are tall <sup>5</sup> , such as water windmill, some are small, but have human activity- such as kiosks) or activities not otherwise addressed in this table. Based on biology team discussion and input, and Connelly et al. 2000 Guidelines that state, “avoid building powerlines and other tall structures that provide perch sites for raptors within 3 km of seasonal habitats” (page 977). Avoiding “seasonal habitats” entirely by 3 km would preclude any of these activities at all

<b>Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary</b>			
<b>Impacts</b>	<b>Causes<sup>1</sup></b>	<b>Minimization Measures Seasonal/Timing Restrictions &amp; Buffers</b>	<b>Rationale</b>
			in Priority, Important or General, but siting 2 miles + from leks as a BMP would nonetheless help protect leks from disturbance. Adding the “viewshed” caveat can help with siting in cases where topography or such screens view of the activity or structure.
	Campgrounds and other developed recreation facilities (trailheads etc.)	BMP: Priority, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.	Biology team discussion. No literature specific to this issue. Aldrich (2012) mentions GRSB avoidance threshold 2.5 km from any single development at patch scale.
	OHV Play or Open Areas	RDF-Priority and Important; BMP for General. No new Open or Play areas.	Rationale is to reduce risk for further noise, habitat loss, fire risk in the Priority, Important and General Areas.
	Solid Minerals		These measures for solid minerals are intended to reduce noise and human disturbance to lekking birds. Siting/ avoidance buffers not realistic due to the nature of mineral deposits.
		Locatables-BMP Priority,	Regulations 43 CFR 3809.420

Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		Important, General: Access roads and associated infrastructure not on the mining claim-Avoid disturbance to leks <sup>4</sup> during the lekking season.	performance standards, speak to T/E, and habitat. As a BMP, it provides an opportunity to work with the developer where we can, such as routing access roads etc., siting of facilities/infrastructure etc., that are off the claim, that we have some discretion with.
		Salables- RDF: Priority: Do not construct new salable development within 0.8 mile (1.3 km) of leks <sup>4</sup> .	<u>Salables</u> - No literature specific to salables but buffer distance is based on the noise literature for roads. See Patricelli et al. 2012 (WY recommendations for interim noise protections) that recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. Chose RDF for Priority and BMP in Important and General habitat since new Salable pits (e.g., gravel) may be necessary to support road maintenance or improvement for access by fire operations or for other locally important factors.

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		<p>Leasables-non-energy (e.g., phosphate)-</p> <p>RDF-Priority and Important: New phosphate leasing is administratively unavailable.</p> <p>BMP-Priority, Important, General- On existing leases avoid disturbance to leks<sup>4</sup> during the lekking season</p>	<p><u>Leasables:</u> None presently known in Priority based on current mapping, but Priority RDF included in case of a trigger trip and re-delineation of IDswMT subregional management areas.</p> <p>In “Important” there is only one such area with existing lease and Known Phosphate Lease Areas (KPLAs), just west of Bear. It is Federal mineral/private surface. No interest in surface mining but there is interest by a company in underground development. Company is proposing facilities on surface, but working with IDFG locally. Lek within .3 mile.</p> <p>BMP for lek disturbance for all Management Areas in case of trigger trip and IDswMT Management Area re-delineation and since there are some KPLAs in the General Management Area. Working with proponent to reduce lek disturbance is realistic and may take on different forms, such as</p>

<b>Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary</b>			
<b>Impacts</b>	<b>Causes<sup>1</sup></b>	<b>Minimization Measures Seasonal/Timing Restrictions &amp; Buffers</b>	<b>Rationale</b>
			road access, placement of facilities, etc.. However, “exclusion” buffers are not realistic given the nature of the location of solid mineral deposits (i.e., cannot site elsewhere). For these, incorporation of appropriate mitigation, in addition to the lek BMP may need to be a primary focus.
	Wind development (commercial)	RDF: Priority-No commercial wind development .  BMP: Important and General: Avoid wind development in nesting and/or winter habitat.	<u>Wind</u> : Labeau et al. (2014) stated that erecting wind turbines at least 5 km from nesting and brood rearing habitat should reduce negative impacts, at least in the short term. However putting a 5 km (3 mile) buffer around leks in Important habitat, would create a defacto closure for the most part, inconsistent with the intent of the Important designation. Hence BMP to avoid placement in nesting or winter habitat.
	Communication Towers	RDF: Priority -Do not allow communication tower construction within 3 miles (5 km) of a lek <sup>4</sup> unless needed to address public safety needs.	Johnson et al. (2011 pg. 427) noted "Analogously, across all management areas there was a steady downward pattern of trends of lek counts as the number of

## Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		BMP- Important and General-- Avoid communication tower construction within 3 miles (5 km) of a lek <sup>4</sup> unless needed to address public safety needs.	towers increased, either within 5 km (Fig. 21) or within 18 km (Fig. 22)."
	Transmission Lines	RDF: Priority, Important, General: Do not allow transmission line construction within 600 m of a lek.  BMP Priority, Important, General: Avoid transmission line construction within 2 miles (3.2 km) of a lek.	A 600 m GRSG avoidance zone reported per Gillan et al. (2013). No other spatial buffer supported by literature. While 600 m is a citable buffer, a 2 mile zone as BMP for Transmission is recommended as well. Based on Connelly et al. 2000 Guidelines to avoid tall structures in important seasonal habitats.
	Distribution Lines	BMP: Priority, Important and General-Avoid distribution line construction within 600 m of a lek or bury where possible	600 m, based on Gillan et al. BMP as this may not always be feasible.
<b>Temporary functional loss of a lek<sup>4</sup>. SEASONAL RESTRICTION</b>			
	BLM and Forest Service permitted anthropogenic activities that result in noise or visual disturbance that may lead to sustained avoidance of the lek during a particular lekking	RDF: Priority and Important- No repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of	Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended

## Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
	season.	leks during the lekking season <sup>3</sup> .  BMP-General: Avoid repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season <sup>3</sup> .	as far as 1.6 km (~ 1 mile) from grouse leks. . IDswMT biology team recommended a more conservative approach to managing disturbance to minimize risk of disturbance.
	Sheep Bedding & Sheep Camps	BMP Priority, Important, General: Avoid bedding sheep and placing camps within 0.6 mi of a lek during the lekking season.	No literature. BMP based on biology team consensus.
	Organized Recreational Events	RDF Priority and Important-Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.  BMP General- Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.	Biology team consensus. No specific literature relative to buffers for recreational events but can manage this through avoiding the appropriate season. This threat (organized recreational events) is a short term, typically one-day event, with temporary disruption from noise the main issue.
<b>Permanent functional or physical loss of nesting or winter habitat.</b>			

## Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
	Anthropogenic development or activities that result in loss of habitat or constant or repeated noise levels or objects on the landscape that result in permanent avoidance of the habitat.	Ensure > 80% of the landscape is functionally and physically meeting GRSG habitat objectives appropriate to the seasonal habitat <sup>3</sup> .	<p>Impacts resulting from loss of habitat vary depending on the extent of the habitat lost. Minimal loss of habitat (e.g. removal of small amounts of sagebrush cover) would not likely result in any measurable impacts to GRSG individuals or the associated populations.</p> <p>More extensive loss of habitat may result in increased probability of population level impacts, and trigger trips, through the increased probability that leks will no longer persist.</p>
	Roads	BMP: Priority, Important, General: Avoid construction of new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of nesting habitat.	See citations used for permanent loss of leks, above.
	Unreleased Fluid Minerals	Stipulation: Priority, Important, General: Limit average well pad density to no more than 1/640 acres within nesting <sup>3</sup> and winter <sup>3</sup> habitat.	See citations used for permanent loss of leks, above.
	Commercial Solar	RDF: Priority-No commercial solar	See citations used for permanent

<b>Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary</b>			
<b>Impacts</b>	<b>Causes<sup>1</sup></b>	<b>Minimization Measures Seasonal/Timing Restrictions &amp; Buffers</b>	<b>Rationale</b>
		development.  RDF: Important: Do not allow facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .  BMP-Important: Avoid placing new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .	loss of leks, above.
	Campgrounds	BMP-Priority, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.	See citations used for permanent loss of leks, above.
	OHV Play and Open areas	RDF-Priority and Important. No new Open or Play areas. BMP-General: Avoid new Open or Play areas	See citations used for permanent loss of leks, above.
	Wind Development (commercial)	RDF Priority - No commercial wind development .  BMP: Important: Avoid wind development in nesting habitat	See citations used for permanent loss of leks, above.
<b>Temporary functional loss of winter habitat</b>			

## Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
	Anthropogenic activities that result in noise or visual disturbance that may lead to avoidance of a particular wintering area during a particular wintering season.	RDF: Priority, Important- No repeated or sustained disturbance from construction activities in winter habitat during the wintering season.  BMP General: Avoid repeated or sustained disturbance from construction activities in winter habitat during the wintering season.	No known buffer. Biology team recommendation.

<sup>1</sup> Land use allocations or activities provided below are examples, but are not limited to those listed.

<sup>2</sup> Heavy equipment includes but is not limited to: tractors, discs, drills, mowers, Lawson aerators, large sprayers, masticators, dozers, graders, large trucks, excavators, backhoes cranes.

<sup>3</sup> As per Habitat Objectives table. Based on local GRSG seasonal use dates. Lekking ~ March 1-May 2<sup>5</sup> depending on elevation; Nesting /early brood ~April 1-June 30; Winter ~December 1-February 28. Source-Modified from ISAC 2006.

<sup>4</sup> Occupied lek as per IDFG definitions (active during at least one of past 5 years). Undetermined status leks will be evaluated on a case by case at the site specific scale during project-level NEPA.

<sup>5</sup> Definition of "tall structure": Any structure that has the potential to disrupt lekking or nesting GRSG and/or decrease the use of an area. This includes but is not limited to communication towers, meteorological towers, electrical transmission or distribution towers, etc.

## Wildfire and Invasive Species Assessments

UNITED STATES DEPARTMENT OF THE INTERIOR  
BUREAU OF LAND MANAGEMENT  
WASHINGTON, D.C. 20240-0036  
<http://www.blm.gov>

August 28, 2014

In Reply Refer To:  
6711 (AD-200, FA-100) I

EMS TRANSMISSION 09/03/2014  
Instruction Memorandum No. 2014-134  
Expires: 09/30/2015

**To:** State Directors: CA, ID, NV, OR, UT

**From:** Assistant Director, Resources and Planning

**Subject:** Completion of Wildfire and Invasive Species DD: 9/8/2014 & 1/30/2015  
Assessments in Greater Sage-Grouse Habitat

**Program Areas:** Wildlife, Special Status Species, Range, Forestry, Emergency Stabilization and Rehabilitation, Riparian, Plant Conservation, Fire Operations, Fire Planning, and Fuels Management

**Purpose:** This Instruction Memorandum (IM) provides guidance for Bureau of Land Management (BLM) offices to cooperate with interagency partners to complete "Step 2" of the Wildfire and Invasive Species assessments (hereafter called FIAT assessments) for six priority landscapes in Greater sage-grouse (hereinafter "sage-grouse") habitats. These assessments will help to quantify future planned actions by the BLM to inform the US Fish and Wildlife Service's sage-grouse listing decision in 2015. The FIAT assessments are also consistent with the direction provided in the *Identification of Multi-year Funding Priorities and Consideration for Healthy Lands Focal Areas IM (WO IM-2014-124)* and the *Sage-Grouse Habitat and Wildland Fire Management IM (WO IM-2014-114)*.

**Policy/Action:** The FIAT assessments will be used to develop collaborative implementation plans that address threats to sage-grouse resulting from invasive annual grasses, wildfires, and conifer expansion in Priority Areas for Conservation (PACs). The completion of this first round of the PAC assessments within the Great Basin will inform the next phase of assessments as the BLM continues to expand into other sage-grouse habitat into 2015, including the Rocky Mountain

States as appropriate.

The State offices listed in Attachment 1 will complete "Step 2" of the FIAT assessments for six priority landscapes in cooperation with interagency partners following the schedule as defined in the Action Plan and a description of the collaboration process and team structure. Attachment 2 illustrates the names and locations of the PACs. The June 2014 FIAT Assessment (Attachment 3) completed "Step 1" of the FIAT assessment process and provides guidance for completing "Step 2".

The FIAT assessments are non-decisional in nature, and involve two steps:

**Step 1:** This step has been completed and is documented in the June 2014 FIAT Assessment protocol (Attachment 3). Step 1 identified focal habitats where management strategies will be prioritized (within or near these important habitats), patterns of resistance to invasive annual grasses and resilience after disturbance, landscape sagebrush cover, and conifer expansion within the six PACs. In addition to presenting the regional context, outcomes of Step 1 included geospatial data which define focal habitats, high density sage-grouse populations, and their intersection with threat factors. This data will be provided to state offices and appropriate field offices to use in their assessments.

**Step 2:** State and local offices will utilize Step 1 information and local data to conduct the FIAT assessments for the six PACs. As described in Attachment 3, offices will utilize Step 1 geospatial data supplemented with appropriate local data to best describe local conditions, treatment needs, and management priorities in or around focal habitats in the six PACs. Outcomes from Step 2 will include spatially identified conservation activities for the program areas of Fuels Management, Habitat Recovery/Restoration, Fire Operations, and Post-Fire Rehabilitation.

The PACs which have been identified for initial assessments include multiple land ownerships, jurisdictions, and in most cases, multiple states requiring a collaborative approach in carrying out the assessments. Partners who will contribute to FIAT assessments include, but are not limited to, National Forests, State wildlife agencies, the Natural Resources Conservation Service, the US Fish and Wildlife Service, tribes, and other local partners.

State Directors need to identify a State lead and the names of the core members of their team to Doug Havlina ([dhavlina@blm.gov](mailto:dhavlina@blm.gov)), the national lead for this effort, by September 8, 2014. The core team members are expected to participate in a

training workshop in Reno, NV September 16-18. The purpose of the workshop is to familiarize team members with the FIAT process, describe the data requirements, and provide the teams with a consistent approach to complete FIAT assessments.

**Timeframe:** This IM is effective immediately. The FIAT assessments for the six initial PACs will be completed by January 30, 2015.

**Budget Impact:** Moderate; one-time costs will be incurred as field offices complete FIAT assessments with adjoining agencies.

**Background:** The FIAT assessment process was approved by BLM leadership at the 2013 sage-grouse Federal Family meetings in Denver, Colorado and Portland, Oregon. In addition, BLM's Sage-Grouse National Policy Team approved the process in June 2014.

Wildfires, invasive annual grasses, and conifer encroachment are identified as primary threats. These threats contribute to fragmentation of habitats, large scale conversion to unsuitable plant communities, and ultimately declining sage-grouse populations. The BLM is moving towards completion of Resource Management Plan (RMP) amendments and revisions by winter 2015 to address these and other threats. While RMPs describe goals, objectives, and management actions to conserve sage-grouse, they generally lack specificity related to project prioritization, extent and location. This information is important to the 2015 USFWS listing decision. As such, FIAT assessments fulfill a key role by providing quantified descriptions of future conservation actions to inform the sage-grouse listing decision.

This assessment relies in large part on concepts of resistance to invasive annual grasses and resilience following disturbance across sage steppe environmental gradients along with sage-grouse habitat landscape cover requirements (available as a U.S. Forest Service General Technical Report at:

[http://www.fs.fed.us/rm/pubs/rmrs\\_gtr326.html](http://www.fs.fed.us/rm/pubs/rmrs_gtr326.html)

**Manual/Handbook Sections Affected:** None.

**Coordination:** This IM has been coordinated between Resources and Planning (WO200), Fire and Aviation (FA100), Fire Operations (FA300), and Fire Planning and Fuels Management (FA600).

**Contacts:** Questions may be directed to Douglas Havlina ([dhavlina@blm.gov](mailto:dhavlina@blm.gov)) Natural Resource Specialist - Fire Ecology, 208-387-5061.

## Priority PACs for Initial Assessments / Fire and Invasives Assessment Action Plan

<b>Priority PAC</b>	<b>BLM State Office Responsible for FIAT Completion</b>	<b>BLM District Offices which intersect priority PAC</b>
Central Oregon	Oregon	Burns, OR Lakeview, OR Prineville, OR
Northern Great Basin (Includes Box Elder in Utah and Management Zone IV portion of the Northern Great Basin/Western Great Basin PAC in Southeast Oregon)	Idaho (in coordination w/ UT)	Boise, ID Burns, OR Elko, NV Idaho Falls, ID Twin Falls, ID Vale, OR West Desert, UT Winnemucca, NV
Southern Great Basin (Includes Hamlin Valley in Utah)	Nevada (in coordination w/ UT)	Battle Mountain, NV Carson City, NV Color Country, UT Elko, NV Ely, NV
Snake, Salmon, and Beaverhead	Idaho	Boise, ID Idaho Falls, ID Twin Falls, ID
Western Great Basin and Warm Springs Valley NV/Western Great Basin (Includes Management Zone V portion of the Northern Great Basin/Western Great Basin PAC in Southeast Oregon)	California	Burns, OR Carson City, NV Lakeview, OR North California, CA Vale, OR Winnemucca, NV

## Fire and Invasives Assessment Action Plan

State Directors assign team members and coordinator for priority landscapes.	September 3, 2014
Initial FIAT Process Coordination Call for State leads– Process Overview; Data Coordination; Report Template of What, Where, Why (Who, When, & How and Implementation); examples of expected deliverables; Training session logistics and details.	September 8, 2014
Training Session for All *Core Team members – Nevada State Office	September 16-18, 2014
Coordination Calls with Team Leaders	Every Two Weeks Starting October 1
Initial Draft Assessment Coordination Webinar	January 5, 2015
Final Draft for Great Basin Regional Management Team Review with State Directors	January 23, 2015
Final Assessments Approved by State Directors	January 30, 2015

### **Process for Collaboration**

Priority landscapes involve multiple ownerships, jurisdictions, and in most cases, multiple states. Consequently, the affected Bureau of Land Management (BLM) State Offices will work cooperatively to complete assessments. Partners which may contribute to FIAT assessments include National Forests managed by the U.S. Forest Service within priority landscapes, the Natural Resources Conservation Service, the USFWS, tribes, State wildlife agencies, and other local partners. A specific BLM State Office has been assigned as the lead for each of the six FIAT assessments (see above).

It is imperative that the assessment teams coordinate with the teams assessing adjacent priority landscapes and appropriate FIAT Development Team members. The Western Great Basin and Warm Springs Valley NV/Western Great Basin priority landscapes will be combined into one assessment for priority consistency across the areas and process efficiency. Similarly, the Northern Great Basin assessment will include the Box Elder PAC in Utah and the Management Zone IV portion of the Northern Great Basin/Western Great Basin PAC in Southeast Oregon. The Southern Great Basin PAC assessment will include the Hamlin Valley in Utah and the Management Zone V portion of the Northern Great Basin/Western Great Basin PAC in Southeast Oregon.

A FIAT training workshop will take place at Nevada State Office in Reno Nevada on September 16-18, 2014. The outcome of the training will be to familiarize designated team members with the FIAT process, understand the data requirements and provide the teams with a consistent approach to complete the FIAT assessment.

The employees required to attend the training will include the Sage Grouse Management Zone Project Team Lead, the project zone GIS Specialist, and two other team members designated by the Project Team Lead. The structure of this team may vary slightly given the requirements of each State. Select members of the FIAT Development Team will be involved in training, technical assistance, and review as assessments are conducted. State points-of-contact will coordinate attendance with Doug Havlina, meeting coordinator, at (208) 387-5061.

### **Core Team Structure**

The State will determine the membership of their team(s). The suggested teams should include the following positions:

1. Team Lead \*
2. GIS Specialist \*
3. Fire Planner
4. Fuels Specialist
5. Vegetation (Restoration) Specialist
6. Wildlife Biologist
7. Ecologist
8. Forester/Woodland Management Specialist
9. Writer- Editor
10. FWS Liaison
11. FS Liaison (Management Zones III & IV)
12. State Agencies
13. NRCS Liaison

\*Core team members

Map of PACs for FIAT Assessments in Management Zones III, IV, & V

# Greater Sage-Grouse Wildfire, Invasive Annual Grasses & Conifer Expansion Assessment

June 2014

## Introduction and Background

The purpose of this assessment is to identify priority habitat areas and management strategies to reduce the threats to Greater Sage-Grouse resulting from impacts of invasive annual grasses, wildfires, and conifer expansion. The Conservation Objectives Team (COT) report (USFWS 2013) and other scientific publications identify wildfire and conversion of sagebrush habitat to invasive annual grass dominated vegetative communities as two of the primary threats to the sustainability of Greater Sage-Grouse (*Centrocercus urophasianus*, hereafter sage-grouse) in the western portion of the species range. For the purposes of this assessment protocol, invasive species are limited to, and hereafter referred to, as **invasive annual grasses** (e.g., primarily cheatgrass [*Bromus tectorum*]). Conifer expansion (also called encroachment) is also addressed in this assessment.

The United States Fish and Wildlife Service (USFWS) will consider the amelioration of impacts, location and extent of treatments, degree of fire risk reduction, locations for suppression priorities, and other proactive measures to conserve sage-grouse in their 2015 listing decision. This determination will be made based in part upon information contained in the United States (US) Department of the Interior, Bureau of Land Management (BLM) resource management plan (RMP) amendments and Forest Service land resource management plan (LRMP) amendments, including this assessment.

This assessment is based in part on National Resources Conservation Service (NRCS) soil surveys that include geospatial information on soil temperature and moisture regimes associated with resistance and resiliency properties (see following section on *Soil Temperature and Moisture Regimes*). While this assessment is applicable across the range of sage-grouse, the analysis is limited to Western Association of Fish and Wildlife Management Agencies' (WAFWA) Management Zones III, IV, and V (roughly the Great Basin region) because of the significant issues associated with invasive annual grasses and the high level of wildfires in this region. The utility of this assessment process is dependent on incorporating improved information and geospatial data as it becomes available. Although the resistance and resilience concepts have broad applications (e.g., infrastructure development), this assessment is limited to developing strategies to reduce threats to sage-grouse habitat (e.g., invasive annual grasses and wildfires).

Draft Greater Sage-Grouse Environmental Impact Statements (EISs) contain a suggested framework in the appendices ("Draft Greater Sage-Grouse Wildland Fire and Invasive Species Assessment") that provided a consistent approach to conduct these assessments. The current protocol was developed by the Fire and Invasive Species Team (FIAT), a team of wildland fire specialists and other resource specialists and managers, to specifically incorporate resistance to invasive annual grasses and resilience after disturbance principles into the assessment protocol. In October 2013, the BLM, Forest Service, and USFWS agreed to incorporate this approach into the final EISs.

The cornerstone of the FIAT protocol is recent scientific research on resistance and resilience of Great Basin ecosystems (Chambers et al. *In press*) and the USFWS-sponsored project with the Western Association of Fish and Wildlife Agencies (WAFWA) to assemble an interdisciplinary team to provide additional information on wildland fire and invasive plants and to develop strategies for addressing

these issues. This interagency collaboration between rangeland scientists, fire specialists, and sage-grouse biologists resulted in the development of a strategic, multi-scale approach for employing ecosystem resilience and resistance concepts to manage threats to sage-grouse habitats from wildfire and invasive annual grasses (Chambers et al. *In prep.* ). This paper is being published as a Forest Service Rocky Mountain Research Station General Technical Report and is available at [www.rockymountainresearchstation.fs.fed.us](http://www.rockymountainresearchstation.fs.fed.us). It serves as the reference and basis for the protocol described in this assessment.

The assessment process sets the stage for:

- Identifying important sage-grouse occupied habitats and baseline data layers important in defining and prioritizing sage-grouse habitats
- Assessing the resistance to invasive annual grasses and resilience after disturbance and prioritizing focal habitats for conservation and restoration
- Identifying geospatially explicit management strategies to conserve sage-grouse habitats

Management strategies are types of actions or treatments that managers typically implement to resolve resource issues. They can be divided into proactive approaches (e.g., fuels management and habitat recovery/restoration) and reactive approaches (e.g., fire operations and post-fire rehabilitation). Proactive management strategies can favorably modify wildfire behavior and restore or improve desirable habitat with greater resistance to invasive annual grasses and/or resilience after disturbances such as wildfires. Reactive management strategies are employed to reduce the loss of sage-grouse habitat from wildfires or stabilize soils and reduce impacts of invasive annual grasses in sage-grouse habitat after wildfires. Proactive management strategies will result in long-term sage-grouse habitat improvement and stability, while reactive management strategies are essential to reducing current impacts of wildfires on sage-grouse habitat, thus maintaining long-term habitat stability. Management strategies include:

#### **Proactive Strategies-**

1. **Fuels Management** includes projects that are designed to change vegetation composition and/or structure to modify fire behavior characteristics for the purpose of aiding in fire suppression and reducing fire extent.
2. **Habitat Restoration/Recovery**
  - a. Recovery, referred to as passive restoration (Pyke 2011), is focused on changes in land use (e.g., improved livestock grazing practices) to achieve a desired outcome where the plant community has not crossed a biotic or physical threshold.
  - b. Restoration is equivalent to active restoration (Pyke 2011) and is needed when desired species or structural groups are poorly represented in the community and reseeding, often preceded by removal of undesirable species, is required. Note: The Fuels Management program supports recovery/restoration projects through its objective to restore and maintain resilient landscapes.

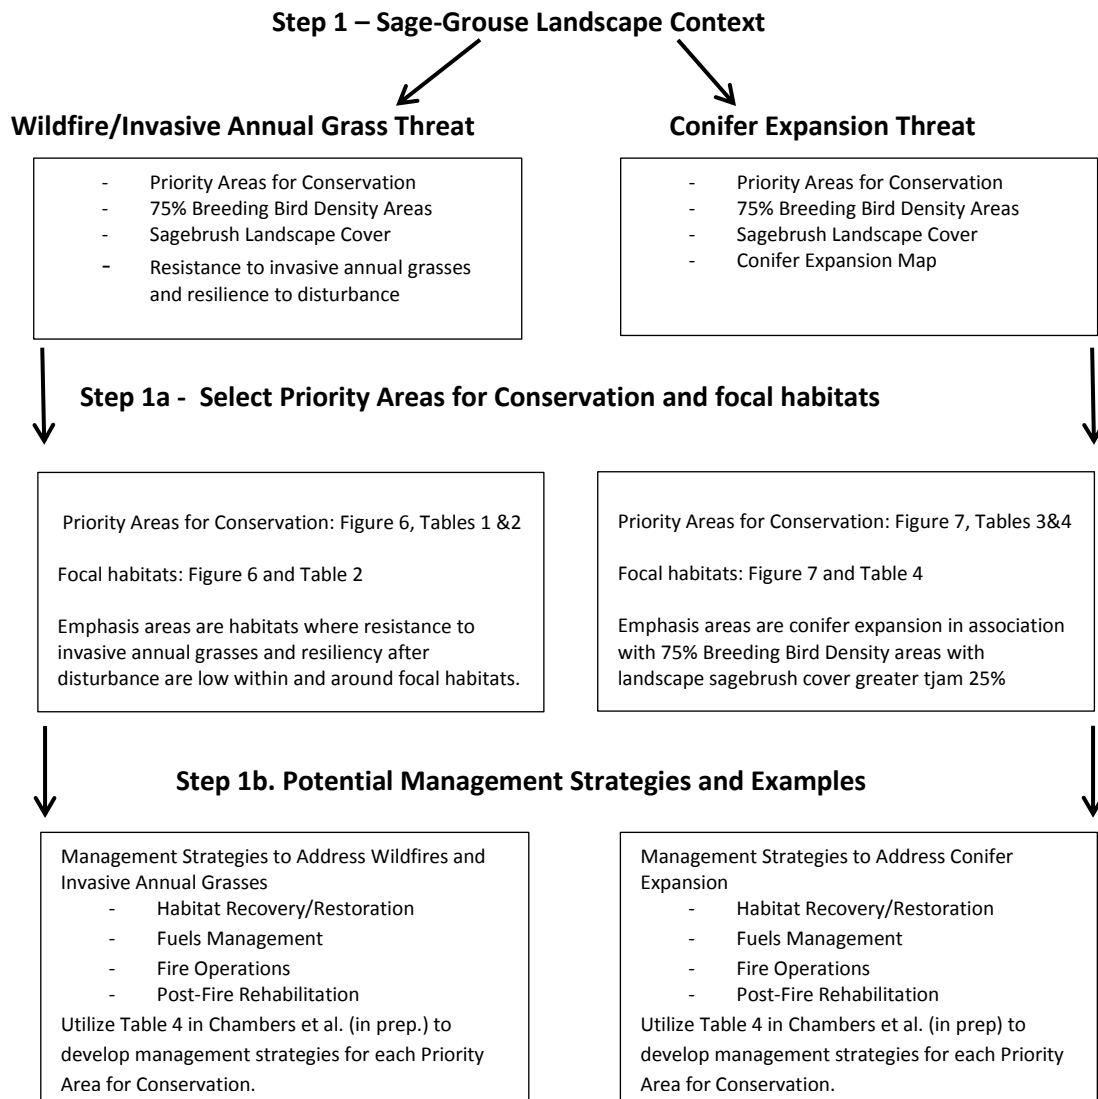

#### **Reactive Strategies-**

3. **Fire Operations** includes preparedness, prevention, and suppression activities. When discussing specific components of fire operations, the terms fire preparedness, fire prevention and fire suppression are used.
4. **Post-Fire Rehabilitation** includes the BLM's Emergency Stabilization and Rehabilitation (ES&R) Program and the Forest Service's Burned Area Emergency Response (BAER) Program. Policy limits application of funds from 1 to 3 years, thus treatments to restore or enhance habitat after this period of time are considered habitat recovery/restoration.

The assessment process included two steps with sub-elements. First, important Priority Areas for Conservation (PACs) and focal habitats are identified (**Step 1a**). Second, potential management **strategies** (described above) are identified to conserve or restore focal habitats threatened by wildfires, invasive annual grasses, and conifer expansion (primarily pinyon pine and/or juniper species; **Step 1b**). Focal habitats are the portions of a PAC with important habitat characteristics, bird populations, and threats (e.g., wildfires, invasive annual grasses, and conifer expansion) where this assessment will be applied. Areas adjacent to or near the focal habitats can be considered for management treatments such as fire control and fuels management if these locations can reduce wildfire impacts to focal habitats. Soil temperature and moisture regimes are used to characterize capacity for resistance to invasive annual grasses and resilience after disturbance (primarily wildfires) within focal habitats to assist in identifying appropriate management strategies, especially in areas with good habitat characteristics that have low recovery potential following disturbance. Soil moisture and temperature regime relationships have not been quantified to the same degree as for conifer expansion; however, Chambers et al. (*In prep.*) discuss preliminary correlations between these two variables.

The results of Steps 1a and 1b, along with associated geospatial data files, are available to local management units to complete Step 2 of the assessment process. Step 2 is conducted by local management units to address wildfire, invasive annual grasses, and conifer expansion in or near focal habitat areas. First, local information and geospatial data are collected and evaluated to apply and improve on Step 1 focal habitat area geospatial data (**Step 2a**). Second, focal habitat activity and implementation plans are developed and include prioritized management **tactics and treatments** to implement effective, fuels management, habitat recovery/restoration, fire operations, and post-fire rehabilitation strategies (**Step 2b**). This assessment will work best if Step 2b is done across management units (internal and externally across BLM and Forest Service administrative units and with other entities). **Figure 1**, Assessment Flow Chart, contains an illustration of the steps in the assessment process.

This analysis does not necessarily address the full suite of actions needed to maintain the current distribution and connectivity of sage-grouse habitats across the Great Basin because resources available to the federal agencies are limited at this time. Future efforts designed to maintain and connect habitats across the range will be needed as current focal areas are addressed and additional resources become available.

**Step 2 – Management Unit Applications for Invasive Annual Grasses and Conifer Expansion**

**Step 2a**

- 1) Evaluate the accuracy and utility of Step 1 geospatial layers and incorporate relevant local information.
- 2) Develop framework for incorporating management strategies to initiate implementation/activity plans.

**Step 2b**

Develop collaborative implementation/activity plans to address threats to focal habitats in Priority Areas for Conservation.

**Figure 1, Assessment Flow Chart**

## Step 1

The first component of the Wildfire and Invasive Annual Grasses Assessment describes the factors that collectively provide the sage-grouse landscape context. Step 1a provides this context by discussing PACs, breeding bird density (BBD), soil temperature and moisture regimes (indicators of resistance to annual grasses and resilience after disturbance), landscape sagebrush cover, and conifer expansion. See Chambers et al. (2014 in prep.) for a detailed description of Invasive Annual Grass and Wildfire threats to sage-grouse habitat. Priority PACs and focal habitats are derived from the information provided in this sage-grouse landscape context section.

### Step 1a- Sage-grouse landscape context

This component of the assessment identifies important PACs and associated focal habitats where wildfire, invasive annual grasses, and conifer expansion pose the most significant threats to sage-grouse.

The primary focus of this assessment is on sage-grouse populations across the WAFWA Management Zones III, IV, and V (**Figure 2**, Current PACs for WAFWA Management Zones III, IV, and V). Sage-grouse are considered a landscape species that require very large areas to meet their annual life history needs. Sage-grouse are highly clumped in their distribution (Doherty et al. 2010), and the amount of landscape cover in sagebrush is an important predictor of sage-grouse persistence in these population centers (Knick et al. 2013). States have used this information combined with local knowledge to identify PACs to help guide long-term conservation efforts. FIAT used data sets that were available across the three management zones as an initial step for prioritizing selected PACs and identifying focal habitats for fire and invasive annual grasses and conifer expansion assessments. These data sets (also described in Chambers et al. *In prep.* ) include:

#### Priority Areas for Conservation (PACs)

PACs have been identified by states as key areas that are necessary to maintain redundant, representative, and resilient sage-grouse populations (USFWS 2013; see Figure 2). A primary objective is to minimize threats within PACs (e.g., wildfire and invasive annual grasses impacts) to ensure the long-term viability of sage-grouse and its habitats. A secondary priority is to conserve sage-grouse habitats outside of PACs since they may also be important for habitat connectivity between PACs (genetic and habitat linkages), habitat restoration and population expansion opportunities, and flexibility for managing habitat changes that may result from climate change. PACs have also been identified by the USFWS as one of the reporting geographic areas that will be considered during listing determinations for sage-grouse.

The combination of PACs with BBD data (described below) assists us in identifying connectivity between populations. PAC boundaries may be modified in the future requiring adjustments in focal habitat areas and management strategy priorities.

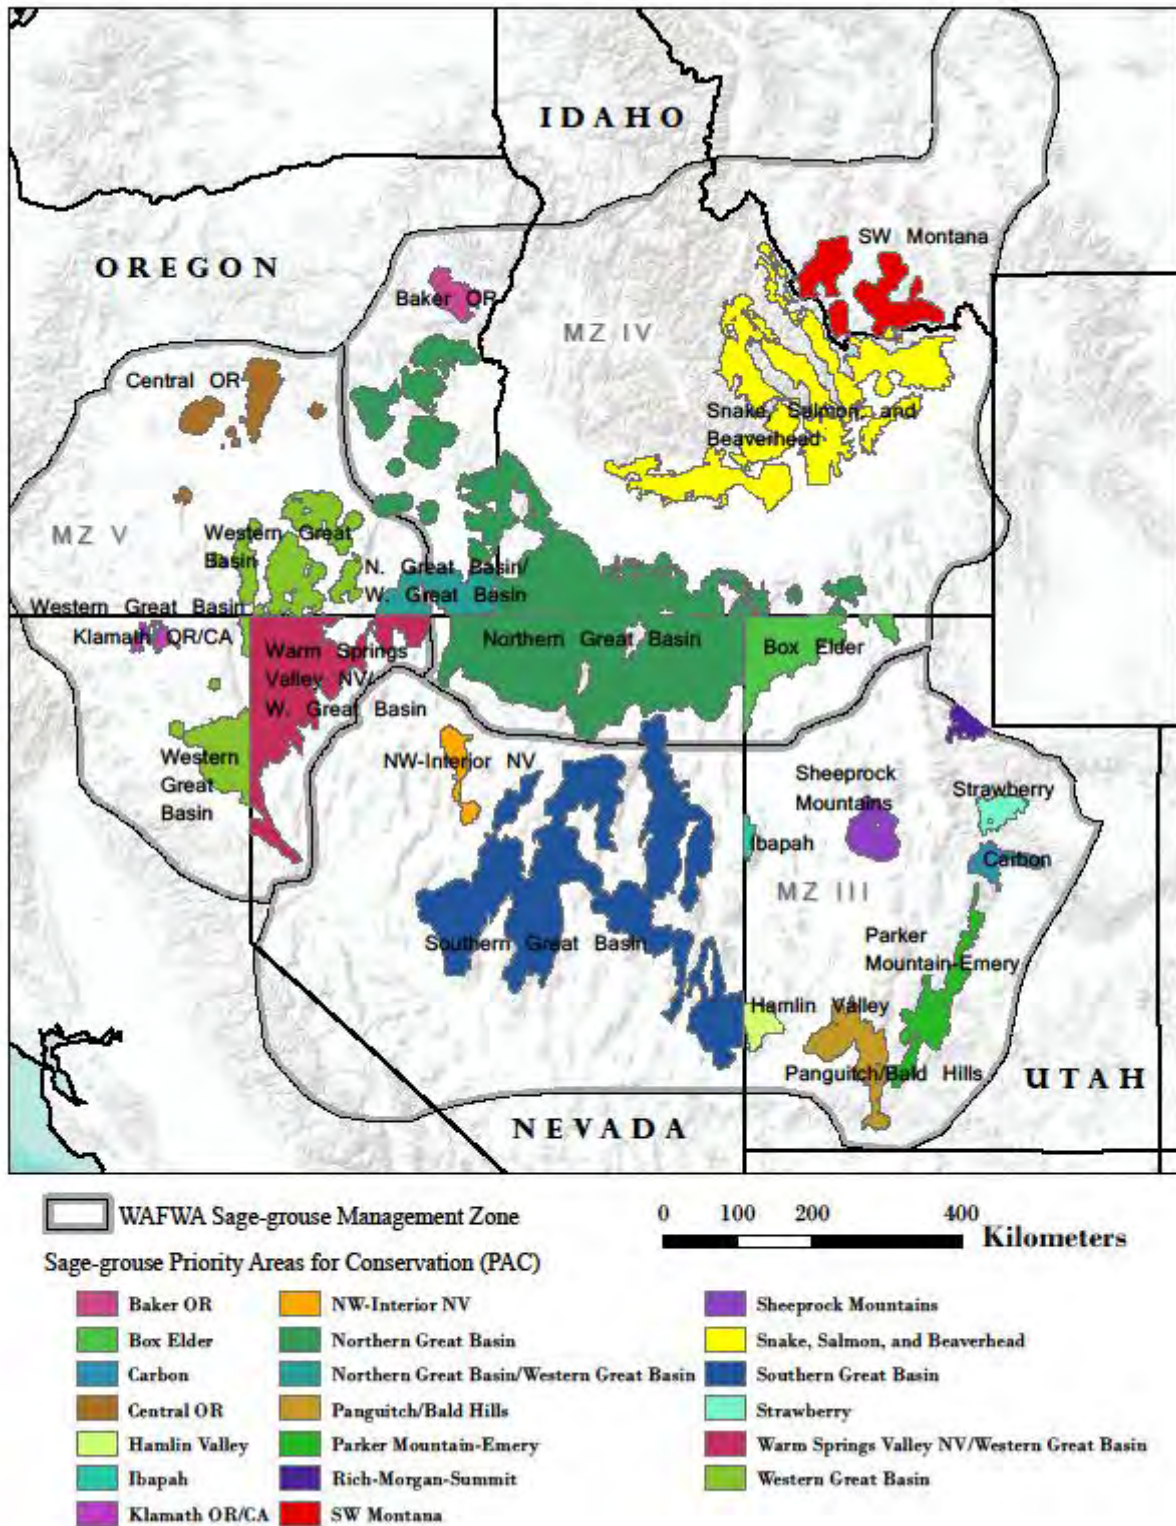

Figure 2, Current PACs for WAFWA Management Zones III, IV, and V. Bi-State sage-grouse populations were not included for this analysis and are being addressed in separate planning efforts.

### Breeding Bird Density

Doherty et al. (2010) provided a useful framework for identifying population concentration centers in their range-wide BBD mapping. FIAT used maximum counts of males on leks (4,885 males) to delineate breeding bird density areas that contain 25, 50, 75, and 100 percent of the known breeding population. Leks were then mapped according to abundance values and buffered by 4 to 5.2 miles (6.4 to 8.5 kilometers) to delineate nesting areas. Findings showed that while sage-grouse occupy extremely large landscapes, their breeding distribution is highly aggregated in comparably smaller identifiable population centers; 25 percent of the known population occurs within 3.9 percent (7.2 million acres [2.92 million hectares]) of the species range, and 75 percent of birds are within 27 percent of the species range (50.5 million acres [20.4 million hectares]; Doherty et al. 2010). See **Figures 3**, Sage-Grouse Breeding Bird Density Thresholds.

This analysis places emphasis on breeding habitats because little broad/mid-scale data exists for associated brood-rearing (summer) and winter habitat use areas. Finer scale seasonal habitat use data should be incorporated (or, if not available studies, should be conducted) at local levels to ensure management actions encompass all seasonal habitat requirements. Federal administrative units should consult with state wildlife agencies for additional seasonal habitat information.

For this assessment, FIAT chose to use the 75 percent BBD as an indicator of high bird density areas that informed the approach used by state wildlife agencies to initially identify PACs. Range-wide BBD areas provide a means to further prioritize actions within relatively large PACs to maintain bird distribution and abundance. FIAT used state level BBD data from Doherty et al. (2010) instead of range-wide model results to ensure important breeding areas in Management Zones III, IV, and V were not underweighted due to relatively higher bird densities in the eastern portion of the range. BBD areas of 75 to 100 percent are included in Appendix 1 to provide context for local management units when making decisions concerning connectivity between populations and PACs.

Note that breeding density areas were identified using best available information in 2009, so this range-wide data does not reflect the most current lek count information and changes in conditions since the original analysis. Subsequent analysis should use the most current information available. Also, BBD areas should not be viewed as rigid boundaries but rather as a means to regionally prioritize landscapes where step down assessments and actions should be implemented quickly to conserve the most birds.

**Figure 3, Sage-Grouse Breeding Bird Density Thresholds** for 75% of the breeding birds, Management Zones, and PACs. Breeding bird density of 75 to 100% is shown in Appendix 1 to provide context for local management units when making decisions concerning connectivity between populations and PACs.

### Soil Temperature and Moisture Regimes

Invasive annual grasses and wildfires can be tied to management strategies through an understanding of resistance and resilience concepts. Invasive annual grasses has significantly reduced sage-grouse habitat throughout large portions of its range (Miller et al. 2011). While abandoned leks were linked to increased nonnative annual grass presence, active leks were associated with less annual grassland cover than in the surrounding landscape (Knick et al. 2013). Invasive annual grasses also increases fire frequency, which directly threatens sage-grouse habitat and further promotes the establishment of invasive annual grasses (Balch et al. 2013). This nonnative annual grass and fire feedback loop can result in conversion from sagebrush shrublands to annual grasslands (Davies 2011).

In cold desert shrublands, vegetation community resistance to invasive annual grasses, especially cheatgrass, and resilience following disturbance is strongly influenced by soil temperature and moisture regimes (Chambers et al. 2007; Meyer et al. 2001). Generally, cooler and moister soil temperature/moisture regimes are associated with more resilient vegetation communities as indicated by increases in vegetation productivity and ability to compete and recover from disturbance along elevation gradients (Chambers et al. 2007; Chambers et al. *in press*). Also, colder soil temperatures are associated with more resistant communities due to limitations on invasive annual grass growth and reproduction. Thus, communities with warm and dry soil temperature and moisture regimes tend to have relatively low resilience and resistance. Communities with cool and dry soil temperature and moisture regimes also can have relatively low resilience and resistance with the degree of resistance to cheatgrass depending on soil temperature (see Figure 9 in Chambers et al. *In prep.*). A continuum in resistance and resilience exists across soil temperature and moisture regimes that will need to be considered when developing implementation or activity plans in Step 2. These relationships can be used to help prioritize management actions within sage-grouse habitat using broadly available data.

To capture relative resistance and resilience to disturbance and invasive annual grasses across the landscape, soil temperature and moisture regime information (described in greater detail in Chambers et al. *In prep.*) were obtained from the Natural Resources Conservation Service (NRCS) Soil Survey Geographic Database (SSURGO) data. Where gaps in this coverage existed, the NRCS US General Soil Map (STATSGO2) data was used (Soil Survey Staff 2014; see Appendix 1). The STATSGO2 database includes soils mapped at a 1:250,000-scale; the SSURGO database includes soils mapped at the 1:20,000 scale. Interpretations made from soil temperature and moisture regimes from the STATSGO2 database will not have the same level of accuracy as those made from the SSURGO database.

Areas characterized by warm and dry soil temperature and moisture regimes (low relative resistance and resilience) were intersected with sage-grouse breeding habitat and sagebrush landscape cover to identify candidate areas (emphasis areas) for potential management actions that mitigate threats from invasive annual grasses and wildfire (**Figure 4**, Soil Moisture and Temperature Regimes for Management Zones III, IV, and V, and **Figure 5**, Intersection of High Density (75% BBD) Populations). These data layers provide the baseline information considered important in prioritizing areas where conservation and management actions could be developed to address invasive annual grasses in a scientifically defensible manner (see Table 4 in Chambers et al. *In prep.*).

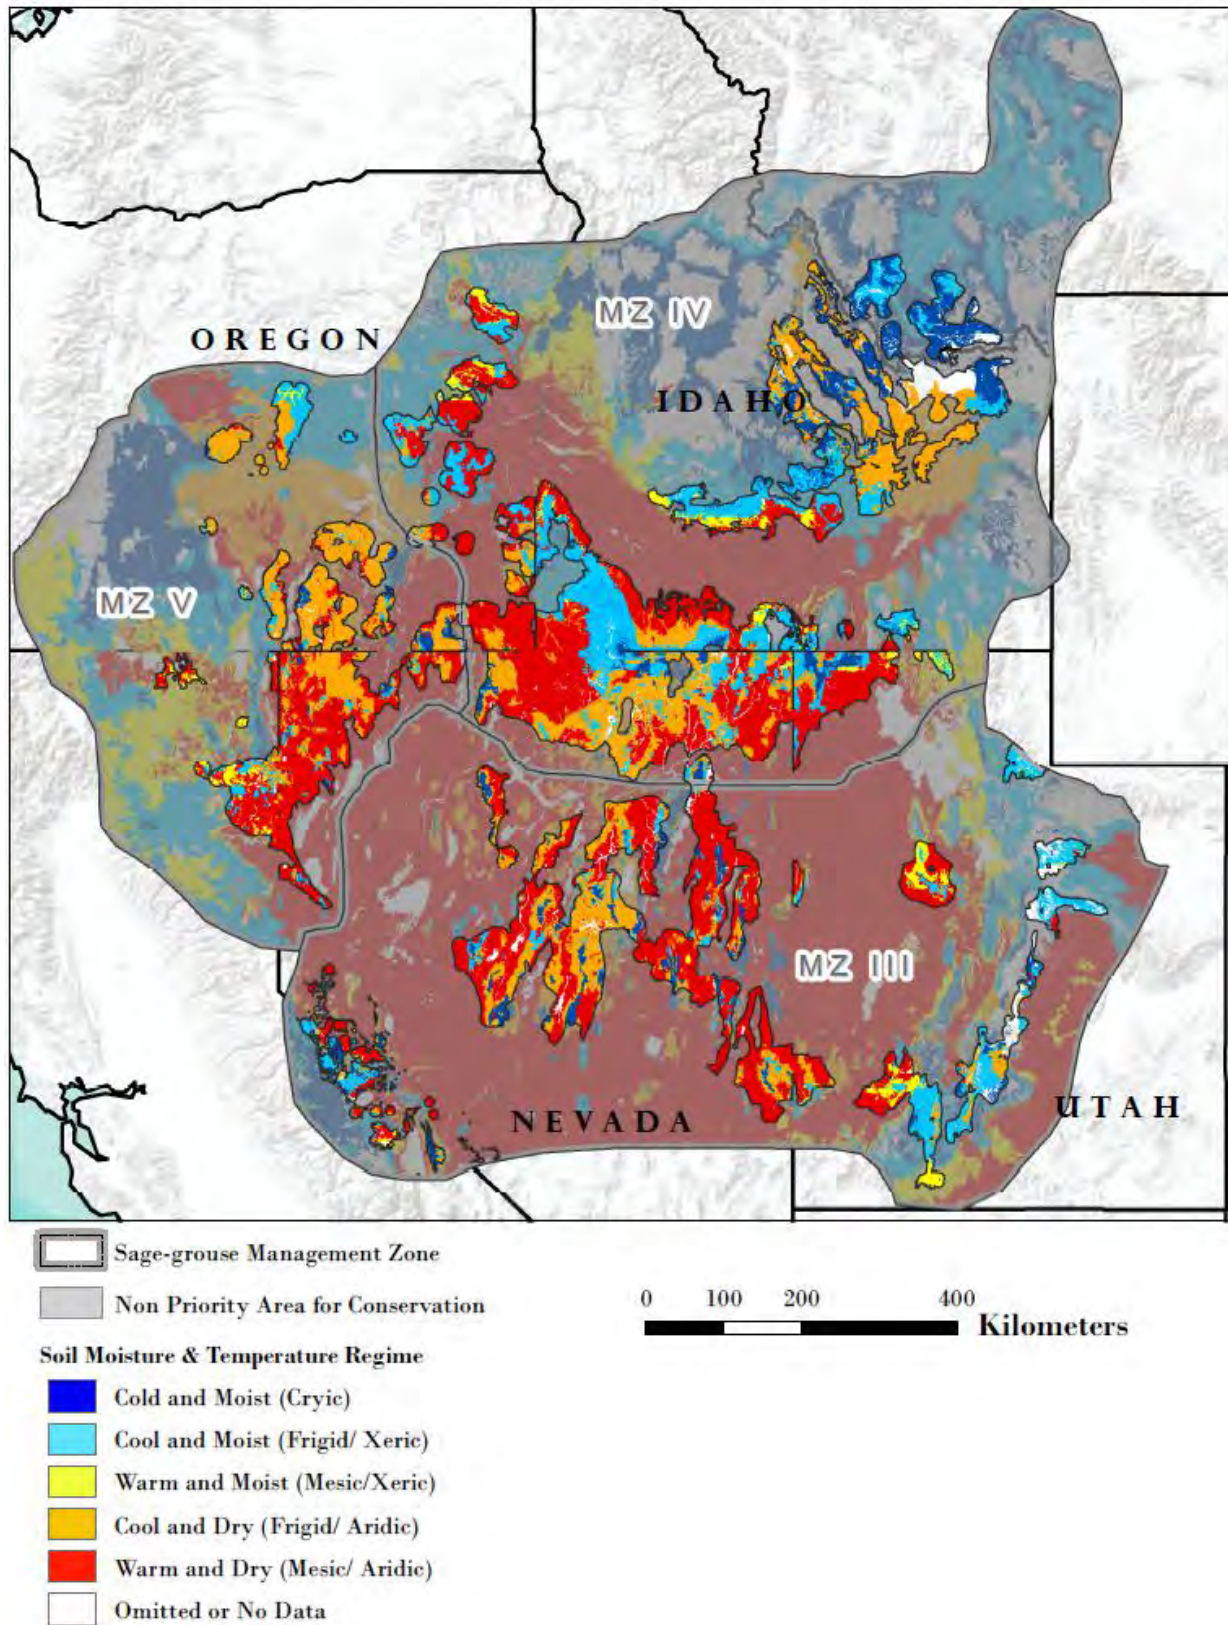

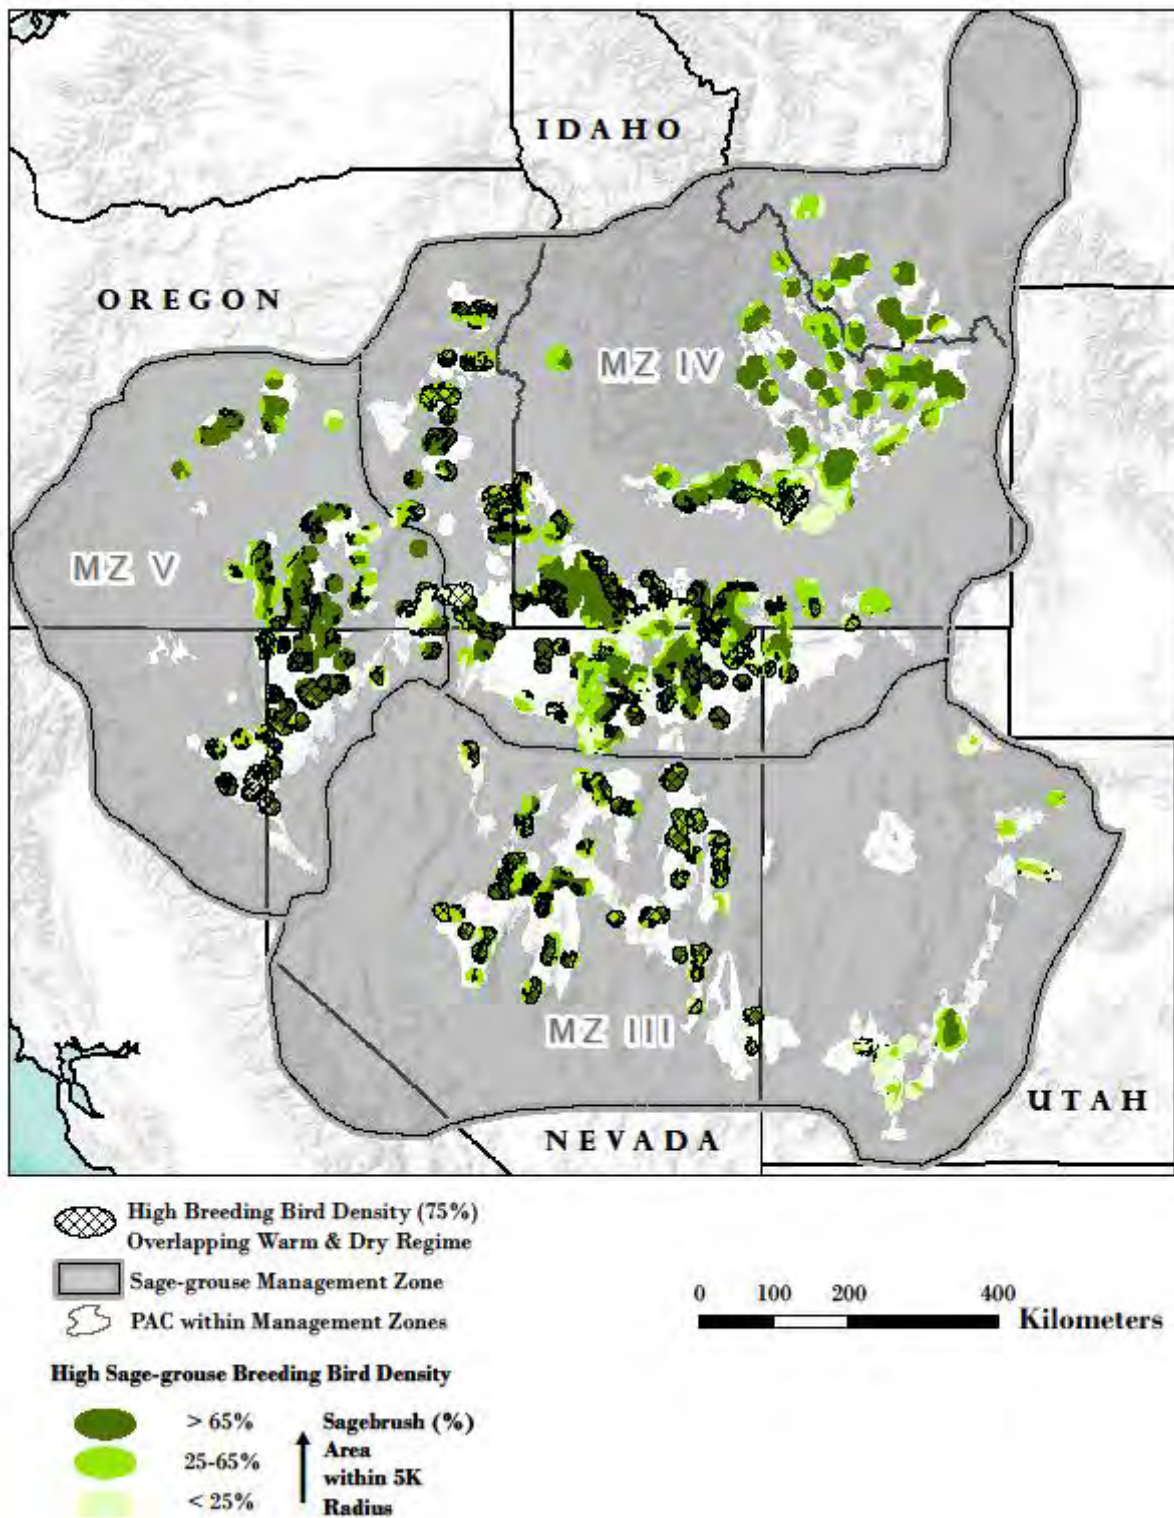

Figure 4, Soil Moisture and Temperature Regimes for Management Zones III, IV, and V

**Figure 5, Intersection of High Density (75% BBD) Populations.** The warm and dry sites and the proportion of these habitats in the three sagebrush landscape cover classes by management zone, and PACs within the Great Basin.

### Sagebrush Landscape Cover

The amount of the landscape in sagebrush cover is closely related to the probability of maintaining active sage-grouse leks, and is used as one of the primary indicators of sage-grouse habitat potential at landscape scales (Aldridge et al. 2008; Wisdom et al. 2011; Knick et al. 2013). For purposes of prioritizing landscapes for sage-grouse habitat management, FIAT used less than or equal to 25 percent sagebrush landscape cover as a level below which there is a low probability of maintaining sage-grouse leks, and greater than or equal to 65 percent as the level above which there is a high probability of sustaining sage-grouse populations with further increases of landscape cover of sagebrush (Aldridge et al. 2008; Wisdom et al. 2011; Knick et al. 2013). Increases in landscape cover of sagebrush have a constant positive relationship with sage-grouse lek probability at between about 25 percent and 65 percent landscape sagebrush cover (Knick et al. 2013). It is important to note that these data and interpretations relate only to persistence (i.e., whether or not a lek remains active), and it is likely that higher proportions of sagebrush cover may be required for population growth.

For the purposes of delineating sagebrush habitat relative to sage-grouse requirements for landscape cover of sagebrush, FIAT calculated the percentage of landscape sagebrush cover (Landfire 2013) within a 3-mile (5-kilometer) radius of each 98-foot by 98-foot (30 meter by 30 meter) pixel in Management Zones III, IV, and V (see Appendix 2 in Chambers et al. (*In prep.*) for how landscape sagebrush cover was calculated). FIAT then grouped the percentage of landscape sagebrush cover into each of the selected categories (0 to 25 percent, 25 to 65 percent, 65 to 100 percent; **Figure 6**, Sagebrush Landscape Cover and Fire Perimeters for the Analysis Area). Landfire data was based on 2000 satellite imagery so wildfire perimeters after that date were incorporated into this layer to better reflect landscape sagebrush cover. Burned areas were assumed to fall into the 0 to 25 percent landscape cover class.

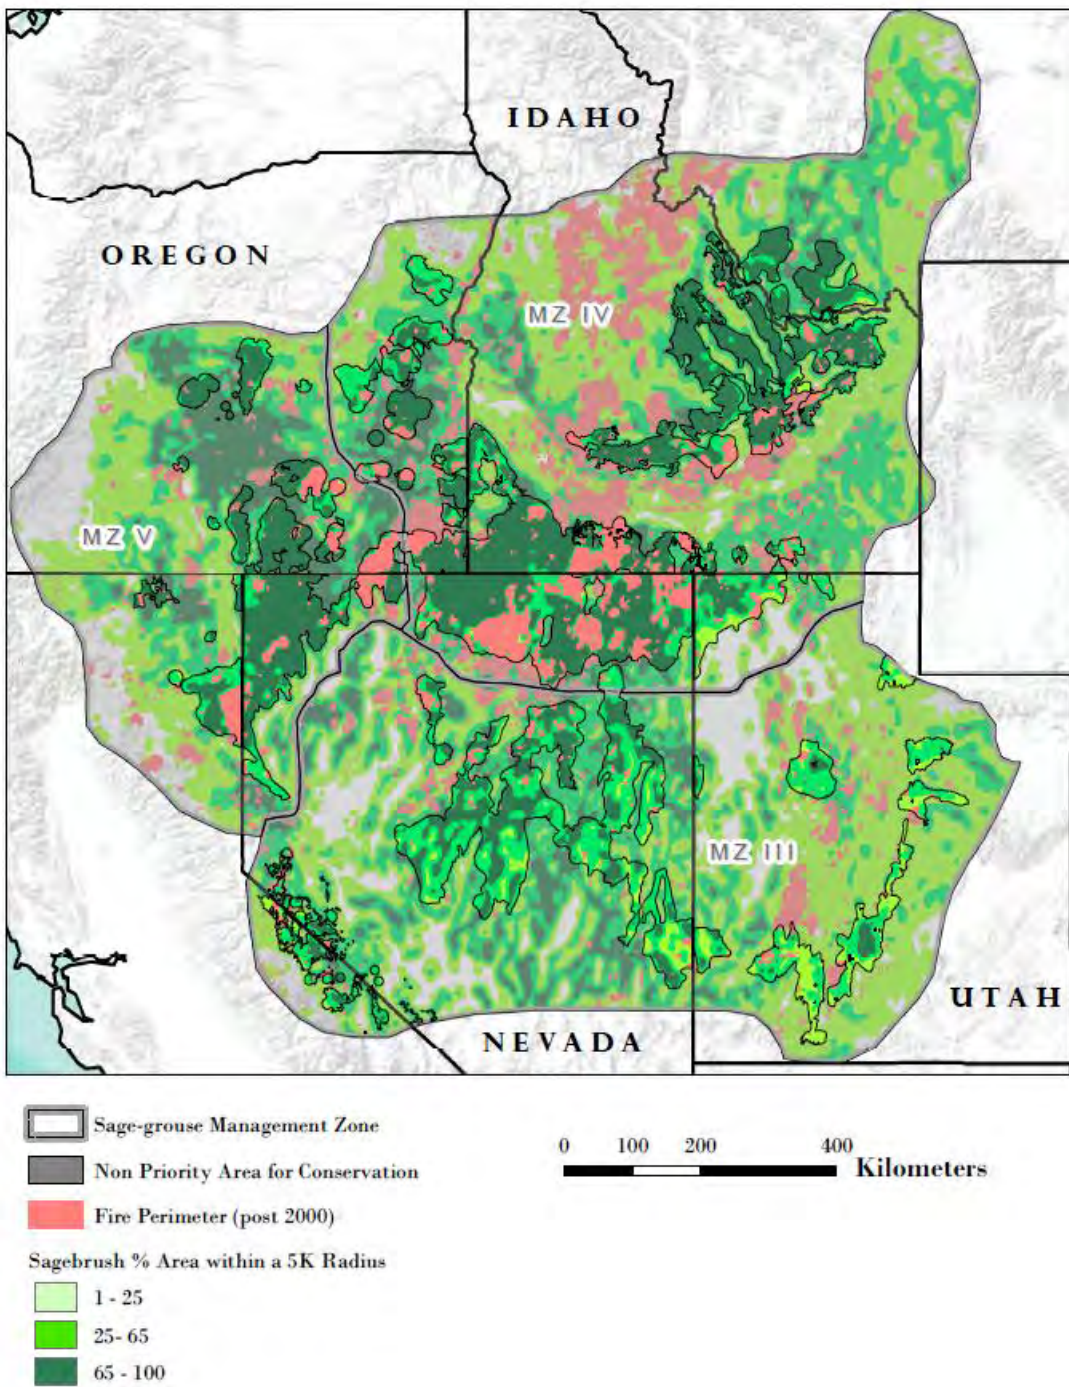

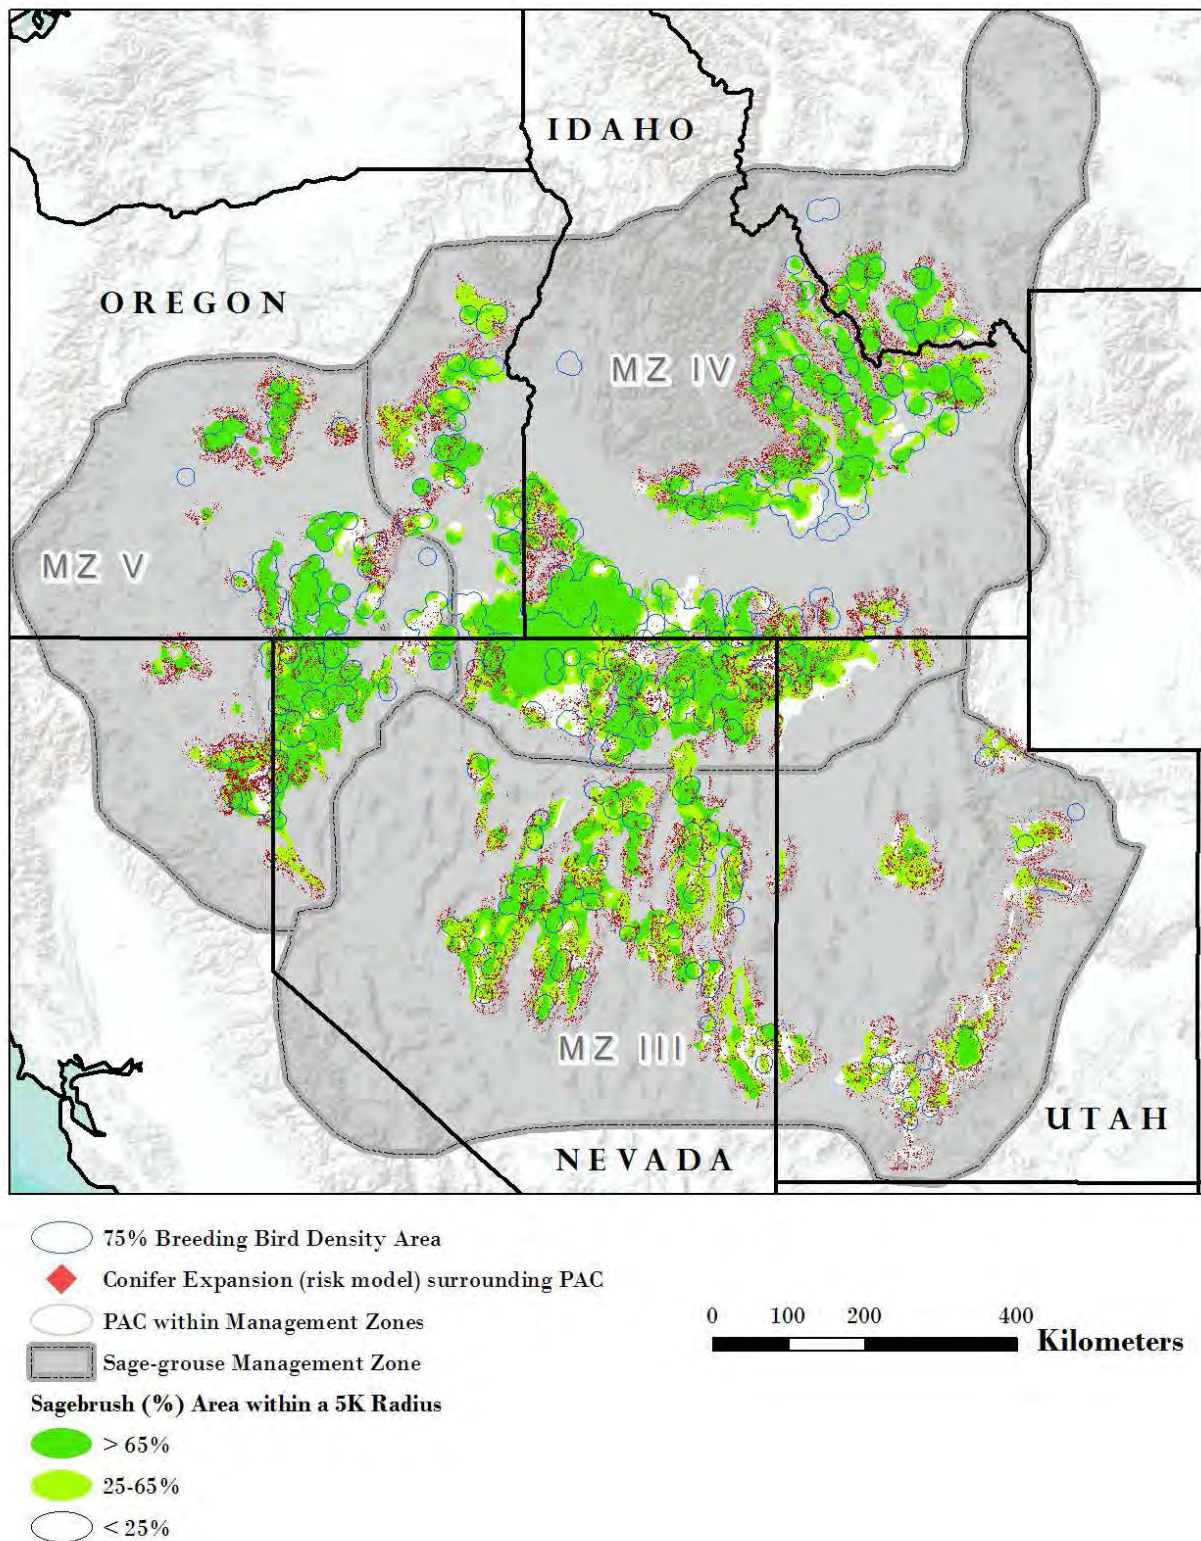

Figure 6, Sagebrush Landscape Cover and Fire Perimeters (post-2000) for the Analysis Area

### Conifer Expansion

Conifer expansion into sagebrush landscapes also directly reduces sage-grouse habitat by displacing shrubs and herbaceous understory as well as by providing perches for avian predators. Conifer expansion also leads to larger, more severe fires in sagebrush systems by increasing woody fuel loads (Miller 2013). Sage-grouse populations have been shown to be impacted by even low levels of conifer expansion (Baruch-Mordo et al. 2013). Active sage-grouse leks persist in regions of relatively low conifer woodland and are threatened by conifer expansion (Baruch-Mordo et al. 2013; Knick et al. 2013).

To estimate where sage-grouse breeding habitat faces the largest threat of conifer expansion, FIAT used a risk model developed by Manier et al. (2013) that locates regions where sagebrush landscapes occur within 250 meters of conifer woodland (**Figure 7**, Modeled Conifer Expansion for PACs with Greater Than 25% Sagebrush Landscape Cover In and Around 75% BBD). Although the model is coarse, it is available for the entirety of the three sage-grouse management zones analyzed. FIAT encourages using more accurate conifer expansion data in Step 2.

**Figure 7, Modeled Conifer Expansion for PACs with Greater Than 25% Sagebrush Landscape Cover In and Around 75% BBD**

## Step 1a. Identifying PACs and focal habitats

A primary goal for the conservation of sage-grouse populations is the identification of important habitats needed to ensure the persistence and recovery of the species. Loss of habitat, and by inference populations, in these habitats would likely imperil the species in the Great Basin. The first objective is to protect and restore those habitats that provide assurances for retaining large well connected populations.

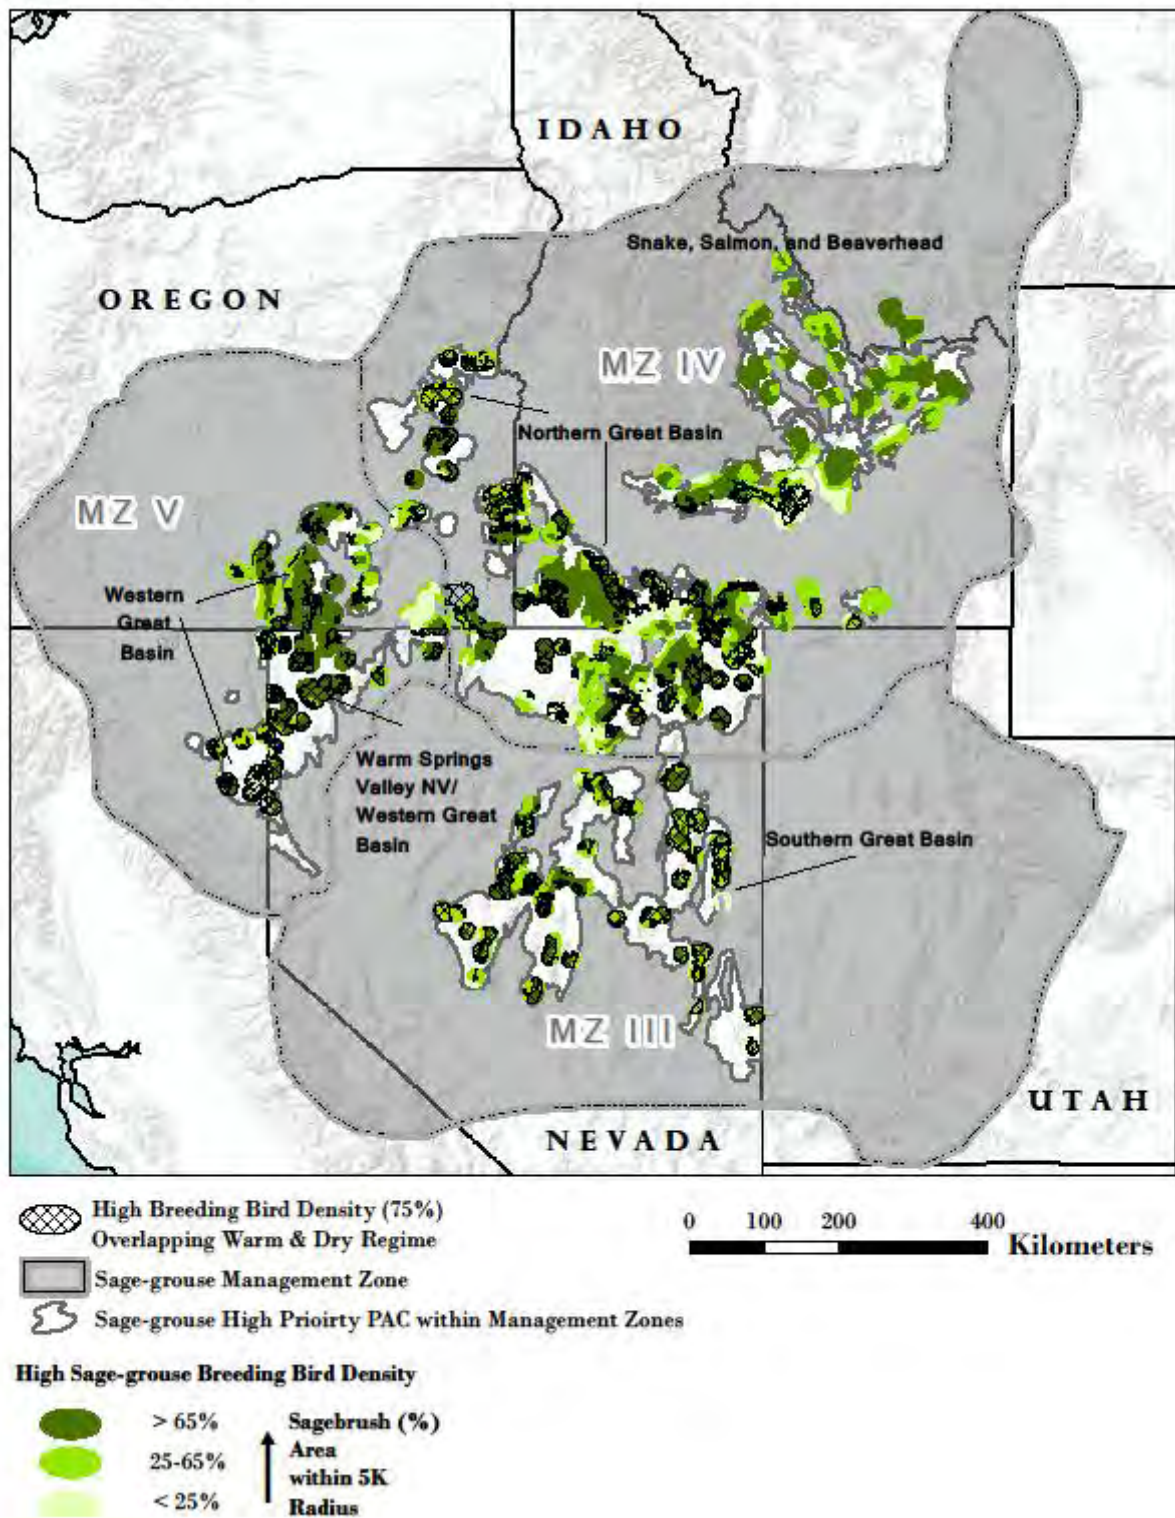

PACs and the 75 percent BBD maps were used to provide a first-tier stratification (e.g., focal habitats) for prioritizing areas where conservation actions could be especially important for sage-grouse populations. Although these areas are a subset of the larger sage-grouse habitats, they are readily identifiable and include habitats (e.g., breeding and nesting habitats that are considered critical for survival; Connelly et al. 2000; Holloran et al. 2005; Connelly et al. 2011) and necessary for the recovery of the species across its range.

The prioritization of habitats for conservation purposes was based on the several primary threats to remaining sage-grouse populations in the Great Basin including the loss of sagebrush habitats to wildfire and invasive annual grasses, and conifer expansion. The first, and probably the most urgent threat for sage-grouse, is the loss of sagebrush habitat due to wildfire and invasive annual species (e.g., cheatgrass; See Figure 11 in Chambers et al. [*In prep.*]). Areas of highest concern are those with low resistance to cheatgrass and low resilience after disturbance (warm/dry and some cool/dry temperature and moisture regimes sites) that are either **within or in close proximity** to remaining high density populations of sage-grouse (Figure 5). Sagebrush habitats (greater than 25 percent sagebrush landscape cover) prone to conifer expansion, particularly pinyon pine and/or juniper, are also a management concern when within or adjacent to high density sage-grouse populations (Figure 7).

Because these two threats occur primarily at different points along an elevational gradient and are associated with different soil temperature and moisture regimes, separate approaches are used to select PACs and focal habitats for each.

### **High Density Populations at Highest Risk from Wildfire and Invasive Annual Grasses**

PACs in Management Zones III, IV, and V. were evaluated on the basis of high density (75 percent) BBDs, sagebrush landscape cover, and soil temperature and moisture regimes to identify initial PACs that are a priority for assessments and associated focal habitats. **Figure 8**, High Priority PACs with High Density Sage-Grouse Populations (75% BBD), displays the results of the analysis focusing on the intersection of high density (75 percent BBD) populations, the warm and dry sites, and the proportion of these habitats in the three sagebrush landscape cover classes by management zone, and PACs within the Great Basin. **Table 1**, Relative Ranking of PACs Based on High Density (75% BBD) Populations, Warm/ Dry Sites, and Percentage of Habitat in Sagebrush Landscape Cover Classes, displays quantitative outputs of this analysis. The table allows a comparison of these data, and assists in selecting five PACs that provide the greatest contribution to high density sage-grouse populations, and the amounts (acres and proportion) within those PACs of sagebrush cover classes associated with warm and dry soil temperature and moisture regimes.

**Figure 8, High Priority PACs with High Density Sage-Grouse Populations (75% BBD) sagebrush landscape cover classes, and areas with low resistance and resilience relative to wildfires and invasive annual species.**

**Table 1, Relative Ranking of PACs Based on High Density (75% BBD) Populations, Warm/ Dry Sites, and Percentage of Habitat in Sagebrush Landscape Cover Classes**

Sage-grouse Management Zone	Sage-grouse Priority Area for Conservation (PAC) Name	Total PAC Acres	Breeding Bird Density (75%) Acres	Percent of Breeding Bird Density (75%) Area within PAC	Warm and Dry Soil Moisture & Temperature Regime within Breeding Bird Density (75%) Acres*		
					0-25% Sagebrush Landscape Cover	25%-65% Sagebrush Landscape Cover	65%+ Sagebrush Landscape Cover

\* Numbers in parenthesis indicate the percent of acres relative to total acres of breeding bird density (75%)

These five PACs comprise 90 percent and 95 percent of remaining PAC sagebrush landscape cover in the 25 to 65 percent and greater than or equal to 65 percent sagebrush landscape cover classes, respectively, of the 75 percent BBD associated with low resistance/resilience habitats. The 75 percent BBD habitats in the Northern, Southern Great Basin, and Warm Spring PACs appear particularly important for two reasons. They represent a significant part of the remaining habitats for the Great Basin metapopulation, and they have the greatest amount of low resiliency habitat remaining that still functions as sage-grouse habitat.

An examination of the 5 selected PACs shows that the sum of the 75 percent BBD within these PACs is 16,995,496 acres (**Table 2**, PACs with the Highest Acres and Proportions of 75% BBD acres, and Acres and Proportions of 75% BBD Acres within the Warm/Dry Soil Temperature and Moisture Class). These are the **focal habitats**. These five PACs constitute 84 percent of the 75 percent BBD low resiliency habitats for all Management Zones III, IV, and V PACs. Within and immediately around these focal habitats, 5,751,293 acres are in high BBD areas with landscape sagebrush cover in the 25-65 percent and  $\geq 65$  percent classes and in the warm and dry soil temperature and moisture regimes. These are the habitats in the most danger to loss due to their low resistance to invasive annual grasses and low resilience following wildfire. Within the focal habitats in the high priority PACs, low resistance and resilience areas (cross-hatched areas in Figure 8) are a high priority (emphasis area) for implementing management strategies. Applying management strategies outside the emphasis areas are appropriate if the application of fire operations and fuels management activities will be more effective in addressing wildfire threats.

**Table 2, PACs with the Highest Acres and Proportions of 75% BBD acres, and Acres and Proportions of 75% BBD Acres within the Warm/Dry Soil Temperature and Moisture Class (see Figure 8)**

PAC	PAC Acres	Acres of 75% BBD in PAC ( <b>focal habitat</b> )	Proportion of 75% BBD within PACs	Warm & Dry Soils within 75% BBD by Sagebrush Landscape Cover Classes Greater Than 25%*	
				25-65%	>65%
Northern Great Basin	13,045,515	7,383,442	0.57	674,517(9%)	1,745,163(24%)
Southern Great Basin	9,461,355	3,146,056	0.33	792,780(25%)	1,062,091(34%)
Snake, Salmon, and Beaverhead	5,477,014	2,823,205	0.52	89,146(3%)	95,970(3%)
Warm Springs Valley NV/Western Great Basin	3,520,937	1,558,166	0.44	207,365(13%)	741,353(48%)
Western Great Basin	3,177,253	2,084,626	0.66	140,141(7%)	202,767(10%)
<b>Total for 5 PACS</b>	<b>34,682,074</b>	<b>16,995,496</b>	<b>0.49</b>	<b>1,903,949</b>	<b>3,847,344</b>

\* This category represents the emphasis areas for applying appropriate management strategies in or near the focal habitats due to the lower probability of recovery after disturbance and higher probability of invasive annual grasses and existing wildfire threats.

### High Density Sage-Grouse Habitats at Risk from Conifer Expansion

PACs, sagebrush landscape cover, and the 75 percent BBD data were also used in conjunction with the conifer expansion data (Mainer et al. 2013) to provide an initial stratification to determine PACs where conifer removal would benefit important sagebrush habitats. Conifer expansion threats are primarily western juniper in the northern Great Basin and pinyon pine/Utah juniper in the southern Great Basin.

Figure 7 displays results of the analysis focusing on the intersection of the 75 percent BBD, and modeled conifer expansion areas within two sagebrush landscape cover classes by management zone and PACs within the Great Basin. To identify high density sage-grouse areas affected by conifer expansion, the amount and proportion of acres estimated to be affected were calculated by sagebrush cover class to assist in the identification of the focal habitats (**Table 3**). **Table 4**, displays quantitative outputs of this analysis using the 25 to 65 percent and greater than 65 percent landscape sagebrush cover classes for the PACs. Thus, **focal habitats** for addressing conifer expansion are the areas within and near conifer expansion in sagebrush landscape cover classes of 25 to 65 percent and greater than 65 percent. Conifer expansion in these two sagebrush landscape cover classes in the 75 percent BBD areas constitutes an emphasis area for treatments to address conifer expansion. Landscapes with less than 25 percent sagebrush cover may require significant additional management actions to restore sagebrush on those landscapes and therefore were considered a lower priority for this analysis. Focal habitats are identified in Table 4 and displayed in **Figure 9**.

Table 3 assists in identifying those PACs that provide the greatest contribution to high density sage-grouse populations, and the amounts (acres and proportion) within those PACs of sagebrush cover classes associated with modelled conifer expansion areas. Although there are uncertainties associated with the model, the results help managers identify specific geographic areas where treatments in conifer (pinyon and/or juniper) could benefit existing important sage-grouse populations.

The results of the screening revealed 5 PACs that contribute substantially to the 75 percent BBD habitats and are currently impacted most by conifer expansion (primarily pinyon pine and/or juniper; Table 4 and Figure 9). Four of the five PACs identified as high priority for conifer expansion treatments were also high priorities for wildfires and invasive annual grass threats. This is likely due to the size of the PACs and the relative importance of these PACs for maintaining the Great Basin sage-grouse meta-populations. As expected, the locations of high density sage-grouse habitats affected by conifer expansion differ spatially from those associated with low resilience habitats within and among the PACs, primarily due to differences in the biophysical settings (e.g., elevation and rainfall) that contribute to threats from invasive annual grasses and wildfires.

Three PACs (Snake/Salmon/Beaverhead, Southwest Montana, and Northern Great Basin/Western Great Basin) ranked high due to their relatively large proportion of high density breeding habitats (Table 3), but were not selected since the threat of conifer expansion was relatively low. One PAC, (Snake/Salmon/Beaverhead, was identified as a potential high priority area but was dismissed because results of the conifer expansion model likely overestimated impacts due to the adjacent conifer forests in this region. The COT Report also identified conifers as a “threat present but localized” in these areas, whereas, the top five PACs prioritized all have conifers identified as a widespread priority threat to address (USFWS 2013).

**Table 3, Relative Ranking of PACs Based on High Density (75% BBD) Populations, Modeled Conifer Expansion, and Percentage of Habitats in Sagebrush Landscape Cover Classes**

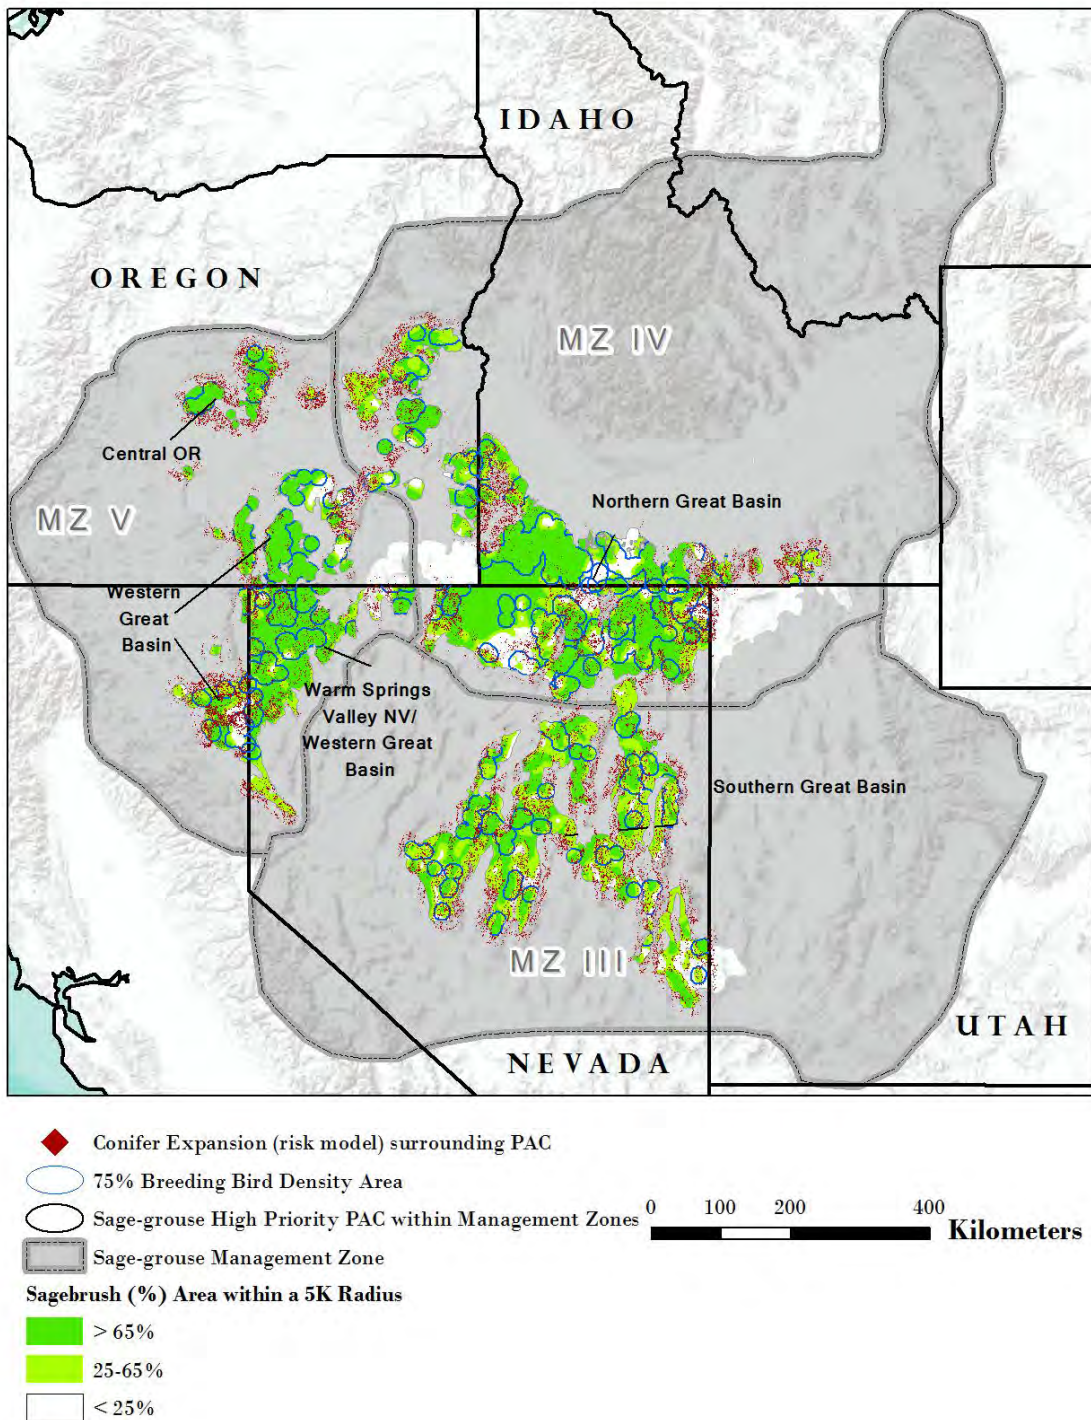

Sage-grouse Management Zone	Sage-grouse Priority Area for Conservation (PAC) Name	PAC acres	Breeding Bird Density (75%) Acres	Relative Proportion of Breeding Bird Density Area within PAC	Conifer Expansion (Modeled) Acres*

**Figure 9, Five PACs Significantly Impacted by Conifer Expansion** that contribute substantially to the 75% BBD and that have sagebrush landscape cover greater than 25%.

While the coarse-scale conifer expansion data used in this analysis likely over estimates the extent of the pinyon pine and/or juniper threat, results suggest that far fewer acres are currently affected by conifers than might be at risk from fire and invasive annual grasses impacts. Conifer expansion into sage-grouse habitats occurs at a slower rate, allowing more time for treatment, but early action may be needed to prevent population level impacts on sage-grouse (Baruch-Mordo et al. 2013). Furthermore, conifer expansion is primarily occurring on cooler and moister sites that are more resilient and where restoration is more likely to be effective (Miller et al. 2011), providing managers the opportunity to potentially offset at least some habitat loss expected to continue in less resilient ecosystems. While the available data set used to estimate conifer expansion provides only a coarse assessment of the problem, considerable efforts are currently underway to map conifers across sage-grouse range. These maps are expected to be available in the near future and should be used by land managers to better target project level conifer removal.

FIAT cautions against using the plotted locations of estimated conifer expansion for local management decisions due to the coarse-scale nature of this range-wide data set. Conifer expansion estimates are primarily provided here to aid in judging the relative scope of the threat in each PAC.

## Step 1b. Potential Management Strategies

Potential management **strategies** (e.g., fuels management, habitat recovery/restoration, fire operations, post-fire rehabilitation) to conserve or restore Step 1 focal habitats are described below to assist local management units to initiate Step 2. These examples are illustrative and do not contain the full range of management strategies that may be required to address wildfires, invasive annual grasses, and conifer expansion within PACs and associated focal habitats. In general, the priority for applying management strategies is to first maintain or conserve intact habitat and second to strategically restore habitat (after a wildfire or proactively to reconnect habitat). Management strategies will differ when applying the protocol to:

**Wildfire and Invasive Annual Grass.** (See PACs identified in Table 2 and focal habitats shown in Figure 8). Focal habitats, as they relate to wildfires and invasive annual grasses, are defined as sage-grouse habitat in priority PACs within 75 percent BBD. Within these focal habitats, sagebrush communities with low resilience to disturbance and resistance to invasive annual grasses (warm and dry soil temperature and moisture regimes) are an emphasis area for management actions. Appendix 5 (A) in Chambers et al. (*In prep.*) includes a generalized state and transition model with an invasive annual grass component and warm and dry soil temperature and moisture regime associated with 8 to 12 inches of annual precipitation. This state and transition models is useful in developing management strategies to deal with annual grass issues as it contains useful restoration pathways.

Burn Probability is another tool that can be used to assist managers to identify the relative likelihood of large fire occurrence across the landscape within PACs and focal habitats. Burn probability raster data were generated by the Missoula Fire Lab using the large fire simulator - FSim - developed for use in the national Interagency [Fire Program Analysis \(FPA\)](#) project. FSim uses historical weather data and LANDFIRE fuel model data to simulate fires burning. Using these simulated fires, an overall burn probability is returned by FSim for each 270m pixel. The burn probability data was overlaid spatially with PACs, soil data, and shrub cover data. The majority of the high and very high burn probability acres lie within the top 5 PACs and are within areas with >25% sagebrush cover. Several of the other PACs have a greater overall percentage of the warm/dry soil regime with high/very high burn probability (northern great basin, baker, and NW interior NV) but the total acres are relatively few. Areas identified with high and very high burn probability are most likely to experience large fires given fire history, fuels, weather and topography. Results are displayed in the table 5 and Figure 10.

**Table 5, Percentages of sage-grouse PAC areas with high and very high burn probability, 75% BBD within PAC, 75% BBD and warm dry/temperature regime, and 75% BBD and warm dry/temperature and warm dry/temperature with high and very high burn probability.**

<b>Sage Grouse Management Zone</b>	<b>Sage-grouse Priority Area for Conservation (PAC) Name</b>	<b>Total PAC Acres</b>	<b>High, very high burn probability (percent of PAC acres)</b>	<b>75% BBD within PAC (percent PAC acres)</b>	<b>75% BBD and warm and dry soil/temperature regime acres (percent PAC acres)</b>	<b>75% BBD and warm and dry soil/temperature regime with high, very high burn probability (percent PAC acres)</b>

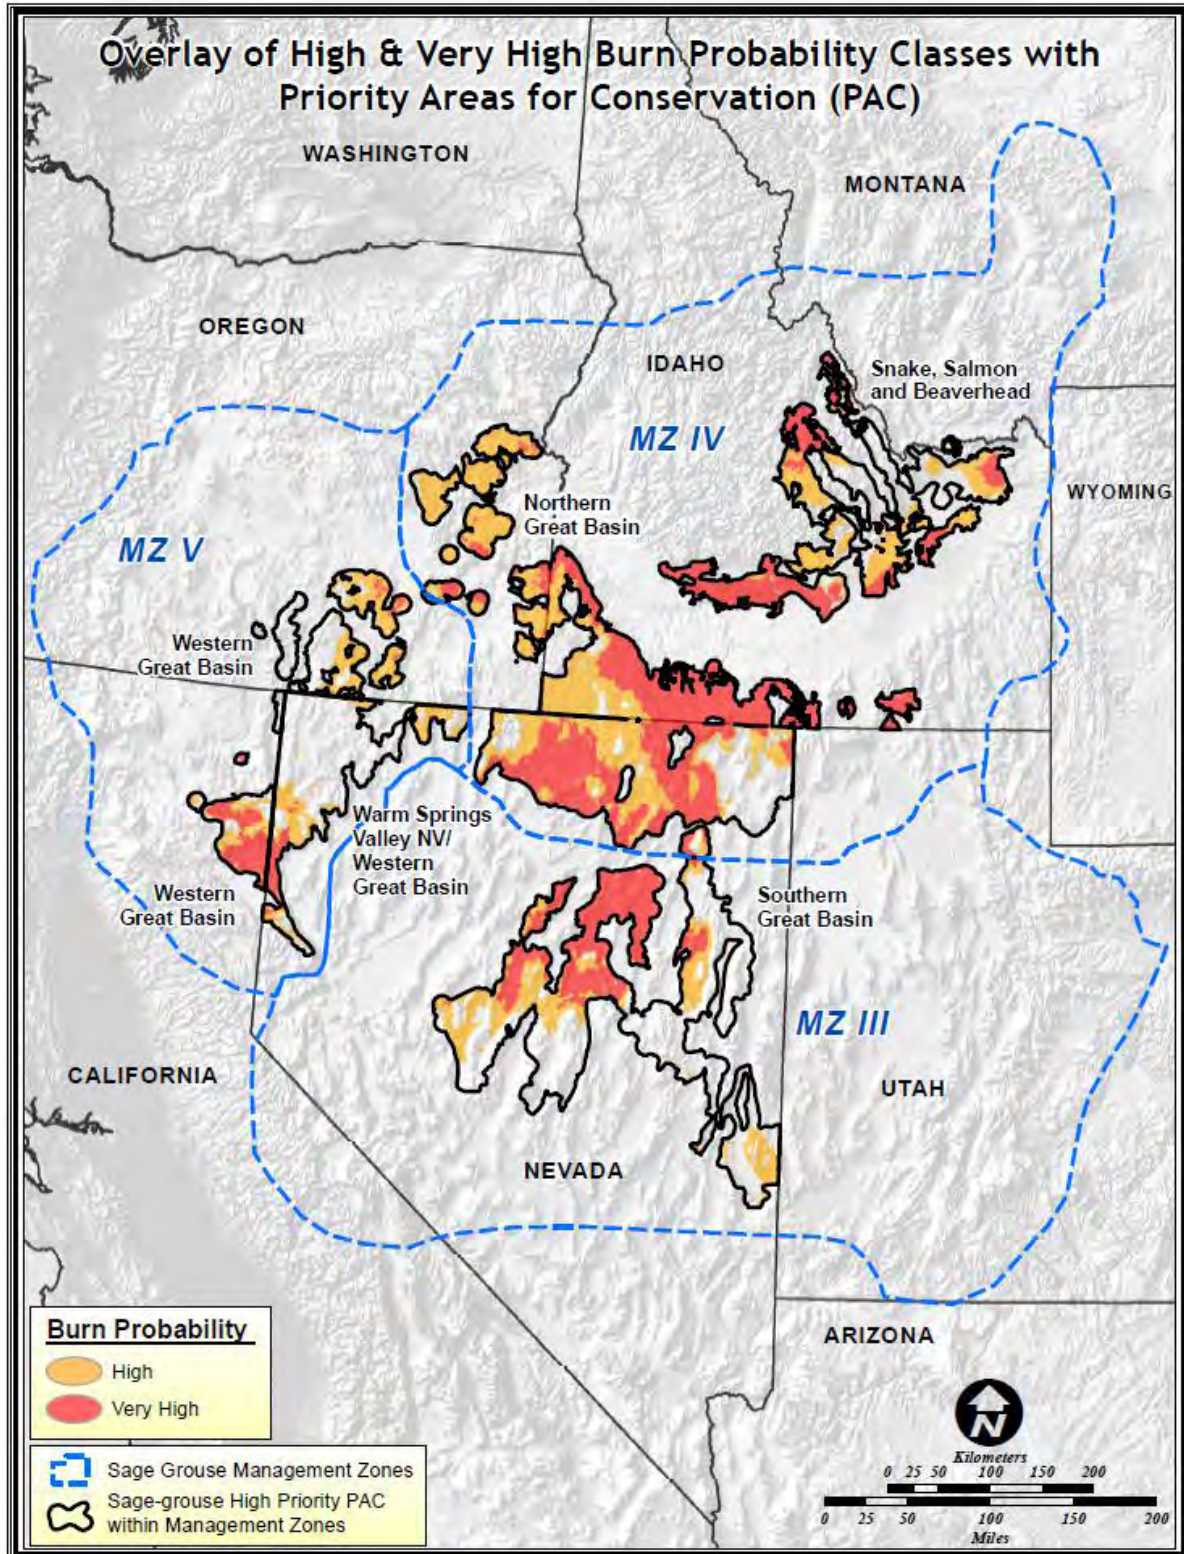

Figure 10, Burn Probability (high and very high) in priority invasive annual grass and wildfire PACs.

**Conifer Expansion.** (See priority PACs for assessment identified in Table 4 and focal habitats shown in Figure 9). Focal habitats, as they relate to conifer expansion, are defined as sage-grouse habitat in a priority PAC with sagebrush landscape cover between 25 and 100 percent that is either near or in a conifer expansion area. The relationship between conifer expansion and resilience to disturbance and resistance to expansion is not documented to the same degree as with invasive annual grasses. However, Appendix 5 (D. and E.) in Chambers et al. (*In prep.*) includes two generalized state and transition models for conifer expansion with warm to cool and soil temperature regimes associated with precipitation ranges from 12 to 14 or more inches of annual precipitation. These state and transition models are useful in developing management strategies to deal with conifer expansion as they contain useful restoration pathways.

Chambers et al. (*In prep.*) is recommended for review at this point for information on applying resistance and resilience concepts along with sage-grouse habitat characteristics to develop management strategies to address wildfires, invasive annual grasses, and conifer expansion. The following tables are recommended for use in developing management strategies in or near focal habitats:

Table 1. Soil temperature and moisture regimes relationship to vegetation types and resistance and resilience.

Table 2. Sage-grouse habitat matrix showing the relationship between landscape sagebrush cover and resistance and resilience.

Table 3. Potential management strategies based on sage-grouse habitat requirements and resistance and resilience.

Table 4. Management strategies (fire suppression, fuels management, post-fire rehabilitation, and habitat restoration) associated with each cell in the sage-grouse habitat matrix (Table 2).

The “Putting it all together” section of the Chambers et al. (*In prep.*) also contains a case study from Northeast Nevada illustrating applications of management strategies to address the conservation, protection, and restoration of sage-grouse habitat.

To further assist in understanding Step 1b, examples of general priorities for management strategies are provided below and illustrated in Appendix 3 and 4:

1. Fuels Management: Projects that are designed to change vegetation composition and/or structure to modify potential fire behavior for the purpose of improving fire suppression effectiveness and limiting fire spread and intensity.
  - a. Identify priorities and potential measures to reduce the threats to sage-grouse habitat resulting from changes in invasive annual grasses (primary focus on exotic annual grasses and conifer encroachment) and wildland fires. Place high priority on areas dominated by invasive annual grasses that are near or adjacent to low resistance and resilience habitats that are still intact.

- b. Areas on or near perimeter of successful post-fire rehabilitation and habitat restoration projects where threats of subsequent fire are present are important for consideration.
  - c. Fuels management can be a high priority in large tracts of intact sagebrush if impacts on sage-grouse populations are minimal and outweighed by the potential benefits of reduced wildfire impacts in area being protected.
  
- 2. Habitat Recovery/Restoration Recovery (passive restoration) is a high priority in intact sagebrush stands to improve resistance and resilience before a disturbance. For example, where understory perennial herbaceous species are limited, improved livestock grazing practices can increase the abundance of these species and promote increased resistance to annual grasses.
  - a. Habitat restoration is important where habitat connectivity issues are present within focal habitats.
  - b. Pinyon pine and/or juniper removal in Phase I and II stands adjacent to large, contiguous areas of sagebrush (greater than 25 percent sagebrush landscape cover) is a priority.
  
- 3. Fire Operations (includes preparedness, prevention and suppression activities).
  - a. Higher priority should be placed on areas with greater than 65 percent cover than on areas with 25 to 65 percent cover, followed by 0 to 25 percent cover (these categories are continuums not discrete thresholds).
  - b. Higher priority should be placed on lower resistance/resilience habitats compared with higher resistance/resilience habitats.
  - c. Fire operations in areas restored or post-fire rehabilitation treatment where subsequent wildfires can have detrimental effect on investment and recovery of habitat are important for consideration.
  - d. Fire operations (suppression) are especially important in low elevation winter sagebrush habitat with low resistance and resiliency.
  
- 4. Post-Fire Rehabilitation
  - a. High priority should be placed on supporting short-term natural recovery and long-term persistence in higher resistance and resiliency habitats (with appropriate management applied).
  - b. High priority should be placed on reseeding in moderate to low resistance and resiliency habitats, but only if competition from invasive annual grasses, if present, can be controlled prior to seeding.

## Step 2

Step 2 is carried out by local management units using the Step 1 geospatial data, focal habitats, and the associated management strategies. Step 2 includes evaluating the availability and accuracy of local information and geospatial data used to develop local management strategies in or near focal habitats (Step 2a).

It also involves developing focal habitat activity/implementation plans that include prioritized management tactics and treatments to implement effective fuels management, habitat recovery/restoration, fire operations, and post-fire rehabilitation (Step 2b). These activity/implementation plans will serve as the basis for NEPA analysis of site-specific projects.

## **Step 2a- Review of Step 1 Data and Incorporation of Local Information**

Evaluate the accuracy and utility of Step 1 geospatial layers for focal habitats by incorporating more accurate or locally relevant:

- Vegetation maps (especially sagebrush cover)
- Updated or higher resolution conifer expansion layers (if applicable)
- Soil survey and ecological site descriptions
- Weather station, including Remote Automatic Weather Stations, data
- PACs, focal habitats, winter habitats, sage-grouse population distributions (i.e., more recent BBD surveys)
- Maps of cheatgrass and other invasive annual grasses that degrade sage-grouse habitat
- Wildfire polygons including perimeters and unburned islands within burn polygons
- Treatment locations and success (consult US Geological Survey Land Treatment Digital Library at <http://ltdl.wr.usgs.gov/>). The Land Treatment Digital Library allows the user to search on treatment results on an ecological site basis.
- Models and tools to help inform management strategies. For example, data which characterizes wildfire potential can help identify risk to focal habitats and help plan fire suppression and fuels management strategies to address these risks.
- Rapid Ecoregional Assessments
- Land Use Plans
- Appropriate monitoring or inventory information
- Any other geospatial data or models that could improve the accuracy of the assessment process

It is essential that subregional or local information and geospatial data be subjected to a quality control assessment to ensure that it is appropriate to use in developing Step 2b activity and implementation plans. Since PACs and focal habitats usually transcend multiple administrative boundaries, a collaborative approach is highly recommended for Step 2a.

A series of questions tied to the management strategies described in the Introduction section follows to assist managers in developing the framework to complete Step 2b (development of activity/implementation plans). The questions that follow apply to the focal habitats (and buffer areas around focal areas where management strategies may be more effectively applied) and will help in developing coordinated implementation/activity plans. These questions should not limit the scope of the assessment and additional questions relative to local situations are encouraged. These questions portray the minimum degree of specificity for focal habitats in order for offices to complete Step 2a.

### Fuels Management

1. Where are the priority fuels management areas (spatially defined treatment opportunity areas that consider fire risk, fuels conditions, and focal habitats [including areas adjacent to focal habitats])?
2. Based on fire risk to focal habitats, what types of fuels treatments should be implemented to reduce this threat (for example, linear features that can be used as anchors during suppression operations)?
3. Considering resistance/resilience concepts and the landscape context from Step 1, where should treatments be applied in and around focal habitats to:
  - a. Constrain fire spread?
  - b. Reduce the extent of conifer expansion?
  - c. Augment future suppression efforts by creating fuel breaks or anchors for suppression?
4. Based on opportunities for fire to improve/restore focal habitats, what types of fuels treatments should be implemented to compliment managed wildfire by modifying fire behavior and effects?
5. Are there opportunities to utilize a coordinated fuels management approach across jurisdictional boundaries?
6. What fuel reduction techniques will be most effective that are within acceptable impact ranges of local sage-grouse populations, including but not limited to grazing, prescribed fire, chemical, and biological and mechanical treatments? Will combinations of these techniques improve effectiveness (e.g., using livestock to graze fine fuels in a mowed fuel break in sagebrush)?

### Habitat Recovery/Restoration

1. Are there opportunities for habitat restoration treatments to protect, enhance or maintain sage-grouse focal habitat especially to restore connectivity of focal area habitat?
2. Considering the resistance and resilience GIS data layer (Figure 4) and the Sage-Grouse Habitat Matrix (Chambers et al. *In prep.*; Table 2), where and why would passive or active restoration treatments be used?
3. What are the risks and opportunities of restoring habitat with low resistance and resilience including the warm/dry and cool/dry soil moisture/temperature regime areas?
4. Are there opportunities to utilize a coordinated approach across jurisdictional boundaries to effectively complete habitat restoration in focal habitats?

### Fire Operations

1. Where are priority fire management areas (spatially defined polygons having the highest need for preparedness and suppression action)?

2. Where are the greatest wildfire risks to focal habitats considering trends in fire occurrence and fuel conditions (see Figure 10)?
3. Where do opportunities exist that could enhance or improve suppression capability in and around focal habitats?
  - a) For example, increased water availability through installation of helicopter refill wells or water storage tanks.
  - b) Decreased response time through pre-positioned resources or staffing remote stations.
4. Should wildfire be managed (per land use plan objectives) for improving focal habitat (e.g., reducing conifer expansion), and if so where, and under what conditions?
5. How can fire management be coordinated across jurisdictional boundaries to reduce risk or to improve focal habitats?

### **Post-fire Rehabilitation**

1. Where are areas that are a high priority for post-fire rehabilitation to improve habitat connectivity if a wildfire occurs?
2. Which areas are more conducive (higher resistance and/or resilience) to recovery and may not need reseeding after a wildfire?
3. What opportunities to build in fire resistant fuel breaks to reduce the likelihood of future wildfires impacts on seeded or recovering areas?
4. Are there opportunities to utilize a coordinated approach across jurisdictional boundaries to implement rehabilitation practices?

The outcome of Step 2a is the assembly of the pertinent information and GIS layers to assist managers in developing implementation or activity plans to address wildfires, invasive annual grasses, and conifer expansion in focal habitats. Activity plans generally refer to plans where management of a resource is changed (livestock grazing plans) whereas implementation plans are generally associated with treatments.

### **Step 2b- Preparation of Activity/Implementation Plans**

Activity/implementation plans are prepared to implement the appropriate management strategies within and adjacent to focal habitats. Since focal habitats cross jurisdictional boundaries, it is especially important that a collaborative approach be used to develop implementation/activity plans. The process of identifying partners and creating collaborative teams to develop these plans is a function of state, regional, and local managers and is not addressed as part of this step.

Implementation/activity plans are required to:

1. Address issues in and around focal habitats related to wildfires, invasive annual grasses, and conifer expansion

2. Use resistance to invasive annual grasses and resilience after disturbance (where appropriate) as part of the selection process for implementing management strategies
3. Emphasize application of management strategies within or near focal habitats with low resistance and resilience (warm/dry and cool/dry soil moisture/temperature regimes) invasive annual grasses and wildfires
4. Use the best available local information to inform the assessment process
5. Encourage collaboration and coordination with focal habitats across jurisdictional boundaries
6. Be adaptive to changing conditions, disturbances, and modifications of PAC boundaries

FIAT recommends considering other factors, such as adaptive management for climate change, local sagebrush mortality due to aroga moth or other pests, and cheatgrass die-off areas in developing activity/implementation plans. The latter two factors could influence where and what kind of management strategies may be needed to address the loss of habitat or changes in fuel characteristics (e.g., load and flammability) associated with these mortality events.

The following recommendations are provided to assist in the preparation of activity/implementation plans:

### **Fuels Management**

1. Spatially delineate priority areas for fuel management treatments per Step 2a information considering:
  - a. Linear fuel breaks along roads
  - b. Other linear fuel breaks to create anchor points
  - c. Prescribed burning which would meet objectives identified in the Fish and Wildlife Service's Conservation Objectives Team (COT) report
  - d. Mechanical (e.g., treatment of conifer expansion into sagebrush communities)
  - e. Other mechanical, biological, or chemical treatments
  - f. If they exist, spatially delineated areas where fuel treatments would increase the ability to use fire to improve/enhance focal habitats.
2. Identify coordination needed between renewable resource, fire management, and fuels management staff to facilitate planning and implementation of fuels treatments.
3. Quantify a projected level of treatment within or near focal habitats.
  - a. Identify treatments (projects) to be planned within or near focal habitats.
  - b. Include a priority and proposed work plan for proposed treatments.

### **Habitat Recovery/Restoration**

1. Spatially delineate priority areas for restoration, using criteria established in Step 2a. Priority areas for restoration should be delineated by treatment methods:
  - a. Seeding priority areas
  - b. Invasive annual grasses priority treatment areas (herbicide, mechanical, biological, combination)

- c. Priority areas requiring combinations of treatments (e.g., herbicide followed by seeding).
  - d. Include tables, maps or appropriate info.
2. Identify coordination needed between renewable resource, fire management, and fuels management staff to facilitate planning and implementation of restoration treatments.
3. Include a priority or implementation schedule for proposed restoration treatment

### **Fire Operations**

1. Spatially delineate priority areas for fire suppression, based upon criteria established in Step 2a. Priority areas for fire operations should be delineated by type, such as:
  - a. Initial attack priority areas
  - b. Resource pre-positioning and staging priority areas
2. Spatially delineate areas where opportunities exist to enhance or improve suppression capability.
3. Spatially delineate areas where wildfire can be managed to achieve land use plan and COT objectives.

### **Post-Fire Rehabilitation**

1. Spatially delineate priority areas for post-fire rehabilitation using criteria in Step 2a.
2. Priority areas for post-fire rehabilitation should be based on resistance and resiliency and pre-fire landscape sagebrush cover and include consideration of:
  - a. Seeding priority areas
  - b. Invasive annual grasses priority treatment areas (herbicide, mechanical, biological (herbivory or seeding),
  - c. Priority areas requiring combinations of treatments (e.g., herbicide followed by seeding)
3. Identify coordination needed between renewable resource, fire management, and fuels management staff to facilitate planning and implementation of post-fire rehabilitation treatments.

This completes the assessment process and sets the stage for more detailed project planning and NEPA associated with implementing on-the-ground treatments and management changes.

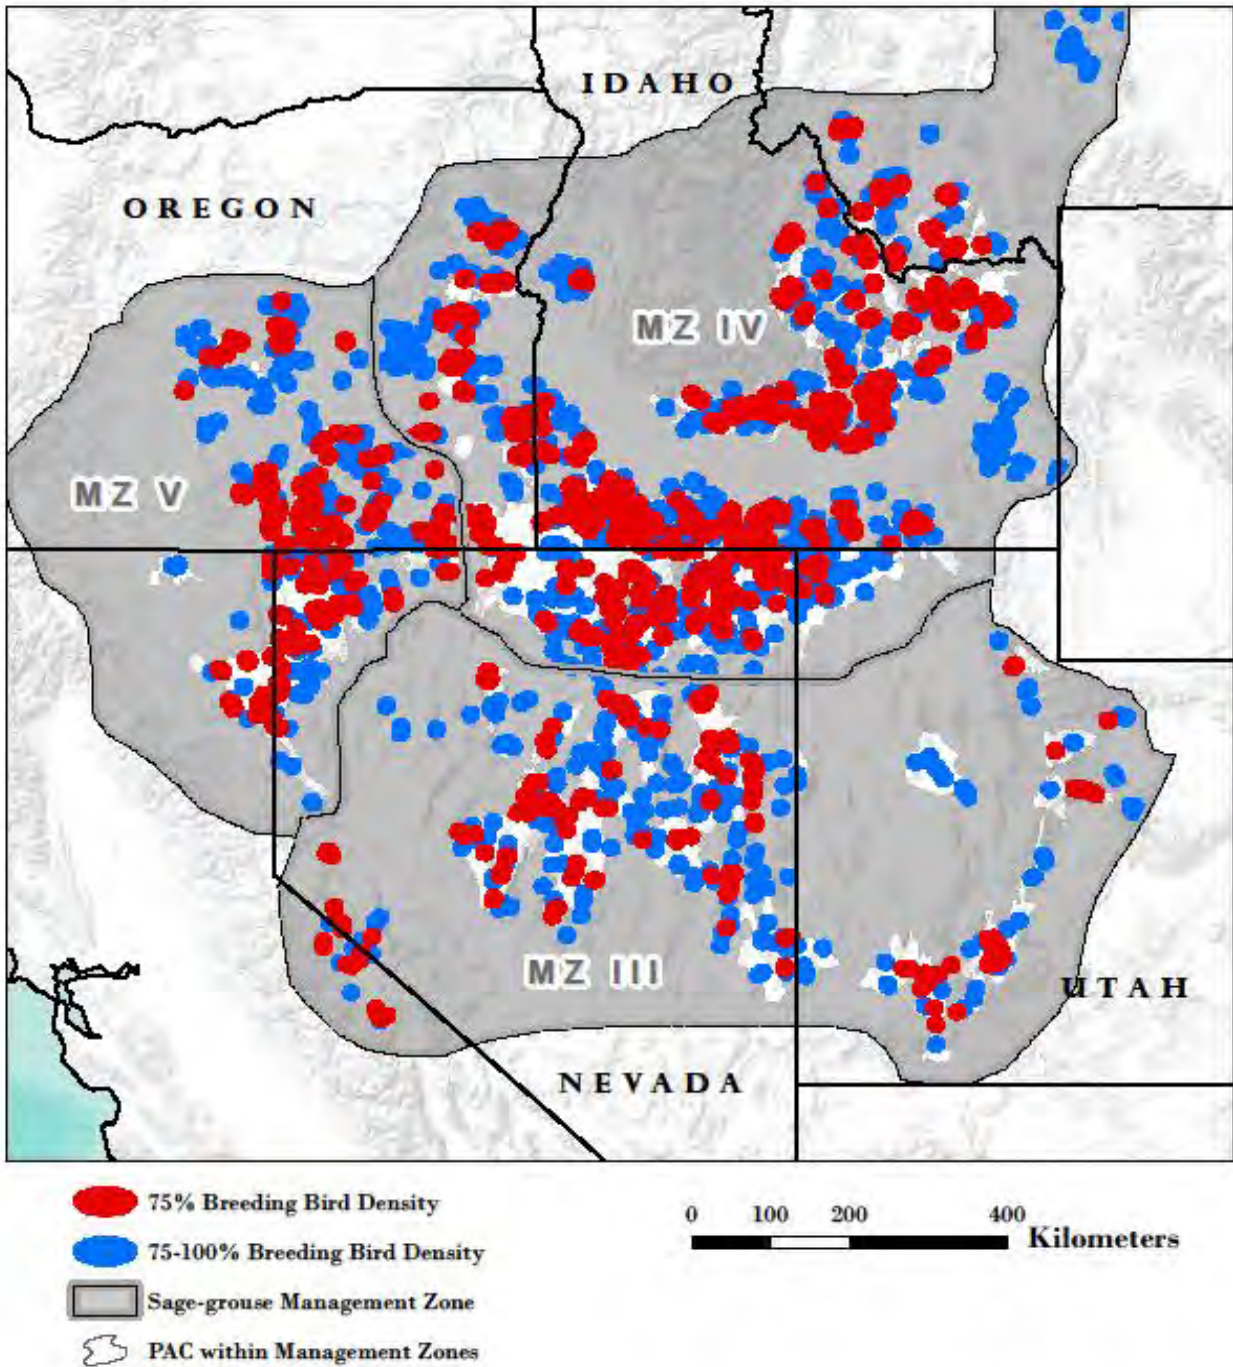

Members of the FIAT Development and Review teams are listed in Appendix 5.

## INTRODUCTION

The purpose of this U.S. Bureau of Land Management (BLM) and U.S. Forest Service (USFS) Greater Sage-Grouse Monitoring Framework (hereafter, monitoring framework) is to describe the methods to monitor habitats and evaluate the implementation and effectiveness of the BLM's national planning strategy (attachment to BLM Instruction Memorandum 2012-044), the BLM resource management plans (RMPs), and the USFS's land management plans (LMPs) to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the USFS (36 CFR part 209, published July 1, 2010) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations based on the sensitivity of the resource to the decisions involved. Therefore, the BLM and the USFS will use the methods described herein to collect monitoring data and to evaluate implementation and effectiveness of the Greater Sage-Grouse (GRSG) (hereafter, sage-grouse) planning strategy and the conservation measures contained in their respective land use plans (LUPs). A monitoring plan specific to the Environmental Impact Statement, land use plan, or field office will be developed after the Record of Decision is signed. For a summary of the frequency of reporting, see Attachment A, An Overview of Monitoring Commitments. Adaptive management will be informed by data collected at any and all scales.

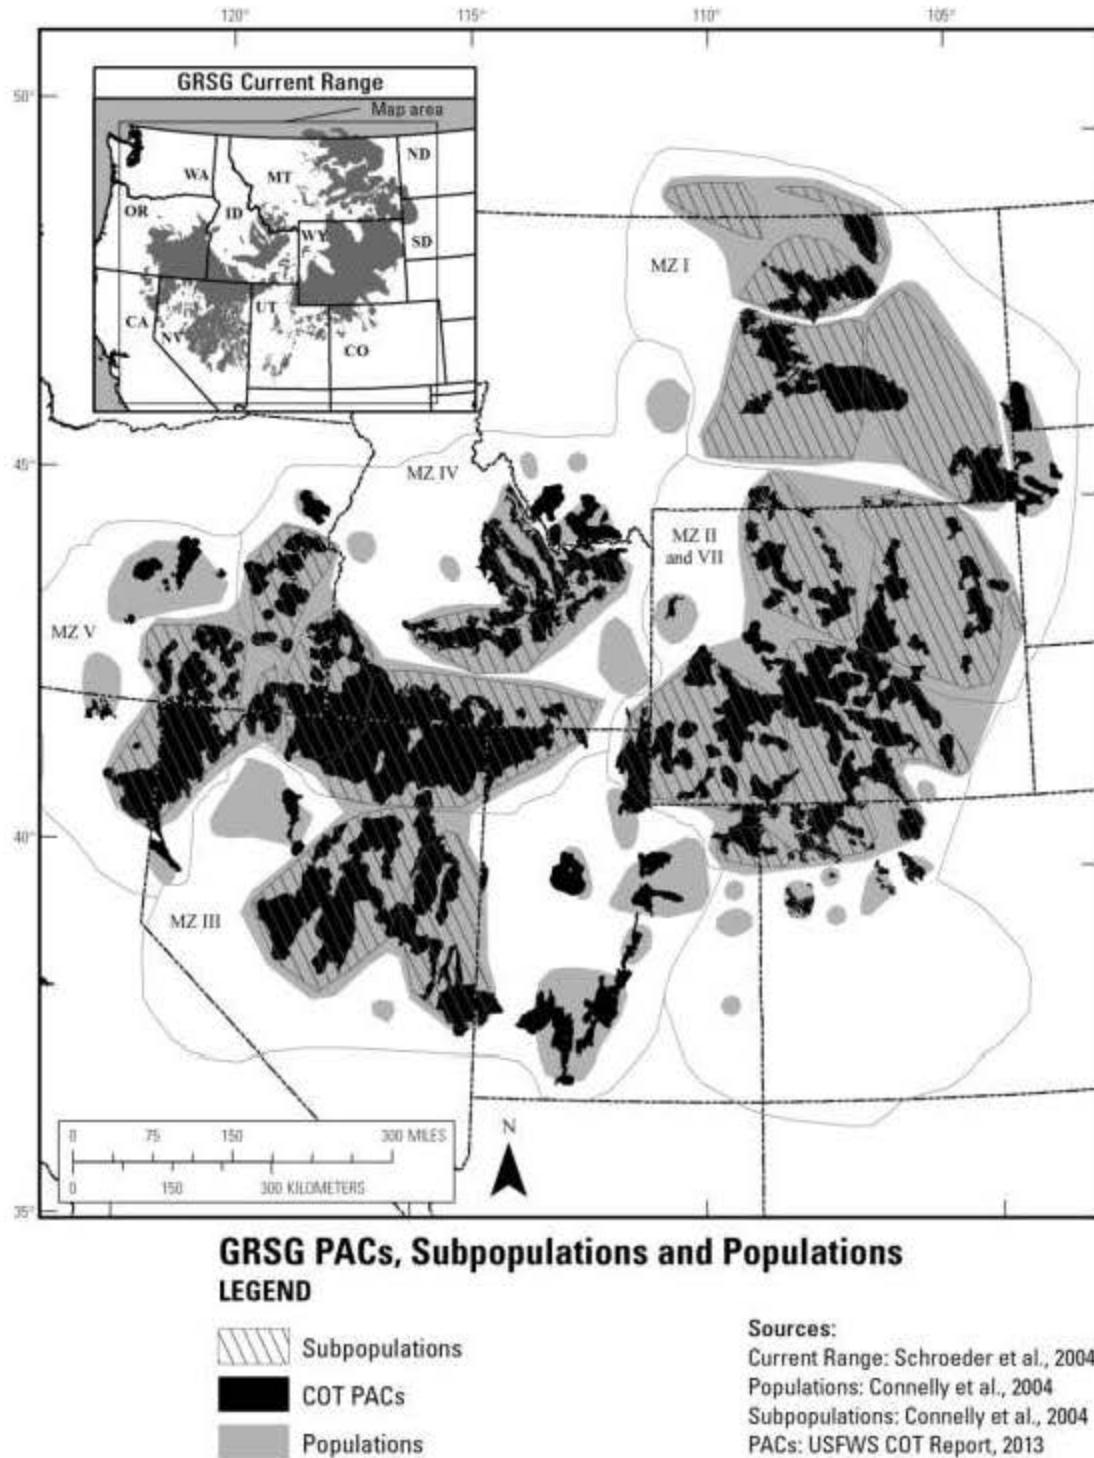

To ensure that the BLM and the USFS are able to make consistent assessments about sage-grouse habitats across the range of the species, this framework lays out the methodology—at multiple scales—for monitoring of implementation and disturbance and for evaluating the effectiveness of BLM and USFS actions to conserve the species and its habitat. Monitoring efforts will include data for measurable quantitative indicators of sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions. Implementation monitoring results will allow the BLM and the USFS to evaluate the extent that decisions from their LUPs to conserve sage-grouse and their habitat have been implemented. State fish and wildlife agencies will collect population monitoring information, which will be incorporated into effectiveness monitoring as it is made available.

This multiscale monitoring approach is necessary, as sage-grouse are a landscape species and conservation is scale-dependent to the extent that conservation actions are implemented within seasonal habitats to benefit populations. The four orders of habitat selection (Johnson 1980) used in this monitoring framework are described by Connelly et al. (2003) and were applied specifically to the scales of sage-grouse habitat selection by Stiver et al. (*in press*) as first order (broad scale), second order (mid scale), third order (fine scale), and fourth order (site scale). Habitat selection and habitat use by sage-grouse occur at multiple scales and are driven by multiple environmental and behavioral factors. Managing and monitoring sage-grouse habitats are complicated by the differences in habitat selection across the range and habitat use by individual birds within a given season. Therefore, the tendency to look at a single indicator of habitat suitability or only one scale limits managers' ability to identify the threats to sage-grouse

and to respond at the appropriate scale. For descriptions of these habitat suitability indicators for each scale, see “Sage-Grouse Habitat Assessment Framework: Multiscale Habitat Assessment Tool” (HAF; Stiver et al. *in press*).

Monitoring methods and indicators in this monitoring framework are derived from the current peer-reviewed science. Rangewide, best available datasets for broad- and mid-scale monitoring will be acquired. If these existing datasets are not readily available or are inadequate, but they are necessary to inform the indicators of sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions, the BLM and the USFS will strive to develop datasets or obtain information to fill these data gaps. Datasets that are not readily available to inform the fine- and site-scale indicators will be developed. These data will be used to generate monitoring reports at the appropriate and applicable geographic scales, boundaries, and analysis units: across the range of sage-grouse as defined by Schroeder et al. (2004), and clipped by Western Association of Fish and Wildlife Agencies (WAFWA) Management Zone (MZ) (Stiver et al. 2006) boundaries and other areas as appropriate for size (e.g., populations based on Connelly et al. 2004). (See Figure 1, Map of Greater Sage-Grouse range, populations, subpopulations, and Priority Areas for Conservation as of 2013.) This broad- and mid-scale monitoring data and analysis will provide context for RMP/LMP areas; states; GRSG Priority Habitat, General Habitat, and other sage-grouse designated management areas; and Priority Areas for Conservation (PACs), as defined in “Greater Sage-grouse (*Centrocercus urophasianus*) Conservation Objectives: Final Report” (Conservation Objectives Team [COT] 2013). Hereafter, all of these areas will be referred to as “sage-grouse areas.”

**Figure 1.** Map of Greater Sage-Grouse range, populations, subpopulations, and Priority Areas for Conservation as of 2013.

This monitoring framework is divided into two sections. The broad- and mid-scale methods, described in Section I, provide a consistent approach across the range of the species to monitor implementation decisions and actions, mid-scale habitat attributes (e.g., sagebrush availability and habitat degradation), and population changes to determine the effectiveness of the planning strategy and management decisions. (See Table 1, Indicators for monitoring implementation of the national planning strategy, RMP/LMP decisions, sage-grouse habitat, and sage-grouse populations at the broad and mid scales.) For sage-grouse habitat at the fine and site scales, described in Section II, this monitoring framework describes a consistent approach (e.g., indicators and methods) for monitoring sage-grouse seasonal habitats. Funding, support, and dedicated personnel for broad- and mid-scale monitoring will be renewed annually through the normal budget process. For an overview of BLM and USFS multiscale monitoring commitments, see Attachment A.

**Table 1.** Indicators for monitoring implementation of the national planning strategy, RMP/LMP decisions, sage-grouse habitat, and sage-grouse populations at the broad and mid scales.

Implementation		Habitat		Population (State Wildlife Agencies)
<i>Geographic Scales</i>		Availability	Degradation	Demographics
Broad Scale: From the range of sage-grouse to WAFWA Management Zones	BLM/USFS National planning strategy goal and objectives	Distribution and amount of sagebrush within the range	Distribution and amount of energy, mining, and infrastructure facilities	WAFWA Management Zone population trend
Mid Scale: From WAFWA Management Zone to populations; PACs	RMP/LMP decisions	Mid-scale habitat indicators (HAF; Table 2 herein, e.g., percent of sagebrush per unit area)	Distribution and amount of energy, mining, and infrastructure facilities (Table 2 herein)	Individual population trend

## I. BROAD AND MID SCALES

First-order habitat selection, the broad scale, describes the physical or geographical range of a species. The first-order habitat of the sage-grouse is defined by populations of sage-grouse associated with sagebrush landscapes, based on Schroeder et al. 2004, and Connelly et al. 2004, and on population or habitat surveys since 2004. An intermediate scale between the broad and mid scales was delineated by WAFWA from floristic provinces within which similar environmental factors influence vegetation communities. This scale is referred to as the WAFWA Sage-Grouse Management Zones (MZs). Although no indicators are specific to this scale, these MZs are biologically meaningful as reporting units.

Second-order habitat selection, the mid-scale, includes sage-grouse populations and PACs. The second order includes at least 40 discrete populations and subpopulations (Connelly et al. 2004). Populations range in area from 150 to 60,000 mi<sup>2</sup> and are nested within MZs. PACs range from 20 to 20,400 mi<sup>2</sup> and are nested within population areas.

Other mid-scale landscape indicators, such as patch size and number, patch connectivity, linkage areas, and landscape matrix and edge effects (Stiver et al. *in press*) will also be assessed. The methods used to calculate these metrics will be derived from existing literature (Knick et al. 2011, Leu and Hanser 2011, Knick and Hanser 2011).

### A. Implementation (Decision) Monitoring

Implementation monitoring is the process of tracking and documenting the implementation (or the progress toward implementation) of RMP/LMP decisions. The BLM and the USFS will monitor implementation of project-level and/or site-specific actions and authorizations, with their associated conditions of approval/stipulations for sage-grouse, spatially (as appropriate) within Priority Habitat, General Habitat, and other sage-grouse designated management areas, at a minimum, for the planning area. These actions and authorizations, as well as progress toward completing and implementing activity-level plans, will be monitored consistently across all planning units and will be reported to BLM and USFS headquarters annually, with a summary report every 5 years, for the planning area. A national-level GRSG Land Use Plan Decision Monitoring and Reporting Tool is being developed to describe how the BLM and the USFS will consistently and systematically monitor and report implementation-level activity plans and implementation actions for all plans within the range of sage-grouse. A description of this tool for collection and reporting of tabular and spatially explicit data will be included in the Record of Decision or approved plan. The BLM and the USFS will provide data that can be integrated with other conservation efforts conducted by state and federal partners.

## **B. Habitat Monitoring**

The U.S. Fish and Wildlife Service (USFWS), in its 2010 listing decision for the sage-grouse, identified 18 threats contributing to the destruction, modification, or curtailment of sage-grouse habitat or range (75 FR 13910 2010). The BLM and the USFS will, therefore, monitor the relative extent of these threats that remove sagebrush, both spatially and temporally, on all lands within an analysis area, and will report on amount, pattern, and condition at the appropriate and applicable geographic scales and boundaries. These 18 threats have been aggregated into three broad- and mid-scale measures to account for whether the threat predominantly removes sagebrush or degrades habitat. (See Table 2, Relationship between the 18 threats and the three habitat disturbance measures for monitoring.) The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Energy and Mining Density (facilities and locations per unit area)

These three habitat disturbance measures will evaluate disturbance on all lands, regardless of land ownership. The direct area of influence will be assessed with the goal of accounting for actual removal of sagebrush on which sage-grouse depend (Connelly et al. 2000) and for habitat degradation as a surrogate for human activity. Measure 1 (sagebrush availability) examines where disturbances have removed plant communities that support sagebrush (or have broadly removed sagebrush from the landscape). Measure 1, therefore, monitors the change in sagebrush availability—or, specifically, where and how much of the sagebrush community is available within the range of sage-grouse. The sagebrush community is defined as the ecological systems that have the capability of supporting sagebrush vegetation and seasonal sage-grouse habitats within the range of sage-grouse (see Section I.B.1., Sagebrush Availability). Measure 2 (see Section I.B.2., Habitat Degradation Monitoring) and Measure 3 (see Section I.B.3., Energy and Mining Density) focus on where habitat degradation is occurring by using the footprint/area of direct disturbance and the number of facilities at the mid scale to identify the relative amount of degradation per geographic area of interest and in areas that have the capability of supporting sagebrush and seasonal sage-grouse use. Measure 2 (habitat degradation) not only quantifies footprint/area of direct disturbance but also establishes a surrogate for those threats most likely to have ongoing activity. Because energy development and mining activities are typically the most intensive activities in sagebrush habitat, Measure 3 (the density of active energy development, production, and mining sites) will help identify areas of particular concern for such factors as noise, dust, traffic, etc. that degrade sage-grouse habitat.

**Table 2.** Relationship between the 18 threats and the three habitat disturbance measures for monitoring.

Note: Data availability may preclude specific analysis of individual layers. See the detailed methodology for more information.

<b>USFWS Listing Decision Threat</b>	<b>Sagebrush Availability</b>	<b>Habitat Degradation</b>	<b>Energy and Mining Density</b>

The methods to monitor disturbance found herein differ slightly from methods used in Manier et al. 2013, which provided a baseline environmental report (BER) of datasets of disturbance across jurisdictions. One difference is that, for some threats, the BER data were for federal lands only. In addition, threats were assessed individually, using different assumptions from those in this monitoring framework about how to quantify the location and magnitude of threats. The methodology herein builds on the BER methodology and identifies datasets and procedures to use the best available data across the range of the sage-grouse and to formulate a consistent approach to quantify impact of the threats through time. This methodology also describes an approach to combine the threats and calculate each of the three habitat disturbance measures.

### **B.1. Sagebrush Availability (Measure 1)**

Sage-grouse populations have been found to be more resilient where a percentage of the landscape is maintained in sagebrush (Knick and Connelly 2011), which will be determined by sagebrush availability. Measure 1 has been divided into two submeasures to describe sagebrush availability on the landscape:

Measure 1a: the current amount of sagebrush on the geographic area of interest, and

Measure 1b: the amount of sagebrush on the geographic area of interest compared with the amount of sagebrush the landscape of interest could ecologically support.

Measure 1a (the current amount of sagebrush on the landscape) will be calculated using this formula: [the existing updated sagebrush layer] divided by [the geographic area of interest]. The appropriate geographic areas of interest for sagebrush availability include the species' range, WAFWA MZs, populations, and PACs. In some cases these sage-grouse areas will need to be aggregated to provide an estimate of sagebrush availability with an acceptable level of accuracy.

Measure 1b (the amount of sagebrush for context within the geographic area of interest) will be calculated using this formula: [existing sagebrush divided by [pre-EuroAmerican settlement geographic extent of lands that could have supported sagebrush]]. This measure will provide information to set the context for a given geographic area of interest during evaluations of monitoring data. The information could also be used to inform management options for restoration or mitigation and to inform effectiveness monitoring.

The sagebrush base layer for Measure 1 will be based on geospatial vegetation data adjusted for the threats listed in Table 2. The following subsections of this monitoring framework describe the methodology for determining both the current availability of sagebrush on the landscape and the context of the amount of sagebrush on the landscape at the broad and mid scales.

### a. Establishing the Sagebrush Base Layer

The current geographic extent of sagebrush vegetation within the rangewide distribution of sage-grouse populations will be ascertained using the most recent version of the Existing Vegetation Type (EVT) layer in LANDFIRE (2013). LANDFIRE EVT was selected to serve as the sagebrush base layer for five reasons: 1) it is the only nationally consistent vegetation layer that has been updated multiple times since 2001; 2) the ecological systems classification within LANDFIRE EVT includes multiple sagebrush type classes that, when aggregated, provide a more accurate (compared with individual classes) and seamless sagebrush base layer across jurisdictional boundaries; 3) LANDFIRE performed a rigorous accuracy assessment from which to derive the rangewide uncertainty of the sagebrush base layer; 4) LANDFIRE is consistently used in several recent analyses of sagebrush habitats (Knick et al. 2011, Leu and Hanser 2011, Knick and Hanser 2011); and 5) LANDFIRE EVT can be compared against the geographic extent of lands that are believed to have had the capability of supporting sagebrush vegetation pre-EuroAmerican settlement [LANDFIRE Biophysical Setting (BpS)]. This fifth reason provides a reference point for understanding how much sagebrush currently remains in a defined geographic area of interest compared with how much sagebrush existed historically (Measure 1b). Therefore, the BLM and the USFS have determined that LANDFIRE provides the best available data at broad and mid scales to serve as a sagebrush base layer for monitoring changes in the geographic extent of sagebrush. The BLM and the USFS, in addition to aggregating the sagebrush types into the sagebrush base layer, will aggregate the accuracy assessment reports from LANDFIRE to document the cumulative accuracy for the sagebrush base layer. The BLM—through its Assessment, Inventory, and Monitoring (AIM) program and, specifically, the BLM’s landscape monitoring framework (Taylor et al. 2014)—will provide field data to the LANDFIRE program to support continuous quality improvements of the LANDFIRE EVT layer. The sagebrush layer based on LANDFIRE EVT will allow for the mid-scale estimation of the existing percent of sagebrush across a variety of reporting units. This sagebrush base layer will be adjusted by changes in land cover and successful restoration for future calculations of sagebrush availability (Measures 1a and 1b).

This layer will also be used to determine the trend in other landscape indicators, such as patch size and number, patch connectivity, linkage areas, and landscape matrix and edge effects (Stiver et al. *in press*). In the future, changes in sagebrush availability, generated annually, will be included in the sagebrush base layer. The landscape metrics will be recalculated to examine changes in pattern and abundance of sagebrush at the various geographic boundaries. This information will be included in effectiveness monitoring (See Section I.D., Effectiveness Monitoring).

Within the USFS and the BLM, forest-wide and field office–wide existing vegetation classification mapping and inventories are available that provide a much finer level of data than what is provided through LANDFIRE. Where available, these finer-scale products will be useful for additional and complementary mid-scale indicators and local-scale analyses (see Section II,

Fine and Site Scales). The fact that these products are not available everywhere limits their utility for monitoring at the broad and mid scale, where consistency of data products is necessary across broader geographies.

### ***Data Sources for Establishing and Monitoring Sagebrush Availability***

There were three criteria for selecting the datasets for establishing and monitoring the change in sagebrush availability (Measure 1):

- Nationally consistent dataset available across the range
- Known level of confidence or accuracy in the dataset
- Continual maintenance of dataset and known update interval

Datasets meeting these criteria are listed in Table 3, Datasets for establishing and monitoring changes in sagebrush availability.

### ***LANDFIRE Existing Vegetation Type (EVT) Version 1.2***

LANDFIRE EVT represents existing vegetation types on the landscape derived from remote sensing data. Initial mapping was conducted using imagery collected in approximately 2001. Since the initial mapping there have been two update efforts: version 1.1 represents changes before 2008, and version 1.2 reflects changes on the landscape before 2010. Version 1.2 will be used as the starting point to develop the sagebrush base layer.
