Notably, the BLM fails entirely to address the specific inconsistencies identified by the Governor in the infrastructure specific portions of the Consistency Review. For example, in the travel management section, the Consistency Review identifies RDF 2 which states that shall be no repeated or sustained behavioral disturbance within 2 miles of a lek, where the Governor’s Plan BMP says one kilometer from the perimeter of a lek. *See Consistency Review* at 43. Additionally, the Consistency Review identified RDFs that were intentionally omitted from the list of BMPs in the Governor’s Plan. *See e.g., Fluid Mineral Development RFDs not contained in the Governor’s Plan at Consistency Review* page 43. The BLM’s failure to even acknowledge these significant inconsistencies does not meet the high standard required of the agency by FLMPA and BLM implementing regulations.

The BLM further argues that “RDFs are designed to respond to recommendations identified in the [COT Report] and will assist in meeting the primary objectives in the BLM Special Status Species policy.” BLM Response at 9. As mentioned in nearly all phases of this NEPA process, the Governor’s Plan, including the BMPs contained therein, gained concurrence with the COT Report, as acknowledged by FWS.<sup>3</sup> Certainly, if the BLM wishes to rely on the COT Reports recommendations to provide the certainty that FWS requires, then this concurrence with the Governor’s Plan should be sufficient.

Finally, the BLM argues that “[i]n light of the BLM’s Greater Sage Grouse Conservation Strategy, its Special Status Species Policy, and its goal to provide regulatory certainty for the conservation of GRSG and its habitats so as to potentially reduce the need to list the species, the BLM finds it is essential to include RDFs for the GRSG in all habitat types.” BLM Response at 9. Again, the BLM has not adequately explained why their plan accomplishes the goals of certainty and conservation while the Governor’s Plan does not. Simply siting to policy guidance

---

<sup>3</sup>The FWS did ask for clarification on how the Implementation Team/Commission operates to determine exceptions to development in CHZ, and IHZ, as well as mitigation of impacts, but stated that “[t]he specific action in the infrastructure element are consistent with the COT report...” *See Kelly letter* at page 6.

does not provide sufficient justification for BLM to ignore their FLPMA consistency requirements.

The Director must reconsider Governor Otter's recommendation to adopt the BMPs contained in the Governor's Plan, eliminate the RDFs from the Proposed Plan, and apply the BMPs in a manner that is consistent with the Governor's Plan.

### **III. THE AGENCIES MUST ACCEPT THE REMEDY PROPOSED BY GOVERNOR OTTER**

Governor Otter has provided the below recommendations to rectify the errors in Idaho BLM's analysis, and bring the agency in compliance with § 202(c)(9) of FLPMA. This Appeal represents the last opportunity in the administrative process for the Director to achieve a meaningful planning partnership with Idaho on this important issue. Lack of time is not a legitimate excuse to avoid negotiations with the Governor. Indeed, FLPMA's regulations provide such an opportunity – namely that, “[t]he Director *shall* accept the recommendations of the Governor(s) if he determines that they provide for a *reasonable balance* between the national interest and the State's interest. The Director shall communicate to the Governor(s) in writing and publish in the Federal Register the *reasons for his/her determination to accept or reject such Governor's recommendations.*” 43 C.F.R. 1610.3-2(e) (emphasis added).

#### **A. Adopt the Governor's recommendations in the Consistency Review**

The Governor's Consistency Review raised actual and significant inconsistencies between the Governor's Plan and the Proposed Plan. Only a few of these were addressed in the BLM Response, and where the State Director addressed the raised inconsistencies, the justification for denial was insufficient and unpersuasive. Moreover, the BLM Response entirely ignored the federalism balance of interest section. As it stands, the record demonstrates that the Governor's Plan represents a reasonable balance between the national interest and the state interest, including the agencies' multiple-use mandates, and meeting the conservation objectives outlined in the COT Report, while the Proposed Plan fails to demonstrate a reasonable balance standard.

As stated in the Governor's Consistency Review at 9, substantial weight must be given to Governor Otter's recommendations; otherwise the agencies will fail to comply with their consistency obligations under FLPMA and NFMA, effectively undermining their duties to cooperate with state governments “to the maximum extent,” and invalidating the BLM's own statement that “[t]he Governor's consistency review is an important part of the [BLM's] land use planning process.” BLM Response at 1.

The Governor's Recommendations are as follows:<sup>4</sup>

---

<sup>4</sup> These recommendations were included in the Governor's Consistency Review beginning at page 61. Contrary to the agency's obligations under FLPMA, BLM did not adopt *any* of the Governor's recommendations.

***Adopt Alternative E.*** The agencies must immediately withdraw the Proposed Plan and adopt Alternative E. The Governor’s Plan is science-based and collaborative, striking a reasonable balance between federal and state interests. It is the perfect fit to meet the needs of the species in Idaho. The Proposed Plan, by contrast, is per se imbalanced because it is inconsistent with federal law as discussed above.

***Adopt Alternative E with modifications.*** Alternatively, and in the spirit of further collaboration, the agencies should withdraw the Proposed Plan, and adopt Alternative E with some of the changes agreed to in the interagency refinement process.

In October 2013, Governor Otter wrote a memorandum to Secretary Jewell outlining a process whereby the stakeholders, and based in part on the DEIS comments, could bridge the remaining differences between the Preferred Alternatives. Memorandum from Governor C.L. “Butch” Otter to Secretary Jewell (Oct. 23, 2014) (Otter DC Memo). The Governor noted in the memo that, “you [Secretary Jewell] understand the significance and exemplary model of collaboration embodied in the Idaho Roadless Rule.” Otter DC Memo, at 3. And in that vein, the memo quoted the COT Report to illustrate the need for the federal government to promote, rather than diminish, the findings in the FWS’s concurrence letter: “Due to the variability in ecological conditions and the nature of the threats across the range of the sage-grouse, developing detailed, prescriptive species or habitat actions is not possible at the range-wide scale. Specific strategies or actions necessary to achieve the following conservation objectives must be developed and implemented at the state or local level, with the involvement of all stakeholders.” Otter DC Memo, at 2; *see also*, COT Report at 31.

This was not an illusory or hypothetical offer from Governor Otter. Following this meeting, the Governor instructed his Task Force to examine a few specific items to determine whether it was possible to reach consensus on a modified-Alternative E. In April 2014, the Task Force provided recommendations to the Governor on some refinement issues, such as modifications to the map; consideration of a Conservation Area-level disturbance cap (the Task Force rejected a project- or NTT-level disturbance cap); and a more clearly-delineated exemption process in the CHZ. (FEIS, Appendix G). On July 18, 2014, OSC Administrator Dustin Miller wrote to BLM State Director Tim Murphy signaling the Governor’s willingness to adopt some of these Task Force recommendations.

Given that these efforts provided a constructive path forward for a modified-Alternative E, the last-minute National Direction stands in direct contradiction to the COT Report, the underlying record, and the collaborative process. The agencies should immediately withdraw the Proposed Plan, open a constructive dialogue with the Governor Otter’s Administration, and submit the outgrowth of that process for public review and comment.

To be acceptable, these modifications would require the following changes to the Proposed Plan:

- Elimination of the SFA proposal and associated management restrictions.
- Significant changes to the livestock grazing section with the explicit recognition that improper grazing is a secondary threat.

- Removal of the project-level disturbance cap, uniform lek buffers, and the undefined net conservation gain mitigation standard.
- Clarification or removal of certain aspects of the adaptive management construct.
- Adopt the recommendations in the Governor’s Plan to fully protect valid and existing rights.

***Provide Idaho an Exemption from the SFAs.*** The designation of SFAs is inconsistent with the Governor’s Plan because it creates a fourth habitat zone. Although the BLM Response addressed this recommendation, it did not adequately clarify why it does not consider the designations of SFAs to be a fourth tier of habitat. The Governor’s Plan designated habitat zones based on certain, consistent restrictions to be applied to subsets of GRSG habitat. Thus, the BLM Response that the designation of SFAs adds additional restrictions to a subset of habitat seems to simply define an additional habitat zone.

Further, in the Wyoming 9-Plan Proposed LUPA, the state is exempted, at least in part, from the onerous provisions of the SFA management regime. Wyoming 9-Plan; ES-12, 13. More specifically, the 7 million acres identified for “super core” designation in the Ashe Memo has been substantially reduced to 1.2 million acres. Wyoming 9-Plan; ES-4.

***Issue a Supplemental EIS.*** Notwithstanding the Governor’s strong opposition to the Proposed Plan, and if the agencies are indeed committed to this imbalanced solution, the Federal government must publicly vet the last-minute and significant National Direction through a Supplemental Environmental Impact Statement.

**B. The Director should, at a minimum, follow federal regulations prior to issuing the Record of Decision, and submit the Proposed Rule to the Office of Management and Budget (OMB).**

***Submit the Proposed Rule to OMB.*** Similarly, because the last-minute direction in the forthcoming Regional Records of Decision will likely have a staggering impact on the economies of western states and local communities, the agencies must submit this “significant” rule to OMB. Under Executive Order 12866, OMB must conduct a cost-benefit analysis of this significant rule. 80 Fed. Reg. 30,711.

**C. The BLM can remand the Consistency Review to the State Director to fulfill BLM’s consistency obligations.**

***Remand the Consistency Review to the State Director.*** The BLM’s uncharacteristically fast and woefully inadequate, cursory, and incomplete response to Governor Otter’s Consistency Review conclusively demonstrates that the BLM did not comply with its consistency obligations by meaningfully considering, analyzing and resolving the inconsistencies to the “maximum extent” as identified in the Consistency Review and Protest Letter duly filed by Governor Otter. This pattern also seems to apply to other western governors. As such, the Director must make a finding that the Proposed Plan is imbalanced and remand the consistency review process with directions to the State Director to resolve the identified inconsistencies as instructed by FLPMA.

## **CONCLUSION**

The State Director's Response did not comport with the agency's obligations under § 202(c)(9) of FLPMA. This error, if left unchecked, will create several immediate and irreparable harms to Idaho. Governor Otter's Administration stands ready to work through the issues identified in the Consistency Review and this Appeal.

Josh, we don't have 3.1 miles as a layer because it is not an allocation decision and would be applied on a case-by-case basis as we determine the effects of projects during project implementation. Jon

Washington, D.C. 20250-1111

Dear Mr. Ellis and Ms. Weldon:

In July, 2014, you sent a memorandum to Bureau of Land Management (BLM) state directors and U.S. Forest Service (USFS) regional foresters on greater sage-grouse (GSG) conservation. In that document, you made a commitment to sit down with impacted Western states for joint discussions to assess how combined state and federal efforts on private, state and federal lands can address threats that influence the vitality of the GSG. This need was first identified at the June 12, 2014 State-Federal Sage-Grouse Task Force meeting. However, it was not until Sept. 19, 2014 that Ed Roberson from BLM proposed dates and times for these discussions.

As Governors, we feel that federal coordination with the states in this planning process is being ineffectually approached and treated more as an afterthought by BLM and USFS at the D.C. level. We are displeased regarding how states are being consulted with respect to an issue of such overriding importance. Contacting the states for planning coordination at such a late stage does not reflect an objective to work in authentic partnership to address GSG conservation.

Western Governors support early, meaningful and substantive state involvement in the development and implementation of federal plans, particularly when the GSG remains a state managed species and states are working to help their federal partners to improve management of federal lands within their states' borders (Western Governors' Association (WGA) Policy Resolution 2014-09 [Respecting State Authority and Expertise](#)). Further, the states need clear, concise input from federal agencies about how to shape state plans so as to eliminate perceived threats to species and the need for a listing under the Endangered Species Act (WGA Policy Resolution 2014-11 [Species of Concern and Candidate Species](#)).

We consent to participate in the Rocky Mountain and Great Basin planning conversations scheduled for the coming weeks, but only on the condition that

Mr. Steve Ellis  
Ms. Leslie Weldon  
September 29, 2014  
Page Two

additional one-on-one meetings with individual states are scheduled and occur before the BLM and USFS make any final decisions relative to GSG plans. The goals and objectives for the Rocky Mountain and Great Basin planning conversations and these individual meetings should be mutually agreed upon by the state and federal agencies in advance. Continued lack of involvement and coordination with the states will only further exacerbate disjunct federal and state plans with regard to conservation of the GSG and future land use development.

We expect that all 11 Governors representing GSG states will exercise their prerogative under the Federal Land Policy and Management Act and the National Forest Management Act to review BLM and USFS plans to determine if they are consistent with state and local plans, policies and programs. If meaningful consultation does occur between your agencies and individual states, the odds that those reviews will be positive are greatly enhanced.

We look forward to the engagement of each of the individual GSG states to get this process back on track.

Sincerely,

John Hickenlooper

The Honorable John Hickenlooper, Co-Chair  
The Honorable Matt Mead, Co-Chair  
State-Federal Sage-Grouse Task Force  
Western Governors' Association  
1600 Broadway, Suite 1700  
Denver, Colorado 80202

Dear Governors Hickenlooper and Mead:

Thank you for your letter of September 29 regarding our collaborative efforts to conserve Greater Sage-Grouse habitat. We appreciate your input on this important issue and want to let you know that we value our partnership with you and each of the Governors as we work together both locally and nationally to ensure the conservation of the Greater Sage-Grouse. We recognize how much is at stake and the importance of our ongoing dialogue.

Since 2011, we have worked cooperatively with the states in developing conservation plans. The states played a critical role in helping to develop the Conservation Objectives Team (COT) report that provides the foundation for guiding our collective conservation efforts to conserve the Greater Sage-Grouse and its habitat.

We hope that our work together will focus on outcomes that will benefit sage grouse conservation and allow for sustainable land use activities where the landscape can best support it. We look forward to continuing to work with you on the planning and implementation of the Greater Sage-Grouse strategy. Together, our planning effort will help us maintain Western economies, protect wildlife that rely on sagebrush habitat, and promote balance between open space and development.

Thank you again for your letter and the opportunity to continue our collaborative efforts to develop the range wide conservation necessary to avoid the need to list the species and protect Western economies. We look forward to our Task Force meeting in Denver and subsequent one-on-one meetings with individual states.

Sincerely,

Tim

Overall hearing with the Federal Lands Interim Committee went well. Laura Skaer of the Mining Asso had strong criticism of the FWS and BLMs planning process and said a listing under ESA is preferred to BLMs RMP amendments in process. Kathleen Clarke had concerns with Utah BLMs lack of consideration of the Utah Govs alternative and was highly critical of The FWS/Dan Ashe and what she said was Dan's repeated reference to a listing with a 4d rule and a possible outcome that could help the states. Mike Carrier of the FWS provided an overview their process for considering BLMs RMPs and spoke highly of the Gov Otters alternative and the BLM collaborative process. I provided an overview of the co preferred alternatives and next steps. Senator Bart Davis expressed concerns that BLM may just pick the most restrictive measures from the two co preferred alternatives. I reiterated the importance of the cooperative agencies role in the process, including the State of Idaho and the Counties, and stated our goal is to get conservation in place such that listing under ESA is unnecessary and the sage grouse remain a State managed species.

The earlier panel included Jim Caswell addressing the Idaho Roadless Rule and the successful collaboration between the FS and State.

Jeff

**Subject:** Funding for sage-grouse habitat projects

Local Working Groups;

Idaho Fish and Game and the Governor's Office of Species Conservation has some funds to do sage-grouse habitat projects. Local Working Groups should consider ideas for habitat improvement projects (e.g. fire rehab, fence marking, seedings, wet meadow restoration, juniper removal, etc.).

Please contact me if your LWG has ideas for habitat projects in your area.

Thank you,

Don Kemner

**Subject:** SAC meeting presentations on you-tube

Please share with Local Working Groups.

Three presentations were video-taped at the May SAC meeting in an effort to share information with LWGs. The video playlist are available on you-tube at the link below. Each video is 30-50 minutes.

[https://www.youtube.com/playlist?list=PLt-O2UCcvHHE\\_gZGje-sNT\\_-mXr6pVkk](https://www.youtube.com/playlist?list=PLt-O2UCcvHHE_gZGje-sNT_-mXr6pVkk)

The videos are:

- Update on BLM/FS Sage-grouse EIS Process by Brent Ralston (BLM)
- How Does Spring Livestock Grazing Influence Sage-grouse Populations? By Courtney Conway (Idaho Cooperative Research Unit) and Karen

Launchbaugh (University of Idaho)

- Update on Sagebrush Nutrition Research by Jennifer Forbey (Boise State)

You may want to watch a video at your next LWG meeting.

**Re: Safari Club International Protest of the 2015 Idaho and Southwestern Montana Greater Sage-Grouse Proposed Land Use Plan Amendments and Final Environmental Impact Statement, EIS No. 20150145**

Dear Sir or Madam:

Safari Club International (SCI) appreciates the opportunity to provide our comments on the 2015 above-referenced Greater Sage-Grouse Proposed Land Use Plan Amendments and Final Environmental Impact Statement (Plan Amendments and Final EIS). SCI and its members consider the Plan Amendments and Final Plan to be inadequate in terms of their assessment of the potential adverse impact of the proposed actions on the hunting community. SCI comments on these documents to inform the agencies in their preparation of the Record of Decision. SCI is filing the comments within the 30 day period following the publication of the Final EIS.

### **Safari Club International**

Safari Club International, a nonprofit IRC § 501(c)(4) corporation, has approximately 47,000 members worldwide, many of whom hunt on federal lands, including those that are the subject of the Plan Amendments and Final EIS. SCI's missions include the conservation of wildlife, protection of the hunter, and education of the public concerning hunting and its use as a conservation tool. The Plan Amendments and Final EIS will likely impact many hunting opportunities currently open to SCI members, as well as the access SCI members will have to these opportunities.

### **The Plan Amendments and Final EIS Do Not Adequately Consider or Evaluate the Potential Adverse Impacts on Hunting on the Subject Lands**

At most, the Plan Amendments and Final EIS offer a very superficial and conjectural examination of the potential adverse impacts that the proposed actions will have on hunting opportunities and access to those hunting opportunities in the planning areas. The likely closures of roads and limitations of means of transportation with the planning areas will undoubtedly affect the ability of many to hunt, access hunting areas and retrieve successfully hunted game. Those limits could impact individual hunters, hunting and outfitting businesses, and other

SCI Comments on Idaho and SW Montana Greater Sage-Grouse Proposed Land Use Plan Amendments and Final Environmental Impact Statement

June 29, 2015

Page 2 of 2

businesses related to hunting. In additions, such closures and limitations could reduce the revenue generated from hunting by the State and the State's ability to use that revenue for managing and conserving wildlife and habitat. The BLM and Forest Service should not approve any actions under the Plan Amendments and Final EIS without conducting a detailed analysis of the ramifications of those actions on the hunting interests in the affected areas. The Plan Amendments and Final EIS do not adequately fulfill this requirement.

These inadequacies may, at least in part, be the result of the haste that the agencies are making to comply with the Greater Sage Grouse (GSG) listing deadline to which the U.S. Fish and Wildlife Service (FWS) committed itself in a litigation settlement. In making that commitment, the FWS put an unnecessary burden not only on itself, but also on all federal agencies with management responsibilities for wildlife and land within GSG habitat. This commitment also affects other stakeholders, such as states and the public who use those lands. That haste has led to a situation where concerns for the listing of the GSG have potentially overridden competing concerns for other species and the needs of the public who use resources within GSG habitat. The BLM and FS must not let the time constraint lead to mistakes and to decisions that fail to take into account the interests of those whose recreation and/or livelihoods depend upon access to the lands addressed by the Plan Amendments and Final EIS.

SCI cautions the BLM and FS to make certain that future project and site specific planning, conducted as part of the implementation of the Plan Amendments and Final EIS, includes comprehensive analyses of the impact of these actions on the hunting community and on the need to continue to hunt and access hunting opportunities in the subject areas.

Thank you again for the opportunity to protest on this important planning decision. If you have any questions or need anything further, please contact Anna Seidman, Director of Litigation, [aseidman@safariclub.org](mailto:aseidman@safariclub.org).

Sincerely,

Craig Kauffman  
President, Safari Club International

**Re: Supplemental Comments on the Draft Land Use Plan Amendment and Environmental Impact Statement; DOI-BLM-UT-9100-2013-0002-EIS**

Dear Mr. Ralston:

The National Mining Association (NMA), the American Exploration & Mining Association (AEMA) and the Industrial Minerals Association – North America (IMA-NA) (collectively “the Associations”) supplement their original comments submitted on January 29, 2014 on the Bureau of Land Management (BLM) and United States Forest Service (USFS) (collectively Agencies) Draft Land Use Plan Amendment (LUPA) and Environmental Impact Statements (EIS) for the Greater sage-grouse (GRSG) (LUPA/EIS). Since the comment period closed, additional information has become available, which directly supports many of the comments the Associations raised in January. For this reason, the Associations seek to supplement the administrative record with their additional comments and materials referenced herein.

In its original comments, the Associations identified deficiencies with the National Technical Team (“NTT”) Report and its associated studies, contending the underlying studies lacked independent authorship, had various methodological and data quality issues, and included limiting factors such as inadequate sampling that undermined the results. Specifically, the Associations referred to several other scientific reports that called these NTT studies into question. One such report was a pre-publication paper prepared by Dr. Robert M Zink, *Comparison of Patterns of Genetic Variation and Demographic History in the Greater Sage-Grouse (Centrocercus urophasianus); Relevance for Conservation* (“Zink Study”). Since the comment period closed, however, Dr. Zink has now finalized his study and a copy is attached hereto as Exhibit A. Notably, Dr. Zink concludes, in part, that “[t]here is no clear evidence that

the population genetic variability of the greater sage-grouse has been influenced by range reduction and fragmentation.” Indeed, Dr. Zink’s study contradicts the findings of Garton, *et al.*, which is cited by the FWS to support the warranted but precluded determination, and the agency’s conclusion that habitat fragmentation caused by human activities, such as oil and gas development, mining and grazing, are responsible for GSG population declines. Because the Associations raised this comment earlier, and specifically cited Dr. Zink’s pre-publication paper, the LUPA/EIS administrative record should be supplemented to include the final Zink Study, which refutes the work of other scientific reports the agency is directly relying upon.

In the originally filed January 2014 comments, the Associations also discussed the inadequacy of the No Action Alternative, contending that it failed to consider existing conservation measures already implemented on the ground. Specifically, the Associations noted the United States Fish & Wildlife Service’s (“FWS”) efforts to protect candidate species by partnering with private landowners as one of these sorts of pre-existing measures that needed to be accounted for. In support of this position is a recent communication from Jason A. Weller, Chief of the Natural Resources Conservation Service (NRCS), dated April 25, 2014, to Colorado Governor Hickenlooper. In this letter, the NRCS discusses exactly these sorts of collaborative and voluntary conservation efforts that the Associations referred to in their original comments. A copy of this letter is attached as Exhibit B. As the letter explains, NRCS has invested approximately \$354 million in the past three years, which has served to protect millions of acres of GRS habitat on private land throughout the eleven western states. NRCS estimates that the additional hiding cover it has protected through its Sage-Grouse Initiative (SGI) will “increase sage-grouse numbers by 8 to 10 percent within the 2.6 million acres of grazing systems implemented.” This letter evidences why partnering with private landowners and developing incentive programs like those discussed therein are a key component to any GRS conservation plan. Furthermore, this letter is significant because NRCS expresses concern with an ESA listing (and associated habitat designations), as they are already seeing the negative effects on their voluntary programs across private land. Several of the alternatives in the LUPA/EIS could very likely have the same effect in Utah.

Similarly, the Associations commented that the No-Action Alternative did not address or account for the other voluntary conservation programs like those funded by certain NRCS programs, including the Wildlife Habitat Incentive Program and the Farm and Ranch Lands Protection Program, both of which have proven to be successful, as the NRCS letter explains. For this reason, the Associations request the administrative record be supplemented to include this recent NRCS letter as well as this supplemental comment.

Other documents that should be included in the administrative record are the recent communications to the State of Utah and Nevada from the FWS. On May 13, 2014, Governor Herbert (Utah) received a letter from the FWS Director Dan Ashe, and Governor Sandoval (Nevada) received a similar letter from Southwest Regional Director Ren Lohofener discussing the respective state plans and certain recommendations, including applying regulatory mechanisms to state and private lands. A copy of these letters is attached as Exhibit C. The letter to Governor Herbert states that the FWS recognizes the need for regulatory mechanisms on state and private land given that a large proportion of GRS populations are on non-federal lands. Consequently, the FWS states its commitment to implementing the state conservation plan, so long as it includes these sufficient regulatory mechanisms on state and private land. The

Nevada letter is similar in that it recognizes the need to include voluntary measures and encourage private landowners to conserve key wet meadow habitat. These letters should be incorporated into the administrative record because they expand on the Associations original comments regarding the need to consider voluntary measures as well as state-wide conservation plans that are already exist.

The Associations also seek to supplement the administrative record with another publication prepared after the close of the comment period. Recently, the Western Governors Association (WGA) published a third report on the status of local and state efforts to protect the GRSG. *See* Inventory of State and Local Government's Conservation Initiatives for Sage-grouse (February 20, 2014) (referred to as the "WGA 2014 Inventory"), a copy is attached as Exhibit D. This report reviews sage-grouse conservation activities throughout the affected western states during 2013. Similar to the NRCS letter, this report also informs the Associations' original comments regarding the benefits of voluntary conservation programs. Like the comments above, the NO Action Alternative failed to develop an accurate baseline condition when it failed to consider these numerous state-wide and local conservation efforts. The Associations request the BLM carefully consider the recent WGA 2014 Inventory and supplement the administrative record with this report.

The Western Governors Association also recently held their annual meeting in Colorado Springs during the week of June 9, 2014, in which the plight of the GRSG was discussed at length. One outcome of the annual meeting was the signing of Policy Resolution 2014-11, *Species of Concern and Candidate Species*, in which the Governors emphasize the need for state plans to lead the GRSG conservation effort rather than the federal government. A copy of this Resolution is attached as Exhibit E. This collective voice of the leaders in the affected western states should be included in the administrative record to demonstrate the political will of these states that are in the best position to understand the state-specific issues, conditions, and opportunities to protect the GRSG.

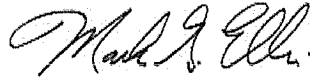

Finally, in April 2014, after the comment period closed, Secretary Jewell issued a detailed mitigation strategies report, launching a new directive for mitigation programs agency-wide. A copy of the report is attached as Exhibit F. The Associations' original comments discussed—at length—the need for a sufficient mitigation program, and in fact, referenced the initial order from Secretary Jewell, which has now been finalized. While the Associations may not agree with this report in several key respects, it nevertheless should be considered when determining the impacts of the "No Action" alternative. Because of the expanded mitigation requirements set forth in this report, GRSG impacts, even without any changes to the land use plans, should be diminished. Accordingly, this latest report is directly on point, was specifically referenced in the original comments, and should be incorporated into the LUPA/EIS decision-making process.

In conclusion, various documents, reports and statements have been prepared since the public comment period closed on January 29, 2014, which are directly related to certain issues the Associations raised in its original comments submitted in January 2014. The Associations request the BLM carefully consider the attached materials and supplement both the Associations' comments and the administrative record with this new information.

Sincerely,

# Comparison of Patterns of Genetic Variation and Demographic History in the Greater Sage-Grouse (*Centrocercus urophasianus*): Relevance for Conservation

Robert M. Zink\*

Bell Museum and Department of Ecology, Evolution and Behavior, University of Minnesota, St. Paul, MN, 55108, USA

**Abstract:** The greater sage-grouse (*Centrocercus urophasianus*) was once widespread in western North America but its range has contracted by an uncertain degree owing to anthropogenic and natural causes. Concern over population declines has led to its proposed listing as threatened under the U.S. Endangered Species Act. Detailed genetic and demographic analyses of this species throughout its range are available but heretofore have not been compared. Reduced genetic variability is often taken as a proxy for declining populations, but rarely are there quantitative population estimates with which to compare. I compared published mitochondrial DNA (mtDNA) control region sequences, microsatellite allele frequencies at seven loci, and estimates of numbers of males per lek, number of active leks, percent decline in the best population models, and the probability (P) of  $N_e < 50$  in 30 years and  $P(N_e < 500)$  in 100 years, at two spatial scales, 45 local population samples and 16 larger aggregates of samples. When excluding the populations from the Columbia Basin, which show little genetic diversity and are statistical outliers, there were no consistent relationships between estimates of genetic variation and demographic trends across the remainder of the range at either spatial scale. A measure of inbreeding derived from microsatellite data was also not related to population trends. Thus, despite habitat reduction and range fragmentation, the greater sage-grouse does not exhibit expected genetic signatures of declining populations. Possibly, the mtDNA and microsatellite data are insufficiently sensitive to detect population declines that have occurred over the span of a half century. Alternatively, only when populations are reduced to the levels seen in the Columbia Basin will genetic effects be seen, suggesting that the bulk of the range of the greater sage-grouse is not currently in genetic peril.

**Keywords:** conservation genetics, heterozygosity, inbreeding, microsatellite loci, mitochondrial DNA, population management, population structure.

## INTRODUCTION

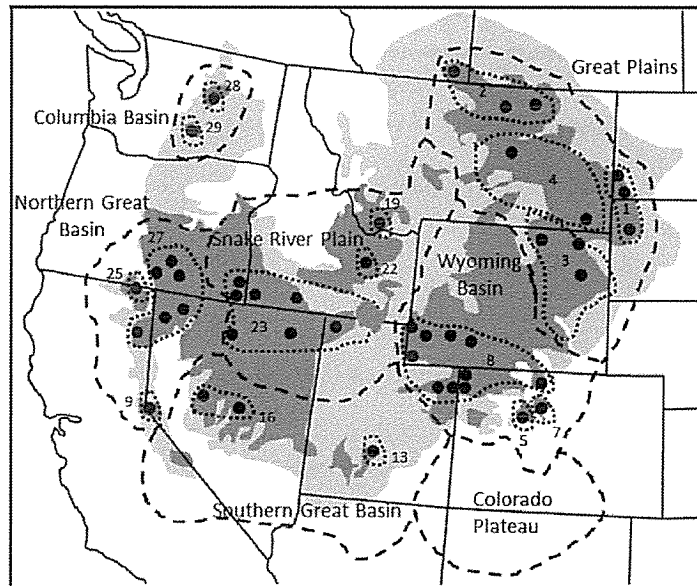

Many sources of biological information can guide management of threatened and endangered species. Measures of genetic variability and differentiation provide indirect historical information on whether populations have experienced bottlenecks or inbreeding, or have been isolated from exchanging individuals with other populations. Measures of demographic fluctuations through long-term population monitoring provide evidence on more recent population fluctuations. In theory, these two types of information should be complementary. Lower than average levels of genetic variability are typically inferred to be a result of population declines. Oyler-McCance *et al.* [1:1293] noted that such populations “can suffer from inbreeding effects and can be more susceptible to parasitic agents and disease.” Small populations can lose genetic diversity, which could hamper their ability to respond to new (or current) environmental challenges [2]. Furthermore, slightly deleterious alleles might increase in frequency and result in lower individual fitness. Given the potential for genetic and demographic information jointly to inform conservation efforts, it is surprisingly rare

to be able to compare measures of genetic variation and inbreeding depression with quantitative estimates of demographic history, especially for species of conservation concern.

The greater sage-grouse (*Centrocercus urophasianus*), considered threatened (but precluded) under the U.S. Endangered Species Act [3], is an exception. Garton *et al.* [4] provided a detailed demographic study of greater sage-grouse population trends at two geographic levels, a broad, inclusive level that included the seven sage grouse management zones (SMZ, Fig. 1), and 30 smaller population units within these zones. Using data from 1965 to 2007 (in five-year intervals) on the number of active leks (display grounds) and males per active lek, they computed estimates of population trends, and estimated the probability of population persistence (P) at two levels ( $N_e < 50, 500$ ) 30 and 100 years into the future.  $N_e$  refers to the genetic effective population size, which is a function of how males and females contribute to future generations, and not an estimate of the census size of a population. They concluded that some populations are in danger of falling below the putative minimum viable population sizes or 50 or 500, which some consider arbitrary [5]. This makes it appropriate to survey genetic variation to determine if populations estimated to be on downward trajectories also show reductions in levels of genetic diversity.

**Fig. (1).** Plot of sample sites (blackened circles) for genetic samples [1]. Dashed lines indicate greater sage-grouse Management Zones, and dotted lines indicate population samples from [4]. Numbers correspond to sequence of populations in [4]. Dark gray indicates current distribution and light gray indicates estimate of historical distribution.

Oyler-McCance *et al.* [1] surveyed mitochondrial DNA control region (141 base pairs) variation and genotyped seven microsatellite loci for over 1000 greater sage-grouse from 45 populations (Fig. 1) throughout the same area as that analyzed by Garton *et al.* [4]. They provided measures of genetic variation within populations, and genetic differentiation among the same populations for which Garton *et al.* [4] tallied the number of active leks and number of males per individual populations. In addition Oyler-McCance *et al.*'s [1] genetic data can be summarized for six of the seven SMZs (only the Colorado Plateau was missing), and for 16 of the 30 larger populations for which Garton *et al.* [4] provided measures of long-term demographic fluctuations and  $P(N_e < 50; N_e < 500)$ . In this paper I compare genetic variability measures with quantitative estimates of population trends to determine whether the effects of population declines can be observed at two geographic scales in the microsatellite and mitochondrial DNA data for this species of conservation concern. The available data sets also allow comparison of the extent to which mtDNA and microsatellites provide similar estimates of population genetic variability.

## MATERIAL AND METHODOLOGY

Analyses were performed on two data sets. Data set I consisted of 45 population samples, each of which has microsatellite and mtDNA data [1] and data on the number of active leks and number of males/active lek [4]. Data set II included the 16 population groupings for which Garton *et al.* [4] estimated  $P(N_e < 50$  or  $N_e < 500)$  in the next 30 or 100 yr, and for which mtDNA and microsatellite data were available. In addition, I used the percent population change in Garton *et al.*'s [4] "best model" as a measure of population fluctuation. Populations for which Garton *et al.* [4] did not find a significant overall trend were considered stable over the time period. For both data sets, if the relationship between the number of individuals sampled and measures of

genetic variability were significantly correlated, residuals from linear regression were used in place of actual values (no differences were found using residuals from other regression models).

For data set II I regrouped individuals' mtDNA and microsatellite data and recomputed measures of genetic variability using Arlequin 3.5.1.3 [6]. Arlequin was also used to compute the Garza-Williamson [7] index (and a modified version) for both data sets (e.g., 16 and 45 population units), which compares the number of alleles at loci with the allelic range to provide an indication of whether populations exhibit effects of bottlenecks. I performed analyses with and without the samples from Yakima and Douglass/Grant (Moses Coulee, WA) representing the Columbia Basin, owing to the possibility that the low variation in these samples represents outliers that could bias analyses.

To evaluate the relationship among the variables, I computed a matrix of Pearson product-moment correlation coefficients. The computation of multiple coefficients runs the risk of spurious significance values. A standard approach is to apply a Bonferroni correction [8] that results in an experiment-wide lowering of the alpha level accepted for significance. For data set I, the level would be  $0.05/21$  (0.0024) and for data set II,  $0.05/45$  (0.0011). Many authors [e.g., 9, 10] have pointed out that this is extremely conservative and runs the opposite risk of failing to recognize significant values, especially if the relationship is weak but nonetheless significant and in studies with relatively small sample sizes. Because this is one of the first large-scale comparisons of genetic and demographic data, and is partly exploratory in nature, I assessed statistical significance using the standard of  $P < 0.05$ , but it should be realized that some values are insignificant if the Bonferroni criterion is applied. Of course if a standard  $P$ -value is not significant, the Bonferroni correction is irrelevant. In addition, although comparisons among genetic variables or among demographic variables are

likely non-independent, comparisons between these two classes of variables are less so. For example, in data set I, there are eight comparisons between genetic and demographic variables, and one could consider the appropriate Bonferroni correction to be 0.05/8 or 0.0063.

To determine whether one might expect a genetic signature of population reductions, I constructed 10 random samples from the total pool of individuals with microsatellite data that matched the observed sample size for each of the 45 populations in Oyler-McCance *et al.* [1], and plotted the relationship between number of individuals and average number of alleles/locus. If there were no relationship, it would suggest there was not enough variability among samples to detect effects from demographic fluctuations.

Previous genetic analyses [1, 11, 12] documented the existence of two well-separated mtDNA clades that are currently geographically co-distributed over much of the range. To evaluate whether these might have once been allopatric and secondarily sympatric, and to provide historical perspective on the distribution and range displacements of greater sage-grouse, I computed ecological niche models for the present, Last Glacial Maximum (LGM; 21,000 ybp), and Last interglacial (LIG; 120,000 ybp). Locality records ( $n = 173$ ) were obtained from Ornis2 (<http://ornis2.ornisnet.org/>); duplicate records (those <1 km apart) were eliminated. Correlative ecological niche models [13, 14] were constructed using MAXENT ver 3.2.2 [15] for the present and projected to the LGM (CCSM database). Climatic data (19 layers) were obtained from the Worldclim bioclimatic database [16], and trimmed so as to provide a buffer around each species' range. Multiple methods exist to account for correlations among climate variables, none with clear superiority [17]. Based on an initial MAXENT run, climatic layers that contributed 5% or more to the model were chosen (layers 1 2 3 8 11 13 18) and MAXENT was rerun using these layers and all locality records for final maps. Each map was based on the average of five MAXENT runs (using all points) and plotted using DIVA-GIS ver. 7.1.7.2 [18]. Predicted distribution maps were coded as presence/absence using the logistic threshold for equal training sensitivity and specificity produced by MAXENT (value = 0.375). MAXENT outputs a threshold-independent measure of the overall performance of the model (Area Under the Receiver Operating Curve or AUC). An AUC value of 0.5 indicates the predictive model is no better than random, whereas higher AUC values indicate better predictive ability with a value of 1 indicating perfect prediction. MAXENT's auto-features and the default regularization multiplier parameter (1.0) were used, and the number of iterations was increased to 1500 to allow the program to reach the default convergence threshold.

To explore further the recent evolutionary history of the two mtDNA clades of greater sage-grouse, DnaSP [19] was used to compute a mismatch distribution and associated statistics ( $k$ , average number of haplotypes;  $\pi$ , nucleotide diversity;  $h$ , haplotype diversity) independently for each clade.

## RESULTS

### Data Set I (45 Populations)

None of the measures of genetic variability (Table 1, Fig. S1) were significantly ( $P > 0.05$ ) correlated with number of

individuals per sample (Table 2). Measures of genetic variability were significant correlated for each type of genetic data, heterozygosity and number of alleles/locus ( $P < 0.001$ ) for microsatellites, and haplotype and nucleotide diversity ( $P < 0.001$ ) for the mtDNA data. Several measures of variability at microsatellite loci and mtDNA were significantly correlated, number of alleles/locus and haplotype diversity ( $P = 0.017$ ), number of alleles/locus and nucleotide diversity ( $P = 0.05$ ), heterozygosity and nucleotide diversity ( $P < 0.024$ ), and heterozygosity and haplotype diversity ( $P < 0.001$ ). There were no consistent or significant relationships between numbers of active leks, number of males/active lek, and heterozygosity, alleles/locus, mtDNA haplotype and nucleotide diversity (Fig. S1). Although microsatellite heterozygosity was significantly ( $P = 0.0395$ ) correlated with the number of active leks, this relationship does not remain ( $P = 0.10$ ) when the two samples from the Columbia Basin are omitted. The G-W index was not significantly ( $P > 0.05$ ) related to measures of population trends (Fig. 2).

### Data Set II (16 Populations)

Only the average number of alleles/locus was significantly correlated ( $P < 0.001$ ) with number of individuals per sample, hence, residuals from the regression of these two variables were used subsequently (Table 3). Measures of genetic variability were significant correlated for each type of genetic data, heterozygosity and number of alleles/locus ( $P = 0.007$ ) for microsatellites, and nucleotide and haplotype diversity for the mtDNA data ( $P < 0.001$ ) (Table 4). Heterozygosity was correlated with haplotype diversity ( $P = 0.013$ ), and number of alleles/locus was correlated with haplotype ( $P = 0.019$ ) and nucleotide ( $P = 0.013$ ) diversity. When the two samples from the Columbia Basin were omitted, no significant correlations remained. With one exception, no correlations were significant between measures of genetic variability and percent decline in best model,  $P(\text{Ne}) < 50$  in 30 years or  $P(\text{Ne}) < 500$  in 100 years (Figs. 3-4). The G-W index was not significantly ( $P > 0.05$ ) related to measures of population trends (Fig. 5). Interestingly, there were no significant correlations between percent decline in best model,  $P(\text{Ne}) < 50$  in 30 yrs, and  $P(\text{Ne}) < 500$  in 100 yrs (Table 4). Random samples of microsatellite genotypes showed that the average number of alleles/locus varied from 6 to 12 (Fig. S2), suggesting that this genetic measure has the potential to reveal demographic declines.

### Ecological Niche Models

Predicted current distribution agrees with the known historical distribution (Fig. 6) and the LIG predicted distribution (not shown); the AUC score of 0.947 estimated under current climate conditions indicates a very good ability to discriminate between presence and absence locations. The LGM distribution suggests two potential refugia, one in the southeast and the consisting of the remainder of the range. Although there is southward displacement at the LGM, much of the distribution, especially in the west, is similar to that found today, suggesting that the species was not greatly range-restricted especially in the western part of the range, at the LGM.

### Recent Evolutionary History of Greater Sage-Grouse

Clades I and II exhibit different mismatch distributions (Fig. 7) and Clade I was consistently less variable (Clade I:  $k = 1.62$ ,  $\pi = 0.0129$ ,  $h = 0.76$ ; Clade II:  $k = 2.52$ ,  $\pi = 0.019$ ,  $h = 0.84$ ). There is no evidence of two clades in the microsatellite data. However, because of the mode of inheritance of these bi-parental, nuclear markers, evidence of two clades would be erased with recombination and interbreeding.

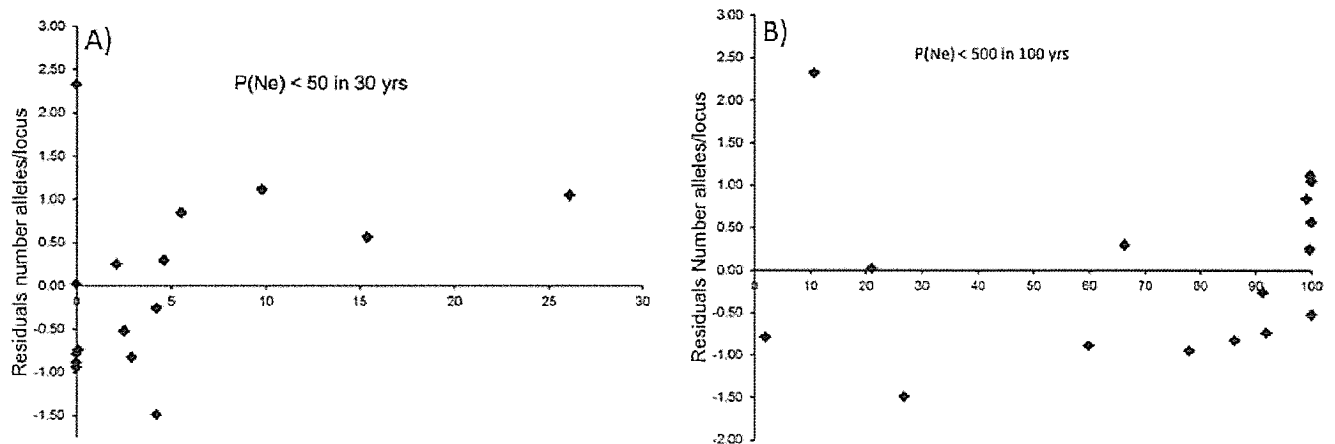

### DISCUSSION

Based on analyses of lek counts over several decades, greater sage-grouse have declined over much of their range [20], although the exact nature of the decline is unclear. Most assessments suggest population declines of from 17-

47% [e.g., 21, 22] concluded from lek counts that the population declined by 2.0% per year from 1965 to 2003, and Schroeder *et al.* [23] suggested that the species currently occupies 56% of its pre-European settlement distribution. Given the lack of quantitative historical surveys that can be compared to current quantitative censuses, these estimates of range contraction are educated guesses. Nonetheless, it appears that not all regions have decreased to the same level, and some populations appear to be stable or increasing. The variability in degree of decline provides an opportunity for assessing the congruence of estimates of population trends and genetic variation. Oyler-McCance and Quinn [24] noted that estimates of population structure and gene flow in greater sage-grouse, i.e., connectivity of populations, as well as levels of genetic diversity "are paramount for

**Table 4.** Correlations among demographic and genetic variables for the 16 population units of greater sage-grouse described in [4]. Values in parentheses are for correlation coefficients excluding the two Columbia Basin populations. Asterisks indicate standard statistical significance levels (\*  $P < 0.05$ , \*\*  $P < 0.01$ , \*\*\*  $P < 0.001$ ); see text for significance levels if applying Bonferroni corrections.

conservation efforts.” Oyler-McCance *et al.* [1:1308] stated that “genetic data used in conjunction with large-scale demographic and habitat data will provide an integrated approach to conservation efforts for the greater sage-grouse”. This is the tact taken in this analysis.

Thousands of studies have been published that include “conservation genetics” in their key word section (*Google Scholar* search 16 February 2014). For the majority, there are no corresponding demographic data that can be used to compare with the genetic data. Hence, results from genetic analyses are often taken as proxies of past population demography. For example, Schmidt *et al.* [25] stated that lower mtDNA and microsatellite variation was associated with

bottlenecked populations in the Eurasian lynx (*Lynx lynx*) although data on population histories consisted of verbal descriptions such as “The Scandinavian population...is believed to number up to 2000 individuals...is now large and appears to be growing rapidly.” Part of the lack of quantitative data on populations stems from the difficulty in observing lynx in the field, making more easily observable species such as the greater sage-grouse better suited to obtaining quantitative estimates of population demography. In fact, the genetic analyses [1] and the demographic results [4] represent one of the most extensive opportunities to compare these logically interrelated data sets.

**Fig. (4).** **A)** Plot of the relationship between  $P(N_e) < 50$  in 30 years [4] and mtDNA haplotype diversity [1] for greater sage-grouse, showing a lack of a relationship. **B)** Plot of the relationship between  $P(N_e) < 500$  in 100 years and mtDNA haplotype diversity in greater sage-grouse showing a lack of a relationship.

**Fig. (5).** Plot of the Garza-Williamson inbreeding index [7] versus  $P(N_e) < 500$  in 100 years [4] excluding the Columbia Basin populations for greater sage-grouse, showing a lack of a relationship.

### Do Measures of Population Trends Explain Genetic Patterns of Variation or Reveal Inbreeding?

Levels of genetic variability should co-vary with long-term population fluctuations. Populations in decline ought to show reductions in heterozygosity, number of alleles/locus, and nucleotide and haplotype diversity. However, it is known that heterozygosity will only show a response to demographic declines if a bottleneck is severe and long term [26], whereas the number of alleles or haplotypes per locus is more sensitive to population fluctuations.

There was no evidence that average number of alleles or haplotypes per population co-varied with estimates of population trends (16 populations) or between measures of genetic variability and number of active leks or males/active lek (45 populations). Thus, the expected population genetic signatures of differences in population size were not ob-

served. Importantly, the insignificant correlation between the G-W indices and measures of population trends suggests that populations, whether declining, increasing or stable, are not showing signs of inbreeding. This casts other studies of genetic variation alone in a different perspective, as one might not be able to infer that populations with low genetic variability are necessarily declining. In addition, Ramey *et al.* [27] detected several potential errors in the calculations of Garton *et al.* [4], although these errors would likely result in less severe estimated declines and lower probabilities of populations being less than 50 or 500 in 30 or 100 years. Hence, analyses presented here potentially evaluated a “worst-case” scenario.

One clear genetic pattern is that the remaining populations in the Columbia Basin exhibit low levels of heterozygosity and numbers of alleles/locus. Although the remaining leks possess an average number of males, their isolation ap-

parently has precluded the maintenance of genetic variability. For example, the mtDNA estimate of gene flow (Slatkin's  $N$ ) averaged 15.4 among all populations excluding the two from the Columbia Basin, whereas an average of only 1.9 immigrants was exchanged between the Columbia Basin and the remaining populations. Hence, isolation from gene flow of the nature observed in Washington likely leads to reduced genetic variability and clearly poses a potential risk to population persistence. However, throughout the rest of the range, there are no similar situations, with the possibility of the population in Lyon/Mono (see below). In fact, in a small population in Alberta, Bush *et al.* [28:343] remarked: "Although the species is endangered in Alberta and occurs in fragmented habitat, it has maintained genetic diversity and connectivity." This was explained as a result of successful dispersal of breeding individuals among leks. Given this level of connectivity at the northern fringe of the current range, it stands to reason that at least this much dispersal and gene flow exists in southern and more continuous portions of the range. It is possible that the lack of a relationship between estimated degree of population decline and levels of genetic variability is that there is still sufficient inter-area dispersal to counteract local population declines and genetic drift.

Populations with high probabilities of  $P(N_e) < 50$  or 500 were already on a historically decreasing population trajectory, given that these calculations were based on lek counts over the past several decades. Possible reasons for a lack of expected genetic signatures-include a high level of gene flow or an inability of available genetic measures to capture population declines owing to a lag effect [e.g., 29]. For example, although the Iberian lynx (*Lynx pardinus*) has decreased from a total population of 1100 individuals in the 1980s to 100 individuals distributed in two isolated populations today, Casas-Marce *et al.* [2] were unable to show genetic effects of bottlenecks in a sample of 36 polymorphic microsatellite loci. However, in randomly sampling from the 1181 individuals for which microsatellite data were available, there are strongly reduced levels of alleles/locus in population samples identical in size to those analyzed in this study

(Zink, unpubl. data). Thus, the lack of a relationship between genetic and  $P(N_e < 50, 500)$  in greater sage-grouse is likely not an artifact of the sensitivity of the genetic markers compared.

### Evolutionary History of Greater Sage-Grouse

An understanding of the past evolutionary history of a species can provide useful perspective on current populations and their distributions, and how the species might respond to future climate change scenarios. The two historically divergent mtDNA lineages (Clades I and II) might have originally corresponded to small-bodied (Clade I) and large-bodied (Clade II) birds. If these two clades had always been part of an interbreeding population, there should not be genetic differences between two clades from the same mtDNA gene genealogy. Based on differences in mismatch distributions (Fig. 7) and associated estimates of variability, these two clades likely represent once geographically and genetically independent lineages that retained the ability to interbreed. In my opinion there is no relevant calibration for a short section of mtDNA control region to determine the age at which these two clades last shared a common ancestor, but the degree of divergence (ca. 15%) is consistent with a Late Pleistocene, if not earlier, origin [30]. Niche models suggest a refugium for Clade II individuals in the southeastern portion of the range, and it would appear that these two clades were isolated as recently as the Last Glacial Maximum (Fig. 6). Post-glacial range expansion resulted in a pattern where members of each historical clade are now co-mingled over much of their range [1], owing to a northward spread of Clade II individuals, and an eastern expansion of clade I individuals. However, the low frequency of individuals bearing Clade I haplotypes in the northeastern part of the range (eastern Montana, Dakotas, northeastern Colorado) could mean that demographic equilibrium has not yet been reached. Alternatively, there could be an as yet unidentified adaptive reason for the nonrandom spatial distribution of haplotypes. Lastly, the potentially isolated refuge for Clade II individuals (Fig. 6B) might explain why current populations have relatively reduced levels of genetic variability.

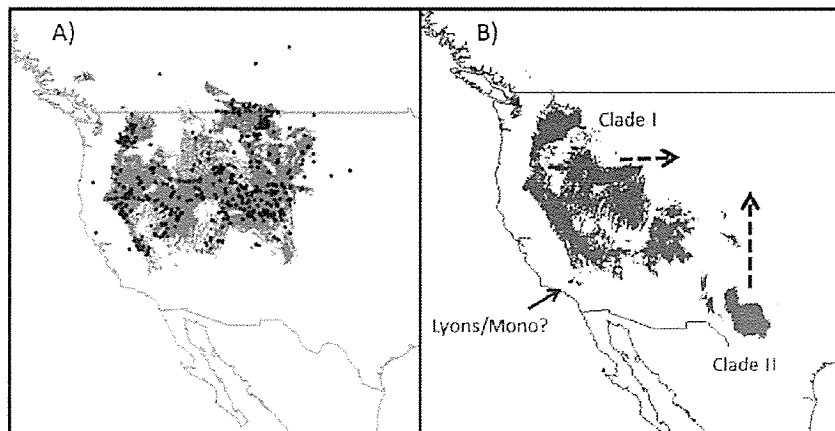

Fig. (6). Map of niche models showing predicted distributions of greater sage-grouse at the A) present and B) Last Glacial Maximum (LGM; 21,000 ybp). Blackened circles show locality points used to develop climate niche model. The arrow on the right panel indicates a possible refugium for the Lyons-Mono population that is today genetically differentiated. This distribution of Clade II could correspond to populations today considered the Gunnison sage-grouse (*Centrocercus minimus*).

**Fig. (7).** Distribution of pairwise differences for Clade I (black bars) and Clade II (gray bars) mtDNA haplotypes [1]. The differing distributions suggest that the two clades of greater sage-grouse were once allopatric and had independent demographic histories until they were reunited following glacial retreat.

The projected LGM distribution (Fig. 6) indicates a southerly outpost of sage-grouse that might represent the current Lyon-Mono population. This population, which is more genetically differentiated from the rest of greater sage-grouse than greater sage-grouse is from the Gunnison sage-grouse (*Centrocercus minimus*), has been proposed as a distinct population segment [31]. However, despite the large number of unique alleles in the Lyon-Mono population, the level of genetic divergence is similar to that among other greater sage-grouse populations. The Lyon-Mono population has similar levels of variability relative to other populations, but not to the low extent found in the Columbia Basin populations (Tables 1, 3).

Thus, niche modeling suggests both stability (western) and range displacement (eastern) of greater sage-grouse over the past 120,000 years. They have survived the last glaciation and responded by shifting their ranges as climates ameliorated and associated vegetation was redistributed over western North America.

### Comparison of Molecular Markers

Many authors have concluded that estimates of mtDNA variation and differentiation are insufficient to describe population variation or lineage divergence owing to stochasticity inherent in any single-locus [32, 33]. MtDNA has been used extensively over the past two decades in phylogeography and conservation genetics, and has been complemented by surveys of nuclear loci, either microsatellites or sequencing [34, 35]. In this study, mtDNA and microsatellites were available for the same 45 populations, and although the original authors [1] did not make explicit comparisons, it is noteworthy that the two markers gave similar estimates of levels of variation and population differentiation for data set I (Table 2) although less strongly for data set II (Table 4).

### CONCLUSION

There is no clear evidence that the population genetic variability of the greater sage-grouse has been influenced by range reduction and fragmentation. The microsatellite data suggest that despite past population trends, there is no evidence of heightened inbreeding in smaller populations. Indeed, over deep evolutionary time, populations ebb and flow. Only in the case of the geographically isolated Columbia Basin populations is there a demonstrable effect of popula-

tion declines and loss of genetic variability, but even in these populations there is no clear evidence of inbreeding. Because genetic variability is thought to be a proxy for population health, it does not appear that demographic declines have reached a point where genetic variation is affected in greater sage-grouse, with the exception of the Columbia Basin populations.

### CONFLICT OF INTEREST

The authors confirm that this article content has no conflict of interest.

### ACKNOWLEDGEMENTS

I thank G. F. Barrowclough, F. K. Barker, H. Vázquez-Miranda, M. Wells and M. Dufort for helpful discussions. R. Ramey provided an advance copy of his manuscript.

APR 25 2014

The Honorable John Hickenlooper  
Governor, State of Colorado  
Chairman, Western Governors' Association  
400 North Capitol Street, N.W., Suite 376  
Washington, D.C. 20001

Dear Governor Hickenlooper:

Thank you for your letter of March 25, 2014, cosigned by Governor Brian Sandoval of Nevada, expressing appreciation and support of voluntary conservation efforts, such as those undertaken as part of the Department of Agriculture (USDA), Natural Resources Conservation Service's (NRCS) Sage-Grouse Initiative (SGI).

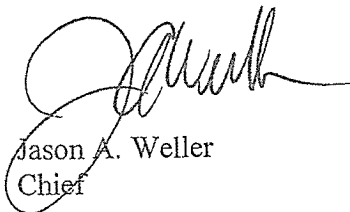

My objective for the collective SGI efforts, "on-the-ground" conservation work and the results of science-based evaluations documenting the effectiveness of that work have always been to support a "not-warranted" listing decision for sage-grouse. I still believe this objective is possible.

NRCS remains committed to working with the U.S. Fish and Wildlife Service to increase the visibility and consideration of voluntary conservation efforts within the legal framework of the Endangered Species Act. I welcome assistance the Western Governors' Association is willing to offer in this regard.

Enclosed are answers to your questions explaining NRCS SGI. I hope the responses are useful. Please let me know if you need additional information.

Again, thank you for writing and for your continued conservation efforts for the greater sage-grouse. An identical letter has been sent to Governor Sandoval.

Sincerely,

Jason A. Weller  
Chief

***1. How much money has NRCS invested (through the SGI and other programs) in sage-grouse conservation between 2010 and 2013? What dollar amount did landowners and other partners contribute for these activities over the same period?***

A total of \$354.3 million has been invested through the Sage-Grouse Initiative (SGI) from fiscal years (FY) 2010 to 2013 to strategically address threats facing sage-grouse and western rangelands. Of this total, NRCS provided \$246.8 million, while partners and landowners invested an additional \$107.4 million.

NRCS primarily fuels SGI through individual contracts with ranchers offered from Farm Bill conservation programs, including the Environmental Quality Incentives Program, Wildlife Habitat Incentive Program, Farm and Ranch Lands Protection Program, Grasslands Reserve Program, and the Wetlands Reserve Program. NRCS and partners invested \$338.4 million through these programs, resulting in direct on-the-ground conservation (Table 1). Examples include developing grazing management practices to maintain nesting cover, removal of encroaching conifers that have invaded former historic sagebrush-steppe, securing conservation easements to keep working lands working as intact range in perpetuity, and making fences more visible to reduce sage-grouse collisions.

Additionally, NRCS and partners invested \$14.7 million through a creative partnership called the SGI Strategic Watershed Action Team (SWAT). This agreement teams NRCS with over 40 conservation partners, including many State agencies, to expand field-delivery capacity, communications, and science. SWAT has been highly effective, resulting in a doubling of SGI implementation. We've further bolstered our investments in science to quantify resulting benefits of applied conservation with a \$1.2 million investment through the Conservation Effects Assessment Project.

*Table 1 - Sage Grouse Initiative: Number of NRCS agreements, contracts, projects, and financial dollars obligated for fiscal years 2010-2013.*

- a) Source 2010: EQIP/WHIP data were queried from NRCS' ProTracts October 1, 2010, GRP data from NEST as of March 2011. Note: The FY 2010 tabular summary for SGI does not reflect contracts developed in Nevada. Six EQIP contracts were developed for a total obligation of \$1,136,303, but were not coded in the system. In addition, Oregon used EQIP to fund 8 EQIP contracts (\$451,107) to benefit Sage Grouse.
- b) Source 2011: EQIP/WHIP data were queried from NRCS' ProTracts 10/1/2011 with 12/24/2012 file update, FRPP/GRP/WRP data derived from State office spreadsheets, 10/19/2011 (Acreages estimates from Program Manager 8/22/2012), State program manager estimates for CO and NV GRP acreages 10/12/2012.
- c) Source 2012: EQIP/WHIP data were queried from NRCS' ProTracts 10/2/2012, NRCS' FMMI query via state office for FRPP and WRP financial information as of 4/25/13-4/30/13 obtained through state program manager query 4/25/13, GRP Financial Assistance from LTP-50 "Agreement to Purchase Conservation Easement" obtained through state program manager query 4/25/13-4/30/13.

d) Source 2013: EQIP/WHIP data were queried from NRCS' ProTracts 10/25/2013, FRPP/GRP/WRP data derived from State office spreadsheets, 3/17/2014.

<b>Total</b>	<b>74</b>	<b>\$64,511,019</b>	<b>152,412</b>	<b>8</b>	<b>\$14,476,657</b>	<b>10,757</b>	<b>953</b>	<b>\$236,378,626</b>	<b>3,826,273</b>

**2. How many acres were put into conservation easements through SGI from 2010-2013? How many additional acres also received other conservation treatments -- such as conifer removal, new grazing systems, and fence marking/removal -- during that same period?**

Through SGI, we partner with 953 ranches to implement conservation on 3.8 million acres across 11 Western States. Conservation practices are designed to address primary threats and targeted in priority landscapes containing the majority of birds. SGI uses outcome-based science to quantify the biological benefits of conservation, to assess effectiveness, and adaptively improve delivery. Listed is a summary of SGI accomplishments from FY 2010-FY 2013.

- Reduced the overarching threat of fragmentation by preventing subdivision of large and intact ranches through the establishment of 381,659 acres of conservation easements. These investments work in tandem with State and Federal policy to maximize benefits to birds. As an example, conservation easements in Wyoming are expected to help reduce by two-thirds anticipated bird losses by embedding conservation easements inside Wyoming's core areas (Copeland et al. 2013-PLos One).
- Additional hiding cover is expected to increase sage-grouse numbers by 8 to 10 percent within the 2.6 million acres of grazing systems implemented (Doherty et al. in press-Wildlife Biology).
- We have tripled the chance of maintaining viable populations by removing 276,250 acres of invasive conifer in core habitats and prevented a loss of 60 percent of the available forage (Baruch-Mordo et al. 2013- Biological Conservation; McClain 2012- MS Thesis).
- Preventing 2,800 sage-grouse fence collisions annually and reduce fence strike risk by 83 percent by marking or moving 537 miles of "high-risk" fence (Stevens et al. 2013-WSB).

**3. What has been the trend in SGI enrollments? Did you see a change in enrollments after the U.S. Fish and Wildlife Service (FWS) proposed listing the Bi-State distinct population segment (DPS) of greater sage-grouse as threatened and, if so, by how much?**

Since inception in 2010, agricultural producers across the West have embraced the voluntary and incentive-based approach to conservation offered through SGI. Producer interest has remained consistently high over the 4-year period with NRCS enrolling an average of 238 SGI participants each year (224 in FY 2010, 239 in FY 2011, 253 in FY 2012, and 237 in FY 2013).

The Bi-State DPS is included as a key part of SGI's conservation strategy. This unique landscape straddling the California and Nevada borders is comprised mostly of federally owned

public lands (92 percent) and ranchers here rely on their continued use of Federal grazing allotments to make their agricultural operations viable. Although Federal lands dominate the landscape, much of the water is located in irrigated meadows on the privately owned lands and is critical to sage-grouse brood survival. Top priorities for Bi-State conservation are establishing conservation easements on private lands to ensure critical brood habitats remain and removing encroaching conifers that degrade habitats and increase predation.

Initial interest and SGI participation from Bi-State landowners was low, resulting in only \$155,000 in SGI projects in FY 2010. Producer interest has grown each successive year and SGI investments have accelerated significantly. Through FY 2013, we finalized contracts for \$26 million of on-the-ground Bi-State projects addressing critical threats identified in the 2012 Bi-State Action Plan; primarily the establishment of perpetual conservation easements, removal of encroached conifer, and restoration of wet meadows to improve brood rearing habitat (Table 2).

*Table 2- Funding totals including both CA and NV*

Year	EQIP	WHIP	GRP	WRP	FRPP*	Total SGI \$
2010	\$119,778	\$36,209	\$ -	\$ -	\$ -	\$155,987
2011	430,294	90,353	-	-	-	520,647
2012	234,642	31,367	2,218,565	278,400	11,400,000	14,162,974
2013	303,447	47,492	9,570,557	0	1,240,000	11,161,496
<b>Totals</b>	1,088,161	205,421	11,789,122	278,400	12,640,000	<b>26,001,104</b>

*\* FRPP funding includes cooperative partnership dollars.*

Although we experienced significant growth in Bi-State SGI participation in the period of FY 2010 through FY 2013, landowner interest has declined precipitously in FY 2014 (Figure 1). While several factors likely influence landowner participation, it appears this decline is associated with the FWS proposal to list the bird in the fall of 2013. There were 13 producers who had submitted early SGI applications for FY 2014 funding and withdrew their applications shortly after the listing announcement. Many expressed continued desire to participate in SGI, but are fearful that listing of the Bi-State sage-grouse will reduce or eliminate their use of Federal grazing allotments, thereby rendering their private agricultural operations unviable. Today, our FY 2014 applications total 3, down from 24 the prior year (FY 2013). None of the FY 2014 applications are for establishment of new conservation easements.

**4. How would a threatened or endangered listing of the greater sage-grouse affect NRCS's investment in sage-grouse conservation? Do you anticipate that landowners and other partners will still want to participate in SGI under a listing scenario?**

NRCS is determined to provide SGI support until the threats facing sage-grouse are addressed.

It is important to note, however, that NRCS does not directly implement any conservation practices on our own. Instead, our voluntary and incentive-based approach depends completely on the willingness of private landowners to voluntarily sign up, agree to implement beneficial practices, and invest their own resources to put conservation on the ground. Because of this, any action, such as an Endangered Species Act (ESA) listing, or otherwise, that negatively impacts private landowner desire ultimately affects our ability to implement SGI in the future. Additionally, new critical habitat designations for sage-grouse could also increase NRCS consultation requirements and impact landowner desire to participate.

To help address landowner concerns regarding additional ESA regulations, NRCS partnered with FWS in 2010 and created the first-ever Sage-Grouse Conference Report. SGI participants benefit by obtaining "ESA predictability" meaning that if sage-grouse are ultimately listed under ESA, landowners can continue implementing approved practices on their private lands and still be in full compliance with the law. This approach is likely to be effective for producers who primarily operate on private land. Our agreement does not offer similar predictability for public land allotments and a solution for this concern is needed as the majority of western ranches operate on a combination of public allotments and private land.

Predicting future landowner and partner participation if sage-grouse are listed is very hard. SGI is based on the belief that we can achieve wildlife conservation through sustainable ranching and adherence to this vision and voluntary framework has fostered an enthusiastic and unprecedented participation rate among diverse partners and landowners across the West. Coupled with the historic actions taken by the States and other Federal land management agencies, I sincerely hope this question will remain hypothetical and we will succeed by proactively conserving sage-grouse and avoiding ESA designation altogether.

**5. If the greater sage-grouse is not listed under the Endangered Species Act, will NRCS continue to provide funding for voluntary conservation efforts and if so, at what level?**

SGI is not a program, rather it is a strategic way of delivering many existing Farm Bill programs to achieve desirable outcomes. This is the premise of all of our Landscape Conservation

Initiatives designed to focus necessary resources to solve conservation challenges of national importance. Working together over the past 4 years, we have improved the outlook for sage-grouse and have implemented unsurpassed conservation on a watershed scale. We also recognize the significant threats facing sage-grouse and the need for a sustained long-term investment from all of us to finish the job. I cannot commit to a specific future monetary or program contribution level, but I can assure you that SGI will remain a highly prioritized and desirable business model for NRCS as long as it continues to net positive conservation outcomes.

# United States Department of the Interior

FISH AND WILDLIFE SERVICE  
Washington, D.C. 20240

MAY 13 2014

The Honorable Gary R. Herbert  
Governor of Utah  
Salt Lake City, Utah 84114-2220

Dear Governor Herbert:

Thank you for your January 3, 2014, letter regarding conservation of the greater sage-grouse. We recognize the meaningful efforts supporting greater sage-grouse conservation across the species' range and in Utah. We appreciate your collaboration with us as we work towards our 2015 listing decision. Conservation efforts implemented by Utah and its federal, state, local, and tribal partners, include pinyon-juniper removal, sagebrush restoration, and seeding projects. Furthermore, Utah and its partners have focused efforts on surveys and monitoring of this species, which have provided population and habitat information to help guide conservation efforts.

As your letter points out, Utah is in the process of implementing its February 14, 2013, Conservation Plan for Greater Sage-grouse in Utah (Plan). Your Plan's strengths lie in its ambitious goals and objectives to protect habitat which provides for the year-round life-cycle needs of the species, perpetuate conditions necessary to ensure recruitment of a continuing population, and enhance or improve sage-grouse habitat through restoration or rehabilitation activities.

In our April 29, 2013, letter to Kathleen Clarke we provided several recommendations to strengthen the State's Plan. Many of our recommendations were specific to avoiding and minimizing impacts to sage-grouse populations and their habitats from land use activities, including recommendations to 1) consider a maximum 3 percent surface disturbance limit in priority sage-grouse habitats regardless of landownership, 2) protect leks and nesting habitats using a 4-mile lek buffer, 3) avoid construction of infrastructure in sage-grouse habitat, and 4) include conservation of the Anthro and West Tavaputs sage-grouse populations—these populations are primarily on federal lands in the otherwise largely non-federally owned Carbon PAC (see Table 1, below), and are important for habitat and population connectivity in northeastern Utah. We provided the BLM and USFS with similar and additional recommendations to avoid, minimize, and mitigate impacts to greater sage-grouse under their Greater Sage-Grouse Land Use Plan Amendment (LUP) DEIS (letter to BLM dated January 31, 2014). The BLM LUP amendment will provide policy and regulatory provisions for land use activities occurring on federal lands across the range of the greater sage-grouse.

In our April 29, 2013, letter we also urged that the State consider the use of regulations and policies to ensure the implementation of conservation measures on non-federal lands. As you indicated in your letter, the State's Plan is based largely on the use of voluntary incentives on non-federal lands, and we commend your efforts to work with partners, conduct habitat treatments, and provide funding to address fire control and rehabilitation needs.

While we strongly support voluntary incentive-based programs as important components of species' conservation efforts, we also strongly recommend (as described in the COT report) the use of regulatory mechanisms as needed to address all threats to the maximum extent practicable. This is particularly important in Utah where several of the sage-grouse Priority Areas of Conservation (PAC) are comprised of large acreages of private or other non-federal lands—specifically the Box Elder (58%), Parker Mountain-Emery (28%), Rich-Morgan-Summit (81%), Strawberry (74%), Uintah (35%), and Carbon (86%) areas that are also identified as sage grouse management areas (SGMAs) in the State's Plan. Given the large proportion of greater sage-grouse populations on non-federal lands in many of the SGMAs, it is uncertain how successful the complete reliance on voluntary incentives will be for greater sage-grouse conservation in the State.

For example, several PACs/SGMAs have a large overlap of non-federal lands and development potential (Table 1). If the State is unable to obtain voluntary conservation mechanisms for greater sage-grouse on these lands, or if the conservation and mitigation measures are substantially less protective than those on neighboring federal lands, it is likely that a high degree of habitat fragmentation and loss of population connectivity will occur within and between PACs in Utah, and possibly with those in neighboring States. As another example, the Bald Hills, Box Elder, Hamlin Valley, Ibabah, and Sheeprocks, PACs/SGMAs all have high potential for loss of habitat from fire and invasive species. The BLM is developing adaptive management protocols to specifically address responses to fire, however landscape level suppression and rehabilitation efforts will be more effective if addressed equally across all land ownerships, with some regulatory mechanisms to ensure implementation.

**Table 1-Percentage of Non-Federal Lands and Development Threat**

SGMA/PAC	Percentage of GRSG Habitat on Non-Federal Land in SGMA*	Energy, Mining ,or Infrastructure listed as a primary threat**
Box Elder	58%	Yes
Carbon	86%	Yes
Panguitch	35%	Yes
Parker Mountain-Emery	28%	Yes
Strawberry	74%	Yes
Rich-Morgan-Summit	81%	Yes
Uintah	35%	Yes

\*from the State's Conservation Plan for Greater Sage-grouse in Utah-Appendix 5

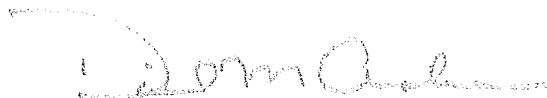

\*\*Based on COT report and BLM Greater Sage-Grouse Land Use Plan Amendment DEIS

Reversing population and habitat declines of greater sage-grouse in Utah and across its range is very challenging and we must continue to work together in order to succeed. We are committed to continuing the collaborative process of working with the State to ensure your Plan is ultimately best positioned to contribute to a future where listing the greater sage-grouse under the Endangered Species Act is unnecessary. We believe your continued coordination with us, along with a commitment to implement a conservation Plan with adequate regulatory mechanisms, will help ensure long-term viability for the species in the State.

However, should the sage-grouse become a listed species; your continued efforts toward greater sage-grouse conservation would help engage partnerships and expedite recovery.

If I can be of further assistance, please contact me at the letterhead address.

Sincerely,

A handwritten signature in cursive script, appearing to read "Tom A. Ash". The signature is written in dark ink and is positioned below the word "Sincerely,".

DIRECTOR

FISH AND WILDLIFE SERVICE  
Pacific Southwest Region  
2800 Cottage Way, Suite W-2606  
Sacramento, California 95825

IN REPLY REFER TO:  
FWS/RS/

MAY 13 2014

The Honorable Brian Sandoval  
One Hundred One North Carson Street  
Carson City, Nevada 89701

Dear Governor Sandoval:

Thank you for taking time from your busy schedule to meet with me on May 5<sup>th</sup>. Your time and thoughts are greatly appreciated.

You asked me what states have sage grouse conservation plans that the Fish and Wildlife Service believes are good plans. I promised to respond to you. Wyoming has completed a plan that has been found sufficient by the Service. Of the other ten states that have sage grouse habitat, eight are working on plans. Oregon, Montana, and Idaho are making progress on plans that the Service hopes will sufficiently plan for conservation of sage grouse. We continue to work closely with those states as they craft approaches that would meet the objectives of the 2013 inter-agency "Conservation Objectives Team" report. This report identified areas of key habitat, the primary threats in the key areas, and objectives for reducing threats. An overarching objective of the report is to ensure the integrity of priority areas by directing human-caused habitat loss elsewhere.

Nevada's plan focuses almost entirely on the Bureau of Land Management's (BLM) actions but does not recognize the need to avoid habitat loss in good occupied sage grouse habitat. As I related during our meeting, Nevada is a key state – perhaps the key state – in conserving sage grouse and its habitat. I believe there are two key components to conserving sage grouse in Nevada: on BLM lands, do not permit actions that would result in loss of good sage grouse habitat that is occupied by sage grouse, and encourage private landowners to conserve key wet meadow habitat. While both voluntary and regulatory measures can conserve habitat in private ownership, voluntary efforts must demonstrate implementation and probability of success if they are to contribute to a finding that Endangered Species Act (ESA) protection is not necessary. Your office could be a strong force for conservation of sage grouse and its habitat and help obviate the need for federal protection under the ESA.

Without doubt, wildfire and invasive species are major threats and much needs to be done before we are confident these threats can be sufficiently ameliorated, which makes it all the more important that we address the threats that can be removed or lessened. I appreciate your offer to work with me as we approach the critical September 2015 date when the Service has to decide whether proposing federal protection is needed. Please feel free to call me at (916) 414-6467 anytime, on any issue. Again, thank you.

Sincerely,

Regional Director

## Inventory of State and Local Governments' Conservation Initiatives for Sage-Grouse

2013 UPDATE  
FEBRUARY 20, 2014

WESTERN  
GOVERNORS'  
ASSOCIATION

## About This Inventory

The greater sage-grouse needs large expanses of land for the stages of its lifecycle. Sagebrush, key habitat for the species, is found throughout 11 of the Western Governors' Association (WGA) member states. But today, evidence shows greater sage-grouse now occupy just 56% of their historic range.

In 2010 the U.S. Fish and Wildlife Service (FWS) listed the greater sage-grouse as "warranted but precluded" under the Endangered Species Act, meaning that the species deserves federal protections but that FWS does not have the resources to support those measures.

Lynn Chamberlain, Utah Division of Wildlife Resources

Western Governors and former Interior Secretary Ken Salazar formed the State-Federal Sage-Grouse Task Force (SGTF) in 2012 to implement high priority conservation actions and integrate ongoing efforts necessary to preclude the need for fully listing the sage-grouse. If fully listed, the economic impacts to states with sage-grouse habitat could be significant.

Since then Western states, through the WGA and Western Association of Fish and Wildlife Agencies (WAFWA), have worked collaboratively to address challenges facing sage-grouse and their habitat. With the passage of WGA Policy Resolution 11-09 (*Sage-Grouse and Sagebrush Conservation*), Western Governors demonstrated support for all reasonable management efforts necessary to avoid a threatened or endangered listing of the species.

At the Governors' request – and as a resource for FWS and the public – WGA and WAFWA created the first annual inventory in 2011 to illustrate how states and counties were taking proactive, voluntary steps to preclude the need to put the greater sage-grouse and Gunnison sage-grouse on the federal endangered species list.

Since that initial report, a second WGA inventory of sage-grouse conservation initiatives was released for 2012. This third WGA report highlights new sage-grouse conservation activities in 2013, along with an appendix that contains all initiatives reported by the relevant states and counties between 2011 and 2013.

## 2013 a busy year for Sage-Grouse Task Force

Representatives appointed by Governors from the 11 states with sage-grouse populations participated in four State-Federal Sage-Grouse Task Force (SGTF) meetings in 2013 with federal representatives from the U.S. Fish and Wildlife Service (FWS), U.S. Department of the Interior (DOI), Bureau of Land Management (BLM), U.S. Forest Service (USFS), Natural Resources Conservation Service (NRCS), and U.S. Geological Survey (USGS).

During the meetings members shared individual state and agency progress reports. Members also engaged in discussions to define the metrics that would demonstrate successful conservation of the species for FWS decision-making purposes.

The task force weighed options for addressing threats to sage-grouse, such as invasive species and wildfire. The task force, for example, commissioned a Near-Term Fire Conservation Action Team comprised of sage-grouse and fire experts. The group issued a report to the SGTF on near-term conservation actions, identifying what policy makers can do to address the wildfire threat, while recognizing the operational realities of fire response.

Scott Root, Utah Division of Wildlife Resources

## The Inventory

Western Governors' Association staff asked states and counties to update the 2012 inventory spreadsheet of state and local governments' conservation initiatives for sage-grouse. The resulting list of policies and conservation measures illustrate the methods used to conserve sage-grouse and sagebrush habitat, including: type of action taken, stage of implementation, description of the action, plus achieved and/or expected outcomes.

**California, Colorado, Idaho, Montana, Nevada, North Dakota, Oregon, South Dakota, Utah, Washington** and **Wyoming** have reviewed and updated the inventory. Counties with inventory updates include, from Colorado: Delta, Dolores, Gunnison, Mesa, Montrose, Ouray, Saguache and San Miguel. Hot Springs County in Wyoming and San Juan County in Utah also participated. The updated data can be found in the appendix.

This inventory provides a catalog of management

approaches by state and local authorities to conserve sage-grouse and their habitat. State and local governments, and their partners, are strongly encouraged to review the elements included in this inventory and give strong consideration to the initiatives recorded here when evaluating their own sage-grouse conservation efforts.

The following is a look at conservation measures of note in the inventory.

## Working Groups

All the states have Local Working Groups (LWGs) actively engaged in sage-grouse conservation activities. Many of the groups are instrumental in overseeing implementation of sage-grouse conservation plans. Several counties also are actively involved in LWGs, such as the Crawford Area Local Working Group and the Bi-State/ Tri-County Sage Grouse Working Group.

## Conservation Plans

All states reported having greater sage-grouse conservation plans, most of which have been in existence for several years. Counties also are utilizing conservation plans for Gunnison sage-grouse, which establish goals and initiatives to ensure adequate work is being conducted to conserve the Gunnison sage-grouse and its habitat.

The office of **Idaho Gov. Butch Otter** developed and submitted a state plan of regulatory mechanism as an alternative in BLM's Environmental Impact Statement. On Nov. 1, 2013, the Idaho Governor's Alternative was named a co-preferred alternative in the BLM Idaho and Southwestern Montana Draft Land Use Plan Amendment and Environmental Impact Statement.

The state of **Nevada**, through the Governor-appointed Sagebrush Ecosystem Council, submitted a state alternative for inclusion in the Nevada and Northeast California Sub-Regional Greater Sage-Grouse Draft Land Use Plan Amendment and Environmental Impact Statement (EIS). The alternative focuses on addressing the primary habitat threats of fire and invasive species, and includes regulatory mechanisms to avoid, minimize and mitigate impacts while establishing a Conservation Credit System to protect and restore critical habitat. The Council provided clarifying comments to the BLM and USFS with the intent of the state alternative being selected as the preferred plan in the Final EIS. The elements of the state alternative serve as the foundation for Nevada's state plan for sage-grouse conservation efforts.

The **South Dakota** Department of Game, Fish and Parks began revising its sage-grouse conservation plan in the fall of 2012 with expected completion in the spring of 2014. The revised plan will identify additional conservation opportunities beyond what are identified in the current management plan. The plan will also include sage-grouse

core areas, which identify the most important sage-grouse landscapes in the state.

In February of 2013 **Utah** released its final conservation plan for sage-grouse. The plan is designed to protect high quality sage-grouse habitat, enhance impaired habitat, and restore converted habitat. It also aims to eliminate threats facing the sage-grouse while balancing the economic and social needs of Utah residents. The plan provides for an incentive-based program for private, local government and school trust lands and a cooperative regulatory program on other state- and federally-managed lands. The plan focuses on conservation within 11 specific Sage-Grouse Management Areas that represent more than 90 percent of the species in Utah. The Plan Implementation Council monitors activities related to the plan.

Eight **Wyoming** LWGs completed sage-grouse conservation plans in 2007-08 and since then have been implementing conservation efforts in the form of habitat treatments, applied research, public outreach and enhanced population monitoring. In response to the 2010 FWS listing decision, the Wyoming Sage-Grouse Executive Orders and other new information, the LWGs have revised and updated their plans. All eight of the final revised plans will be presented to the Wyoming Game and Fish Commission in March 2014.

Implementation of the **Washington** State Recovery Plan for the Greater Sage-Grouse began in 2004, guiding management and research activities in the state. Activities include translocations to re-establish or augment populations, population monitoring, support of federal farm programs in greater sage-grouse management zones, establishment and prioritization of management zones, research, and support of sage-grouse management activities for agency-specific and area-specific management plans.

**Oregon's** sage-grouse conservation plan documents the state's All-Lands/All-Threats approach to sage-grouse conservation. It is tied to the SageCon Partnership co-convened by the Governor's office, BLM and NRCS. The plan documents the efforts undertaken since 2010 to reduce threats to sage-grouse conservation in Oregon and the strategies and actions (programmatic, voluntary and regulatory) the state will take in addressing gaps tied to those threats.

**North Dakota** Game and Fish developed a Sage-Grouse Nesting Resource Selection Model that predicts high, medium and low nest use locations. The model will be

used to identify priority habitat and to prioritize areas for conservation efforts.

## Initiatives

Nearly all states have initiatives to protect or enhance sage-grouse populations or sagebrush habitat. Several states have hired additional biologists to help landowners implement conservation practices such as habitat restoration, fencing removal and rangeland management.

In 2013 the states of **Colorado** and **Utah**, along with nine local governments, entered into a Conservation Agreement for cooperation, collaboration and partnership for fostering conservation efforts for the Gunnison sage-grouse. **Oregon** Department of State Lands (DSL) is working with the FWS to develop a Candidate Conservation Agreement with Assurances (CCAA) for State Common School Fund Rangelands to implement conservation measures on over 610,000 acres of sage-grouse habitat. **Wyoming** also has a CCAA for greater sage-grouse. In addition, the state mapped sagebrush habitat by canopy cover category, using remote sensing and modeling efforts through a collaboration with industry, NGOs, academia and federal partners.

On the local level, 11 governments from Colorado and Utah signed a 2013 MOU creating a coalition for coordinated action to increase the abundance, viability and vitality of the Gunnison sage-grouse and its habitat. One outcome of the MOU was the execution of the Conservation Agreement between Colorado, Utah and nine local governments. It identified a commitment to amending the 2005 Gunnison Sage-Grouse Rangewide Conservation Plan, and adoption of the same, along with implementing the Habitat Prioritization Tool.

Gunnison County in Colorado utilizes a 1% county sales tax to finance the Gunnison County Land Preservation Fund. The fund generates approximately \$300,000 annually to pay for open space and conservation easements, including areas within the Gunnison Sage-Grouse Occupied Habitat. The Fund has provided funding (all or part) for 29 conservation easements, totaling 8,422 acres,

in Gunnison sage-grouse occupied habitat as of December 2013. Gunnison County also has a Gunnison Sage-Grouse Conservation Trust Fund used to fund research and habitat enhancements.

San Miguel County in Colorado has a Land Heritage Program providing private landowners with financial incentives to maintain land ownership while protecting open space and wildlife habitat.

## Executive Orders and Agreements

In 2013 Montana **Gov. Steve Bullock** issued Executive Order No 2-2013, which established a Greater Sage-Grouse Habitat Conservation Advisory Council. The council crafted recommendations for addressing the threats identified by the FWS to sage-grouse in Montana. Final recommendations will be submitted to the Governor in early 2014.

**Idaho Gov. Butch Otter** established the Governor's Sage-Grouse Task Force by executive order in 2012. **Wyoming Gov. Matt Mead** issued an Executive Order in 2011 that reiterated and clarified the intent of Wyoming's Core Area Strategy, originally developed under former Gov. Dave Freudenthal.

In May of 2013, **Washington Gov. Jay Inslee** and **Oregon Gov. John Kitzhaber** made a Declaration of Cooperation with Secretary of the Interior Sally Jewell on the Pacific Northwest Regional Infrastructure Team. This agreement recognized the need to mitigate and protect sage-grouse as energy projects are permitted.

## Statutes and Regulations

The **Washington** legislature by statute authorized the Department of Natural Resources to fight fires on non-forested land that may include sage-grouse habitat. In **Wyoming**, the legislature has appropriated \$7.9 million for sage-grouse conservation since 2005.

Seven states, up from four states in 2012, reported having regulations in effect for sage-grouse. **California, Idaho, Montana, Oregon** and **South Dakota** cited special hunting season rules

or recommendations. **Wyoming** Public Service Commission regulations ensure consistency of proposed public utility projects with the Governor's Executive Order.

The **Oregon** Statewide Planning Program provides a legal framework to protect rural lands for rural uses. The state statute is implemented through county comprehensive plans and zoning ordinances. A review conducted by the seven Oregon sage-grouse counties shows that almost all of the non-federal land identified as sage-grouse habitat is included in some type of Exclusive Farm Use Zoning District.

Under Oregon's Energy Facility Siting Standards, there is a requirement that a proposed energy facility comply with the habitat mitigation goals and standards of the Oregon Department of Fish and Wildlife.

**Nevada** has several regulations. Assembly Bill 461 formally created and gave regulatory authorization for the Sagebrush Ecosystem Program. After being approved by the state legislature, **Gov. Brian Sandoval** signed the bill into law in July, 2013. The state also has a pesticide registration fee where revenue from a fee increase will provide additional funding to the state noxious weed program. Funds from that fee will go to the statewide effort toward sage-grouse habitat conservation, as well as continue the program's ability to provide effective, efficient service in pesticide registration. The funds will also be used to fund a position on the Sagebrush Ecosystem Technical Team (SETT) and allow for greater statewide weed mapping and control efforts. This funding source will be leveraged with other federal and local sources to maximize the benefit. The state also has a Nevada Cheatgrass Action Team, a voluntary multi-disciplinary group of individuals to assist the SETT with planning and managing projects to address cheatgrass and other invasive or noxious weeds that impact greater sage-grouse habitat.

Counties are also using regulatory tools to support sage-grouse. Three **Colorado** counties—Delta, Dolores and Montrose—passed 2013 resolutions giving the counties authority to help preserve Gunnison sage-grouse and its habitat. Saguache County and Ouray County in Colorado have regulations for seasonal road closures near active leks.

## Partnerships

All states participating in this inventory take part in the **Natural Resources Conservation Service (NRCS) Sage Grouse**

Larry Dalton, Utah Division of Wildlife Resources

**Initiative.** States are also cooperating with BLM to identify strategic habitat, provide feedback on draft EISs and provide technical assistance.

In **Nevada**, collaborative funding through state and federal agencies is being used to support three new positions within the Department of Conservation and Natural Resources' Conservation District Program. The positions were created within the conservation district program to assist local conservation districts in their efforts to lead Local Area Work Group meetings and planning efforts as well as assisting the SETT with habitat evaluations, "groundtruthing" local conditions for the administration of the Conservation Credit System, and implementing sage-grouse habitat conservation projects.

There is also a new agreement in Nevada to provide additional services under the Wildland Fire Protection Program, under which the Nevada Division of Forestry and the state's counties will work closely to maintain effective wildfire management. Better wildfire management translates into reduced loss of sage-grouse habitat due to fire.

The **North Dakota** Game and Fish Department funded a cooperative monitoring project with the Little Missouri Grazing Association to identify grazing practices that are beneficial to nesting sage-grouse. North Dakota is also collaborating with local and private partners to introduce private landowners to the CCAA program with the FWS.

The **South Dakota** Department of Game, Fish and Parks has partnered with the Intermountain West Joint Venture

CONTINUED ON PAGE 8

# Major Federal Activities

## Bureau of Land Management (BLM) / U.S. Forest Service (USFS)

The BLM and USFS are currently revising and amending a total of 98 land use plans across 10 western states. By Feb. 1, 2014, all 15 planning efforts in those states associated with the National Greater Sage-Grouse Planning Strategy will have released draft versions for public review. The Wyoming 9-Plan and Oregon Draft greater sage-grouse land use plan amendments are the only two efforts that have existing open public comment periods (ending on Feb. 20, 2014, and March 24, 2014, respectively). The BLM and Forest Service expect to release proposed plans and final environmental impact statements associated with this strategy throughout the summer and fall of 2014, with the expectation that these planning efforts will be completed by year's end.

## U.S. Fish and Wildlife Service (FWS)

In March 2013, the FWS released the Conservation Objectives Team (COT) report to help guide efforts by the states and other partners to conserve the greater sage-grouse. The landscape-level strategy outlined in the report, which was developed by a team of federal and state wildlife biologists and managers, describes the conservation status of the sage-grouse, identifies the threats facing the species, and establishes long-term conservation objectives. The report represents a collaborative state and federal effort to evaluate species conservation before the FWS is required to make a decision in 2015 on whether to propose protecting the species under the Endangered Species Act. It also provides state, federal, local and private entities with permitting or land management authority with information to support conservation actions for the sage-grouse.

FWS has also worked closely with federal land managers and state wildlife agencies to help guide the development of their respective sage-grouse conservation plans at both the technical and policy levels, while at the same time building the tools for evaluating the status of sage-grouse conservation efforts in a consistent, transparent and thorough manner. Finally, FWS has invested heavily in funding research aimed at addressing key scientific questions about sage-grouse conservation, including the invasive species-fire nexus.

## Natural Resources Conservation Service (NRCS)

The NRCS-led Sage Grouse Initiative (SGI) partnership carries out conservation in 11 western states. SGI proactively conserves sage-grouse, cares for other wildlife sharing the same extensive sagebrush country, and helps ranchers pass on their rural way of life. The paradigm for at-risk wildlife works through voluntary cooperation, incentives and community support. Applying the power of the Farm Bill to target lands where habitats are intact and sage-grouse numbers are highest, SGI has invested more than \$145 million, generating \$70 million in matching contributions since 2010. As of 2013, more than 700 ranchers have enrolled and reduced sodbusting and subdivision threat on more than 240,000 acres; increased hiding cover for nesting birds on 2+ million acres; removed invading conifers on more than 200,000 acres, and marked or removed 500+ miles of high-risk fences to prevent bird collisions.

## U.S. Geological Survey (USGS)

At the request of the Western Association of Fish and Wildlife Agencies (WAFWA), the USGS led the development of a Greater Sage-Grouse National Research Strategy. The Strategy, published in 2013, was requested as a way to connect existing research and conservation plans with persisting or emerging information needs. It documents information gaps and identifies priority research topics to inform future planning and management activities. The USGS also completed a report for the BLM that summarizes several decades of work on sage-grouse populations, sagebrush as habitat, and sagebrush ecological functions. This Baseline Environmental Report (BER) summarizes scientific information in the context of threats identified in the FWS's "warranted but precluded finding." In addition, the USGS completed an analysis and mapping of ecological conditions necessary to support sage-grouse across large expanses of its range. This Ecological Minimums publication examined environmental factors surrounding 3,000 active leks, within a 355,000 square-mile portion of the sage-grouse's historic range.

(IWJV), Pheasants Forever and the NRCS to place a Farm Bill biologist position in western South Dakota, emphasizing the implementation of the NRCS Sage-Grouse Initiative.

**Montana** Fish, Wildlife and Parks, BLM, NRCS, IWJV, and Montana Association of Conservation Districts developed a partnership to purchase bulk orders of fence markers and use volunteer groups to mark fences within core areas determined to be at the highest risk for collision (using the NRCS risk model).

## Programs

Annual sage-grouse lek counts, which establish population trends and habitat protection needs, are featured in most states. **Montana** has translocated greater sage-grouse to augment populations in Alberta, Canada. **Idaho** has a new Rural Land Fire Protection Association program, with three rural fire protection associations created allowing private landowners and agency (local, state, and federal) fire management coordination to improve initial response on wildfires.

The **Washington** departments of Fish and Wildlife and Natural Resources are acquiring and conserving sagebrush habitat through the Natural Heritage and Wildlife Area programs. In **Utah**, more than \$8.8 million dollars was spent in 2013 on improving and enhancing sage-grouse habitat. The **Wyoming** Wildlife and Natural Resources Trust focuses on sage-grouse habitat enhancement and conservation easements. In addition, the Wyoming Department of Environmental Quality administers the process for industrial permits, working with developers to ensure the **Governor's Sage-Grouse Executive Order** is being implemented.

## Management Tools

**Nevada** is making quick progress with the development of the Nevada Conservation Credit System (NCCS). In December, 2013, the Sagebrush Ecosystem Council and the interdisciplinary Sagebrush Ecosystem Technical Team began working with a contractor on the development of biological metrics for the NCCS as well as the framework for implementation. The NCCS is a key management tool for the state to achieve no net unmitigated loss of sage-grouse habitat. The system is being designed to utilize the Habitat Suitability Model that the state contracted with USGS for development. The scale of this mitigation system will be the first of its kind for greater sage-grouse mitigation and can serve as a model for other conservation efforts.

In addition, Nevada has contracted with the USGS to complete Habitat Suitability Modeling and Mapping for the greater sage-grouse. A preliminary draft of the map and suitability index was completed and will be reviewed by an expert review team in February of 2014 for refinement and final inclusion in the BLM/Forest Service EIS. The model incorporates greater sage-grouse telemetry data along with environmental data at multiple scales, such as land cover, vegetation communities, physiographic indices and anthropogenic attributes. The habitat suitability model will be used to inform management decisions on protecting the most critical habitat and to provide strategic decision tools to identify where conservation activities will have the greatest beneficial impact on the habitat.

In three **Colorado** counties (Delta, Gunnison and Montrose) a GIS "Habitat Prioritization Tool" is used to assess all land use applications for impacts to sage-grouse habitat.

## WESTERN GOVERNORS' ASSOCIATION

1600 Broadway  
Suite 1700  
Denver, CO 80202  
303.623.9378  
westgov.org

The Western Governors' Association represents the Governors of 19 Western states and 3 U.S. flag islands. The association is an instrument of the Governors for bipartisan policy development, information exchange and collective action on issues of critical importance to the Western United States.

WESTERN  
GOVERNORS'  
ASSOCIATION

Western Governors' Association  
Policy Resolution 2014-11

*Species of Concern and Candidate Species*

**A. BACKGROUND**

1. States possess broad trustee responsibilities, police powers and primacy over management of the majority of fish and wildlife within their borders, and state wildlife managers have on-the-ground expertise in managing species.
2. Western states are proactively engaged in species conservation, including development of state and/or multi-state conservation plans to manage species as an alternative to federal Endangered Species Act (ESA) regulation.
  - a. All 11 states with greater sage-grouse have developed state conservation plans or other authorities for conservation.
  - b. The five states with lesser prairie-chicken collaborated with the Western Association of Fish and Wildlife Agencies to develop the Lesser Prairie-Chicken Range-wide Conservation Plan. The Plan was endorsed by the U.S. Fish and Wildlife Service (FWS).
3. Western Governors applaud federal incentive-based conservation efforts such as the Sage-Grouse Initiative (SGI) and the Lesser Prairie-Chicken Initiative of the Natural Resources Conservation Service. These initiatives have successfully assisted landowners in conserving habitat for those species on a voluntary basis. ESA listings dramatically alter the ability of states and federal agencies to seek incentive-based, collaborative solutions to difficult conservation questions by causing citizens to avoid cooperative agreements.
4. ESA listing decisions have real economic impacts for state and local governments through restriction on rangeland grazing, hunting, tourism and development of resources on public and private lands. The negative economic impacts of federal ESA decisions fall solely on states, local communities, businesses, jobs, and private property owners.

**B. GOVERNORS' POLICY STATEMENT**

1. Western Governors support all reasonable management efforts to conserve species and preclude the need to list species under the ESA.

2. Western Governors believe that state and multi-state conservation plans, upon review, consultation and endorsement by the U.S. Fish and Wildlife Service or National Marine Fisheries Service (NMFS), should give rise to a regulatory presumption by federal agencies that an ESA listing is not warranted. To that end:
  - a. States need clear, concrete guidance from FWS and NMFS about the requirements of state and multi-state conservation plans in meeting minimum conservation goals and objectives that would lead to stable or increasing populations, eliminate perceived threats to the species, and eliminate the need for listing.
  - b. FWS and NMFS should acknowledge that variability in state approaches for conservation of species, particularly for species with a wide geographic range such as the greater sage-grouse, can be valid so long as conservation goals and objectives are met.
3. States should be included as partners in ESA listing determinations, particularly in the case of listings that could have significant impact on state economies. Partnership must include:
  - a. Cooperative engagement of federal agencies with state fish and wildlife agencies to ensure that state fish and wildlife data, analyses and management recommendations are used as a principal source to inform listing determinations.
  - b. Avoiding duplicate analysis by federal agencies of raw data previously prepared by the states.
  - c. Giving full consideration to state conservation plans as a means for species management and using such plans to the greatest extent practicable.
  - d. Private landowners are central to voluntary conservation efforts. Concerns about public release of data make private landowners reluctant to engage in these valuable voluntary conservation efforts. Efforts should be made to publicly release data at an appropriate scale which acknowledges and addresses such concerns.
4. In considering whether to list a species under the ESA, the FWS should give full recognition to voluntary conservation efforts conducted by landowners, states, non-profit organizations, and other stakeholders, whether independently conducted or in partnership with federal programs like the Sage Grouse Initiative (SGI).
5. When issuing a proposed rule for a candidate species, the FWS should define what thresholds of geographic, temporal or other conditions are necessary to preclude the need to list a species.

6. Conservation efforts by both federal and state governments should prioritize time and funding for primary challenges facing a particular species, rather than less-significant concerns or those easiest to mitigate.
7. Federal agencies, as partners, should do their share to conserve species and be consistent and coordinated in their efforts to conserve species.
  - a. Federal agencies need to demonstrate their commitment to species conservation by prioritizing such efforts on their own lands, in cooperation with the overarching goals of state conservation plans.
  - b. Adequate funding must be budgeted by the federal agencies for conservation efforts on federal lands.
  - c. The proportion of a species' habitat that occurs on federal land should inform the federal agencies' level of commitment to conservation of that species. States and local governments cannot bear a disproportional burden for species conservation when federal management practices are a dominating factor in the likelihood of a species' success.
8. Federal funding for state conservation of species including State and Tribal Wildlife Grants and Section 6 funds must remain robust. States rely on these grants to support and leverage state management of non-game species.
9. Governors support legislative initiatives, court rulings, petitions or regulatory measures which allow local, state, federal and private conservation efforts adequate time to be implemented and demonstrate their efficacy.

C. **GOVERNORS' MANAGEMENT DIRECTIVE**

1. The Governors direct the WGA staff, where appropriate, to work with Congressional committees of jurisdiction and the Executive Branch to achieve the objectives of this resolution including funding, subject to the appropriation process, based on a prioritization of needs.
2. Furthermore, the Governors direct WGA staff to develop, as appropriate and timely, detailed annual work plans to advance the policy positions and goals contained in this resolution. Those work plans shall be presented to, and approved by, Western Governors prior to implementation. WGA staff shall keep the Governors informed, on a regular basis, of their progress in implementing approved annual work plans.

Clement, J.P. et al. 2014. A strategy for improving the mitigation policies and practices of the Department of the Interior. A report to the Secretary of the Interior from the Energy and Climate Change Task Force, Washington, D.C., 25 p.

The concept of mitigation, as expressly identified or implicit in the mission and statutory direction of the Department and its bureaus, is an essential element in how the Department manages the lands and resources under its jurisdiction. In response to Secretarial Order Number 3330 entitled “Improving Mitigation Policies and Practices of the Department of the Interior,” issued by Secretary of the Interior Sally Jewell in October 2013, this report highlights the challenges and opportunities associated with developing and implementing an effective mitigation policy, and describes the key principles and actions necessary to successfully shift from project-by-project management to consistent, landscape-scale, science-based management of the lands and resources for which the Department is responsible. In so doing, we believe that the natural and cultural assets stewarded by the Department can be managed more efficiently, effectively, and responsibly for the greater good of the nation.

To address the challenges associated with mitigation and improve practices while accommodating both infrastructure development and the conservation needs of America’s rapidly changing landscapes, the Department and its bureaus need mitigation policies and practices that a) more effectively avoid, minimize, and compensate for the impact of development on Department-managed lands and resources; b) provide better information and greater predictability to project proponents and land managers; c) improve the resilience of our Nation’s resources in the face of climate change; d) encourage more strategic conservation investments in lands and other resources; and e) increase compensatory mitigation effectiveness, durability, transparency and consistency.

Taking a landscape-scale approach to mitigation can meet these needs while improving permitting efficiencies, reducing conflict, and better achieving

development and conservation goals. In the mitigation context, the landscape approach dictates that it is not sufficient to look narrowly at impacts at the scale of the project; it is necessary to account for impacts to resource values throughout the relevant range of the resource that is being impacted. In order to realize the promise of landscape-scale mitigation, the Department and its bureaus will institute policies and procedures that reflect the following guiding principles:

1. **Landscape-scale:** *Incorporate landscape-scale approaches into all facets of development and conservation planning and mitigation.*
2. **Full Hierarchy:** *Utilize the full mitigation hierarchy in project planning and review.*
3. **Promote Certainty:** *Establish protocols to simplify planning and project review while improving operational certainty for project proponents.*
4. **Advance mitigation planning:** *At the outset of the project planning process, incorporate mitigation and landscape objectives into the design and development of projects that are likely to impact natural or cultural resources.*
5. **Science and Tools:** *Develop and utilize the scientific information and tools necessary to identify the most efficient and effective means of mitigating the effects of development and to inform monitoring and evaluation of mitigation efforts.*
6. **Foster Resilience:** *Identify and promote mitigation efforts that improve the resilience of our Nation’s resources in a rapidly changing climate.*
7. **Durability:** *Ensure that mitigation measures are durable.*
8. **Transparency:** *Promote transparency and consistency in the development of mitigation measures.*
9. **Collaboration:** *Coordinate with other federal and state agencies, tribes, and stakeholders in conducting assessments of existing and projected resource conditions, forming mitigation strategies, and developing compensatory mitigation programs.*
10. **Monitoring:** *Monitor and evaluate the results of mitigation over time to ensure that the intended outcomes are achieved.*

To effectively integrate these guiding principles and enhance the ability of state and federal agencies to address wildland fire, invasive species, climate change and other large-scale stressors, the Department’s management bureaus are moving toward a landscape approach to managing resources. The landscape approach to mitigation involves four distinct steps:

1. Identifying key landscape-scale attributes, and the conditions, trends, and baselines that characterize these attributes;

2. Developing landscape-scale goals and strategies;
3. Developing efficient and effective compensatory mitigation programs for impacts that cannot be avoided or minimized; and
4. Monitoring and evaluating progress and making adjustments, as necessary, to ensure that mitigation is effective despite changing conditions.

This report describes planned outcomes and next steps for each of these phases, as well as a number of near-term deliverables for the Department and its bureaus. Departmental bureaus are currently advancing this landscape approach to mitigation in various contexts, and anticipate that the strategy will evolve over time. This work is being conducted in collaboration with other federal, state, and tribal agencies, non-governmental organizations, and commercial interests.

This report describes an advanced form of collaborative problem-solving at a time when the uncertainties of a rapidly changing climate and the imperative of an energy transformation pose challenges for sustaining the natural ecosystems that buffer us from extreme weather events and play a fundamental role in the maintenance of America's clean air, clean water, agricultural productivity, world class recreational opportunities, and economy. This report, and the strategy it describes, is the Department's first step in building upon the innovative efforts that have been emerging across the Country to avert resource conflicts prior to development and to advance sustainable solutions that ensure the highest and best use of our natural resources.

On October 31, 2013, the Secretary of the Interior issued Secretarial Order Number 3330 entitled "Improving Mitigation Policies and Practices of the Department of the Interior." The Order charged the Department's Energy and Climate Change Task Force (Task Force) with developing a coordinated Department-wide strategy to strengthen mitigation practices:

*The purpose of this Order is to establish a Department-wide mitigation strategy that will ensure consistency and efficiency in the review and permitting of infrastructure development projects and in conserving our Nation's valuable natural and cultural resources. Central to this strategy will be (1) the use of a landscape-scale approach to identify and facilitate investment in key conservation priorities in a region; (2) early integration of mitigation considerations in project planning and design; (3) ensuring the durability of mitigation measures over time; (4) ensuring transparency and consistency in mitigation decisions; and (5) a focus on mitigation efforts that improve the resilience of our Nation's resources in the face of climate change.*

The Department has management responsibility over much of our Nation's federal lands, waters, and other natural resources. Steward for 20 percent of our Nation's lands, the Department oversees the development of over 20 percent of U.S. energy supplies, is the largest wholesaler and manager of water in the 17 western states, and provides services to over 500 federally recognized tribes and Alaska Native communities. In addition, the Department is responsible for the conservation and management of fish and wildlife resources, including over 800 native migratory bird species and nearly 2,000 federally listed threatened and endangered species. The Department also preserves and manages over 400 units of the National Park System and provides leadership for the National Historic Preservation Program, which guides the preservation of cultural resources both on and off the federal lands.

Given the inherent and sometimes difficult conflicts associated with the Department's responsibilities for both managing development and conserving the natural and cultural resources of the Nation's lands and waters, effective mitigation of the impacts of development is critical in enabling the Department, through its bureaus, to fulfill its statutory mandates. This report describes the rationale and the principles that will govern a Department-wide, landscape-scale approach to mitigation that fulfills the five purposes set forth in the Secretarial order and noted above. It also documents a number of actions that the Department and its bureaus will take in the coming months to further develop and implement the landscape-scale mitigation policy.

As directed in the Order, the Task Force report team conducted extensive outreach to many of our fellow federal agencies that conduct mitigation as well as several states and a subset of other stakeholders and partners (Appendix II). Due to the scope of mitigation efforts nationwide, this outreach effort will necessarily continue over the coming months as the Department works to implement an overarching mitigation framework consistent with the principles described in this report. To advance those efforts and provide the building blocks for its comprehensive new approach to mitigation, this report provides:

- a) A primer on the concept of mitigation and how it has been applied;
- b) A description of some of the key challenges that the Department and other agencies have faced in implementing effective mitigation;
- c) A Departmental strategy for overcoming those challenges, including a set of guiding principles that will govern the Department's landscape-scale mitigation efforts;
- d) Initial actions to be taken by the Department and its bureaus and agencies to implement a consistent and integrated landscape-scale mitigation policy;
- e) A list of deliverables and timelines for developing or revising landscape-scale mitigation policies and practices of the Department;
- f) A representative sample of some of the ongoing efforts that embrace the principles described in the strategy;
- g) A brief summary of the mitigation aspects of the Department's existing management practices and procedures, permitting, and legal authorities (Appendix I);
- h) A list of some of the agencies and partners contacted during outreach for this report (Appendix II).

The concept of mitigation, as expressly identified or implicit in the mission and statutory direction of the Department and its bureaus and agencies, is an essential element in how the Department manages the lands and resources under its jurisdiction. The purpose of this report is to highlight the challenges and opportunities associated with developing and implementing an effective mitigation policy and to describe the key principles and actions necessary to successfully shift from project-by-project management to consistent, landscape-scale, science-based management of the lands and resources for which the Department is responsible. In so doing, we believe that the natural and cultural assets stewarded by the Department can be managed more efficiently, effectively, and responsibly for the greater good of the nation.

## Origins

The Fish and Wildlife Coordination Act of 1934 included requirements that were the first formal expressions in law of a duty to minimize the negative environmental impacts of major development projects and to compensate for those impacts that remained – giving birth to the core ideas of what we now label as environmental mitigation. In the ensuing decades, environmental mitigation has come to play a key role in many other statutes and programs. Contemporary understanding of mitigation has benefited from decades of scientific advances and experience implementing the National Environmental Policy Act (NEPA), the Endangered Species Act (ESA), the wetlands protection provisions of Section 404 of the Clean Water Act, the National Historic Preservation Act (NHPA) and other federal and state laws.

Under NEPA, federal agencies that are required to evaluate the environmental impacts of proposed federal actions may incorporate mitigation measures to reduce the impacts of the action. The Federal Land Policy and Management Act (FLPMA) requires that “the public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values.” The habitat conservation planning provisions of Section 10 of the ESA have proven sufficiently flexible

to provide the basis for either mitigation for the impacts of small, single-landowner development projects or broader regional conservation plans that offset the impacts of multiple projects undertaken by multiple landowners or project proponents. The Clean Water Act has spawned creative approaches to mitigation, including banking and in-lieu fee arrangements that seek to improve upon the outcomes of more typical, project-by-project mitigation efforts. The Clean Air Act has also encouraged innovative market-based approaches for reducing air emissions while also capturing cost savings.

Major energy and infrastructure development projects, both on land and offshore, can adversely affect a broad array of resources and values, including fish and wildlife, cultural resources, unique natural communities, scenic views, air quality, recreational opportunities, and water supplies for human use. For certain resources – including wetlands, endangered species, cultural resources, national parks, wildlife refuges, and wild and scenic rivers – there are explicit statutory and regulatory drivers requiring mitigation.<sup>12</sup> For other resources, mitigation decisions have been driven by the more broadly stated requirements of statutes such as NEPA and FLPMA.

## The Hierarchical Approach to Mitigation

As used in this report, the term “mitigation” encompasses the full suite of activities to avoid, minimize, and compensate for adverse impacts to particular resources or values. In the implementation of both NEPA and the Clean Water Act, there has developed a mitigation “hierarchy” or sequence of steps through which mitigation is typically achieved. The hierarchy starts with avoidance. If a project can reasonably be sited so as to have no negative impacts to resources of concern then that is generally the most defensible approach. By avoiding adverse impacts in the first place, there is no need to take further action to minimize or offset such impacts. If the authorization of the proposed action requires compliance with NEPA, NHPA, and/or ESA, determining whether or not adverse effects may occur is carried out through a public process for impact analysis and interagency consultation processes.

Frequently, however, it is not practical or possible to avoid negative impacts altogether. A linear project such as a road or pipeline may of necessity entail a number of stream or wetland crossings, for example. In such cases, the second step of the mitigation hierarchy seeks minimization of the associated impacts. For example, altering design features or integrating pollution control technologies could substantially minimize impacts to the immediate site, to human health and safety, and to nearby affected

resources in special status areas like national parks or wilderness areas. In the case of cultural resources, steps may be taken to minimize adverse effects by, for example, choosing paint colors or reducing the height of oil and gas tanks to reduce visual impacts. If the impacts cannot be adequately minimized, a project in a given location may not be appropriate and the permit denied.

Remaining steps in the mitigation hierarchy seek to repair, rehabilitate, or restore the affected environment or resource, and ultimately to compensate for, or offset, any impacts that remain. For example, compensating for unavoidable wetland impacts may include creating new wetlands where none previously existed, or restoring and protecting wetlands where they were damaged or destroyed. In still other cases, this type of mitigation might take the form of acquiring and bringing under long-term protection an existing, fully functional wetland. While the preservation of existing wetlands is an uncommon form of compensatory mitigation under the Clean Water Act, permanently preserving existing habitat is a common form of compensatory mitigation under the ESA.<sup>3</sup>

It should be noted that the term “mitigation” is sometimes used to refer only to the final step in the sequence described here. Thus, one sometimes sees the mitigation hierarchy somewhat confusingly described as “avoid, minimize, and mitigate.” For clarity, when referring to the final step in the hierarchy, this report will use the term “compensatory mitigation.” The term “mitigation” will refer to all of the steps in the hierarchy.

Although this hierarchical approach to mitigation includes a strong presumption in favor of the sequence described above, there are circumstances in which rigid adherence to the sequence may not realize the greatest overall benefit. There may, for example, be circumstances in which already-degraded habitat can be *avoided* or certain *minimization* measures are economically feasible, and yet other *compensatory* mitigation measures could achieve a better environmental outcome at less cost. In such situations, a rigid adherence to the mitigation hierarchy might not best serve the goals and purposes of the statutes that provided the basis for mitigation requirements. Similarly, some endangered species may occupy sites that are ephemeral in nature or facing major threats not subject to regulatory control. In such cases, greater conservation benefit may be secured by compensating elsewhere for the loss of such sites than by avoiding development in them.

### *Forms of Compensatory Mitigation*

Mitigation requirements – including compensatory mitigation requirements – are often imposed as a condition of a permit issued to a project sponsor by a regulatory agency. Traditionally, the permittee either

carries out the compensatory mitigation itself, or pays to have it done by another party (known as permittee-responsible mitigation).

Another mechanism for implementing compensatory mitigation is known as mitigation “banking.” This approach may be used where there might be economic efficiencies as well as better environmental results if compensatory mitigation actions are carried out in advance of foreseeable future projects, or if a single large mitigation action could compensate for the impacts of multiple future development projects. This approach allows for “banking” credits earned for early compensatory mitigation actions, and later drawing down against those banked credits as new development projects are undertaken. Wetland and stream banks have been developed under the CWA, and habitat conservation banks have been developed under the ESA. Mitigation banking is specifically provided for under the Clean Air Act with regard to emission controls and the siting of new facilities.

Two forms of mitigation banks are used. In one, credits from the bank are intended to be used to offset projects carried out by the bank creator. Other banks, however, earn credits that can be sold to third parties whose projects require compensatory mitigation. These multi-user banks are often called “entrepreneurial banks” because they are frequently established by for-profit businesses that seek to provide a specialized service (e.g., creation, restoration, or enhancement of wetlands) to others.

Yet another form of compensatory mitigation is referred to as “in-lieu fee” mitigation. This mechanism allows a project developer to satisfy its compensatory mitigation responsibilities by paying a fee to a third party (often a state agency or a conservation non-governmental organization, or NGO), with the assurance that the third party will use the fees to carry out future conservation actions. Some in-lieu fee arrangements initially received limited oversight, with fees sometimes accumulating for lengthy periods and ultimately being used for purposes that may not have offset authorized impacts. Under the Clean Water Act, however, recent regulatory revisions have addressed these shortcomings and reduced some of the distinctions between mitigation banks and in-lieu fee mitigation arrangements.

It is important to ensure that the mitigation measures required under different forms of compensatory mitigation actually offset the impacts of the authorized project – that is, ensure that the offsets are comparable to the impacts. There are multiple methods for establishing such comparability. For example, ratios are often used (for example, a 2:1 ratio requirement in which two acres of endangered species habitat

are restored or enhanced elsewhere for every acre of habitat lost) to ensure that the required mitigation offsets the project impacts, and to account for uncertainty, temporal losses, and other factors. In other cases, more sophisticated methods that focus on functional losses may be used.

### ***Science in Support of Mitigation***

The quality of mitigation decision-making depends, in large part, upon the quality of available information. Science informs mitigation decisions by providing: 1) a solid foundation for understanding the status, function, value, and drivers of change to natural resources within proposed development areas, 2) a basis for evaluating the tradeoffs associated with alternative mitigation strategies, 3) data and tools for measuring and understanding the short and long-term impacts of proposed projects, and 4) monitoring protocols to understand the effectiveness of mitigation actions relative to their design objectives. Throughout the process, quality science provides value-neutral data that

increases credibility and transparency, provides a factual basis for policy and agency decisions, and ultimately ensures that the mitigation design-process and resulting actions are supported by relevant knowledge. Science is particularly important for evaluating mitigation performance relative to predicted performance, thereby enabling adaptive management and the ongoing improvement of avoidance, minimization, and compensatory actions.

When underpinned by sound science, an array of tools can be used to significantly enhance and inform decision-making, provide a basis for the analysis of costs, benefits and trade-offs, and aid in understanding the long-term impacts of near-term decisions. These science-based tools include geospatial data integration, remote sensing, predictive modeling, habitat evaluation, scenario development, and forecasting and simulation, along with traditional tools like natural histories and condition assessments of species and communities.

In practice, the application of the mitigation hierarchy to manage the lands and resources under the Department's jurisdiction presents numerous challenges for land managers, project proponents, and other stakeholders. These challenges complicate not only the application of mitigation and other management tools, but also the ability to measure progress toward established mitigation goals. In this chapter we describe several of the major mitigation challenges, and in succeeding chapters we present a strategy for addressing them, including ways to enhance the effectiveness of the Department's overall mitigation policies and practices.

### 1. Resources at Risk:

#### **Increasing Pressure and Cumulative Impacts**

Not surprisingly, predictions suggest that pressures on natural and cultural resources will increase with population growth. "Our lands, air and waters are increasingly in demand for a wide diversity of uses including recreation, energy development – both renewable and conventional – and other forms of commerce. The *cumulative* impacts of these uses are having a significant effect on the landscape. The term cumulative impacts refers to the combined effects of human activity on a resource or community; impacts of an action may be relatively insignificant on their own, but as they accumulate over time and combine with the impacts from other sources they can lead to significant overall degradation of resources.

To date, analyzing and addressing these cumulative impacts has proven challenging. In the case of air quality, for example, a single oil and gas well or small group of wells generally cannot be identified as causing an exceedance of a specific threshold—be it a health based standard or a requirement to protect visibility in national parks. Tools exist, however, for analyzing cumulative impacts from multiple wells and determining whether mitigation is needed on individual operations to avoid exceedances.

### 2. Changing Climate: Increasing Uncertainty

Climate change has many known and potential impacts. Known impacts include increased temperature and evaporation, changes in precipitation patterns, extreme weather events, sea level rise and higher storm surge. These impacts can have significant effects on the natural and cultural resources managed by the Department, including changes in stream flow, increased wildfire risks, increased spread of invasive species, changes to wildlife health and behavior, and increased occurrence of flood

damage to historic properties. In addition to ecological impacts, climate change presents profound implications for social, cultural, and economic conditions. Science suggests that regions such as the Arctic are moving toward conditions never before witnessed.<sup>5</sup> The increasing uncertainty of near and long-term impacts of a changing climate requires decision-makers to manage toward less predictable future scenarios, and limits the effectiveness of current management tools that are based on more predictable variables, such as historical condition.

This increased uncertainty can have a significant effect on mitigation efforts that are designed to address impacts well into the future – impacts that cannot be easily predicted. New tools and approaches are necessary to allow managers to consider a range of plausible scenarios, make contingency plans, assess the resilience of the proposed mitigation strategies, provide for adaptive management, and ensure a precautionary approach in the face of uncertainty.

### 3. Science: Assessments, Baselines, Monitoring and Evaluation

The lack of adequate scientific information can be a constraint in the implementation of mitigation efforts. Scientific baselines that are necessary for understanding, monitoring and evaluating resources and their interactions are not always available. Without baseline information and an understanding of the complex interactions within and between natural systems, developing useful, quantifiable measures of mitigation success is extremely difficult. Effective and consistent monitoring of mitigation efforts at multiple scales is also needed to ensure that the measures are actually undertaken and that these measures are accomplishing their intended results. Fiscal resources should be allocated to ensure that monitoring and evaluation take place, particularly for system level impacts, multiple stressors, and/or the durability of the mitigation over the lifetime of the mitigation period.

When the science is inadequate, the promise of mitigation may not be realized, leading to potential ecological and compliance failures. In the case of salmon in the Pacific Northwest, for example, hatcheries were intended to compensate for the unavoidable loss of naturally spawning fish caused by dams. Unfortunately, however, it has turned out that artificial production of salmon has negatively impacted wild salmon stocks through competition for space and food, predation by

hatchery fish on wild stocks, introduction of disease and parasites, and a host of other factors.

To add to the challenges, effective mitigation requires many different types of scientific information and processes. Examples of scientific requirements for effective mitigation include monitoring conditions and processes in a comprehensive and consistent manner across jurisdictional boundaries; quantifying resources in both the impacted and mitigated areas; developing a system of metrics for adequately analyzing the comparability of development impacts and compensatory mitigation actions; assessing habitat quality for specific species of interest and assigning ecological equivalence to different locations; identifying tipping points that may lead to major degradation of natural and cultural resources and ecosystem services; developing models that accurately simulate environmental conditions in order to assess future possible scenarios; and providing useful data and training to land managers.

#### 4. Durability of Mitigation

The durability of mitigation efforts over time is another important area of concern. To be successful, compensatory mitigation measures must be effective at least as long as the impacts – specifically those impacts the measures are designed to offset. Easements, covenants, and title conveyance are all widely used mechanisms that can ensure against new actions that harm resources on private land. However, many mitigation areas also require ongoing management to prevent dumping, control invasive plants, respond to natural or human-caused disturbances, and address unexpected contingencies. Such management often requires significant financial resources.

Thus, a key challenge in ensuring the durability of mitigation efforts is ensuring the availability of needed resources over the long term. On federal lands, the challenge of ensuring durability of mitigation efforts has two added dimensions in that the laws applicable to such lands may restrict long-term encumbrances upon them and agency action is often dependent on yearly appropriations. Further complicating matters, current regulatory structures may restrict federal agencies from requiring compensatory mitigation beyond the life cycle of the project, which, even if the project site is later reclaimed, may not represent the full duration of the impacts.

#### 5. Additionality of Mitigation Measures

The goal of compensatory mitigation is typically to offset a proposed development action's expected impact on a resource value through conservation

measures that create, restore, enhance, or protect that same resource value in another location. For this goal to be achieved, it is essential that the offsetting conservation measures would not otherwise have occurred. If they would otherwise have occurred, then the impacts of development will not have been offset. In short, the beneficial effects of compensatory mitigation must be *additional* to what would otherwise have occurred.

When compensatory mitigation takes place on private land, it is usually not difficult to demonstrate additionality. When compensatory mitigation takes place on public lands, however, demonstrating additionality can be more problematic. The Fish and Wildlife Service, as a general matter, does not allow wetland restoration on National Wildlife Refuges to serve as compensatory mitigation for wetlands losses elsewhere, because the Service is already committed to restoring wetlands on its Refuges – wetland restoration efforts on Refuges would not be additional to what would otherwise happen there. For other land managing agencies with missions that encompass conservation, sorting out what would likely have occurred anyway from what will occur only because of compensatory mitigation initiatives is often very complex, entailing consideration of not only agency authorities, but possibly also agency budgets, plans, and historical practices.

#### 6. Issues of Scale

Project-by-project compensatory mitigation, particularly when guided by a rigid presumption that such mitigation should be located as near to the impact site as possible, can be inefficient and ineffective for many reasons. Most notably, the narrow focus of project-by-project development and associated mitigation foregoes the opportunity to consider and address broadly the full impacts of a project upon the functional values of the place that is impacted. By examining the conservation needs of a more expansive area, such as a watershed or landscape, it may be possible to determine how mitigation decisions could more effectively and efficiently compensate for the project's impacts. Limited by scale and scope, project-by-project mitigation is more likely to result in inefficient use of mitigation resources and can reduce overall environmental benefit.

Adding to the challenge of addressing impacts at larger scales, the lack of landscape-scale scientific information, and the tools to use it, can make it difficult to identify and prioritize mitigation opportunities at a greater scale. If available at the appropriate scale, such information could be

incorporated into decision support tools that would help policy makers and managers to better plan landscape-scale mitigation.

#### **7. Timeliness of Mitigation Considerations**

The timing of mitigation considerations can be a concern for permitting agencies, project proponents and the public. Project planning involves many steps, and mitigation requirements are often inconsistently addressed and take place late in the planning process. The failure to coordinate these considerations at an early stage in the permitting process can result in efforts that are unsatisfactory for the permitting agency, inefficient or costly for the project proponent, and/or ineffective as mitigation measures – an outcome frustrating for all partners and stakeholders. When a project proponent is required to provide costly compensation for impacts that may have been avoided if mitigation expectations were understood and addressed early in the planning process, for example, both the proponent and the resources being impacted suffer.

Discussions early in the process can facilitate the application of the mitigation hierarchy and help to avoid or minimize environmental impacts before more costly mitigation efforts are planned. Without these early discussions, project proponents can face uncertain requirements and costs, constraints that may compromise the success or sustainability of development efforts.<sup>6</sup>

#### **8. Consideration of the Full Mitigation Hierarchy**

Although mitigation includes avoidance, minimization, and compensation, the structures and procedures that have been developed to accommodate *compensatory* mitigation provide the clearest guidance thus far for project proponents and resource managers. Because of this and because few managers have the information and resources in place to consider issues and impacts across a landscape scale, reported mitigation activities tend to focus primarily on well-established compensatory mitigation approaches at a project site, and typically do so on a project-by-project basis. Although not all impacts can be avoided, there is currently no clear guidance on how to develop and apply avoidance criteria or how to measure and evaluate the degree to which avoidance was considered as an option. While mechanisms to encourage avoidance have been incorporated into some bureau planning and development functions in recent years (e.g., Western Solar Energy Plan and Master Leasing Plans), greater attention to avoidance early in the proposal process can help forestall considerable expense and/or conflict for the project proponent.

#### **9. Transparency and Efficiency**

Because compensatory mitigation at a landscape scale inherently involves making tradeoffs between resources, the transparency of mitigation decision-making is particularly important. Where clearly described and justified mitigation ratios or other criteria exist, are publicly available, and are consistently followed, transparency is seldom a concern. In the absence of such ratios or other criteria, however, mitigation decisions can appear to be ad hoc rather than principled, giving rise to the suspicion that those decisions are influenced by political or other inappropriate considerations. Coordination, consultation, and collaboration are essential to transparency. While some statutes, such as NHPA, require outreach and transparency, such measures are often not fully realized.

In addition to transparency, efficiency is an ongoing concern for project proponents concerned about the length of time it can take to acquire a permit. Studies are beginning to provide guidance for advancing more efficient, effective approaches to compensatory mitigation planning while ensuring opportunity for meaningful public input into such planning. For example, a recent analysis of Clean Water Act Section 404 permitting data shows that mitigation banks and in-lieu fee programs result in a shorter average time to permit than both on-site permittee-responsible mitigation and off-site permittee-responsible mitigation for wetland and stream mitigation. On average, mitigation banks took 107 days to permit and in-lieu fee programs took 123 days, while permittee-responsible mitigation took 189 days for on-site, and 222 days for off-site. Reduced permitting time can help decrease uncertainty for developers and increase mitigation efficiency.<sup>7</sup> The challenge is to reduce permitting times and uncertainty without sacrificing the opportunity for meaningful public input.

#### **10. Collaboration**

Although working at the landscape scale provides the best approach for addressing the challenges described above, it often requires the involvement of a number of partners – particularly for those efforts that cross jurisdictional boundaries and involve multiple government agencies. Effective coordination among federal, state, tribal, and local agencies, and private and NGO landowners and stakeholders can avoid duplication and lead to more effective mitigation efforts. In addition, certain situations may arise where appropriate large-scale mitigation efforts could benefit some agencies and adversely affect others. Mechanisms need to be developed both at the Departmental and interagency level to address these potential conflicts.

Finally, it should be noted that all of the above concerns exist even when the impacts to be mitigated involve only a single type of resource, such as an endangered species or a wetland. Mitigation becomes much more complicated when the goal is to address impacts to a variety of resources, including species, habitats, historic and cultural resources, water quantity and quality, air quality, scenic views, night skies, natural soundscapes and others. Conducting a comprehensive assessment and developing a mitigation plan for these different resources and associated ecological services at the landscape scale is a major challenge in light of current capabilities and the requirements of the various laws that apply. The fact that primary responsibility for these various resources may rest with several different state and federal agencies adds still more complexity. The coordination of mitigation decisions among several agencies must be a primary focus as the Department develops a landscape-level approach to mitigation.

### *Meeting the Challenge*

As a result of the many complexities and challenges described above, the application and effectiveness of the mitigation hierarchy to date has been uneven and difficult to evaluate. Rigid bureaucratic procedures are now straining to accommodate escalating expectations for federal lands at the same time that the resilience of those lands is increasingly compromised by rapid environmental change. Over a decade ago, the EPA

requested that the National Research Council (NRC) form a committee to evaluate the practice of compensatory mitigation for wetlands. In 2001, the NRC report found that compensatory mitigation projects “often are not undertaken or fail to meet permit conditions.” More recently, mitigation experts have noted, “[T]he way mitigation is currently applied does not capture cumulative impacts associated with development; it does not provide a structured decision-making framework to determine when projects can proceed or should be avoided; and it does not harness the full potential of offsets (conservation actions applied away from the development site).”<sup>9</sup>

To address these challenges and improve mitigation practices while accommodating both infrastructure development and the conservation needs of America’s rapidly changing landscapes, the Department and its bureaus need modern mitigation policies, procedures and practices that more effectively avoid, minimize, and compensate for the impact of development on the lands and resources under the Department’s jurisdiction; provide better information and greater predictability to project proponents and land managers; improve the resilience of our Nation’s resources in the face of climate change; encourage more strategic conservation investments in lands and other resources; and increase compensatory mitigation effectiveness, durability, transparency and consistency. The following chapters describe a strategy for developing such policies and procedures.

Mitigation is an essential part of the Department's efforts to implement its mission and those of its bureaus. The challenges described in the previous chapter present important considerations for improving Departmental mitigation policies and procedures. The strategy described in the following chapters addresses these challenges head-on in order to enhance the efficiency and effectiveness of mitigation practices at the Department.

This strategy advances ongoing efforts at the Department to embrace a landscape-scale approach to managing natural and cultural resources and improve the implementation of the mitigation hierarchy. The term "landscape-scale" can represent many different spatial scales depending on the resource values being managed. For the purposes of this report and related Departmental efforts, a "landscape" is defined as a large area encompassing an interacting mosaic of ecosystems and human systems that is characterized by a set of common management concerns. The landscape is not defined by the size of the area, but rather by the interacting elements that are meaningful to the management objectives.

In the mitigation context, the landscape approach dictates that it is not sufficient to look narrowly at impacts at the scale of the project; it is necessary to account for impacts to resource values throughout the relevant range

of the resource that is being impacted. While "landscape-scale" and "regional" are not synonymous, they indicate a similar consideration of interacting systems at a scale larger than the ecosystem, and should not be constrained by administrative boundaries.

As described below, a landscape-scale approach to mitigation – in contrast to project-by-project and single-resource mitigation approaches that focus on small spatial areas – can improve permitting efficiencies, reduce conflict, and better achieve development and conservation goals. Such an approach provides a broader palette of mitigation opportunities and improves the opportunity for mitigation success.

### *Guiding Principles for Landscape-Scale Mitigation*

In order to realize the promise of landscape-scale mitigation, the Department and its bureaus will institute policies and procedures that reflect the following guiding principles:

1. **Landscape-scale:** *Incorporate landscape-scale approaches into all facets of development and conservation planning, project review, and mitigation implementation.*

Consideration of the landscape-scale context provides the opportunity to see project development in the context of the larger landscape it will occupy and

associated resource values it will affect; enhances the ability to evaluate cumulative effects of multiple projects; expands the capacity to avoid, minimize, and offset project impacts; and allows managers to make avoidance and compensatory mitigation site selection decisions that optimize for multiple resource values.

Generally speaking, advancing landscape-scale mitigation involves assessing existing and projected landscape conditions; establishing management goals and strategies for the landscape; incorporating those goals and strategies into plans and actions; identifying landscape-scale issues, threats, and impacts; tailoring strategies to address those threats or impacts; and developing and implementing monitoring and evaluation protocols and metrics in an adaptive framework.

**2. Full Mitigation Hierarchy:** *Utilize the full mitigation hierarchy in project planning and review.*

Agency officials, project developers, and other stakeholders will use landscape-scale strategies and plans to more effectively design projects that avoid potential conflicts with natural, cultural, and other valued resources and minimize impacts to those resources. Bureau protocols and guidelines will be established to inform, monitor, and report on these avoidance and minimization efforts. For projects that have unavoidable impacts, compensatory actions will be designed to address those impacts by protecting or restoring resources of similar function and value within the context of the landscape strategy. Such compensatory actions will be characterized by the principles described in this chapter.

**3. Promote Certainty:** *Establish protocols to simplify planning and project review while improving operational certainty for project proponents.*

Implementing landscape-scale mitigation approaches can increase agency efficiency by reducing the time, costs, and complexities associated with project reviews, environmental analysis, and permitting. However, Departmental bureaus should seek to establish additional practices and procedures that will improve operational certainty and reduce costs. Some important practices, such as advance determination of mitigation needs, providing scientific information and tools for assessing baselines and trends, and instituting cross-agency collaboration, are described below, while others will be specific to the development sector or resource under consideration.

To enhance certainty for compensatory mitigation, policies and plans should clarify up front: (1) the types of actions that will qualify as compensatory mitigation; (2) the manner in which mitigation obligations will be quantified; and (3) the consequences of mitigation failure or unexpected developments. There is no single correct approach to dealing with unexpected future circumstances that render mitigation efforts less effective

than anticipated. However, transparent and consistent approaches and expectations will foster a more adaptive and effective response to these uncertainties and reduce surprises for project proponents.

To further improve certainty, bureaus should take steps to ensure that mitigation commitments are implemented consistent with the specific mitigation outcomes identified in each project decision or resource management plan. For mitigation actions to be undertaken by a particular bureau, the bureau should commit to seek necessary funding. If impacts to resource values and functions cannot be adequately mitigated, the bureau may deny the proposed land-use authorization or project approval. In order to advance a transparent and consistent approach to mitigation, the Department will clearly identify in decision documents the commitments to mitigation measures designed to achieve environmentally-preferable outcomes.

**4. Advance mitigation planning:** *At the outset of the project planning process, incorporate mitigation and landscape objectives into the design and development of projects that are likely to impact natural or cultural resources.*

Ensuring consideration of the mitigation hierarchy and landscape strategies up-front in the project planning process can dramatically increase operational certainty and advance management objectives. For resource developers, identifying mitigation needs early in the project development process can provide greater predictability and certainty in the design, development and implementation of projects by avoiding the need for late project revisions and analyses, and by providing for coordination and consistency among agencies. This can serve to reduce project costs and increase the confidence of investors, purchasers, and other project beneficiaries in the ultimate success of the project.

In order to determine the mitigation requirements of a proposed development at the beginning of the planning process, bureaus should clearly state the management objectives and legal requirements for the affected landscape. This ensures that the project developer understands any potential conflicts with these objectives and the mitigation requirements for a proposed project. Providing clear descriptions of these management objectives requires that landscape-scale strategies, informed by landscape-scale scientific information and tools, be developed and made accessible for all of the involved partners. Strategies should use the best available science and be inclusive of, and incorporated into, any existing plans that describe the agency's intended use and management of a particular landscape, such as Bureau of Land Management (BLM) resource management plans, Fish and Wildlife Service (FWS) threatened and endangered species recovery plans, and National Park Service (NPS) park unit plans.

- 5. Science and Tools:** *Develop and utilize the scientific information and tools necessary to identify the most efficient and effective means of mitigating the effects of development and to inform monitoring and evaluation of mitigation efforts.*

The concept of mitigation begins with a detailed understanding of the resources that are impacted by development, which resource values need to be protected, the current baseline status of these resources, and other projected threats such as the impacts associated with climate change, invasive species, or changing fire regimes. This baseline information is necessary in order to develop landscape-scale strategies, compare mitigation scenarios, and assess the effectiveness of mitigation actions over time. Scientific data and tools are therefore needed to gain an understanding of the condition of existing resources, to identify where these resources are found and best conserved across broad geographies, and to understand how the resources respond to the impacts of development.

Science at the landscape-scale is also necessary to place mitigation decision-making in the context of changing environments, influences, and impacts that are beyond the local or project scale. Geospatial tools, now capable of optimizing for more than one species or resource value at a time, should be used to identify priorities for avoidance and compensation for these multiple resource values.

- 6. Foster Resilience:** *Identify and promote mitigation efforts that improve the resilience of our nation's resources in a rapidly changing climate.*

Climate change impacts and trends are an important consideration for conservation and development goals; this is increasingly true if development impacts or conservation goals have long time horizons. The Department's climate change adaptation policy, issued in December 2012, requires the Department and its bureaus to "use the best available science to increase understanding of climate change impacts, inform decision making, and coordinate an appropriate response to impacts on land, water, wildlife, cultural and tribal resources, and other assets." It also established the Department's policy to promote landscape-scale, ecosystem-based management approaches to enhance the resilience and sustainability of linked human and natural systems and consider climate change when developing or revising management plans, setting priorities for scientific research and assessments, and making major investment decisions.

The policy promotes several practices essential to mitigation decision making, including protecting diversity of habitat, communities and species; protecting and restoring core, un-fragmented

habitat areas and the key habitat linkages among them; anticipating and preparing for shifting wildlife movement patterns; maintaining key ecosystem services; monitoring and preventing the spread of invasive species; focusing development activities in ecologically disturbed areas when possible, and avoiding ecologically sensitive landscapes, culturally sensitive areas, and crucial wildlife corridors. Landscape-scale mitigation provides opportunities to build resilience by considering the cumulative effects of development, incorporating conservation principles such as habitat connectivity into landscape strategies, and ensuring that conservation and development activities take place within a comprehensive regional strategy.

- 7. Durability:** *Ensure that mitigation measures are durable.*

Mitigation must be durable to be effective. Mitigation is only durable if it is effective for the duration of the development's impacts on the affected resource values and functions. Durability also requires that resources protected or restored must remain "un-impacted" by subsequent development and minimally vulnerable to other stressors (e.g., fire, invasive species) for the duration of the impacts of the proposed development. Ensuring such durability requires the use of multiple approaches, particularly on public lands. For example, BLM is exploring potential new approaches, including easements, cooperative agreements, conservation rights of way, and withdrawals, for ensuring effective and durable mitigation actions.

- 8. Transparency:** *Promote transparency and consistency in the development of mitigation measures.*

Ensuring the transparency and predictability of mitigation decision-making begins by clarifying what management objectives are to be met by these decisions. The objectives may depend upon the nature of the resource being affected by a particular project and by the legal authority protecting that resource. For example, some resources are inherently unique and irreplaceable, so the option of offsetting their loss by creating or restoring them elsewhere is not possible. For other resources for which offsets are possible, the goal of mitigation can be expressed as maintaining or expanding a resource, value, or function, or it could seek to offset unavoidable impacts "to the maximum extent practicable," or to achieve through compensatory mitigation a "net conservation benefit." Still other formulations are possible. Thus, Departmental mitigation policies should clearly state the resource values and functions for which mitigation is being implemented, the mitigation objectives in terms of specific, measurable performance standards; and expected results consistent with existing authorities, policies, guidance, and instruction memoranda.

To serve this transparency principle and ensure consistency in mitigation actions, the Department and its bureaus will ensure that mitigation measures are demonstrably additional and durable when compensating for unavoidable impacts, and always reflect the guiding principles described in this report, including the need to monitor the results of mitigation actions. When monitoring indicates that mitigation outcomes have not been met, additional corrective measures must be undertaken. Such measures should be provided for through assurances established as part of the compensatory mitigation agreement.

**9. Collaboration:** *Coordinate with other federal and state agencies, tribes, and stakeholders in conducting assessments of existing and projected resource conditions, forming mitigation strategies, and developing compensatory mitigation programs.*

For projects likely to impact multiple resources administered by different agencies, landscape-level mitigation can be used to bring these entities together early in the planning process to assemble the best available science and focus jointly on finding means to resolve any potential conflicts. In developing and implementing a landscape-scale approach to management, the Department will work with other federal and state agencies, tribes, scientific institutions, and stakeholders.

The networks of Landscape Conservation Cooperatives, Climate Science Centers, and other partnerships should be engaged to provide essential information in the development of landscape-level mitigation strategies across sectors, scales, and levels of government. For example, the Western Governors Association Wildlife Council's initiative on wildlife corridors and crucial habitats provides a regional data base that can support landscape-level project planning and mitigation. Tribes have off-reservation treaty and co-management rights that reflect long held traditions of cultural and spiritual site management and access concerns; the Department's special relationship with tribes requires special efforts to communicate and coordinate regarding these concerns.

**10. Monitoring:** *Monitor and evaluate the results of mitigation over time to ensure that the intended outcomes are achieved.*

Mitigation can fail to fully meet expected outcomes if the mitigation actions are not properly designed and implemented, if the actions prescribed are not the right ones to address a specific project impact, or if unanticipated changes in resource conditions (e.g., wildfire or drought) occur. To remain adaptive and effective, mitigation strategies and plans must be adjusted over time to respond to changing conditions or unanticipated or inadequate outcomes to ensure that such efforts successfully achieve their intended

purpose.<sup>10</sup> As part of the initial phases of project planning and in concert with project implementation, a monitoring strategy must be developed that permits accurate and transparent assessment of the current status of the resources of concern, how development has affected those resources, and progress in achieving the specific mitigation objectives for the resources and values impacted by the project.

Should monitoring reveal that mitigation objectives are not being achieved, or the outcomes of the mitigation are not producing the intended benefits, then changes in the mitigation strategy for current and future projects should be developed and adopted. A successful adaptive management process requires the establishment of management benchmarks to ensure progress toward mitigation goals, the establishment of protocols to monitor progress in relation to these benchmarks, and the resolve, fiscal resources, and ability to make adjustments as new information becomes available to ensure that mitigation objectives are ultimately achieved.

To effectively integrate the guiding principles described above and enhance the ability of state and federal agencies to address wildland fire, invasive species, climate change and other large-scale stressors, the Department's management bureaus are implementing a landscape approach that involves four distinct steps: 1) identifying key landscape-scale attributes, and the

conditions, trends, and baselines that characterize these attributes; 2) developing landscape-scale goals and strategies; 3) developing efficient and effective compensatory mitigation programs for impacts that cannot be avoided or minimized; and 4) monitoring and evaluating progress and making adjustments, as necessary, to ensure that mitigation is effective despite changing conditions (Figure 1).

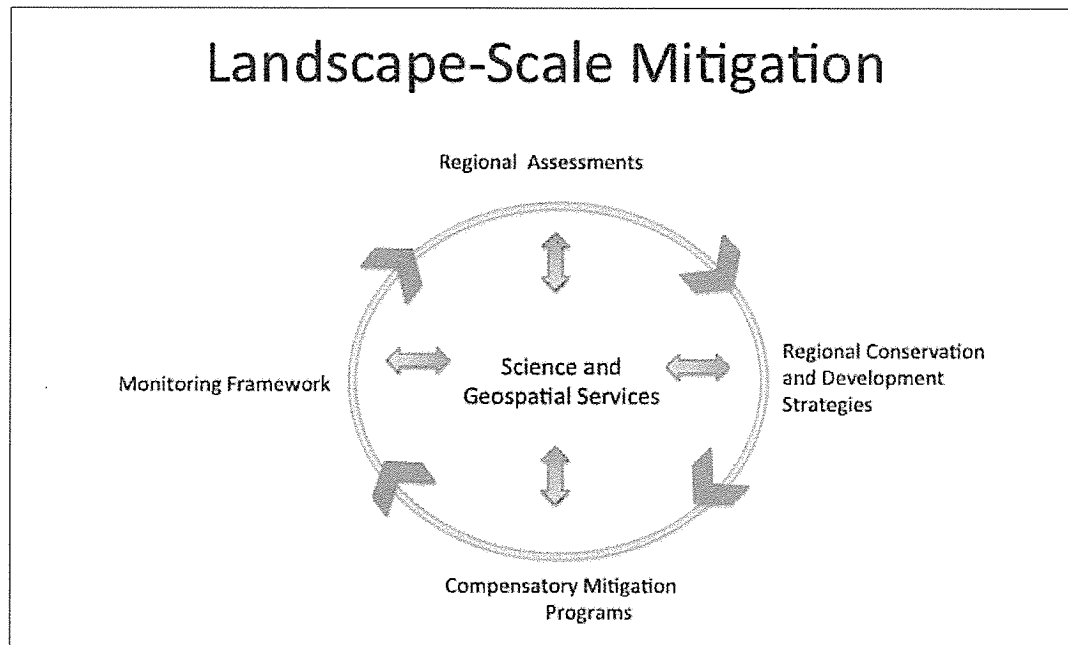

Figure 1. A Landscape Approach to Mitigation

Departmental bureaus are currently advancing a landscape approach to mitigation in various contexts in collaboration with multiple agencies and partners, and anticipate that these practices will evolve over time. To ensure consistent policies and practices and align the efforts of the bureaus to advance their respective missions, the bureaus will work together to advance a coherent landscape-scale strategy based on each of the four steps described above, and will do so in collaboration with other federal, state, and tribal agencies and non-governmental organizations, including industry. The outcomes for each of the steps are as follows:

1. **Geospatial Assessments:** Data and subject matter experts from the across the Department, collaborating with partners in other federal, state, and tribal agencies, will develop and maintain geospatial information systems for use in identifying existing and potential conservation priorities and development opportunities. These experts will develop tools and provide training to enable the appropriate scaling and use of these

geospatial data sources and maps. Much of this work has already been initiated; the United States Geological Survey (USGS) and other Departmental bureaus are developing science products and collaborating with state and non-governmental experts to help inform this landscape approach. These ongoing efforts include conducting research to help understand causal relationships and to identify potential thresholds, developing models to project future conditions, and providing remotely sensed imagery. Tools being developed by other federal agencies and several states will also inform this effort, including the Western Governors Association's Crucial Habitat Assessment Tool (CHAT) and State Wildlife Action Plans. *Outcomes:* a) A geospatial information system (or systems) that permits identification of existing and potential conservation priorities and development opportunities at the regional scale; and b) tools and the training necessary to promote their effective use in mitigation strategies. *Next Step:* Conduct a data and tools workshop and needs assessment, to be led by USGS in collaboration with other bureaus at the Department.

**2. Landscape-level Strategies:** Experts within the bureaus and offices of the Department will develop guidance for bureaus to employ in establishing landscape-scale goals and strategies. These goals and strategies will guide future resource planning and management decisions to advance a landscape level approach. This process will utilize the geospatial tools and data described above to help guide application of the mitigation hierarchy. Existing and planned policies will inform this effort, including the BLM Master Leasing Plans, BLM's interim Regional Mitigation Policy, the Dry Lake Solar Energy Zone Regional Pilot Mitigation Strategy, and subsequent regional mitigation strategies. Ongoing efforts to mitigate for impacts to the greater sage-grouse will also inform this work. Strategies will be utilized in agency planning efforts, such as BLM's Resource Management Plans (when each plan is updated), and used to enhance project-specific NEPA processes. *Outcome:* Guidance for developing landscape-scale strategies that ensure the effective implementation of the mitigation hierarchy in planning major development activities, including energy and infrastructure, minerals, and water resources development. *Next Step:* Undertake a multi-bureau survey of existing and planned guidance related to mitigation strategies, to be led by BLM in collaboration with other bureaus at the Department.

**3. Compensatory Mitigation Programs:** Experts within the bureaus and offices of the Department will develop a template to inform future compensatory mitigation efforts. The purpose of this template will be to ensure that compensatory mitigation programs advance landscape-scale mitigation strategies; provide appropriate means for addressing the unavoidable impacts to resources associated with development; frame the management of compensatory mitigation funds; set standards for the certification of regional mitigation and/or conservation banks, and provide for periodic reporting on the effectiveness of completed mitigation actions. This work will build upon existing efforts across Departmental bureaus, other federal agencies, and states, and will incorporate best practices from ongoing programs, including compensatory mitigation programs for impacts to streams, wetlands, and endangered species. *Outcome:* A template for developing compensatory mitigation programs that achieve landscape level strategic goals and incorporate the guiding principles described in this report. *Next Step:* Prepare a multi-state comparison of existing compensatory mitigation programs and practices, led by FWS.

**4. Monitoring and Evaluation:** In consultation with their counterparts in federal, state, and tribal agencies, experts within the bureaus and offices

of the Department will develop a framework for monitoring and evaluating the effectiveness of specific mitigation actions or strategies. Utilizing the geospatial systems and data sources described above, this framework will build upon existing and evolving monitoring protocols and be integrated at a landscape scale. The framework will be used for projects, mitigation actions, and regional mitigation strategies or plans and will include the establishment of metrics and benchmarks that will help inform the application of the mitigation hierarchy over time, including periodic reviews of specific mitigation strategies. This framework will ultimately inform adaptive management strategies for achieving landscape-level management goals. *Outcome:* A monitoring and evaluation framework to measure the effectiveness of mitigation projects and actions, to measure progress toward the goals established by the landscape-level strategies, and to direct adjustments to these strategies when necessary to correct mitigation failures and adapt to changing conditions. *Next step:* Conduct a multi-agency review of existing landscape-scale programs for monitoring change in terrestrial condition, aquatic condition, and landscape pattern, to be led by Departmental bureaus working with the Interagency Land Management Adaptation Group.

### Near-Term Policy Deliverables

The above outcomes will provide the foundation for developing a meaningful landscape-scale approach in the face of increasing pressures and accelerating change across American landscapes. In order to facilitate the four outcomes described above, incorporate the guiding principles into practice, and ensure the implementation and reporting that will be required, the Department will complete the following policy and process deliverables while examining additional measures that would advance the landscape-scale mitigation strategy:

1. **Department Manual Mitigation Chapter** – Q3 2014. The Office of Policy Analysis will develop guidance, in the form of a new chapter to the Department Manual, for implementing, Department-wide, the principles and procedures outlined in this strategy.
2. **Interagency Coordination** – The Department will work with the Steering Committee on Infrastructure Permitting and related working groups to execute the Implementation Plan for the Presidential Memorandum on Modernizing Infrastructure Permitting, including its provision to "Expand Innovative Mitigation Approaches."
3. **Develop Mitigation Framework for Greater Sage-Grouse Conservation** – Complete Q4 2014. The Department, with leadership from the BLM, USGS, and the FWS, will develop a landscape-scale mitigation framework for greater sage-

- grouse conservation in collaboration with states, tribes, and local governments, as well as industry and other stakeholders.
4. **Initiate Guidance for Mitigation in National Environmental Policy Act Analysis – Q3 2014.** The Office of Environmental Policy and Compliance will convene a working group of Department NEPA specialists to develop Departmental guidance based on the Council on Environmental Quality's 2011 guidance on the "Appropriate Use of Mitigation and Monitoring and Clarifying the Appropriate Use of Mitigated Findings of No Significant Impact." This guidance will reflect CEQ guidance on integrating compliance with NEPA and section 106 of NHPA.
  5. **Develop Geospatial Data Tools for Landscape-scale mitigation – Q4 2014.** The Department, with leadership from the Geospatial Information Officer and the USGS, will convene a workshop of partners and experts to identify and evaluate existing landscape analysis data and tools and issue guidance for their use in mitigation decision support as described in section 4.2 above.
  6. **Develop Technical Reference for Solar Energy Zone Regional Mitigation.** The BLM will conduct a stakeholder workshop to discuss the lessons learned from the Dry Lake SEZ Regional Mitigation Pilot Strategy and develop a technical reference document for developing future regional mitigation strategies for solar development. Lessons learned from the Dry Lake pilot effort, as well as public feedback on the strategy, will inform the development of mitigation strategies for additional SEZs.
  7. **Finalize BLM Regional Mitigation Policy – Q3 2014** The BLM will finalize its "Interim Draft Regional Mitigation Manual Section 1794" in accordance with this strategy. This policy will include a commitment to avoid, minimize, and compensate for residual impacts to appropriate resources, including conservation areas within and outside the jurisdiction of the bureau in collaboration with relevant land managers such as NPS, FWS, USFS, and state resource management agencies.
  8. **Initiate Development of Handbook for Implementing Regional Mitigation Policy – Q1 2015.** The BLM will initiate development of a handbook for implementing its Regional Mitigation Policy and will work to incorporate mitigation principles into relevant programmatic handbooks and manuals. The BLM will also develop training modules for field staff.
  9. **Develop and Implement Regional Workshops and Training for Implementation of Landscape-Level Mitigation – Q1 2015 and ongoing.** An interagency team will conduct regional workshops on implementation of the policies, programs, and guidance for landscape-level mitigation described in this strategy. Training and resources will address lessons learned and best management practices, and may include non-agency stakeholders. USGS, in collaboration with other bureaus within the Department, will provide training, technical assistance, and tool development for incorporating best available science, design of monitoring frameworks, adaptive management, and use of Structured Decision Making for evaluating mitigation alternatives.
  10. **Policy Forum on Landscape-Scale Analysis – Q4 2014.** In conjunction with other bureaus within the Department and the U.S. Forest Service, the BLM will convene a policy forum of federal scientists and policy experts, working with state authorities and other key stakeholders, to share methods for identifying potential landscape-scale conservation and development priorities and to discuss how those methods may be better integrated into BLM Resource Management Plans and U.S. Forest Service Forest Plans.
  11. **Propose Revisions to FWS Mitigation Policy – Q4 2014.** The FWS will formally propose revisions to its 1981 Mitigation Policy consistent with the principles outlined in this strategy.
  12. **Propose Revisions to FWS Mitigation Banking Policy – Q4 2014.** The FWS will formally propose revisions to its 2003 "Guidance for the Establishment, Use, and Operation of Conservation Banks" consistent with the principles outlined in this strategy.
  13. **Propose FWS Policy on Mitigation for Candidate Species – Q2 2014.** The FWS will formally propose new policy regarding mitigation for established "candidate species" that ensures the validity of those commitments should the species be listed under the ESA.
  14. **Initiate Guidance for Landscape Scale Mitigation Under Section 106 of NHPA – Q1 2015.** The NPS will convene a workgroup of experts from DOI land managing bureaus, the Advisory Council on Historic Preservation, and other stakeholders to develop guidance for landscape-scale mitigation of impacts to cultural resources under Section 106 of the NHPA.
  15. **Initiate Guidance for Landscape Level Mitigation for Shared Scenic Resources and Values – Q1 2015.** The NPS will convene a workgroup of experts from Departmental land managing bureaus and other stakeholders to collaboratively develop guidance for addressing landscape-level mitigation for preserving shared scenic views.

The preceding strategy provides a blueprint for improving the effectiveness of the Department's mitigation policies and practices. In developing this proposed strategy, the authors reviewed many efforts, tools, and initiatives already ongoing or planned at the state and federal level that will inform the implementation of these reforms. The following sampling of efforts provides both proof-of-concept and a hopeful sign that many of the principles described above are already embedded in initiatives at all levels of government. Our challenge now is to build from these endeavors to construct a consistent and effective set of policies for the Department of the Interior and nationwide.

- **The Maryland Water Resources Registry (WRR)** is a collaborative effort by multiple federal and state agencies to streamline permitting processes while simultaneously enhancing ecological outcomes. The stated objective of the WRR is to "map natural resource areas that are a priority for preservation" and to "identify sites best-suited for ecosystem preservation and restoration". The WRR interagency team worked in partnership to 1) Integrate agency conservation priorities associated with the Clean Water Act; 2) Develop criteria for prioritizing areas suitable for conservation and restoration; and 3) Publish a web site where mitigation "opportunities" can be explored via a Geographic Information System. Published mitigation opportunities include the protection or restoration of wetlands, uplands, streamside areas, and storm water infrastructure areas. The interactive-mapping tool uses a scoring system to rate mitigation opportunities with the goal of attracting developers towards mitigation opportunities with the highest ecological value. The benefits of the WRR include the following:
  - *Permit applicants can easily identify priority mitigation opportunities during the planning phase, before the review process is initiated.*
  - *Private developers can guide their land use and mitigation decisions based on multi-agency priorities.*
  - *Public land trusts and wetland bankers can target areas for purchase and preservation.*
  - *Local and County planners can inform resource protection, zoning, and land use plans. Registry Web site: <http://www.watershedresourcesregistry.com>.*
- **Advance Permitting for Bridge Modernization in Oregon.** In 2003 the Oregon State Legislature enacted the third Oregon Transportation Investment Act (OTIA III), an infrastructure and economic stimulus law that established a State Bridge Delivery Program requiring advance permitting and environmental mitigation planning prior to design and build. In 2008

the Oregon Department of Transportation conducted a cost/benefit comparison of a traditional project permitting approach with the programmatic process developed for the OTIA III State Bridge Delivery Program. The analysis noted that "the expected need for mitigation as a result of bridge construction has been a fraction of what was anticipated at the beginning of the program due to the avoidance of resources during the development process..." While \$54 million in savings was projected, the realized savings exceeded \$73 million in 2008.

In addition to cost avoidance and a substantial reduction in delays, the qualitative benefits of the programmatic approach versus the project-by-project approach were also described in the analysis as substantial, including increased trust and improved flexibility in resolving issues. "The economies of scale realized by addressing regulatory obligations at a program level have taken negotiations on mitigation and enhancement opportunities off of the critical path for individual projects. This has led to decreased construction schedules and better environmental outcomes."<sup>11</sup>

- **North Carolina Ecosystem Enhancement Program.** North Carolina's Ecosystem Enhancement Program (EEP), a State-backed in-lieu fee program that provides offsite compensatory wetland and stream mitigation offsets, has allowed the state's Department of Transportation (NCDOT) to integrate their transportation planning with landscape-level watershed planning in order to streamline the overall mitigation process. In doing so, the EEP has reduced wetland mitigation expenses, as a percent of NCDOT project costs, from 8 percent to less than 3 percent, representing an annual cost savings of \$32.5 to \$65.0 million.<sup>12</sup> The North Carolina Department of

Environment and Natural Resources reports that, since 2003, the EEP has allowed the NCDOT to advance nearly \$14 billion in transportation projects without a single delay due to mitigation permitting (from: <http://portal.ncdenr.org/web/eeep/why-eeep-matters>).

- **The Western Governors' Crucial Habitat Assessment Tool (CHAT).** The CHAT is a cooperative effort of 16 Western states to provide the public and industry a high-level overview of "crucial habitat" across the West. As defined by the Western Governors Association (WGA), crucial habitats are areas that are "likely to provide the natural resources important to aquatic and terrestrial wildlife, including species of concern, as well as hunting and fishing species." The CHAT, built from state wildlife agency data, is intended to help project proponents during pre-planning of development or in comparing wildlife habitat areas. The tool is designed to help developers reduce costs, conflicts and surprises while ensuring wildlife values are better incorporated into land use decision-making. The online tool is an example of WGA's collaboration with federal agencies – including the FWS, the BLM, and the U.S. Forest Service – to enable state fish and wildlife data and analyses to inform land use, planning and other land use decisions. "The Western Governors encourage widespread use of CHATs to better inform energy, transportation, and land use planning while providing for healthy and productive landscapes." (from: [http://www.westgov.org/policies/cat\\_view/95-reports/280-2013?orderby=dmdatecounter&ascdesc=DESC](http://www.westgov.org/policies/cat_view/95-reports/280-2013?orderby=dmdatecounter&ascdesc=DESC)).
- **Dry Lake Solar Energy Zone.** In conjunction with the Western Solar Energy Plan, the BLM developed a pilot mitigation strategy for solar energy projects that may occur in the Dry Lake Solar Energy Zone. The Solar Energy Plan calls for the development of mitigation strategies for each solar energy zone (SEZ) to identify opportunities for compensatory mitigation to offset the impacts of projects on resource values in the SEZ. Through the development of these mitigation strategies, project proponents will have a better understanding of the mitigation measures required, and the associated costs, for compensatory mitigation actions in conjunction with development in the particular SEZ. Lessons learned from the Solar Regional Mitigation Strategy for the Dry Lake Solar Energy Zone will be used to inform the development of future mitigation strategies for other solar energy zones.
- **Multi-State Habitat Conservation Plans.** Habitat conservation plans (HCPs) under the Endangered Species Act have been used both to offset the impacts of single-landowner development projects

and to integrate endangered species conservation considerations into local land-use ordinances. Increasingly, habitat conservation plans are being used to address activities occurring in multiple states. A recent example is the plan approved for NiSource, Inc., a natural gas pipeline and distribution company. This HCP mitigates the impacts of pipeline construction and maintenance activities on dozens of endangered species in fourteen states. Similar multi-state HCPs are under development for wind energy projects within the migratory corridor of the whooping crane and within the range of the endangered Indiana bat.

- **Desert Renewable Energy Conservation Plan.** The Desert Renewable Energy Conservation Plan (DRECP) is a comprehensive and coordinated state/federal effort to provide effective protection and conservation of California's desert ecosystems while guiding the development of appropriate renewable energy projects throughout the region (over 22,585,000 acres).

Goals and objectives for the DRECP: Provide for the long-term conservation and management of Covered Species\*; preserve, restore, and enhance natural communities and ecosystems; identify and avoid impacts to sensitive cultural resources; build on the Competitive Renewable Energy Zones identified by previous studies; further identify the most appropriate locations for utility-scale renewable energy projects; provide a framework for a more efficient process for regulatory authorization resulting in greater conservation than project-by-project or species-by-species reviews can obtain; provide durable and reliable regulatory assurances; identify and incorporate climate change adaptation research, management objectives, and/or policies into the final plan document.

- **Advance Mitigation for Greater Sage-Grouse and Lesser Prairie-Chicken**

#### *Greater Sage-Grouse*

In conjunction with the development of a conservation strategy for the greater sage-grouse, federal and state land management agencies are developing guidance for measures to mitigate the effects of development activities that may pose a threat to the continued existence of the species. This strategy will apply to all management actions on BLM, Forest Service, and state lands within the remaining range of the species while providing each state the flexibility to develop tools (e.g., mitigation banks, fee structures) to meet the desired mitigation outcomes.

\* Proposed Covered Species are plants and animals identified in the Plan for which conservation and management are provided and "take" will be authorized over a long-term permit period. The Covered Species list is developed through an iterative planning process incorporating input from the public stakeholders, and independent scientific review.

### *Lesser Prairie-Chicken*

The five states with lesser prairie-chickens (CO, KS, NM, OK, and TX) have developed a rangewide conservation plan that relies heavily on a mitigation program in which agricultural landowners will be paid to undertake conservation measures on their lands. Funds for these payments will come from assessments on oil and gas and other development activities. Under the special 4(d) rule proposed by the FWS, development activities that result in the taking of lesser prairie-chickens will be authorized, provided that those development activities are covered by the mitigation program. Thus, even though the lesser prairie-chicken is a federally listed threatened species, the state-developed rangewide conservation plan and its mitigation program will effectively leave the states with the authority to continue to manage and conserve the species.

- **Offshore Wind Energy.** In 2010, the Department's Bureau of Ocean Energy Management (BOEM) launched an offshore 'Smart from the Start' program designed to facilitate efficient and environmentally responsible siting, leasing and construction of new offshore wind energy projects on the Atlantic Outer Continental Shelf (OCS). The Initiative calls for BOEM, in close coordination with local, state and Federal partners, to identify priority wind energy areas for potential development and accelerate the leasing process for those areas. BOEM has convened 10 intergovernmental state Task Forces engaged in planning for Atlantic OCS wind leasing and development, and has also launched Task Forces in Oregon and Hawaii. The Task Forces are central to planning and designing wind energy areas that provide opportunities for significant wind energy generation while minimizing and managing potential conflicts with environmental concerns and important other uses, such as fishing, shipping, tourism, National Seashores, and Native American and cultural interests.

BOEM uses the best available science and a stakeholder-driven process to identify resources, conflict-use areas and suitable placement of offshore energy facilities. Through the Task Forces and the environmental review process, BOEM will identify necessary mitigation needs for potential environmental risks early in the process. Mitigation may include avoiding archaeological resources, reduced vessel traffic, avoiding high value fishing grounds, requiring minimum separation distances for marine mammals, preserving important ocean views, or adjusting the locations of meteorological towers and buoys to avoid adverse effects to offshore cultural resources or biologically sensitive habitats.

- **Rapid Ecoregional Assessments.** The BLM's Rapid Ecoregional Assessments (REA) Program was initiated in 2010. REAs are peer-reviewed science products that synthesize existing information (including a significant

amount of non-BLM data) about resource conditions and trends. They highlight and map areas of high ecological value; gauge potential risks from stressors including climate change; and establish landscape-scale baseline ecological data to gauge the effect and effectiveness of future management actions. It is the policy of the BLM to use this REA information and similar information from other large-scale assessments to help identify potential development and conservation priorities; prepare land use plans and plan amendments; conduct cumulative impact analyses; develop best management practices; and authorize public land uses. Like the Western Governors Association's Crucial Habitat Assessment Tool, the REAs are foundational to a landscape approach to management. The BLM released four Rapid Ecoregional Assessments (REAs) in 2013 and is planning to release four additional REAs in 2014, six in 2015, and one in 2016. Taken together, these 15 REAs cover over 700 million acres of public and non-public lands.

- **Transportation Infrastructure.** With the understanding that existing mitigation efforts do not always provide the greatest environmental benefits or promote ecosystem sustainability, the U.S. Department of Transportation and a team of representatives from eight other federal agencies and Departments of Transportation from four states developed guidance for making transportation infrastructure development more sensitive to wildlife and ecosystems through enhanced interagency and stakeholder collaboration. This effort culminated in the 2006 report *Eco-Logical: An Ecosystem Approach to Developing Infrastructure Projects*. In 2012, the State of California adopted a draft framework for Regional Advanced Mitigation Planning (RAMP) that embraced the principles from *Eco-Logical* but also established guidelines for streamlining permitting processes as well as improving conservation outcomes – essentially integrating infrastructure and conservation planning. This approach has been endorsed by the California Departments of Transportation, Water Resources, and Fish and Game, as well as the California Wildlife Conservation Board, the California State Water Resources Board, the U.S. EPA, National Marine Fisheries Service, and the U.S. Department of Transportation.

The initiatives and programs described above are only a few of the many programs now being developed at state and federal levels to address the need to better integrate development and conservation planning at the landscape scale on both public and private lands and waters. To varying degrees they all address the guiding principles from Chapter 4 and seek to improve mitigation efficiencies and effectiveness, provide more transparency and predictability, and foster more resilient human and natural systems in the face of a changing climate.

This report describes an advanced form of collaborative problem-solving at a time when the uncertainties of a rapidly changing climate and the imperative of an energy transformation pose challenges for sustaining the natural ecosystems that buffer us from extreme weather events and play a fundamental role in the maintenance of America's clean air, clean water, agricultural productivity, world class recreational opportunities, and economy.

The list of promising efforts described in the previous chapter demonstrates that there is a widely shared understanding of the need to work collaboratively to advance landscape-scale approaches. It also demonstrates that there are as many variations on the approach as there are management needs. To advance the multiple missions of the Department and its bureaus, these approaches must be aligned as much as possible across bureaus, agencies, states, and partners.

The strategy described in this report is intended to establish a common approach that will evolve and adapt to changing needs but ensure consistent policies and practices Department-wide. Getting it right on mitigation will improve our Nation's ability to more effectively balance the Department's responsibilities for managing development and conserving America's incomparable natural and cultural resources. This report, and the strategy it describes, is the Department's first step in building upon the innovative efforts that have been emerging across the country to avert resource conflicts prior to development and to advance sustainable solutions that ensure the highest and best use of our natural resources.

## References

- <sup>1</sup> Under NHPA, federal agencies are required to consider the effects of their “undertakings” on historic properties; regulations require that the federal agency consult States, Tribes, and the public to identify historic properties, assess, and resolve adverse effects (if any).
- <sup>2</sup> The Wild and Scenic Rivers Act requires the avoidance of adverse impacts to river values.
- <sup>3</sup> Compensatory mitigation is not a concept explicitly expressed under the NHPA, but in practice it does sometimes occur. For example, an activity that adversely affects some properties in a historic district might be mitigated through creation of a dedicated funding source to care for the remaining properties. In general, however, due the uniqueness of cultural and historic resources, avoidance and minimization are usually essential to the successful conservation of these resources. Similarly, avoidance of impacts to parks, wilderness areas, and conservation system lands from nearby development will best ensure the integrity of these areas and avoid the need for compensatory mitigation of uncertain efficacy.

## Selected Major Authorities, Regulations, and Guidance Addressing Mitigation

This strategy is supported by a variety of authorities, regulations, and guidance including, but not limited to:

**National Environmental Policy Act (NEPA) - 42 U.S.C. § 4371 et seq.** NEPA aims to integrate environmental values into decision making by requiring agencies to analyze the environmental impacts of proposed actions that may significantly impact the environment. 42 U.S.C. § 4332(2) (C). Council on Environmental Quality and Department of the Interior regulations implementing NEPA recognize the potential for mitigation to ameliorate impacts of a proposal and require agencies to include in their analyses appropriate mitigation measures not already included in the proposed action or alternatives. 40 C.F.R. §§ 1502.14(f), 1502.16(h); 43 C.F.R. § 46.130. Mitigation is defined broadly, to include means by which impacts can be avoided, minimized, rectified, and reduced, as well as means for compensating for impacts through replacement of resources. 40 C.F.R. § 1508.20. The regulations further require that agency decisions must “[s]tate whether all practicable means to avoid or minimize environmental harm from the alternative selected have been adopted, and if not, why they were not.” 40 C.F.R. § 1505.2(c). CEQ guidance recognizes the importance of mitigation, including the use of mitigation to ensure that impacts of a proposed action will not be significant, along with monitoring and other mechanisms for ensuring that mitigation is implemented, thus enabling agencies to reach a Finding of No Significant Impact (i.e., a “mitigated FONSI”). *Appropriate Use of Mitigation and Monitoring and Clarifying the Appropriate Use of Mitigated Findings of No Significant Impact* (January 14, 2011).

**Federal Land Policy and Management Act (FLPMA) - 43 U.S.C. § 1701 et seq.** FLPMA requires that the public lands be managed “on the basis of multiple use and sustained yield,” 43 U.S.C. § 1701(a)(7), and “in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resources, and archeological values...” 43 U.S.C. § 1701(a)(8). Under the broad discretion afforded by FLPMA, the BLM can condition uses of the public lands authorized through various instruments (e.g., rights-of-way, permits, licenses, easements, etc.) on the implementation of mitigation measures intended to reduce impacts. The BLM’s recently issued draft mitigation policy provides policy, procedures, and instructions for developing strategies that identify and facilitate regional mitigation strategies, using BLM’s land use planning process to identify potential mitigation sites and measures, and identifying and implementing appropriate mitigation within or outside of the area of impact for particular land-use authorizations. *Interim Draft Policy on Regional Mitigation*; Manual Section 1794 (June 13, 2013).

**Mineral Leasing Act (MLA) - 30 U.S.C. § 181 et seq.** The MLA governs leasing of several minerals, most notably oil and gas. The BLM is required, at a minimum, to hold quarterly auctions of oil and gas leases in each state, 30 U.S.C. 226(b)(1). Leases are issued for 10 year terms and may be extended for as long as they produce oil or gas in paying quantities, and include stipulations for reducing impacts of development, *Id.*, 226(e); 43 C.F.R. 3101.1-3. Prior to drilling, operators must file an application for a permit to drill (APD) that, when issued, can require additional measures for mitigating anticipated impacts of development, 30 U.S.C. 226(f),(g).

**National Landscape Conservation System (NLCS, Organic Act) - 16 U.S.C. § 7201 et seq.** The NLCS was established “in order to conserve, protect, and restore nationally significant landscapes that have outstanding cultural, ecological, and scientific values for the benefit of current and future generations” and that “The Secretary shall manage the system...in a manner that protects the values for which the components of the system were designated.” Under this direction, the BLM has implemented policy to require mitigation of impacts in order to protect the objects and values for which the units of the NLCS were designated. For example, BLM Manual Section 6100 § 1.6.A.3 describes how “valid existing rights and other non-discretionary uses occurring within NLCS units will be managed to mitigate associated impacts to the values for which these lands were designated”. Similarly, BLM Manual Section 6220 § 1.6.E.5.b describes how “the effects of projects from the grants of the (rights-of-way) must be mitigated” for National Monuments and National Conservation Areas. Additionally, BLM Manual Section 6100 § 1.6.C.5 identifies how NLCS units provide good locations for compensatory mitigation projects.

**Endangered Species Act of 1973 (ESA) - 16 U.S.C. § 1531 et seq.** Under sections 7 and 10 of the ESA, the FWS may recommend means to avoid and minimize the take of listed wildlife species, as well as to establish targeted habitat. Under section 7, Federal agencies must consult with FWS or National Marine Fisheries Service to ensure that agency actions are not likely to jeopardize the continued existence of a listed species or destroy or adversely modify designated critical habitat. The biological opinion issued by FWS or NMFS includes an incidental take statement, if appropriate, and provides reasonable and prudent measures that must be implemented to minimize the impacts of any anticipated take of listed wildlife species. Where a jeopardy or adverse modification opinion is rendered, reasonable and prudent alternatives will be recommended. Landowners who wish to develop private lands inhabited by listed wildlife species may receive an incidental take permit from FWS under Section

10, provided they have developed an approved habitat conservation plan (HCP), which sets out steps that the permit holder will take to avoid, minimize, and mitigate the impacts on species likely to occur from the proposed action. Off-site mitigation banks often play a key role in meeting conservation requirements under an HCP. Candidate Conservation Agreements, also under section 10, are voluntary agreements where landowners agree to carry out measures to assist in the conservation of candidate and other at-risk species.

The FWS issued a mitigation policy in 1981 to help the agency make consistent and effective mitigation recommendations to protect and conserve the most important and valuable fish and wildlife resources, while facilitating balanced development of the Nation's natural resources; U.S. Fish and Wildlife Service Mitigation Policy (46 FR 7644-7663, 1981). FWS has also issued guidance to help the agency evaluate proposals for establishing conservation banks for the purpose of off-setting adverse impacts to listed species. Guidance for the Establishment, Use, and Operation of Conservation Banks (May 2, 2003). More recently, FWS issued draft guidance that describes a crediting framework for Federal agencies in carrying out recovery of threatened and endangered species. Under the draft guidance, Federal agencies could show how adverse effects of agency activities to a listed species are offset by beneficial actions taken elsewhere for that species, so long as there is a net conservation benefit to the species. Draft Guidance on Recovery Crediting for the Conservation of Threatened and Endangered Species; 72 Federal Register 62258 (November 2, 2007).

***Fish and Wildlife Coordination Act (FWCA) - 16 USC § 661-667e.*** The FWCA establishes fish and wildlife conservation as a coequal objective of all federally-funded, permitted, or licensed water-related development projects. Under the FWCA, Federal agencies developing such projects must consult with FWS (and NMFS in some instances) and the states regarding fish and wildlife impacts. The statute provides FWS with authority to investigate and prepare reports providing mitigation analyses on all water-related development projects; FWS mitigation recommendations may include measures addressing a broad set of habitats beyond the aquatic impacts triggering the FWCA and species beyond those covered by other resource laws.

***National Historic Preservation Act (NHPA) - 16 U.S.C. § 470 et seq.*** The NHPA is a procedural statute that requires Federal agencies under Section 106 to take into account the effects of their undertakings on historic properties, and to afford the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment on these undertakings. For the purposes

of NHPA, historic properties include properties that are listed in or eligible for listing in the National Register of Historic Places. Through the implementing regulations of Section 106, which are contained in 36 CFR Part 800, "Protection of Historic Properties," federal agencies are required to consult with State/Tribal Historic Preservation Officers, Indian tribes or Native Hawaiian Organizations, local governments, interested parties such as historic preservation advocacy organizations, the public, and the ACHP. Consultation includes assessing whether or not the undertaking will have adverse effects on such properties and measures to resolve those adverse effects. Section 110(f) specifically addresses mitigation of adverse effects to properties of national significance, requiring that "prior to the approval of any Federal undertaking which may directly and indirectly affect any National Historic Landmark, the head of the responsible Federal agency shall, to the maximum extent possible, undertake such planning and actions as may be necessary to minimize harm to such landmark." In many instances, the Section 106 consultation process will result in the execution of a memorandum of agreement, see 36 C.F.R. § 800.6(c), which may include federal agency commitments to avoid or mitigate any adverse effects.

***Clean Water Act - 33 U.S.C. § 1251 et seq.*** Section 404 of the Clean Water Act provides extensive authority to the U.S. Army Corps of Engineers and the Environmental Protection Agency to conduct mitigation where federal actions impact waters of the United States. The FWS has specific authority under section 404(m) to secure mitigation for impacts to aquatic resources nationwide. Section 404 (m) requires the Secretary of the Army to notify the Secretary of the Interior, through the FWS Director, when a permit application has been received or when the Secretary proposes to issue a general permit, and FWS can submit written comments within 90 days. Through its comments, FWS can assist the Corps of Engineers in developing permit terms that avoid, minimize or compensate for permitted impacts. Through its policy on compensatory mitigation related to the National Wildlife Refuge System, FWS has established guidelines for using Refuge lands for siting compensatory mitigation for impacts permitted through section 404 or section 10 of the Rivers and Harbors Act. Final Policy on the National Wildlife Refuge System and Compensatory Mitigation under the Section 10/404 Program (64 FR 49229-49234, 1999).

***Clean Air Act - §7401, et seq.*** The Clean Air Act calls for the prevention and control of air pollution across the country and includes a national goal to "to preserve, protect and enhance the air quality in national parks, national wilderness areas, national monuments, national seashores, and other areas of special national or regional natural, recreational, scenic or historic value" (42 U.S.C. §7470(2)). It sets forth an affirmative duty to protect air quality and air quality related values (e.g., visibility and

ecosystem resources) of national parks and wilderness areas designated as Class I areas under the statute by avoiding and minimizing impacts to such areas. The Clean Air Act also provides for the banking and trading of emissions reductions and use of emission offsets to capture cost efficiencies. The NPS, BLM, FWS, US Forest Service and the EPA have entered into a memorandum of understanding that adopts a standardized approach that facilitates the completion of NEPA environmental analyses for federal land use planning and oil and gas development decisions and leads to improved design and implementation of mitigation measures that will both protect air quality and air quality related values and provide opportunities for future oil and gas development.

***NPS Organic Act of 1916 and General Authorities Act of 1970, as amended - 16 U.S.C. §1, et seq.*** Under the Organic Act, the National Park Service (NPS) in the Department of the Interior is charged with managing the units of the National Park System so as to “conserve the scenery and the national and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations. Through the General Authorities Act as amended, Congress directed that “the authorization of activities shall be construed and the protection, management and administration of these areas shall be conducted in light of the high public value and integrity of the National Park System and shall not be exercised in derogation of the values and purposes for which these various areas have been established, except as many have been or shall be directly and specifically provided by Congress.” These authorities, among others, provide a framework for the Secretary of the Interior to be proactive in protecting the resources and values of the National Park System and for bureaus within the Department to mitigate the impacts of their discretionary activities on the resources and values of park units.

***Paleontological Resources Preservation Act (PRPA) - 16 U.S.C. § 470 aaa et seq.*** This statute states that federal agencies “shall manage and protect paleontological resources on Federal land using scientific principles and expertise.” In areas determined to have high or undetermined potential for significant paleontological resources, the agency must implement an adequate program for mitigating the impact of development, including surveys, monitoring, salvage, identification and reporting, and other activities required by law.

#### ***White House Guidance and Initiatives***

***Executive Order (EO) 13604 on Improving Performance of Federal Permitting and Review of Infrastructure Projects (March 28, 2012).*** The EO calls for more timely and efficient Federal permitting and review of infrastructure projects while improving environmental

and community outcomes. To achieve that objective, the order calls on agencies to integrate reforms into project planning processes “so that projects are designed appropriately to avoid, to the extent practicable, adverse impacts on public health, security, historic properties and other cultural resources, and the environment, and to minimize or mitigation impacts that may occur.”

***A Federal Plan for Modernizing the Federal Permitting and Review Process for Better Projects, Improved Environmental and Community Outcomes, and Quicker Decisions (June 2012).*** The Plan calls on Federal agencies to identify opportunities to improve mitigation processes by integrating intra- and inter-agency processes and encouraging mitigation planning at the regional, watershed and landscape levels, and to move away from addressing mitigation at the end of project development and on a project-by-project basis.

#### ***Presidential Memorandum on Modernizing Federal Infrastructure Review and Permitting Regulations, Policies, and Procedures (May 17, 2013).***

The Memorandum recognizes landscape- and watershed-level mitigation practices as means by which agencies have achieved better outcomes for communities and the environment and realized substantial time savings in review and permitting. The Memorandum directs an interagency leadership team to, among other things, expand the use of IT tools to facilitate monitoring of mitigation commitments and “identify improvements to mitigation policies to provide project developers with added predictability, facilitate landscape-scale mitigation based on conservation plans and regional environmental assessments, facilitate interagency mitigation plans where appropriate, ensure accountability and the long-term effectiveness of mitigation activities, and utilize innovative mechanisms where appropriate.”

#### ***Implementation Plan for the Presidential Memorandum on Modernizing Infrastructure Permitting (March 2014).***

The Plan includes actions to identify policy changes to promote in-advance, landscape-scale mitigation; to facilitate high-quality and efficient permitting and review processes; to identify best practices for early engagement with tribal, state, and local governments; and to expand innovative mitigation approaches that facilitate landscape-level mitigation planning, consistent and transparent standards for applying the mitigation hierarchy, and use of in-lieu fee program and mitigation banks. The overall goal of the plan is to “modernize the Federal permitting and review process for major infrastructure projects to reduce uncertainty for project applicants, reduce the aggregate time it takes to conduct reviews and make permitting decisions by half, and produce measurably better environmental and community outcomes.”

## Appendix II

Subsequent to the Secretarial Order and during the preparation of this report, the Climate and Energy Task Force communicated with many federal, state, and private partners and stakeholders. This outreach process is ongoing and will continue to inform the development and implementation of the Department's mitigation policies as this strategy takes shape. The following entities are representative of the many partners contacted:

- U.S. Department of Agriculture
- U.S. Department of Transportation
- U.S. Army Corps of Engineers
- U.S. Environmental Protection Agency
- White House Office of Management and Budget
- Federal Energy Regulatory Commission
- Advisory Council on Historic Preservation
- State of California, Office of the Governor

Hey B,

Got your voice mail; here's the list I used to mail the letters/the CDs for review, etc. I am not sure how Idaho Power ended up with one? Maybe someone gave him a copy? I did not send him one. Weird...

**To:** Brent Ralston  
**Subject:** Re: Review of Administrative Draft Proposed Plan

PO Box 490 Pocatello 83204, or 230 W Lewis, 83204. Yes, we had this problem before. It will get lost in the Courthouse. The Commissioners do not meet that frequently. Doug

**Subject:** Review of Administrative Draft Proposed Plan

Just a quick follow-up to the information we discussed at the recent call about your opportunity to review the Administrative Draft Proposed Plan (ADPP) –

On the call I indicated a deadline for comments back to BLM by July 18<sup>th</sup>. I had assumed our mailing would reach you not later than July 11<sup>th</sup>. It seems that was not the case and most folks are only now receiving the review materials. I still want to afford you the two weeks for review we spoke of and in that spirit need to delay the comment deadline until July 25<sup>th</sup>.

If you still have not received the materials please let me know.

**MEMORANDUM OF UNDERSTANDING  
BETWEEN  
UNITED STATES DEPARTMENT OF THE INTERIOR  
BUREAU OF LAND MANAGEMENT  
TWIN FALLS DISTRICT, IDAHO  
AND  
ELKO DISTRICT, NEVADA**

**I. Introduction**

This Memorandum of Understanding (MOU) is between the United States Department of the Interior, Bureau of Land Management (BLM), Twin Falls District and United States Department of the Interior, Bureau of Land Management (BLM), and Elko District; jointly referred to as the "Parties."

**II. Purposes**

- A. Clearly identify the Idaho/Nevada border as the official boundary between the Twin Falls District and Elko District within the China Creek, Player Butte, Player Canyon, and Horse Creek Allotments. *See attached maps for details.*
- B. Define the Twin Falls District and Elko District Management responsibilities within the Nevada portions of the China Creek, Player Canyon, and Horse Creek Allotments. These public lands are described below and will be referred to in this document as the "subject public lands."

The portions of Township 47N, Range 63E Sections 4, 5 & 6 that fall within the Nevada public lands of the Player Canyon Allotment; portions of Township 47N, Range 63E Sections 2, 3, & 4 of the Player Butte Allotment; and portions of Township 47N, Range 63E Sections 1 & 2, and portions of Township 47N, Range 64E Sections 5 & 6 within the Nevada public lands of the China Creek Allotment; and portions of Township 47N, Range 67E Sections 2 and 3 of the Horse Creek Allotment. See attached maps for details.

**III. Background**

- A. The BLM Idaho GIS data depicting the Twin Falls District, Jarbidge Field Office Administrative Unit Boundary incorrectly follows the southern extents of the China Creek, Player Butte, and Player Canyon allotments in Nevada. It is assumed that the Jarbidge Field Office boundary was (incorrectly) mapped this way to reflect Idaho's grazing administration responsibilities in Nevada according to MOU Idaho -6 signed in 1969. This same error was propagated in the 1987 Jarbidge RMP planning maps. The Wells Field Office boundary has correctly mapped their Field Office boundary along

the Idaho/Nevada state line in this area.

- B. MOU Idaho -6 provided the Jarbidge Field Office with grazing administration within the subject public land. This MOU will expand upon those responsibilities for the Twin Falls District to include vegetation management actions such as Emergency Stabilization and Rehabilitation (ES&R), hazardous fuels reduction, wildlife habitat restoration and weed treatments on public lands within the China Creek, Player Butte, and Player Canyon allotments within subject public land.
- C. The BLM Idaho GIS data depicting the Twin Falls District, Burley Field Office Administrative Unit Boundary correctly follows the Idaho/Nevada State boundary. The Burley Field Office and Wells Field Office have been managing the above mentioned land in accordance with the Horse Creek Allotment Agreement which was signed in 1980. This agreement assigned grazing administration of this portion of land to the Burley Field Office (formerly District). This MOU will expand upon those responsibilities for the Twin Falls District, Burley Field Office to include vegetation management actions such as ES&R, hazardous fuels reduction, wildlife habitat restoration and weed treatments on public lands within the Horse Creek Allotment portion of subject public land.

#### **IV. Authorities**

Federal Land Policy Act of 1969 (42 USC 4321 et seq.)

Nothing in this MOU alters or supersedes the authorities and responsibilities of any of the Parties on any matter under their respective jurisdictions.

#### **V. Roles and Responsibilities**

- A. The Twin Falls District roles and responsibilities include:
  1. The Twin Falls District GIS Specialist will correct the BLM Idaho GIS data to follow the Idaho/Nevada state line for its District boundary.
  2. The Twin Falls District will be responsible for the administration of livestock grazing for the subject public lands.
  3. The Twin Falls District will be responsible for all vegetation management within the subject public land, including activities such as ES&R hazardous fuels reduction, threatened and endangered vegetation management, wildlife habitat restoration and

treatment of noxious weeds. ES&R on subject public lands will be managed according to the current Twin Falls District ES&R Plan.

4. The Twin Falls District will coordinate with Elko District Office Nevada on all resources affected by actions taken for grazing permit renewal or modification or vegetation management within the subject public land.

B. The Elko District roles and responsibilities include:

1. The Elko District will be responsible for all resources and activities on public lands within the subject public land with the exception of livestock grazing administration and vegetation management.
2. The Elko District will coordinate with the Twin Falls District Office on all actions that would affect the administration of livestock grazing or vegetation management within the subject public land.

## **VI. Representatives**

The Parties will designate representatives as specified in Exhibit A to ensure coordination during the implementation of this MOU. The Parties may change their point of contact at any time by providing a revised Exhibit A to the other Party. Any revisions must be added to the official file.

## **VII. Funding**

- A. Subject to the availability of funds, the Parties agree to fund their own expenses associated with the implementation of this MOU.
- B. Nothing contained herein shall be construed as obligating the BLM to any expenditure or obligation of funds in excess or in advance of appropriations, in accordance with the Anti-Deficiency Act, 31 U.S.C. § 1341.

## **VIII. Records**

Any records or documents generated as a result of this MOU shall become part of the official BLM record maintained in accordance with applicable BLM Records Management policies. Any request for release of records associated with the implementation of this MOU to anyone outside the Parties must be determined by the BLM based on applicable laws, including the Freedom of Information Act and the Privacy Act.

## **IX. Tribal Consultations**

The Twin Falls District as appropriate shall engage in government-to-government consultation with all actions as associated with this agreement with affected Indian Tribe(s) during all phases of this process, in accordance with applicable Federal statutes,

regulations, and other authorities, including Executive Order 13175 on consultation with Indian Tribes and Executive Order 13007 on Indian Sacred Sites. This MOU in no way affects the responsibility of the BLM and the authority of affected Tribe(s) to engage in these government-to-government consultations. To the extent the BLM receives any Indian Trust data as a function of the requirement to conduct government-to-government consultations with affected Indian Tribe(s), the BLM certifies it will accord such data all necessary protection and security pursuant to applicable statutes, regulations, and policies, including those set forth in the context of any applicable litigation.

**X. Compliance with Applicable Laws and Regulations; Severability Clause**

This MOU is subject to all applicable Federal laws, regulations and rules, whether now in force or hereafter enacted or promulgated. Nothing in this MOU shall be construed as in any way impairing the general powers of the BLM under such applicable laws, regulations, and rules. If any term or provision of this MOU is held to be invalid or illegal, such term or provision shall not affect the validity or enforceability of the remaining terms and provisions. Meeting the terms of this MOU shall not excuse any failure to comply with all applicable laws and regulations, whether or not these laws and regulations are specifically listed herein.

**XI. Term, Amendment, and Termination**

A. Term of MOU:

1. This MOU becomes effective upon the date last signed and executed by the duly authorized representative of the Parties to this MOU.
2. This MOU shall remain in effect for five (5) years from the execution date unless terminated or cancelled by either party prior to the expiration date.

B. Amendments:

1. The Parties may request changes to this MOU, which shall be effective only upon the written agreement of all Parties.
2. Any changes, modification, revisions, or amendments to this MOU shall be incorporated by written instrument, executed and signed by all Parties, and will be effective in accordance with the terms and conditions contained herein.

C. Termination:

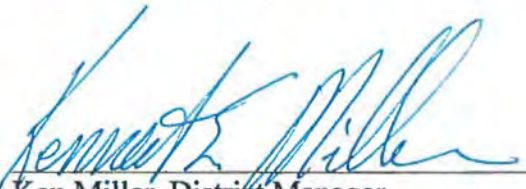

This MOU may be terminated prior to the expiration date upon 30-day written notice and agreement between all parties to terminate this MOU.

**XII. Signatures**

- A. All signatories have the appropriate delegation of authority to sign this MOU.
- B. The Parties hereto have executed this MOU on the dates shown below.

**Subject:** Fwd: GRSG: Contact list Sec 7 Consultation (BLM, FS, FWS points of contact by EIS)

Hello,

As the national contact for the Section 7 Greater Sage-grouse Consultations, I have been in routine conversations with USFS and USFWS. We have all identified a greater need for local engagement between all three agencies in regard to the specific drafting of each Biological Assessment.

Attached is a spreadsheet indicating the specific contacts for each BA/EIS for each agency. Although preferred alternatives have not yet been selected, informal consultation should be ongoing due to the aggressive time frame we are all tasked to meet.

It is important to keep in mind the following:

Although the FS is drafting the BA's for several EIS's, they are reliant upon input and feedback from the BLM on how to address particular concerns USFWS might raise on proposed implementation of GRSG conservation measures on BLM lands.

With limited engagement taking place, FWS has only the draft EIS to evaluate and have identified species that may be adversely affected. Only through engagement with the BLM can some of these issues be addressed, clarified and perhaps resolved. The BLM must speak for our land and management practices and be the driver of whatever modifications, if any, we will consider based on discussions with USFWS. The FS would then be available to capture those resolutions within the Biological Assessment, but they are not, nor should they be, tasked as the decision makers for BLM management.

I encourage you all to engage with your counterparts in FS and FWS on a routine basis. Please keep in mind that if formal consultation is necessary, the FWS are allotted the allowable 135 days to complete their Biological Opinion and such a situation will delay the current expectation of signing Records of Decision by December 15, 2014. Routine engagement among all agencies throughout the course of informal consultation and the drafting of the BAs will be advantageous and beneficial to all involved.

Thanks for your cooperation.  
Kim

**Custer County Idaho Comments on Idaho and Southwestern Montana Greater Sage-Grouse Administrative Draft of Proposed Land Use Plan Amendment and Final Environmental Impact Statement**

On behalf of the Custer County Idaho Board of Commissioners, please incorporate the following comments into the above referenced documents. All prior Custer County comments to this NEPA process are herein incorporated by reference.

**1. FEIS Chapter 1, Page 2:** *“While historical Euro-American settlement of these lands has been slower and sparser than in other regions of the country, habitat conversion to suit human purposes has contributed to widespread loss and decline of sagebrush habitat availability or quality and associated wildlife populations. These human purposes include agriculture and urban development, energy and mineral resource development, and a long history of dispersed (but sometimes intensive) uses such as domestic grazing.”*

Comment:

The Land Use Plan Amendment (LUPA) and Final Environmental Impact Statement (FEIS) for Idaho and southwestern Montana are based on a series of false assumptions including the statement quoted above. As testimonials from Custer County Commissioners and residents show, before enactment of the ESA, sage-grouse were abundant. Sage-grouse populations thrived in the era of agriculture in Idaho and southwest Montana. This fact is understated in the FEIS in favor of hypothetical pre-European settlement “make-believe” maps that are not

based on science. The artificial stories and maps created by federal biologists leave out the fact that when ranchers, farmers and miners settled in Idaho and Montana in the 1800s and 1900s they cleared trees, leveled land, planted crops, created year round water sources and increased the abundance of sage-grouse and the diversity of habitat the sage-grouse needed for optimum year round survival.

The false assumptions throughout the FEIS result in a proposed action that would harm the Greater Sage-Grouse as well as the economy of Custer County and other counties in Idaho and southwestern Montana. The proposed action would also harm the economic well being of our nation as a whole by destroying the very industries that have helped sage-grouse habitat diversification over time. The proposed action would also harm our military defense system by adding restrictions that are unnecessary and expensive. Every hour and every dollar the military spend on this false crisis is time and money that is urgently needed to strengthen our national defenses.

The false assumptions and incorrect political rationalizations in the name of the Endangered Species Act (ESA) are disingenuous and need to be corrected. For the reasons listed below and those itemized in past comments, the Custer County Board of Commissions recommends the No Action Alternative as the preferred alternative.

**2. FEIS Page 1 -9. “Within the Idaho and southwestern Montana sub-region, the PACs consist of a total 11,232,800 acres.”**

Comment:

Custer County is opposed to restrictions within over 11.2 million acres of Priority Areas for Conservation (PACs) including each and every proposed land withdrawal, restriction on land disposal, leasing closure, leasing constraint, non-energy leasing closure, saleable mineral material leasing closure, travel management restriction, ban from surface occupancy, anthropomorphic surface disturbance limitation and other action that prohibits economic opportunities, scientific vegetative management, and predator control options outlined clearly and succinctly in the Custer County Land Use Plan.

**3. FEIS Figure 1-1**

Comment:

This figure demonstrates that the Greater sage-grouse habitat is widespread and abundant. The proposed action is based on the premise that sage-grouse are declining due to man induced factors related to livestock grazing, oil and gas development, roads, and mining.

Instead, the science shows the sage-grouse populations fluctuate in relation to climate and predators and that sage-grouse are not threatened with extinction. Genetic work by Dr. Zink, discussed in previous comments submitted by Custer County, clearly demonstrates the genetic health of the Greater sage-grouse population across the eleven states where listing is proposed but not warranted.

The very work federal land management agencies should be taking to enhance sage-grouse habitat would be severely restricted by the proposed alternative. The proposed plan of action would limit options to manage sagebrush and riparian communities as well as predators, thus harming sage-grouse populations in Idaho and southwestern Montana.

**4. FEIS Table 1-3 Lists Predators as a threat to sage-grouse in all three documents cited:**

<b>USFWS 2010 Finding</b>	<b>2006 Idaho GRSG Conservation Plan</b>	<b>2005 Montana GRSG Management Plan</b>
---------------------------	--	--

Comment

FEIS Table 1-3 clearly demonstrates that USFWS, Idaho and Montana all consider predators a significant threat to sage-grouse. This fact contradicts Appendix R, Page R 15 which states:

*“The [Catron] county plan identifies predation as the primary threat in the county (p. 14). This threat is not shown as a primary threat on other threat descriptions (BLM, State, USFWS, Local Working Group). **Predator control is not under the jurisdiction or authority of the BLM or FS** (emphasis added) and a specific alternative to address predator control has been eliminated from detailed analysis”*

The FEIS and Appendix R need to be corrected so they don't contradict each other.

Please answer the question of why BLM and FS personnel think they can manage game bird populations (sage-grouse) and their habitat and why they think they can't manage predator populations (foxes, badgers, ravens, etc) and their habitat.

Also, if *“**Predator control is not under the jurisdiction or authority of the BLM or FS**”* (emphasis added) why are the two agencies involved in interdisciplinary teams to manage wolves? Wolves are predators. Wolves prey on sage-grouse.

Stating that BLM and FS can manage sage-grouse and wolves, but not “predators” is illogical and contradicts ongoing actions by both agencies. The statement that predator control is not under the jurisdiction or authority of BLM or FS is false and needs to be corrected. Both agencies know that they currently, through agreements with state and other federal agencies, jointly perform predator management control activities. The statement was merely placed in

Appendix R to discard the Custer County recommendation for predator control actions as a mechanism to increase sage-grouse numbers. The statement is political and it is false.

Please rewrite Appendix R as it relates to the Custer County Land Use Plan predator control recommendations and what BLM and FS can and cannot do through interagency agreements to control predators and to fund predator control programs when they so desire.

Why is it that BLM and Forest Service seem to think they can create rules and restrictions for sage-grouse and wolf habitat, hire biologists to count sage-grouse and wolves, radio track sage-grouse and wolves, map sage-grouse and wolf movements, etc. yet the same federal agencies say they can't count badgers, radio track badgers, map badger movements, or otherwise "manage" predators such as badgers?

What federal laws create the distinction between when the BLM and Forest Service can manage a particular species? BLM and Forest Service biologists are involved in programs to track deer and elk, yet these species are not listed as sensitive, threatened or endangered.

The FEIS needs to analyze predators as well a prey. The two are directly related and inseparable.

Anyone with basic wildlife management training knows that there is a predator – prey cycle:

Prior to enacting the ESA, predator control was a key factor in keeping sage-grouse numbers high. This is a well documented fact that recent agency biologists choose to ignore.

The presence or absence of predators is a key population factor in the survival and population viability of sage-grouse and cannot be categorically ignored. By ignoring the predator prey cycle in the FEIS, the agencies have missed a key factor in sage-grouse management that is critical to their decision. The lack of a detailed predator prey analysis negates the ability of the agencies to make an informed decision. The lack of a predator prey analysis makes the current FEIS proposed decision arbitrary and/or capricious.

## **5. FEIS Figure 3-3**

Comment:

This figure demonstrates that catastrophic fires are significant in Idaho and southwestern Montana. Science proves sage-grouse habitat is dynamic and vulnerable to catastrophic fires if left unmanaged (Davies et al 2011). The catastrophic fires that would be perpetuated by the proposed action will destroy soil microbes necessary to restore vegetation.

Livestock grazing prevents blazing, yet livestock grazing is severely restricted under the proposed action. The result of implementing the proposed action would be massive fuel loads that build up and burn hot, requiring federal, state and local resources to fight fires instead of producing food and economic prosperity.

## **6. FEIS Appendix D**

Comment:

Though the federal agencies assess fire strategies, they fail to include the private land and the value of partnerships with private landowners to create an ecosystem approach to fire management. Their analysis also fails to consider the large amount of revenue generated from mining, oil and gas, and livestock grazing that would be available to implement the fire management strategies if these resource uses were allowed to persist and thrive under Congressionally mandated multiple use guidelines.

The combination of natural resource use and mitigation provided when industry is involved in natural resource management, while at the same time creating wealth from food and energy producers, was not analyzed. Money matters. The Big Green organizations are not spending enough of their money on land management. Instead they spend it on litigation and lobbying. The litigation takes money away from federal land management agencies that would be better spent on managing wildlife habitat.

Natural resource users will spend money to manage the land so they can continue to use it wisely. Federal agencies should ally with livestock producers, mining companies, oil and gas companies, hunters and other natural resource users to find ways to work towards the goal of bringing both healthy natural resources and healthy economic metrics into balance. Government would be better served to work with producers instead of against them. The current plan of action works against industry.

The current plan of action did not take into account the comments provided by Custer County to date in regard to this NEPA decision. The proposed action is inconsistent with the Custer County Land Use Plan and the economic needs and willingness of the County and its constituents to work to assure the health of sage-grouse populations and their habitat.

## **7. FEIS Appendix R**

Comment:

Though Appendix R of the FEIS purports to take into account relevant County Land Use Plans, it does nothing to create consistency between federal and local plans. The Custer County Board of Commissioners adopted their Land Use Plan in hopes that it would be relevant to the decisions of federal land managers within the County. Instead, the Custer County Land Use Plan was largely ignored because it did not fit with the easier and less expensive government GIS models that lock up the land instead of managing land as evidenced by the millions of acres that would be withdrawn or restricted from multiple use under the proposed alternative.

## **8. Appendix AA**

Comment

The IMPLAN addressed in Appendix AA is deceiving in respect to tables that show no decrease in AUMs under the proposed action. The problem is that the price of the AUMs increases to the point that livestock producers will not be able to afford the AUMs (Appendix AA).

This real and significant economic impact was not analyzed in the FEIS, in direct violation of NEPA, CEQ regulations, the Regulatory Flexibility Act and a variety of other laws, policies and Executive Orders detailed in previous Custer County comments. Based on a lack of a proper economic analysis, any decision from the FEIS is by nature arbitrary and/or capricious.

The IMPLAN is akin to stating that the number of federal employees in BLM and Forest Service will stay the same, though in a different part of the analysis, their salaries will be cut 90%. Logic tells you the federal employees will leave if their salaries are significantly cut. Why wasn't the same logic used to state that AUMs will be significantly reduced under the proposed action alternative due to the significant increase in the cost of each AUM?

## 9. Appendix R

Comment:

The LUPA/FEIS continue to ignore the Custer County Land Use Plan as evidenced in Appendix R of the FEIS. Custer County Commissioners have watched as ESA actions to bring back species such as the spotted owl, gray wolf and grizzly bear have restricted perceived threats such as livestock grazing, timber harvest, oil and gas development, mining and other natural resource uses. The result is unhealthy and unbalanced. Custer County Commissioners reacted by writing their own land use plan that should become part of any federal plans within the County. Instead, the proposed action is inconsistent with the County Land Use Plan and the federal government is negligent in its actions to dismiss the County Plan as irrelevant.

The proposed action further restricts land uses and land management tools that constituents of Custer County need to utilize in order to keep sagebrush from becoming decadent. Old growth climax sagebrush is not used by sage-grouse, yet that is what the proposed action will create, to the detriment of the very species the federal agencies purport to want to protect.

How did federal agencies get off track? The answer is simple. Politics, emotions and egos are overtaking science and facts. Many federal biologists have put their careers on the line to get promoted, make friends in Washington DC and become Hollywood – type stars in the eyes of people who trust them to save a species that would be best left to local management.

Pro-sage-grouse organizations are making billions of dollars off this false crisis. Politicians are getting reelected based on the lobbying efforts of these Big Green organizations that know the real issue is not sage-grouse. The real issue is power and wealth, big government control and a wildlands network where rural populations are exterminated for the perceived greater good of the country.

The crime is in the fact that rural Americans that feed the world are the heart and soul of our country. They should not be destroyed in favor of zealots that believe humans are a parasite on this earth. By writing Appendix R in a way that dismissed the Custer County Land Use Plan, the federal agencies are buying into a false premise that will actually put the security of

our nation at risk as we become dependent on other nations for food, energy, minerals, and other necessities of life.

The ESA action to place Canadian timber wolves in Idaho and southwest Montana has created a significant increase in predators which in turn threatens sage-grouse. As documented in earlier Custer County comments, raven numbers have increased thousands of fold in certain areas of Idaho due to the carcasses left by wolves. Ravens and other predators eat sage-grouse eggs and sage-grouse chicks. Why is the fact that ravens and other predators are causing a decline in sage-grouse ignored? The answer has to be political because it certainly isn't scientific. Many members of the Custer County Commission have seen the benefits of predator control. Many of the people who live in Custer County grew up in the County. They know the history, customs and culture of their ancestors. They know wildlife management. They know more about sage-grouse and sage-grouse habitat than federal biologists. Custer County Commissioners know that the proposed action is bad for sage-grouse and bad for their County.

## **10. FEIS Appendix BB**

Comment:

The federal agencies do not see the hypocrisy of their thinking. In Appendix BB they discuss nonmarket values including *“value from using these non-market resources, such as photographing ranch houses, old barns ... driving backcountry roads.”* They don't stop to think that the proposed action will destroy the very values they weigh. The proposed action will cause ranch houses and old barns to crumble and high density subdivisions to be built (Davies et al. 2011). Backcountry roads will either disappear or become paved roads with more traffic. The nonmarket analysis is fatally flawed because it places values on so many resources that will disappear if the proposed action is implemented. The nonmarket analysis must be re-written to take into account this factor.

## **SUMMARY**

In summary, the only acceptable alternative is the No Action Alternative. Idaho and Montana fish and wildlife management agencies need to work with local governments and multiple use groups to keep a wide diversity of habitat, with vegetation in various seral stages, to recreate an ecosystem where sage-grouse and other wild animals thrive. Predator control must be part of the solution.

The western eleven states where Greater sage-grouse are found should not become part of a conservation system that creates protection akin to national parks or wilderness. Sage-grouse

thrive on agriculture and a diversity of land uses and seral stages of vegetation. Sage-grouse do not thrive in climax communities of old growth sagebrush with unpalatable vegetation. The proposed action will exacerbate a situation where a spark of lightening is enough to start a catastrophic fire that burns millions of acres of sage-grouse habitat where fuel loads are so high that the habitat is lost for decades to come.

The FEIS needs to be rewritten to analyze the impacts the proposed action will have as fires increase and add more carbon to the environment than what was analyzed in the FEIS. (See <http://www.lanl.gov/discover/news-release-archive/2013/July/07.09-wildfires-may-contribute-to-global-warming.php>).

Please choose the No Action Alternative and work with local and state governments to manage sage-grouse and their habitat in balance with all wildlife and human activities. To do otherwise will rapidly result in the demise of sage-grouse and their habitat.

Respectfully Submitted on Behalf of Custer County by  
Darling Geomatics Sage-Grouse Biologist

**To:** Jon Beals (Jon.Beals@osc.idaho.gov)  
**Subject:** Cooperating Agency Involvement for Idaho and southwestern Montana Sage-grouse EIS  
**Attachments:** GRSB MOU\_OSC\_052112.docx

Jon Beals,

The BLM appreciates your continued involvement for the Idaho and southwestern Montana portion of BLM's National Greater Sage-Grouse Planning Strategy.

To formalize that Cooperating Agency agreement, we have prepared a memorandum of understanding (MOU) for your review and approval which is attached to this email. This MOU replaces the MOU draft your office has previously reviewed. The MOU describes specific aspects of the agreement. In general Cooperating Agencies share skills and resources to help shape BLM land use plans and environmental analyses that better reflect the policies, needs, and conditions of their jurisdictions and the citizens they represent. Cooperating Agencies accept obligations to contribute staff time, develop and review analyses for which they have particular expertise, and fund their own participation. The MOU contains any specific details regarding that contribution, and primarily identifies collaboration through meetings and potential data sharing.

Given the large geographic scale of the project – covering southern Idaho and southwestern Montana – most coordination as a Cooperating Agency for this effort will be done in a virtual environment (i.e. via phone, conference calls and electronic mail) and hosted by the BLM.

We look forward to working with you throughout the development of this project. The next step is to formalize a Cooperating Agency relationship through approval of the MOU. To that end please review the attached MOU and approve through signature. Approval of this MOU specific to the National Greater Sage-Grouse Planning Strategy does not replace or supplant any other cooperation, coordination or collaboration agreements you may have with the BLM. Please send the signed and approved hard copy to:

Steve Ellis  
Idaho BLM State Director  
c/o Brent Ralston  
1387 S. Vinnell Way  
Boise, ID 83709

If you have any questions or concerns please contact Brent Ralston at (208) 373-3812 or [bralston@blm.gov](mailto:bralston@blm.gov). There is also information regarding Cooperating Agencies available online at: [http://www.blm.gov/wo/st/en/info/nepa/cooperating\\_agencies.html](http://www.blm.gov/wo/st/en/info/nepa/cooperating_agencies.html).

Upon your approval of the MOU, the Idaho BLM State Director will finalize the agreement through his signature and a copy will be provided to you for your records. We appreciate your continued interest in this project and look forward to working with you in the future.

Brent Ralston  
Sage-Grouse Project Lead  
Idaho and Southwestern Montana Subregion

Idaho State Office  
208-373-3812

# **MEMORANDUM OF UNDERSTANDING**

BETWEEN

IDAHO GOVERNOR'S OFFICE OF SPECIES CONSERVATION

AND

THE UNITED STATES DEPARTMENT OF THE INTERIOR

**BUREAU OF LAND MANAGEMENT**

*BY AND THROUGH THE IDAHO BLM STATE DIRECTOR – STEVEN A. ELLIS*

REGARDING

DEVELOPMENT OF THE RESOURCE MANAGEMENT PLAN  
AMENDMENTS AND

ENVIRONMENTAL IMPACT STATEMENT FOR THE PROPOSED

**GREATER SAGE-GROUSE NATIONAL PLANNING  
STRATEGY, IDAHO AND SOUTHWESTERN MONTANA  
SUB-REGION**

**Memorandum of Understanding  
Between the Idaho Governor's Office of Species Conservation  
and the Bureau of Land Management, Idaho State Office**

**Parties to and Purpose for this Document:** This Memorandum of Understanding (MOU) is entered into between the Idaho Governor's Office of Species Conservation and the United States Department of the Interior (DOI), Bureau of Land Management (BLM) by and through the Idaho BLM State Director, for the purpose of cooperating in conducting an environmental analysis and preparing the draft and final programmatic Environmental Impact Statement (EIS) for amendment of land use plans to incorporate conservation measures for the Greater sage-grouse. This unprecedented planning effort has been split into two regions: a Rocky Mountain Region and a Great Basin Region. The Rocky Mountain Region will conduct numerous EISs which include land use plans in the states of Colorado, Wyoming, North Dakota, South Dakota, and portions of eastern Utah and eastern Montana. The Great Basin Region will also conduct multiple EISs which include land use plans in California, Idaho, Nevada, Oregon, and portions of western Utah and western Montana.

The BLM is the lead agency assigned to complete the programmatic EISs, and the US Forest Service (FS) has joined the BLM as a Cooperating Agency to include FS lands into the programmatic EIS and amendment process. The FS will be amending their Land and Resource Management Plans (LMPS) under the same EISs that BLM will be amending their Resource Management Plans (RMPs) or Management Framework Plans (MFPs).

Within the Great Basin and Rocky Mountain Regions, sub-regional interdisciplinary teams (IDTs) will be developing the individual EISs. Based on the identified threats to the Greater sage-grouse and the US Fish and Wildlife Service (FWS) timeline for making a listing decision on this species, the BLM and the FS aim to incorporate objectives and conservation measures into land use plans by September 2014 in order to provide adequate regulatory mechanisms to conserve Greater sage-grouse and its habitat. These measures would be considered by FWS as it makes its final determination on whether to list the Greater sage-grouse under Section 4 of the Endangered Species Act (ESA). Therefore, these EISs will be prepared under expedited timeframes.

The Idaho and Southwest Montana Sub-regional effort, for which you requested to participate as a Cooperating Agency, will produce one state-wide programmatic EIS that will amend up to 22 BLM RMPs/MFPs, and 8 FS LMPS.

**1. Cooperating Agency:** This MOU establishes the Idaho Governor's Office of Species Conservation as a Cooperating Agency in the environmental impact analysis and documentation process and establishes procedures through which Idaho Governor's Office of Species Conservation and BLM will participate with the BLM (and/or the FS) to help develop the Idaho and southwest Montana Sub-region EIS. The Idaho Governor's Office of Species Conservation has been identified as a Cooperating Agency because it has jurisdiction by law and special expertise with respect to environmental impacts relating to the Greater sage-grouse National Planning Strategy (40 CFR 1508.5). This MOU applies specifically to the Idaho and southwestern Montana Sub-Region.

- 2. Authorities:** This MOU has been prepared under the authority of the National Environmental Policy Act (NEPA) of 1969, 42 U.S.C. 4321 et seq., and federal regulations codified at 40 Code of Federal Regulations (CFR) Part 1500-1508, and 43 CFR Part 46; the Federal Land Policy and Management Act of 1976, 43 U.S.C. 1701 et seq., and BLM's planning regulations (in particular 43 CFR 1601.0-5, 1610.3-1, and 1610.4).
- 3. Background:** In March 2010, the FWS published its listing decision for the Greater sage-grouse indicating that listing was "Warranted but Precluded" due to higher listing priorities under the ESA. The inadequacy of regulatory mechanisms to conserve the Greater sage-grouse and its habitat was identified as a significant threat in the FWS finding on the petition to list the Greater sage-grouse as a threatened or endangered species. In view of the identified threats to the Greater sage-grouse, and the FWS timeline for making a listing decision on this species, the BLM and the FS propose to incorporate consistent conservation measures for the protection of Greater sage-grouse and its habitat into relevant BLM RMPs/MFPs and FS LMPs by September 2014 in order to provide adequate regulatory mechanisms to conserve Greater sage-grouse and its habitat. The BLM and the FS will consider and analyze these conservation measures through the plan amendment processes of the respective agencies. The BLM and the FS expect to prepare EISs to analyze proposed amendments to land use plans that are not currently undergoing amendment or revision. For plans already undergoing amendment or revision, the BLM and the FS will consider incorporating conservation measures through the ongoing amendment or revision processes.

The BLM and the FS intend to evaluate the adequacy of Greater sage-grouse conservation measures in existing BLM RMPs/MFPs and selected FS LMPs, and consider conservation measures, as appropriate, in proposed RMP/MFP and selected LMP amendments throughout the range of the Greater sage-grouse, with the exception of the bi-state population in California and Nevada and the Washington State distinct population segment, which will be addressed through other planning efforts.

The BLM and the FS have sought public and agency input to identify issues to address in the EISs, and the BLM and the FS will coordinate, as appropriate, with other federal, state, and local government agencies in preparing the EISs. The BLM and the FS will conduct detailed environmental studies of proposed conservation measures to be incorporated into RMPs/MFPs and LMPs and alternative conservation measures, and analyze how incorporation of these conservation measures into RMPs/MFPs and LMPs may affect the quality of the environment.

The BLM will serve as the lead agency and the FWS and the FS are Cooperating Agencies for these EISs. Cooperating Agency status may be offered to other federal agencies, tribes and local government agencies as the BLM deems appropriate.

All EISs will consider both federal and non-federal lands in its analyses. However, implementation of any decisions that amend RMPs/MFPs and LMPs would apply ONLY to federal land and minerals.

**4. Term of MOU:** This MOU will commence upon the date of the last signature made by the duly authorized representatives of the parties to this MOU, and will remain in full force and effect for the duration of the project, not to exceed five years, or until terminated, as described in item 9i below.

**5. Responsibilities of the Idaho Governor's Office of Species Conservation:** In agreement with the time frames identified in Attachment A for this planning effort, the Idaho Governor's Office of Species Conservation will participate in the environmental analysis and documentation process where appropriate given the agency's jurisdiction and special expertise. The schedule and preliminary timeframe for the respective stages of EIS development is included in Attachment A.

The Idaho Governor's Office of Species Conservation will have the opportunity to provide review and input on draft documents prepared during the EIS process prior to public release of those materials. The IDT leader may, at any time during the effective term of this MOU, request records and/or information by contacting the Idaho Governor's Office of Species Conservation point of contact identified in Section 9k below.

**6. Responsibilities of the BLM:** In accordance with 40 CFR 1501.5, the BLM is the lead agency. The point of contact for the preparation of this EIS is as designated in Section 9k of this MOU. The BLM will keep the Idaho Governor's Office of Species Conservation representative apprised of current events and timeframes in relation to this EIS. The BLM will consider and may use Idaho Governor's Office of Species Conservation input and proposals to the maximum extent possible and consistent with responsibilities as lead agency as described in 40 CFR 1501.5. BLM may incorporate information provided by Idaho Governor's Office of Species Conservation into the draft and final EIS, as appropriate and deemed relevant to the planning process. The BLM and FS are solely responsible for any decisions made for the planning effort. Any BLM decisions made associated with the EIS apply only to BLM-administered lands and federal mineral estate. Any FS decisions made associated with the EIS would apply only to FS land, upon adoption of the EIS under 40 CFR 1506.3.

**7. Mutual Responsibilities of the Parties:** The Idaho Governor's Office of Species Conservation and the BLM agree to cooperate by informing each other as far in advance as possible, of any related actions, issues or procedural problems that may affect the environmental analysis and documentation process or that may affect either party. The parties agree to cooperate in the development and review of any operating guidelines or agreements between the Idaho Governor's Office of Species Conservation or BLM and other agencies involved in the EIS that may affect the environmental analyses and writing of the EIS.

Responsible parties identified in 9k serve as the MOU primary points of contact. The purpose of these points of contact is to ensure that timely and coordinated communication and exchange of information between the parties to the MOU occurs throughout the planning process.

**8. Payment:** No payment will be made to either party by the other as a result of this MOU. Each party is responsible for the costs of their participation. During the term of this MOU, should it become necessary for one party to purchase from or make payment or reimbursement to the other party, such arrangements will be covered in a separate cooperative agreement.

**9. General Provisions:**

**a. Amendments.** Either party may request changes to this MOU. Any changes, modifications, revisions, or amendments to this MOU, that are mutually agreed upon by and between the parties to this MOU, will be incorporated by written instrument, executed and signed by both parties to this MOU, and are effective in accordance with the authorities defined herein.

**b. Applicable Law.** The construction, interpretation and enforcement of this MOU will be governed by the applicable laws of the United States.

**c. Entirety of Agreement.** This MOU, consisting of 8 pages, represents the entire and integrated agreement between the parties and supersedes all prior negotiations, representations and agreements concerning the parties' environmental documents, whether written or oral.

**d. Severability.** Should any portion of this MOU be determined to be illegal or unenforceable, the remainder of the MOU will continue in full force and effect, and either party may renegotiate the terms affected by the severance.

**e. Sovereign Immunity.** The Idaho Governor's Office of Species Conservation and the BLM do not waive their sovereign immunity by entering into this MOU, and each fully retains all immunities and defenses provided by law with respect to any action based on or occurring as a result of this MOU.

**f. Third Party Beneficiary Rights.** The parties do not intend to create in any other individual or entity the status of third party beneficiary, and this MOU must not be construed so as to create such status. The rights, duties and obligations contained in this MOU will operate only between the parties to this MOU, and will benefit only the parties to this MOU. The provisions of this MOU are intended only to assist the parties in determining and performing their obligations under this MOU. The parties to this MOU intend and expressly agree that only parties signatory to this MOU will have any legal or equitable right to seek to enforce this MOU, to seek any remedy arising out of a party's performance or failure to perform any term or condition of this MOU, or to bring an action for the breach of this MOU.

**g. Exchange of Information/Confidentiality.** All records or information requested of either party by the other will be reviewed by the releasing party prior to release. To the extent permissible under law, any recipient of proprietary and/or pre-decisional information agrees not to disclose, transmit, or otherwise divulge this information without prior approval from the releasing party. Any breach of this provision may result in termination of this MOU. The BLM and the Idaho Governor's Office of Species Conservation recognize that applicable

public records laws will require release of non-exempt documents.

**h. Administrative Considerations.** Pursuant to 204(b) of the Unfunded Mandates Reform Act of 1995, responsible Federal Agency officials may meet or enter into project level MOUs with officials of State, Tribal and local Governments or their designees. During such meetings and development, implementation and monitoring of such MOUs, views, information and advice are exchanged, or input relative to the implementation of Federal programs is obtained. Such meetings and MOUs will further the administration of intergovernmental coordination.

The meetings or MOUs referred to include, but are not limited to, meetings called for the purpose of exchanging views, information, advice or recommendations, or for facilitating any other interaction relating to intergovernmental responsibilities or administration.

Nothing in this MOU will be construed as limiting or affecting in any way the authority or legal responsibility of the Idaho Governor's Office of Species Conservation or the BLM, or as binding either the Idaho Governor's Office of Species Conservation or the BLM to perform beyond the respective authority of each, or to require either to assume or expend any sum in excess of appropriations available. It is understood that all the provisions herein must be within financial, legal, and personnel limitations, as determined practical by the Idaho Governor's Office of Species Conservation and the BLM for their respective responsibilities. This MOU is neither a fiscal nor a funds obligation document.

Nothing in this MOU will be construed to extend jurisdiction or decision-making authority to BLM for planning and management of land and resource uses for any non-BLM administered lands or resources in the planning area. Similarly, nothing in this MOU will be construed to extend jurisdiction or decision-making authority to the Idaho Governor's Office of Species Conservation for planning and management of land or resource uses on the Federal lands or mineral estates administered by the BLM. Both the Idaho Governor's Office of Species Conservation and BLM will work together cooperatively and will communicate about issues of mutual concern.

Nothing in this MOU may be construed to obligate the Department of the Interior, the BLM, or the United States to any current or future expenditure of resources in advance of the availability of appropriations from Congress.

No member of or delegate to Congress shall be entitled to any share or part of this MOU, or to any benefit that may arise from it.

**i. Termination:** Either party may terminate this MOU upon 30 days written notice to the other party of their intention to do so. During the 30-day period, the parties will conduct negotiations to resolve any disagreement(s). If the disagreement(s), if any, have not been resolved and the party initiating the termination has not rescinded its termination in writing by the end of the 30-day period, the MOU will terminate. In the event negotiations are progressing but are not concluded by the end of the 30-day period, the party initiating the termination notice may request in writing that termination be postponed for an additional 30-

day period or longer while the negotiations continue; upon such request, the termination shall be postponed for the specified period.

**j. Dispute Resolution:** In the event of any disagreement between the parties regarding their obligations under this MOU that cannot be resolved between the parties in a reasonable time, either party may refer the disagreement to the Idaho BLM State Director Steven A. Ellis to timely resolve said issue. The decision of the Idaho BLM State Director Steven A. Ellis will be the final decision for purposes of resolving the issue.

**k. Contacts:** The primary points of contact for carrying out the provisions of this MOU are:

**COOPERATOR**

John Beals  
Idaho Governor’s Office of Species Conservation  
304 N. 8th Street, Room 149  
Boise, ID 83702

### Current EIS and Planning schedule, as of MOU signature:

<b>RMP/EIS Stage</b>	<b>Proposed Completion Date</b>
Conduct scoping and identify issues	May 15, 2012
Formulate alternatives	July 15, 2012
Estimate effects of alternatives	September 30, 2012
Select the preferred alternative; issue Draft RMP/EIS	December 31, 2012
Respond to comments	June 15, 2013
Issue Proposed RMP/FEIS	December 1, 2013
Governor's Consistency Review	January 31, 2014
Resolve protests; modify Proposed RMP/FEIS if needed;	April 15, 2014
Sign ROD	September 30, 2014 (latest date acceptable)

March 12, 2015

The Honorable Sally Jewell  
Secretary  
U.S. Department of the Interior  
1849 C. Street NW  
Washington, D.C. 20240

The Honorable Tom Vilsack  
Secretary  
U.S. Department of Agriculture  
1400 Independence Avenue NW  
Washington, D.C. 20250

Dear Secretaries Jewell and Vilsack:

You are aware the Bureau of Land Management (BLM) and U.S. Forest Service (USFS) are engaged in an unprecedented planning effort to conserve greater sage-grouse and its habitat, which requires strong leadership embracing the best available science to develop and implement adequate conservation measures needed to foreclose protecting greater sage-grouse under the Endangered Species Act (ESA). We strongly encourage you to direct federal planners to finalize conservation plans that prescribe objective, measurable and robust conservation measures based on the best available science across the species' range, as discussed below.

Federal agencies organized a National Technical Team (NTT) in 2011 to review the best available science and make recommendations for conserving greater sage-grouse. Many scientists and biologists described this report as a "comprehensive compilation of the scientific knowledge needed for conserving Sage-Grouse" that "offers the best scientifically supportable approach to reduce the need to list Sage-Grouse as a Threatened or Endangered species." Letter from Michael Soulé, Ph.D. and Clait Braun, Ph.D. *et al.* to the Honorable Ken Salazar, January 13, 2013, p. 1. Indeed, many portions of the NTT Report provide a scientific baseline for managing greater sage-grouse habitat using consistent, measurable conservation standards. However, other parts of the report contained questionable statements that are not supported by the best available science. For example, the report contains the assertion that "Prescribed fire... can assist in the recovery of sagebrush habitat in some vegetation types...." This statement ignores a large body of evidence showing just the opposite. Thus, conservation measures embraced by the current BLM/USFS planning effort must be tightened to account for more robust scientific evidence.

We are concerned that federal agencies appear to be abandoning science-based conservation measures reflected in the published scientific literature as well as in the NTT Report in favor of more elastic, subjective measures identified in the U.S. Fish and Wildlife Service's Conservation Objectives Team Report (COT Report). The COT Report adequately identifies the threats to sage-grouse populations, but it does not include adequate conservation measures to address these threats. This report was largely a review of previously published information. It also introduced ambiguous concepts (representation, redundancy, and resilience) to guide conservation actions. Unfortunately, these parameters are not measured by state wildlife agencies when assessing sage-grouse populations (in fact, no information was provided on how to measure them or even if they could be adequately measured), and their use may further confuse the issue. Thus, the COT Report cannot reasonably serve as either a guide or gauge for planning and assessing the adequacy of federal sage-grouse conservation plans.

We are particularly concerned that federal agencies are failing to adhere to the following conservation measures in the NTT Report:

- **Mining and Minerals Management**: Closing and recommending for immediate withdrawal lands from leasing or sale (including coal) under federal mineral laws for the maximum period allowed under law (NTT 2011: 22, 24-25, 26). Where fluid minerals development is already permitted, require conditions of approval for existing fluid minerals leases to include a 4-mile no-surface-occupancy lek buffer to protect Sage-grouse breeding, nesting and brood-rearing habitat (NTT 2011: 22-24). Sage-grouse concentrate their habitat use within 4-6 miles of leks during breeding and nesting (NTT 2011: 21, Table 1; Coates et al. 2014), and the presence of oil and gas wells within 1.9-4 miles of leks causes reductions of breeding populations (Holloran 2005, Walker et al. 2007; Manier et al. 2014).
- **Disturbance Footprint**: Limiting discrete anthropogenic surface disturbance to less than 3 percent per section in priority habitat (NTT 2011: 7-8; Knick et al. 2013: 9, Fig. C; Baruch-Mordo et al. 2013: 237, Fig. B.), and restricting development to one site per section in priority habitat (NTT 2011: 21, 24; Holloran 2005; Doherty 2008; Doherty et al. 2010). Sage-grouse are sensitive to habitat disturbance; the best available science recommends capping disturbance (including existing disturbance) at less than 3 percent per section to maintain sage-grouse populations (NTT 2011: 7).

Moreover, additional scientific evidence suggests that the conservation measures for livestock grazing, land treatments, vegetation projects and fire in the NTT Report must be revised and strengthened, including in the following ways:

- **Livestock Grazing**: Requiring grazing strategies to maintain a minimum average grass height in sage-grouse nesting and early brood-rearing habitat (Connelly et al. 2000; *see also* Braun et al. 2005; Hagen et al. 2007; Rebholz 2007; Herman-Brunson et al. 2009; Taylor et al. 2010; Kaczor et al. 2011; Doherty et al. 2014). Tall, dense, vegetation appears to provide scent, visual, and physical barriers to predation on nesting sage-grouse hens, sage-grouse nests and chicks, and may enhance nest success (Gregg et al. 1994; Herman-Brunson et al. 2009).
- **Vegetation Treatments**: Prohibiting all sagebrush control projects in sage-grouse breeding and winter habitat (Beck et al. 2012; Connelly 2014). The acting BLM Director issued an Instruction Memorandum (IM) in 2013 that established actions for fire operations and fuels management related to sage-grouse conservation. This IM directed field offices to plan and implement fuel breaks and vegetation treatments. The IM did not provide guidance on relative size of treatments or timing with respect to sage-grouse breeding activities. Although the IM acknowledged that treatments may fragment habitats, it did not indicate that they can increase invasive species, enhance access into remote sagebrush steppe, and (with respect to roads) result in more wildfire (Miller et al. 2011). Moreover, the IM included lists of “best management practices” emphasizing sagebrush treatments. Clearly this IM and other similar guidance should be substantially revised to reflect appropriate, science-based actions.

- **Prescribed Fire:** No prescribed fire should be allowed in sage-grouse nesting, early brood rearing or winter habitat. Beck et al. (2012) provided compelling evidence that these kinds of treatments have few or no positive effects on sage-grouse; the evidence is clear that prescribed burning in sage-grouse nest habitat harms sage-grouse populations (Connelly et al. 2000; Beck et al. 2012).

The proposed alternatives in draft BLM resource management plans and sub-regional environmental impact statements (as well as the one final plan available – for the Lander Field Office) fail to adopt all of these prescriptions, and, instead, identify a series of measures that side-step these objective, measurable conservation protections. For example, in the Lander RMP, BLM uses a so-called Disturbance Density Calculation Tool (DDCT), which will allow greater surface disturbance than the science supports. These plans also fail to adhere to the current science on vegetation treatments and prescribed fires in important sage-grouse habitat, as discussed above. This must be fixed in all final BLM RMPs if there is any reasonable hope to avoid an ESA listing.

We support the federal planning process and are prepared to assist your Departments in developing measures to conserve and recover greater sage-grouse, but federal planners must commit to science-based planning to achieve this goal. Adhering to the COT Report will not accomplish this goal. Please let us know if we can assist in any way, and we can provide a complete list of all references cited upon request.

Sincerely,

William L. Baker, Ph.D., Laramie, Wyoming

Dear:

The Bureau of Land Management (BLM) would like to apologize for the letter dated June \_\_, 2014, that you received regarding the administrative draft proposed plan (ADPP) for the Idaho and Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment (LUPA). Regretfully, BLM must issue an official retraction of the letter; it was intended only for cooperating agencies that have signed an official Memorandum of Understanding (MOU) with BLM, however it was mistakenly sent to an incorrect mailing list. Per the Code of Federal Regulations, a cooperating agency is defined as an eligible governmental entity that has entered into a written agreement (MOU) with the BLM establishing cooperating agency status in the planning and NEPA processes (43 CFR 1601.0-5 BLM).

Commented [GJD1]: KATHY, DO YOU KNOW WHAT DATE THEY WERE SENT OUT? ☺

This planning strategy illustrates the BLM's continued commitment to long-term, range-wide Greater Sage-Grouse conservation and acknowledges the added value of engaging all stakeholders and governmental partners in cooperative conservation efforts. At this time, official cooperating agencies are reviewing the Administrative Draft Proposed Plan for a two week period. After their review, BLM and the U.S. Forest Service (USFS) will analyze cooperating agency comments, incorporate any relevant additions or changes to the plan, and then we expect to publish the Proposed Plan/Final Environmental Impact Statement (FEIS) in fall of 2014. Once the document is published, a 30 day protest period will begin.

After the 30 day protest period ends, BLM and the USFS will analyze and respond to any appropriate protest issues, incorporate any relevant and necessary changes to the FEIS, and release a Record of Decision (ROD) with the final proposed land use plan amendments. Once the ROD has been signed, the U.S. Fish and Wildlife Service will review the BLM and USFS's proposed land use plan amendments. Because of a court-ordered settlement, the FWS has until 2015 to make a final determination on listing the Greater Sage-Grouse under the Endangered Species Act.

Again, we apologize for mistakenly sending the letter to you and truly regret any misperception this may have caused. If you have any questions, contact Brent Ralston (BLM Idaho) at (208) 373-3812 or Rob Mickelsen (USFS) at (208) 557-5764. Thank you in advance for your review and input throughout this planning process.

Sincerely,

Timothy M. Murphy

Acting Idaho State Director  
Bureau of Land Management

RE: Sage Grouse EIS

---

Brent,

I called last week to discuss this with you. I did not receive the EIS, and still have not received the CDs. I know we had the same problem previously, that you sent the EIS to the Power County Courthouse instead of to my office.

I am confused by the table on pages two (2) and three (3).

Under Alternative E, which was largely adopted, important habitat “contemplated greater management flexibility than” then core habitat. However it looks as if according to page two (2), for high voltage transmission, the standards are the same between core and important.

What I wanted to discuss with you is exactly what the EIS would do with Power and Cassia County’s proposal to authorize segments five (5) and seven (7) of the Gateway West Transmission Line.

Does avoidance “LR-1”, in important habitat, mean that transmission lines are not allowed, are allowed with restrictions and mitigation, or what?

In looking at Figure 2-23 from Volume one (1) of the Draft EIS, it does not appear that segments five (5) or seven (7) would cross any important or core habitat. Is that the case under the new EIS?

The new EIS appears to talk about a buffer zone of six hundred meters from transmission lines to lecs, apparently based upon a study by Connelly in 2000. Am I reading that correctly.

We are very aware that there is no scientific evidence that transmission lines interfere with Sage Grouse, in the slightest. As the EIS implies, if all infrastructure is placed on private property then public Sage Grouse will not be impacted. We submit that this is a non sequitur, grouse do not exist solely on public land.

Please review this and give me a call.

Doug

Good Morning Everyone!

Attached is the Camas County Rangeland Management Plan for your review. A letter is being mailed via snail mail in regards to this Plan. The Plan itself is being sent electronically to save on postage and eliminate cumbersome paperwork. If you should have any questions, please contact us at one of the methods listed below.

Thank you.

Resolution # 1104

CAMAS COUNTY  
Recorded for:  
COUNTY BOARD OF COMMISSIONERS  
2:35:27 pm 07-14-2014  
**2014-086027**  
No. Record Fee: \$  
KORRI BLODGETT  
County Clerk  
Deputy: BWALTON

RESOLUTION ADOPTING THE CAMAS COUNTY  
RANGELAND MANAGEMENT PLAN

State of Idaho  
County of Camas

At a meeting of the Board of County Commissioners (BOCC) for Camas County, Idaho, held at the Commissioner's Meeting Room, Camas County Court House annex in Camas, Idaho June 22, 2014, there were present:

Chairman, Ken Backstrom, Commissioner Barb McMurdo, Commissioner Janet Croner, and Clerk Korri Blodgett when the following proceedings were discussed and voted on, to-wit:

RESOLUTION NO. 1104

A RESOLUTION APPROVING THE CAMAS COUNTY GREATER SAGE-GROUSE  
CONSERVATION PLAN

Recitals

- A. In 1997, the State of Idaho provided a management framework for the Greater Sage-Grouse (sage grouse) in Idaho calling for local working groups. The North Magic Valley Sage-Grouse Local Working Group (NMVSGLWG) was formed to provide local management strategies for Gooding, Camas, Lincoln and Blaine Counties. The Camas Conservation District prepared the Camas Sage Grouse Conservation Plan that was adopted in April, 2014.
- B. The State of Idaho released a plan in 2006, and later modified this and requested that it be considered as an alternative to the National Greater Sage-Grouse Land Use Planning Strategy of the U.S. Bureau of Land Management (BLM) and U.S. Forest Service (USFS). The State's Sage-Grouse Alternative was prepared for the purpose of providing "special management for sage-grouse on lands managed by the BLM and USFS." The State also maintains that with this management framework in place, the State will approach local governments to see what actions are taking place locally that are necessary and appropriate to complement, and be, included in the State's Federal Alternative.
- C. Camas Conservation District and Camas County Board of Commissioners wish to provide said guidance to the State of Idaho and the BLM, by adopting the Camas County Rangeland Management Plan (Plan), defining the policies and practices that have been effectively utilized and implemented locally to manage the Sage-Grouse.

- D. The Plan is designed to reflect the unique characteristics of the habitat in Camas County and to acknowledge and support current management practices that have kept the sage grouse and its habitat in Camas County healthy and viable.
- E. The U.S. Fish and Wildlife Service (the Service) listed the Sage-grouse as a Candidate species (warranted, but precluded) for endangered status in 2010, with a pending decision for a final determination anticipated in September, 2015.
- F. Camas County intends to develop a Memorandum of Understanding (MOU) with the Bureau of Land Management and to participate as a Cooperating Agency in the review of the Greater Sage-Grouse.
- G. In addition, Camas County will adopt by Resolution the local government position asserting its coordination authority with regard to all federal and state agencies maintaining jurisdiction over lands and/or resources located within Camas County, Idaho. As a result, Camas County has requested the BLM, through the Coordination process, to reconcile their planning efforts with local planning efforts in Camas County.
- H. At the direction of the U.S. Department of Interior, a National Technical Team (NTT) was assembled which produced a set of conservation strategies known as the NTT Report in December, 2011. While the NTT Report used the Wyoming region as the basis for the national habitat range characteristics and subsequent land use management recommendations, it does not address the unique landscape qualities, habitat characteristics or land uses found in Camas County.
- I. The sage grouse population has remained the same or increased steadily making the Camas County population of sage grouse one of the most stable in Idaho.
- J. The State of Idaho continues to allow hunting Sage Grouse. The hunting season is open September 15 through September 21 allowing one-bird daily limits with two in possession. Hunting remains a viable industry in Camas County, and the sage-grouse population has remained stable as well.
- K. The BLM has a statutory duty to manage lands under their direct or indirect jurisdiction for multiple uses of resources, and not for a single purpose. The implementation of the NTT recommendations across large areas of Camas County through an amendment to the applicable Resource Management Plans would burden large areas of private lands that are either not under their jurisdiction or are not suitable sage grouse habitats with severe land use restrictions.
- L. Camas County remains concerned that if the NTT recommendations are adopted across all currently proposed Preliminary Priority Habitat, Preliminary General Habitat, and Linkage Areas as mapped without regard, for local conditions and using inaccurate data, large swaths of non-habitat on public and private lands in the County would be encumbered and burdened with unnecessary regulations that would significantly hurt local economies and misallocate resources which would not help recover the species.

M. Camas County's primary source of revenue that supports the operations and welfare of the County and its citizens comes directly and indirectly from the ranching, farming, recreation, and resource industries. Camas County's ability to protect the health, safety and welfare of its citizens, as well as, ensure continued protection for all wildlife and their habitats, and the productive uses of land within the County depends on the continuation of balanced development and management of agriculture, and recreation interests.

N. The CCD held a public meeting on Tuesday, June 11, 2013 to discuss and consider the Plan.

O. Based on substantial and competent discussion and input at the aforementioned public meeting, the BOCC has made the following determination:

1. That proper public notice was provided for the meeting before the Board of County Commissioners.
2. The public meeting before the Board of Commissioners was extensive and a majority of members of the Natural Resource Advisory Committee were present with all pertinent matters, issues and facts thoroughly discussed and submitted, and all in attendance were heard at the meeting.
3. For the above stated and other reasons, the Plan is in the best interest of the health, safety, and welfare of the citizens of Camas County.
4. That the Plan is in general conformance with the Camas County Comprehensive Plan.
5. Camas County has the explicit authority to plan for land use in the county.
6. The Board of County Commissioners, pursuant to 43 U.S.C. §17127 has formally enacted Coordination via Resolution with agencies acknowledging that federal law requires the BLM to (1) make its plans consistent with the Plan and related policies; (2) include this plan as an alternative pursuant to 43 U.S.C. §4332(e); and (3) in the event it cannot reach consistency, state why it cannot resolve the conflicts with Camas County. The same resolution stated above also acknowledges that federal law requires the Service to take into account all local efforts to conserve species prior to making a listing determination and to coordinate with the County when determining critical habitat. The resolution also acknowledges the County's primary planning authority for lands and wildlife within its boundaries, which it exercises in part by coordinating with all other federal and state agencies to ensure the policies set forth in this plan are consistently and uniformly applied.

RESOLUTION

NOW THEREFORE, BE IT RESOLVED by the Board of County Commissioners of Camas County, Idaho that:

- A. The foregoing Recitals are incorporated by this reference as part of this resolution.
- B. Camas County adopts the Plan (attached as Exhibit A). The Plan serves as an updated Plan with policies specific to the County based on the most current and best available data. Further, Camas County finds that in the best interest of the health, safety, and welfare of the citizens of Camas County
- C. Camas County recognizes the statutory obligation of the Bureau of Land Management and other Federal Agencies to make its planning, inventory and management activities consistent with the policies of Camas County and will continue to work to resolve the conflicts with the agency.
- D. Camas County appoints the Camas Conservation District as its representative in all matters that regard the plan.

Upon motion duly made and seconded, the foregoing Resolution was adopted by the following vote: 3 Aye 0 Nay

Adopted this 14<sup>th</sup> day of July, 2014.

COUNTY BOARD OF COMMISSIONERS

  
Ken Backstrom, Chairperson

  
Janet Croner, Commissioner

  
Barb McMurdo, Commissioner

Attest:   
Korri Blodgett, County Clerk

## Chapter 2: Purpose of the Plan

In recent years, the Greater Sage-Grouse, native to Camas County, has received national attention resulting in the U.S. Fish and Wildlife Service's (Service) determination in 2010 to list the species as a candidate for endangered status. This has prompted numerous state and federal agencies to modify their management plans for the species and its habitat in order to preclude an endangered listing in the eleven western states where it resides. As a result, there has been a lack of coordination and cohesiveness of conservation measures between the various agencies; importantly with Camas County.

The sage-grouse has been a vital part of the ecology in Camas County, and an equally important part of the culture. The State of Idaho has permitted the hunting of the species in the County since early settlement. The population has increased and decreased in response to natural environmental factors, primarily weather changes and predator dominance. It has benefited from the active agriculture industry of ranching and farming, which provide essential riparian and meadow habitat used seasonally by the sage-grouse throughout the year.

The sage-grouse habitat in Camas County is located in the 401,300 acres of native range, of which 120,490 acres are BLM managed and 280,810 are State and private lands. The original native vegetation consisted predominately of bluebunch wheatgrass, nevada bluegrass, basin wild rye, sod forming wheat grasses, needle grasses, balsamroot, little sunflower, big and low sagebrush, and bitterbrush. The rangeland is an extremely important segment of the economy.

***Monitoring data for the sage-grouse in the local area has been recorded since 1971 and currently show the species is static or improving.*** A consistent uptrend in males counted on lek routes has been observed since 1986. This indicates that the current productive agriculture activities and conservation measures being utilized in Camas County today are benefiting the species and should be maintained. Many of the primary impacts and threats identified at the national level are not an issue in Camas County. Therefore, conservation measures designed to correct these and other impacts must be thoroughly analyzed at the local level utilizing local expertise to ensure they are appropriate for the long-term health of the species and its habitat.

The State of Idaho has taken the lead in providing a management framework for the Greater Sage-Grouse in Idaho, releasing its first plan in 1997, calling for the development of local working groups. The North Magic Valley Sage-Grouse Local Working Group (NMVSGLWG) was formed to provide local management strategies for the North Magic Valley plan area (See North Magic Valley Sage-Grouse Conservation Plan, Figure 1), which includes Camas County. This group, currently made up of federal and state agency personnel, private and interested landowners prepared the North Magic Valley Sage Grouse Conservation Plan (NMVSGLWG) adopted in 2011.

The State's Plan was released in 2006, and more recently updated to be considered as an alternative in the National Greater Sage-Grouse Land Use Planning Strategy (Strategy) of the U.S. Bureau of Land Management (BLM) and U.S. Forest Service (USFS). Governor Otter's Sage-Grouse Alternative (State Alternative) was prepared for the purpose of providing "special

management for sage-grouse on lands managed by the BLM and USFS,” (State Alternative, page 3). The State also maintains that “with this management framework in place, the State will approach ... local governments ... to see what actions are necessary and appropriate to complement the State’s Federal Alternative” (page 3).

In an effort to provide the State this guidance, and for the purpose of ensuring the conflicts between the County’s plans and policies for the sage-grouse are considered and resolved by the BLM and USFS, as required under the National Environmental Policy Act, the County has formally established the Camas County Rangeland Management Plan (Plan), which incorporates best management practices and goals identified within the Camas County Landuse Plan, see appendix A. The Landuse Plan defines the policies and strategies that have been utilized effectively to manage the sage-grouse in Camas County and should be incorporated into all management activities of all agencies with responsibility for managing the species and its habitat.

As implemented, this Plan shall require these policies and principles be applied on public lands as “regulatory assurances” through Coordination and they will be applied on private lands as “incentive-based assurance.” In this way, the Plan serves as a planning tool for private land owners by informing and improving their conservation efforts on a voluntary basis with the added opportunity to amend this Plan as a result of their stewardship successes.

Finally, because of the scientifically sound habitat modeling conducted to identify the suitable habitat in Camas County which is the basis of this Plan, the County intends that this Plan may serve as a model for other counties located within the same management Region. Furthermore, this Plan explicitly relies on the Coordination process that requires federal and state agencies with sage grouse management responsibilities in Camas County to ensure that their plans are consistent with this Plan. Ultimately, the Coordination process will be the vehicle that brings disparate parties together with the same intent on making sound land management decisions that benefit the sage-grouse and its habitat recognizing that there are multiple uses being managed at the same time.

## **Chapter 3: Plan Area and Habitat Characteristics**

### **A. Plan Area**

The Plan Area includes all of the lands within the political boundaries of Camas County. This area is a high mountain valley area located in South Central Idaho, sandwiched between the Sawtooth National Forest and the Bennett Hills to the south. An area of similar use covers Camas and Blaine Counties by soil makeup and land use and Grouse migration habitat includes Gooding and Lincoln Counties and is known as the Wood River Area.

The Wood River Area is in the south-central part of Idaho. It includes about 751,800 acres in Blaine County, 469,000 acres in Gooding, 1,132,300 acres in Camas County, 344,320 acres in Lincoln County, and 218,600 acres in Minidoka County. The total area is about 1,784,020 acres, or 2,788 square miles. About 89 percent of the total area is rangeland, and about 11 percent is irrigated cropland and pastureland. Urban land makes up less than 0.2 percent of the area. The survey area includes private, State, and Federal land. The Federal land is administered by the Bureau of Land Management and the State land is administered by the Idaho Department of Lands. Fairfield is the county seat of Camas County; Shoshone, Lincoln County; Rupert, Minidoka County; and Hailey, Blaine County. The population of the survey area was about 14,906 in 1990.

The middle one-third of the survey area is a broad alluvial valley that is 3-11 miles wide and about 28 miles long. Camas Creek and its tributaries bisect the valley and most of the soils in this valley are cultivated. The southern one-third of the area consists of rolling uplands and the steep Mount Bennett Hills while the northern one-third consist of mountains and narrow alluvial valleys. The elevation ranges from 4,750 feet, near Magic Reservoir to about 10,095 feet in the Soldier Mountains. Fairfield is at an elevation of 5,059 feet; and Hill City is at 5,092 feet. Davis Mountain has an elevation of 6,806 feet.

The survey area lies within three geological provinces. The southern part of the area is in the Columbia Plateau Province, and the northern part is in the Rocky Mountain Province and the eastern part is in the Moonstone Cauldron. Relief and geology are extremely varied. The southern part of the survey area consists of rolling to steep uplands and hills that are composed of rhyolitic and silicic volcanics. The east-central part consists of smoothly sloping alluvial fans, terraces, and bottom lands. The northern part consists of steep mountains that are composed of granite and andesite.

Camas Creek drains most of the survey area. Twelve tributaries of Camas Creek drain the northern mountains, and two tributaries drain the southern hills. Camas Creek flows into Magic Reservoir.

With the large volume of land being held in public and state ownership, these lands must remain open and utilized for the full potential of their productive multiple uses. Camas County has demonstrated that this activity can occur and the sage-grouse will continue to thrive and even increase, as long as, the conservation measures employed by all of the agencies with

management authority over the habitat and species focus on the primary threats as they exist in Camas County, based on good science and inventory and not as they exist at the state or national level.

## **B. Habitat Characteristics**

Due to growing concerns over sage-grouse trends and populations, biologists from multiple federal, state, and local agencies in Idaho collaborated in 2000 and created a sage-grouse habitat planning map for the state. Habitat types included: Key sage-grouse habitat defined as areas of generally in-tact sagebrush that provide sage-grouse habitat during some portion of the year; Potential restoration area Type I- Perennial, defined as sagebrush limited areas characterized by perennial grass species composition and/ or structure that should provide suitable potential nesting habitat in the future, once sufficient sagebrush cover (at least 10%) is re-established; Potential Restoration Area Type II- Annual Grasslands, defined as areas dominated or strongly influenced by invasive annuals such as cheatgrass or medusahead rye, or similar species. Areas of sagebrush may be present but, in general, understories are not ideal for sage-grouse; and Potential Restoration Area Type III-Conifer Encroachment Areas, defined as areas where junipers and/or other conifer species are encroaching into sagebrush habitat areas.

The maps used by the NMV LWG have been provided by the BLM who states that they have been updated annually since 2002, based on improved information, the past seasons 'wildfire activity, vegetation treatments and successional changes noted by field-level biologists. It is noted however that some allotments, specifically in Northwest Gooding are classified as R1 habitat and subsequently grazing management guidelines are based on that designation. Inventory of the allotment indicates the species present actually are consistent with an R2 designation and difficulty arises when grazing management is judged against erroneous classification. The grazing permittee cannot be held responsible for maintenance of plant species which are not present in the allotment. This is an example where current and best science is necessary to develop local management planning.

The NMV LWG planning area consists of approximately 2,950,588 acres of mixed habitat types. Based on the 2010 habitat classification for Idaho, the NMV area contains 1,118,191 acres of 'key' habitat, 568,333 acres of 'R1' habitat, 258,938 acres of 'R2' habitat, and no 'R3' habitat types (Figure 1).

Occupied sage-grouse habitat is categorized into two delineations in Camas County. For general purposes these will be identified as Key and R1 (Perennial Grass) and are shown with location on the Habitat Classification Map. The locations where leks have been cited occur in the valley floor south of Camas Creek in the Bennett Hill range and heavy use in the Macon Flat area containing appropriate sagebrush cover. It is not appropriate to designate a primary habitat and a secondary habitat area in Camas County. All habitat that has been identified as either having lek's present or having the characteristics necessary to support the sage-grouse, shall be identified as "suitable habitat."

There is no good estimate of total acres of suitable habitat currently available. For purposes of discussion the areas as they relate to Camas County in the North Magic Valley Sage-grouse

Local Working Group Conservation Plan as adopted in 2007 and Figure 3 in the 2009 amendment the to same plan will be used as points of reference.

The following definitions apply to the Wood River Area but can be used to describe the habitat characteristics in Camas County.

### **1. Suitable Habitat**

Suitable habitat includes all seasonal habitats, including breeding habitats, early breeding habitats, summer late brood-rearing habitats and winter habitats. The description of these habitats can be found in the North Magic Valley Sage-grouse Local Working Group Conservation Plan (page 3 & 4), and are as follows:

### **2. Breeding Habitats**

Breeding habitats, called leks, generally occur in open areas surrounded by sagebrush from mid-March through mid-May. Local examples include low sagebrush flats and ridge tops, landing strips, old lakebeds, unpaved roads, cropland, and burned areas. Sage-grouse males form leks opportunistically at sites within or adjacent to potential nesting habitat. Nesting habitat and leks have the following conditions (Connelly, et al. 2000):

- a. Mesic sites have a sagebrush height that is 16-31 inches with a 15-25% canopy cover and a grass-forb height >7 inches with a  $\geq 25\%$  (15% perennial grasses and 10% forbs) canopy cover.
- b. Arid sites have a sagebrush height that is 12-31 inches with a 15-25% canopy cover and a grass-forb height >7 inches with a  $\geq 15\%$  canopy cover.

Habitats used by pre-laying hens are part of the breeding habitat. These areas should provide a diversity of forbs high in calcium, phosphorus, and protein. The ecological condition of these areas may greatly affect nest initiation rate, clutch size, and subsequent reproductive successes.

Sage-grouse hens typically select nest sites under sagebrush, although other shrub species may be used. Nests occurring under sagebrush cover have higher nest success than other shrub types, height ranges from 12-31 inches and nests tend to be under the tallest sagebrush within a stand. In general, sage-grouse nesting occurs under shrubs having larger canopies and more ground and lateral cover (spreading growth form rather than columnar).

Grass height and cover are important components of sage-grouse nest sites. Herbaceous cover associated with nest sites may provide scent, visual and physical barriers to potential predators.

### **3. Early Brood-Rearing Habitats**

Early brood-rearing habitats occur in upland sagebrush habitats relatively close to nest sites, but movements of individual broods may vary. The period of early brood-rearing is from mid-April to mid-June. These habitats may be relatively open (about 15% sagebrush canopy cover) stands of sagebrush with >15% canopy cover of grasses and forbs. Great plant species richness with

abundant forbs and insects characterize brood areas. Insects, especially ants (*Hymenoptera*) and beetles (*Coleoptera*) are an important component of early brood-rearing habitat.

Early brood-rearing habitats should have the following characteristics (Connelly, et al. 2000):

- a. Sagebrush height of 16-31 inches with a canopy cover of 10-25%;
- b. Grass-forb height is variable with a canopy cover >15%.

#### **4. Summer Late Brood-Rearing Habitats**

As sagebrush habitats desiccate, sage-grouse usually move to more mesic sites which are higher in forb availability through June through August. These areas include meadows or riparian areas dominated by mesic or hydric (also hydrophytic) plant species. The habitat should not have evidence of excessive erosion, though there may be some bare ground. The habitat suitability decreases as erosion increases or as xeric species invade the riparian/wetland zone. The presence of succulent, green forbs is essential. There should be sagebrush cover adjacent to the riparian areas to provide escape or protective cover. There are some upland sagebrush communities that provide late brood-rearing habitat due to elevation which helps to retain succulent, green forbs later into the summer. Wet meadows, springs, riparian zones and alfalfa fields are locally important.

#### **5. Winter habitats**

Movements to winter range are slow and meandering, and occur from late August to December. Wintering habitat is utilized from November through March. Feeding habits generally shift from forbs in early fall to sagebrush in winter. Characteristics of sage-grouse winter habitats are relatively similar throughout most of the species' range. During winter, sage-grouse feed almost exclusively on leaves of sagebrush in stands generally >15% sagebrush cover. On winter ranges, areas with access to sagebrush above the snow (such as south slopes and wind blown ridges) are important. Winter habitats should allow sage-grouse access to sagebrush stands with canopy cover of 10-30% and heights of at least 10-14 inches above snow cover.

### **Chapter 4: Threat Assessment**

There are numerous federal and state agencies that have management responsibilities for the sage-grouse and/or its habitat in Camas County. There are also other groups, such as the NMVLWG that have researched and studied the species and has provided advice and recommendations to the agencies. Each of these entities has individually prioritized the threats to the sage-grouse.

#### **A. U.S. Fish and Wildlife Service (USFWS)**

The Service has determined that it should list the species as endangered because it has found there to be (USFWS Candidate Notice, 2010):

1. Habitat Loss
2. Lack of Regulatory Assurances

### **B. Bureau of Land Management (BLM)**

The BLM has determined the greatest threats to the habitat to be (National Greater Sage-Grouse Conservation Measures/Planning Strategy, pg 6) (NTT Report):

1. Fire
2. Invasion of exotic grasses
3. Human Land Use
  - a. Tillage Agriculture
  - b. Historic grazing management
  - c. Energy development
  - d. Roads and power line infrastructure
  - e. Recreation

### **C. State of Idaho (State)**

The State of Idaho has found that the focus of all efforts should be on “enhancement of habitats, populations and connectivity.” They find the greatest threats to be:

1. Wildfire
2. Invasive Species
3. Habitat Restoration
4. Infrastructure

Secondary threats are:

1. Recreation
2. West Nile Virus
3. Livestock Grazing Management
4. Livestock Grazing Infrastructure

### **D. North Magic Valley Local Working Group**

The NMVLWG found there to be the following risks to the species (North Magic Valley Sage-Grouse Conservation Plan, pg 10):

High Risk

1. Habitat Fragmentation
2. Invasive plant species
3. Inappropriate management strategies

## Medium Risk

1. Improper livestock grazing
2. Fire
3. Other natural causes

## Low Risk

1. Excessive predation
2. Human disturbance
3. Health risks to sage-grouse populations
4. Over harvest
5. Successional vegetation changes in brood-rearing habitat.

## **E. Camas Board of County Commissioners (BOCC)**

While the Board of County Commissioners (BOCC) recognizes that these threats may be present at the national and state level, they do not represent the predominate threats in the unique climate and landscape of Camas County. Through the research and advisement of the County's Natural Resource Advisory Committee (NRAC) (see Appendix A), and after reviewing all of the plans stated above as well as the latest and best available science, the BOCC has determined that the primary threats to the Greater Sage-Grouse in Camas County are the following:

### **Primary Threats:**

1. Predation
2. Wildfire
3. Invasive plant Species

The BOCC has found that many of the threats prioritized by the federal and state agencies, as well as, the NMVLWG are low priority threats in Camas County. Also, human disturbances are not a concern as the current and previous populations of Sage-Grouse have successfully habituated to the human activity, primarily the active agriculture community that is continually changing. It is not an uncommon site to see sage-grouse in cultivated fields, jumping from row to row as farming and ranching operations are underway. The sage-grouse depend on the benefits provided by the agriculture community.

In contrast, the second primary threat in Camas County to the sage-grouse, Habitat Fragmentation, has received little, if any, recognition from both federal and state agencies. For this reason, the BOCC will be taking an active role to ensure that the proper cause and effect relationship between the threats and management activities are implemented in Camas County.

## **Chapter 5: Plan Implementation**

The BOCC or their assigned delegates shall be responsible for managing and implementing the Plan. Camas County has previously developed its Comprehensive Plan related to privately owned lands in the County. This Land Use Plan is now directed toward management of federally and state managed lands. As implemented, this Plan shall require these policies and principles be applied on public lands as ‘regulatory assurances’ through Coordination and they will be applied on private lands as ‘incentive-based assurances.’ In this way, this Plan serves as a planning tool for private land owners by informing and improving their conservation efforts on a voluntary basis with the added opportunity to amend this Plan as a result of their stewardship successes. With adoption of this Plan the County puts in place a "Comprehensive Plan" which includes "all land within the jurisdiction of the governing Board" as directed by the legislature. Idaho Code § 67-6528 provides that "the state of Idaho, and all its agencies, Boards, departments, institutions, and local special purpose districts, shall comply with all plans and ordinances adopted under the Local Planning Act."

### **A. Implementation on Public Lands**

The principles and policies contained within this Plan shall be required for the management of sage-grouse and its habitat on public lands that contain suitable habitat as described in the Habitat Characteristics above.

### **B. Implementation on Private Lands**

For private lands in the Plan Area, the principles and policies contained within this Plan are voluntary and encouraged to be implemented through Best Management Practices (BMP’s) and conservation measures for the management of sage-grouse and its habitat as defined as suitable habitat and depicted in **B Habitat Characteristics** above.

### **C. Implementation Process**

This policy shall serve as the primary conservation policy for the sage-grouse in Camas County. The BOCC has the unique authority to require federal agencies to coordinate their plans and policies with the County, and ability to coordinate with state agencies, therefore, ensuring that all entities with responsibilities for the species and habitat are working together efficiently and effectively and not pursuing counter-productive measures. This Plan is designed to serve as the comprehensive planning document for the sage-grouse in Camas County.

While recognizing that each agency has its own planning processes, federal agencies are required to not only consider the County’s policies, but work to resolve conflicts and make federal plans consistent with the county’s policies (43 USC 1712). Federal statues require that the County’s policies are integrated into the federal conservation strategy for the sage-grouse on federal lands within the County’s borders. The State of Idaho has given Camas County planning authority over lands within the County’s borders, ensuring consideration of the County’s sage-grouse policy with state agencies as well.

Implementation of this plan will be conducted through a formal coordination process with all agencies that have jurisdiction and/or responsibility for the sage-grouse and/or its habitat. The plan will serve as the unifying and primary planning document.

The BOCC shall utilize this Plan as a tool to evaluate and provide comment regarding land management decisions on both public and private land for which it has land management jurisdiction. More specifically, the BOCC shall utilize this Plan in evaluating land use development applications submitted under the County's comprehensive plan, as well as, ensuring that any federal or state land management action remains consistent with this Plan.

#### **D. Plan Update / Amendment Process**

This Plan is managed under adaptive management principles where it is understood that the scientific understanding of the species and its habitat will be continually expanding. This requires that the policies, principles, and best management practices of this Plan be frequently evaluated and modified as warranted by the best available science appropriate for the unique Plan Area in Camas County.

##### **1. Annual Review**

The BOCC will conduct an annual Coordination review, commencing one year from the date of enactment of this Plan with the federal and state agencies that have habitat or species responsibilities within the Plan Area. This review process will evaluate the availability and condition of habitats, direct and indirect impacts, conservation measures, policies and BMP's being implemented by each agency for their effectiveness and applicability to the Plan Area.

Also incorporated in this review is any new science and, if warranted, modifications to the BMP's, policies, and conservation measures within the Plan. The Coordination review shall take place in government-to-government meetings between the different agencies and the BOCC.

The BOCC will also initiate meetings with entities that have private property interests in the Plan Area for the purpose of analyzing their conservation efforts and effectiveness, as well as, any new science they may be able to contribute to the process to ensure Plan updates are also based on the best available science.

The consideration of changes to the Plan shall be discussed in these coordination meetings, followed up with a draft Plan update to be shared with all agencies through the Coordination process and private entities with private property interests for input. The input shall be considered and incorporated where appropriate into a formal written Plan update to be approved by the BOCC within 120 days of the submittal date of the requested change.

##### **2. New Scientific Information**

If at any time between the annual review period with federal or state agencies, or private entities with property interests in the Plan Area become aware of or acquire new science regarding the species or its habitat in the Plan Area within Camas County that may warrant changes to the

BMP's, conservation measures or policies within this Plan, then they shall submit a written report to the County, including the scientific review and supporting data, for the County's consideration. If the BOCC finds changes to the Plan are warranted, then it can initiate a formal review of the Plan in coordination with all entities.

### **3. Additional Coordination Meetings**

Additional Coordination meetings are encouraged beyond the required annual review and new scientific information review for the purpose of keeping apprised of and working to resolve all issues impacting the sage-grouse.

## **Chapter 6: Principles**

The Plan Principles are designed to inform and guide all decision making, regardless of specific issue or impact, as they relate to the well-being of the sage-grouse and the health, safety and welfare of the people in Camas County.

A. Southern Idaho homesteaders began to use the planning area for sheep and cattle grazing, cleared land for crops, and ultimately developed large water transportation projects that enabled further settlement and development. It is unknown what degree sage-grouse may have used areas converted to agriculture, pre-settlement. Much of these areas were covered by basin big sagebrush (*Artemisia tridentata*) which due to its ability to grow to a large size, may have only been utilized by sage-grouse post-disturbance or during very deep snow years. Additional sage-grouse habitat declines resulted overtime from infrastructure, rangeland improvements (crested wheatgrass seedings), and increased rangeland fire frequencies in areas dominated by invasive annual grasses.

Historic and current land conversions have reduced potential sage-grouse habitat to approximately 61% (1,801,997 acres) of the original acreage identified in the NMVSGGLWC planning Area. Approximately 1% (22,836 acres) of the area has been developed, and nearly 14% (408,800 acres) has been converted to agriculture (Figure 3). More than 70% of the planning area (based on buffering around infrastructure features using criteria from the state plan) is affected by some form of current or planned infrastructure, and the area contains some of the highest linear infrastructure density of Idaho's SGPAs (Figure 12). Currently livestock grazing allotments comprise 65% (1,902,598 acres) of the total planning area, and wildland fires have burned over two million total acres over the past 20 years.

B. The economy of Camas County is dependent upon productive ranching, farming, mining, and recreational industries. These industries represent the primary current and historical uses of the land. They are not only the vital part of the local economy, but they have also contributed to the sage-grouse's continued persistence. By enhancing the habitat through activities, such as, riparian improvements and proper livestock grazing, these industries

have both protected and improved the species habitat by reducing fuel for wildfires, controlling invasive species and limiting predators.

- C. Camas County has a population of approximately 1,124 (2011), and therefore is considered a “small local jurisdiction” as defined by the Regulatory Flexibility Act (5 USC 601). All proposed rules for the purpose of managing the sage-grouse or its habitat by federal agencies requires an economic analysis and consideration of that analysis prior to the finalization of the proposed rule. This analysis shall be prepared in Coordination with Camas County.
- D. Human disturbances have a minimal impact on the sage-grouse as the current population and those before it have been raised surrounded by an active agricultural and recreational community. If this activity were to be removed or reduced, it would create unintended disturbances to the species and may threaten their survivability.
- E. Sage-grouse management decisions shall be made based on the best available scientific information that is applicable to sage-grouse habitat in Camas County. The scientific information used will be consistent with standards of the Information Quality Act (44 USC 3516) (see definitions of Quality, Objectivity, Utility and Integrity), as verified by the County.
- F. Land management plans of all government agencies that have ownership or management responsibilities for the lands or species within Camas County shall be consistent with the policies set forth in this plan subject to valid existing rights.
- G. For private lands, the policies set forth in this Plan are encouraged through conservation incentives and BMP’s that do not encumber private property rights of the landowners, but do address long-term needs of sage-grouse.
- H. No policies shall infringe on the private property rights of any landowner within Camas County. All species and land coverage information gathered on private property shall be treated as the property of the landowner and shall not be used by any private or government entity for any purpose unless express, written permission has been obtained from the landowner.
- I. All sage-grouse habitat and species management programs that impact the County, administered by federal and state agencies, shall be coordinated with Camas County, and the data collected by state and federal agencies will be shared with the County in a timely manner and be provided to the County regardless of completeness.
- J. All public lands within the Plan Area containing suitable habitat for sage-grouse shall be managed to continue the multiple-uses of the lands as required by 43 USC 1707(a)(7). No policies shall be implemented that prescribe the management of lands for a single purpose, but all functions of the land, including providing habitat for wildlife and supporting the

productive uses of its resources, shall be considered with the objective of balancing and continuing all uses of the land. Unlike public owned land where there are many property interest holders and the multiple uses must be maintained, private land owners have more discretion to manage their property for the primary purpose of conserving sage-grouse, if so desired.

- K. The ability of wildlife, including sage-grouse, to habituate to inanimate manmade structures and changes to the landscape shall be acknowledged.
- L. All sage-grouse conservation measures enacted on public land or through a federal nexus shall be for the purpose of directly benefiting the species and its verified habitats. These measures shall be scientifically defensible. All data and information used to produce conservation measures shall be made available to the public and the County and shall be coordinated with the County. Additionally, the balance of impacts to other species and to human welfare must be weighed prior to approval and implementation. All planning efforts shall be governed through adaptive management principles to ensure that use of the latest scientific research on sage-grouse and their habitat; BMP's, technological advances, and incorporation of impact avoidance, minimization, and mitigation opportunities are vetted and utilized.
- M. Private land ownership of sage-grouse habitat areas should be continued and encouraged as private land conservation efforts have been the most effective methods to preserve diverse and healthy habitats for many species.

## **Chapter 7: Policies**

The policies set forth in this chapter are for the purpose of providing specific conservation measures that are to be implemented in the Plan Area in order to eliminate or limit impacts that may affect the suitable habitat of the sage-grouse.

### **A. Infrastructure and Roads – Habitat Fragmentation**

Infrastructure includes large scale anthropogenic features, including highways, high voltage transmission lines, commercial wind projects, energy development (e.g. oil and gas development, geothermal wells) airports, mines, cell phone towers, landfills, residential and commercial subdivisions. (State Alternative, page 11)

Roads provide necessary access to the area to ensure proper management of resources, infrastructure and assets, and accessibility in the event of emergencies. Because of the nature of the terrain in Camas County, most road surfaces, and driving conditions ensure that vehicles maintain low speed and the risk of collision with the sage-grouse is minimal in suitable habitat areas.

One of the primary threats to sage-grouse habitat in Camas County is Habitat fragmentation. Installation of access roads to enable power transmission lines and wind energy structures

continue to be planned across federal lands. If not properly managed there may be a reduction of nest success, survival of juveniles, and survival of adult birds.

### **Policy**

1. Limit motorized travel to existing roads, primitive roads and trails as verified by Camas County in suitable habitat.
2. Any road, primitive road, or trail closures must comply with Camas County's Transportation Plan and must be coordinated with the BOCC.
3. New infrastructure can be placed in suitable habitat, as long as, reasonable measures are taken to ensure there will be no deleterious effect on the sage-grouse, as determined by Camas County. Best Management Practices, as defined in the State's Alternative (pg 43) shall be followed.

### **B. Livestock Grazing**

Camas County continues to enjoy a long history of livestock grazing both on private and public lands. When properly managed, livestock can coexist with sage-grouse, as well as, help improve suitable habitat and decrease fire hazards.

### **Policy**

1. Maintain sustainable grazing consistent with historic land use and ranching practices, with the goal of attaining no net loss in economic value.
2. Livestock grazing is an important tool to properly manage sage-grouse habitat, and should not be removed from the Plan Area.
3. Any grazing restrictions or conservation measures that are implemented through a grazing permit shall be based solely on the conditions and activities specific to that permitted grazing allotment, as identified by specific allotment inventory.
4. Annual precipitation measurements and species composition should become a part of annual operating plans. If the monitoring data shows there is an increase in forage that supports additional livestock in a suitable habitat area, then increased grazing should be considered. If monitoring data shows a decrease in forage in a suitable habitat area, then a reduction in livestock can be considered as long as it is demonstrated that failure to do so would cause a deleterious effect on the sage-grouse.
5. Add sage-grouse guidelines into management plans as desired conditions, recognizing livestock grazing may not always be a causal factor (State Alternative)
6. Prioritize completion of land (range) health assessments and grazing permit NEPA analysis on allotments with declining sage-grouse populations, as verified by Camas County.
7. Allotment Assessments will use published Characteristics of sage-grouse habitat and comply with 43 CFR 4180.2(c).
8. Allotment management changes must be tailored to address specific problems when the cause of that problem has been determined using the best available science including the flexibility to change time on a unit, the number of livestock for a designated period of time and season of use.

9. Changes in grazing management should only occur when monitoring indicates sage-grouse objectives are not being met as a result of grazing practices.
10. Management changes, when needed, must be tailored to specifically address habitat objectives that need improvement, but should not adversely affect the habitat of other species.
11. Altering grazing schemes in allotments, where needed and appropriate, may be facilitated by enhanced grazing opportunities with introduced seeding or areas with lower values to sage-grouse. The unintended consequences of altering grazing use, such as possible increased risk of wildfire, must be carefully considered in any management proposal. (State Alternative)

### **C. Fire Management and Wildfire**

Wildfires are a common event in Camas County. This is due, in part, to basic weather patterns directing thunderstorms across the Bennett hills or along the Snake River. Multiple lightning strikes can be frequent during summer storms.

#### **Policy**

1. During fuels management project design, consider the utility of using livestock to strategically reduce fine fuels (Diamond et al. 2009), and implement grazing management that will accomplish this objective (Davies et al. 2011 and Launchbaugh et al 2007).
2. Prior to prescribed controlled burns near suitable habitat, all other fuel reduction methods shall be considered.
3. In the event of a wildfire, coordinate with appropriate agencies in developing and implementing rehabilitation plans.
4. When pursuing habitat restoration or rehabilitation, use native plant species, based on availability, and focus on the probability of successful establishment.
5. Following post burn habitat restoration, consider timely short term grazing to control invasive plant establishment and seed production such as Downey Brome and Medusahead grass. While rest and deferment is essential to establish desired grass species, especially native grasses, targeted grazing can aid in reducing seed head development and greatly reduced fuel loading for the following year's fire potential.

### **D. Monitoring and Habitat Category Changes**

The primary objective of this plan is to ensure the long-term health and continued existence of sage-grouse in Camas County. Regular monitoring of the species and its habitat in Camas County is essential to ensuring the policies and best management practices are updated and implemented within the Plan Area.

## **Policy**

1. All federal and state agencies, with management responsibilities in the plan area for the species and/or its habitat, shall provide the County with an annual update of the monitoring programs they have in place, data collected and specifics about their collection protocols. These agencies will inform the County of proposed research projects and allow for the County's input and collaboration prior to implementation.
2. All data shall be collected and studies prepared using protocols that will ensure the quality, utility, objectivity and integrity of the information as required under the Information Quality Act.
3. All data that is gathered in the Plan Area shall be shared with the County in a timely manner, and supplied to the County regardless of its state of completion.
4. Private landowners are also encouraged to monitor and share data collected on private property with the County.
5. All data that is shared with the County that is not public information will be treated as confidential and used by the County only to help inform its policies and best management practices.

## **E. Invasive Species**

The County has actively worked to control invasive plant species, primarily through the Cooperative Weed Management Areas (CWMA) and maintains a good working relationship with the federal and state agencies for the purposes of controlling the introduction or spread of invasive plants.

## **Policy**

1. The Cooperative Weed Management Areas (CWMA), in cooperation with all land managers, shall encourage the continuing inventory for invasive species.
2. Areas of suitable habitat, where non-natives have invaded, shall be prioritized for treatment in coordination with the BOCC and the CWMA.
3. The County's Invasive Species Plan shall be followed when any treatment, reseeding or restoration projects occur in or around suitable habitat.

## **F. Predation--NMVSLWC**

Historically, predation is the primary cause of mortalities on the sage-grouse (Bergerud 1988). Sage-grouse are common prey for numerous predators present in the County, including coyotes,

ravens, various raptors, eagles, feral cats and, more recently, wolves. “While some level of predation should be expected in all sage-grouse populations, in certain situations predator/prey relationships may become disrupted, resulting in excessive predation. For example, the establishment of non-native predator species or an unusually high number of one or more predator species, may be cause for concern.” (July 2006 Idaho Sage-grouse Conservation plan, 4-10)

### **Policy**

1. Prior to implementing any conservation measures that decrease the productive use of the land for the benefit of the sage-grouse, the impact of predation must be considered. Measures must be put in place to control predation to the satisfaction of the BOCC, if found to be the cause of the impact.
2. The BOCC will coordinate with the Idaho Fish and Game to determine appropriate predator control measures.
3. Encourage private landowners and citizens to document predator occurrences and provide these to the BOCC so that the proper agencies can be notified and appropriate control measures implemented.
4. Anti-perch devices will be encouraged, but not required, for all existing and future transmission lines and structures that may have a deleterious effect on sage-grouse in suitable habitat.

### **G. Recreation**

Recreational use within the Plan Area is extremely important as the majority of the land is publicly held and access is crucial to the economic viability of the County. Full access to public land shall remain open and accessible to the people.

### **Policy**

1. Any plan for creating new or additional recreational opportunities on federal lands in suitable habitat must provide Camas County a sage-grouse impact analysis for review.
2. Limit motorized recreational use to existing roads, primitive roads, and trails, as verified by Camas County in suitable habitat.
3. Any road, primitive road and trail closures must comply with Camas County’s Transportation Plan and must be coordinated with the BOCC.

### **H. Mineral Development**

The geology created the extensive mining activities which contributed so much to the economy, and early settlement defining culture, and characteristics of the counties and state.

Mining has always been a small component of Camas County’s history and should continue. Mineral access, claim access and future mineral development can all be pursued, as has been done historically in habitat that is also occupied by the sage-grouse, following best management

practices and with the advancement of technology that continues to reduce short-term and long-term impacts.

### **Policy**

1. Mineral development can occur in suitable habitat utilizing best management practices and taking all reasonable measures to reduce impacts and avoid impacts to suitable habitat where possible.
2. Conservation measures designed to protect suitable habitat shall not affect access to any existing or future mining claim.
3. No federal land mineral withdrawals shall be made as an effort to conserve suitable habitat. Full access to all resources must be maintained in order to ensure a productive economy and the health, safety and welfare of the citizens of Camas County.

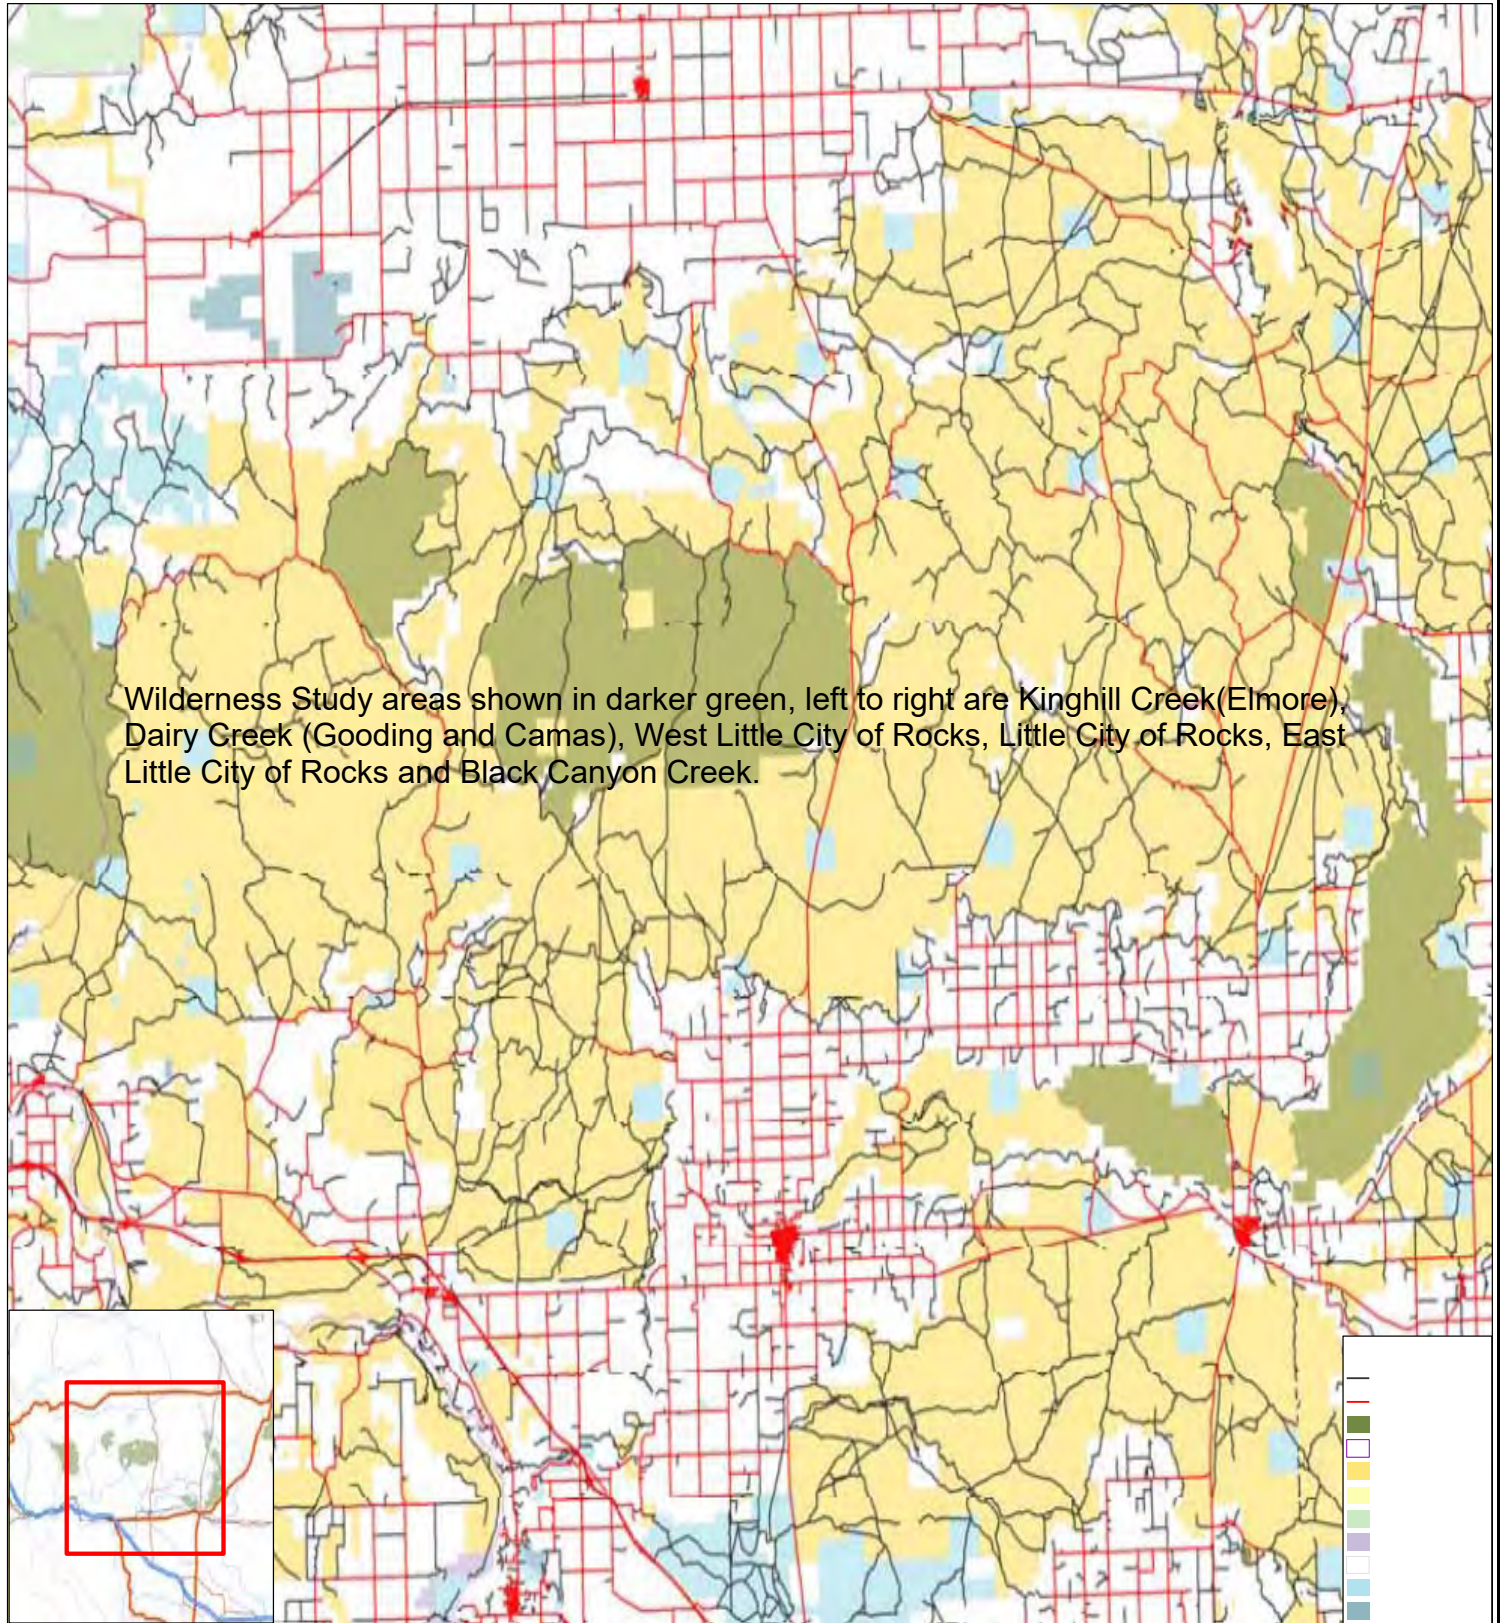

### **I. Areas of Critical Concern and Wilderness Study Areas**

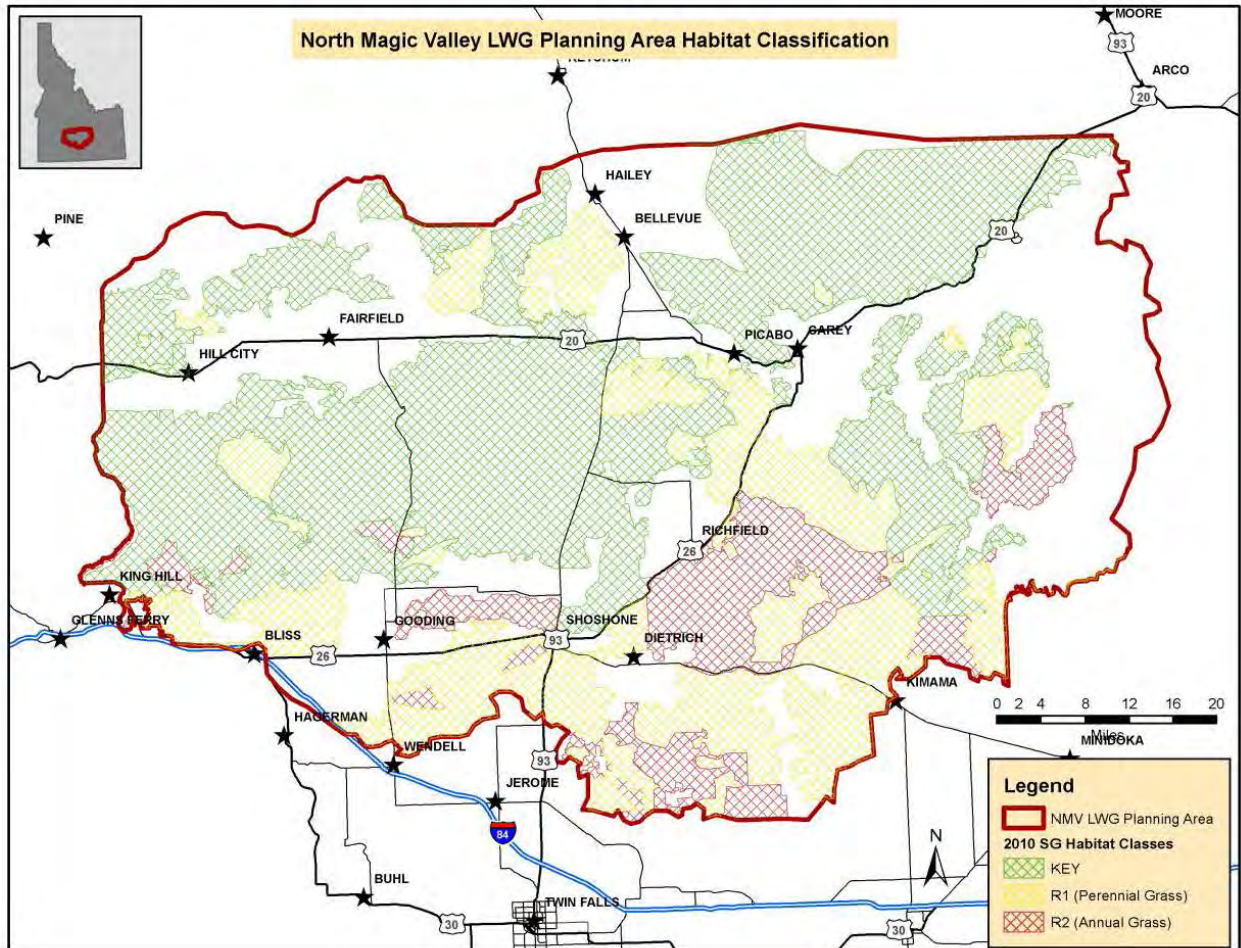

Currently, there are two Wilderness Study Areas (WSA) in Camas County and seven additional Areas within the Grouse migratory area for a total of nine. The WSA residing within Camas County, located from west to east are Dairy Creek,. These areas were designated by BLM in response to a Congressional request for roadless areas containing wilderness characteristics in 1979. In 1993 the Agency reviewed the submitted Area list to determine which areas would be presented with recommendations to proceed as meeting the criteria and which areas are not fully supporting the Wilderness Area intent. All of the Camas areas submitted were reviewed and it was determined that these areas did not fully meet the criteria for listing as a Wilderness Area. The final decision to either list or release lands for non-wilderness uses resides solely with Congress, however: the BLM is required to manage the Areas on the list to a level which maintains the wilderness characteristics as existed in 1980 until they are delisted. This thirty three year period of interim designation without decision has the potential to limit future access and productive use of the land, which may limit the County's revenue and future ability to properly manage the suitable habitat and ensure the long-term viability of the sage grouse.

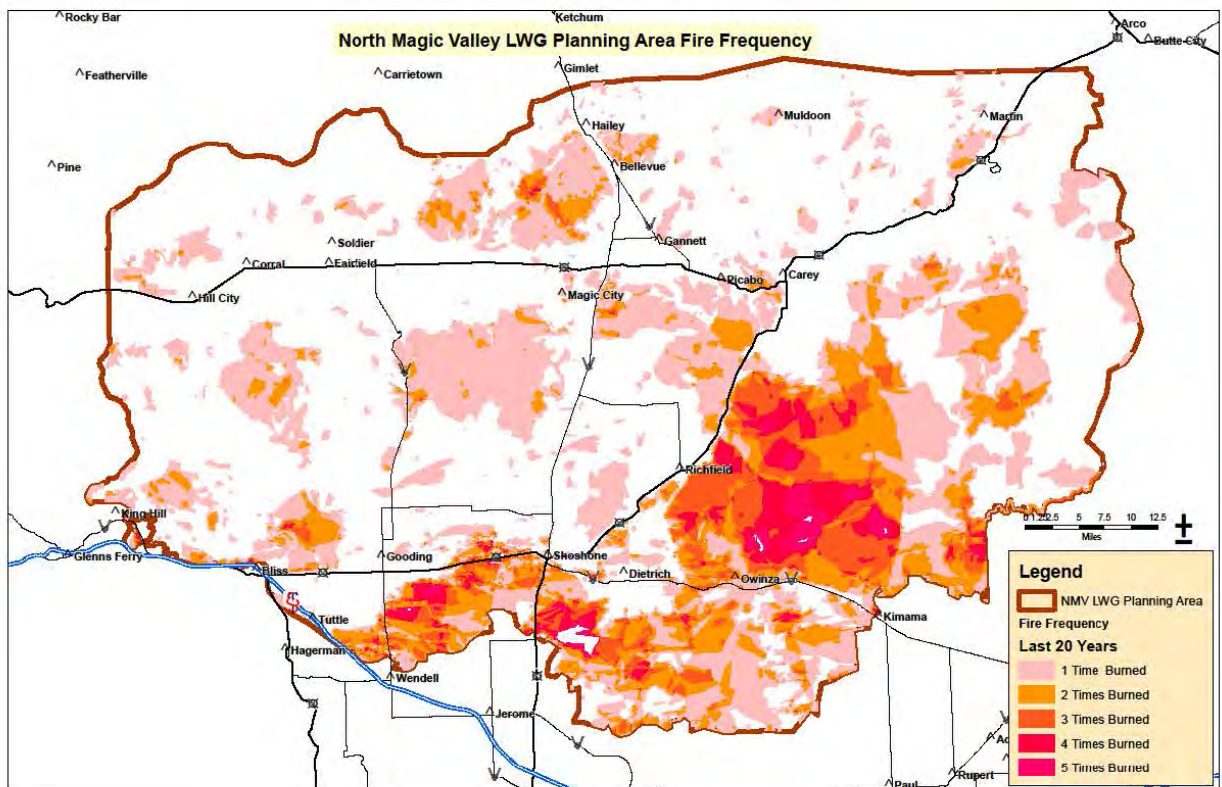

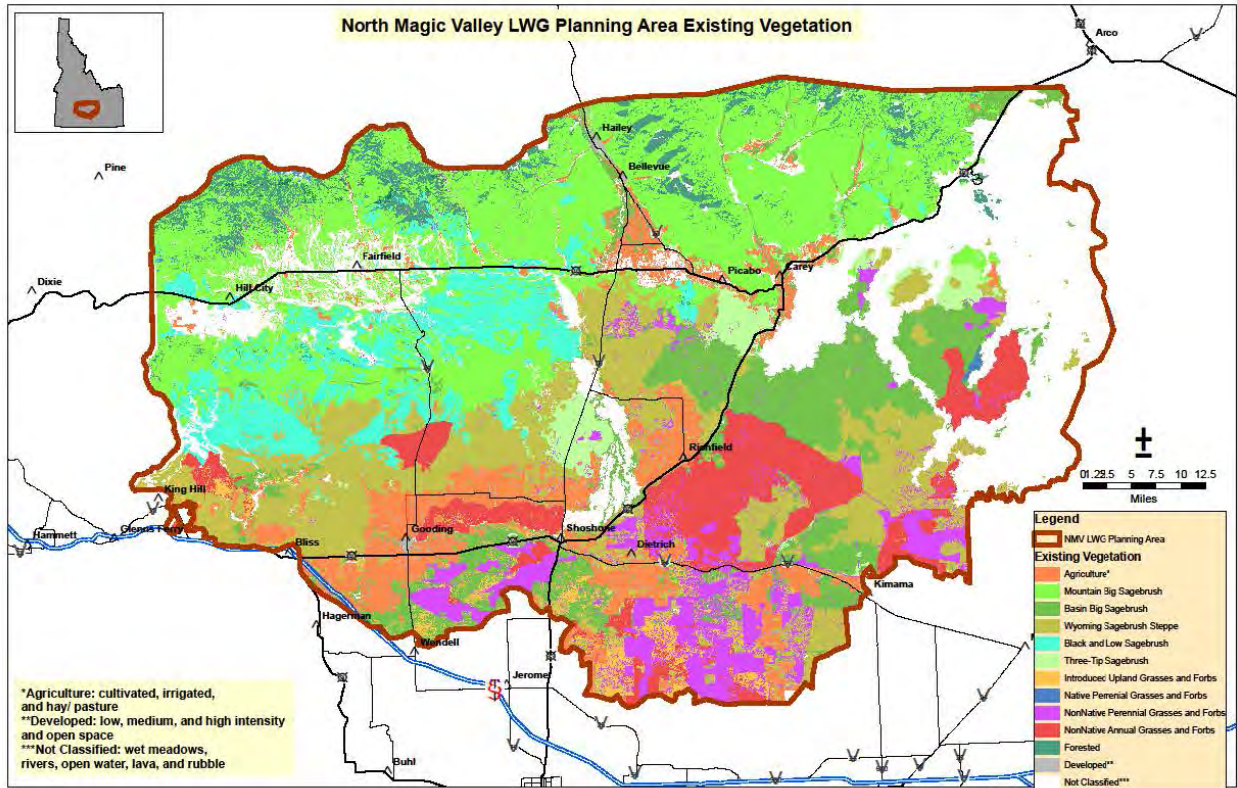

### **Policy**

There shall be no new designations of Areas of Critical Concern (ACEC's) or WSA in Camas County. If such designations are being considered by federal land managers, then the county is to be informed immediately and the consideration of the designation coordinated with the County. With the existing Wilderness Study Areas, the listing qualifications should be reviewed and concurred with by the Camas County Commissioners to ensure realistic goals and benefits can be achieved. If the targeted area does not warrant listing by supporting all characteristics for a Wilderness Area, a request for delisting should be presented to Congressional representatives to allow full management strategies for consideration.

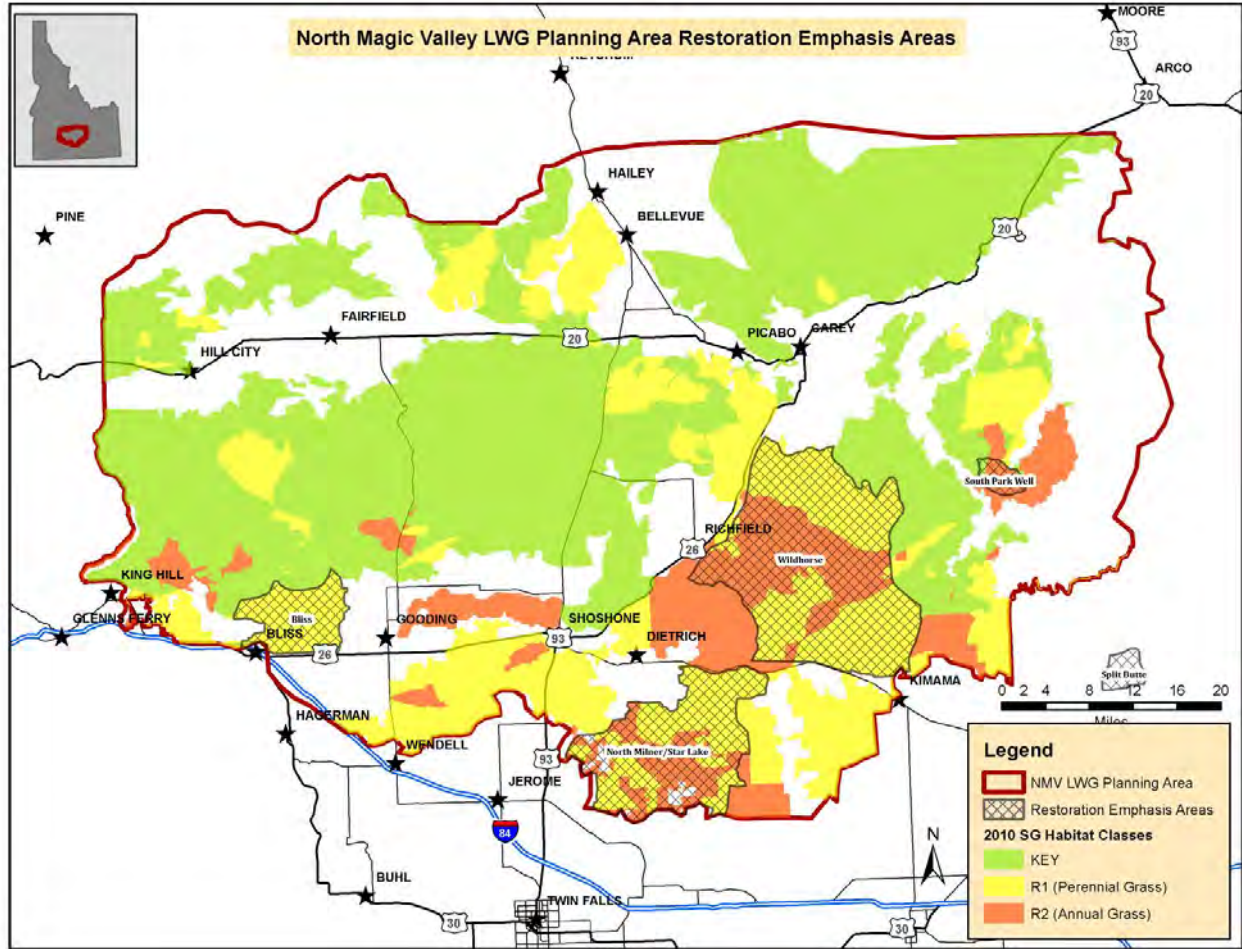

The following maps are included for informational purposes only. Specific comments relating to map information may be found included in various topic discussions. The five county areas include Camas County and coverage demonstrates the full range of habitat utilized by the local Grouse population.

It should be noted that the Restoration Emphasis Areas targeted on this map have a definite correlation to the preceding Fire Frequency Map.

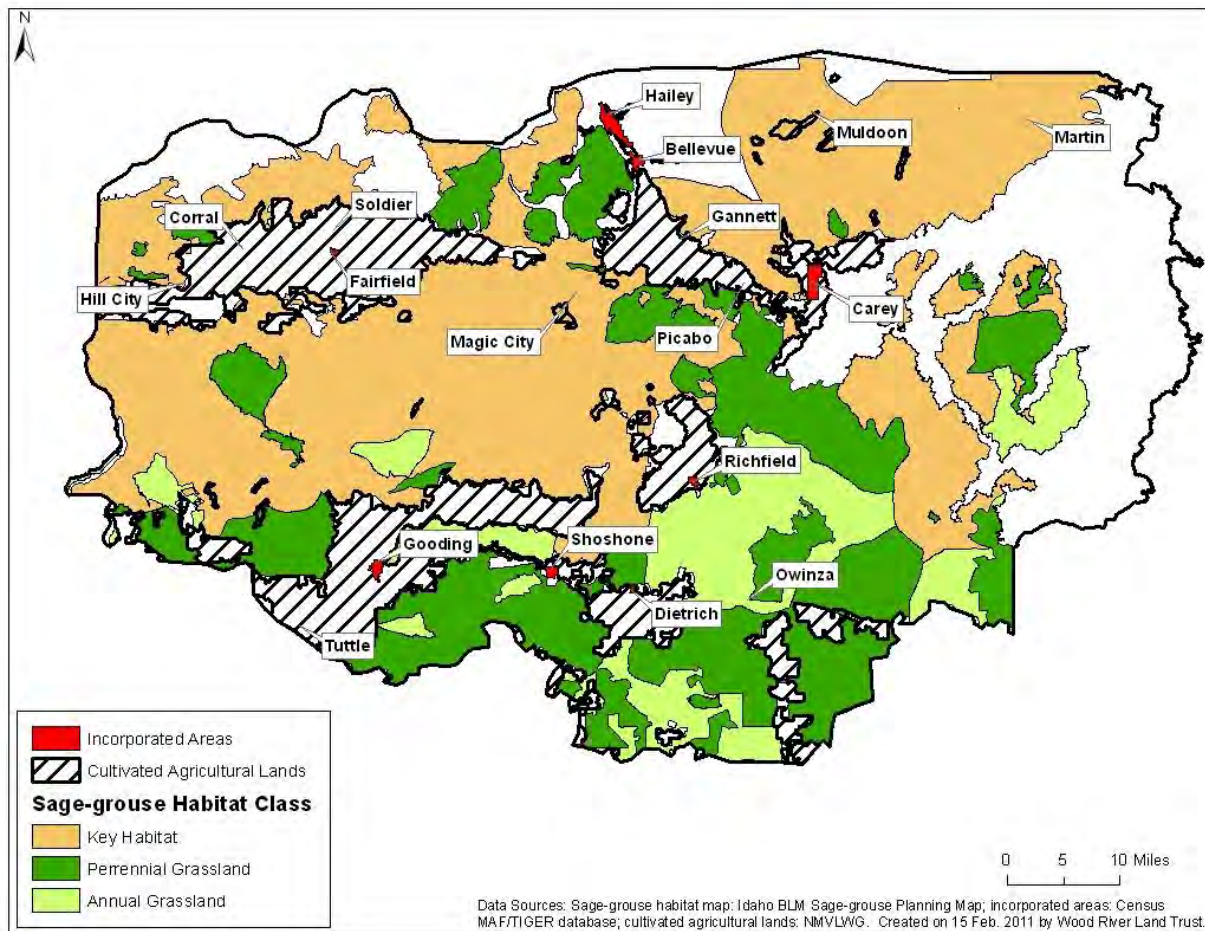

### Threats Prioritization

Each member of the NMV SGLWC Group was issued 5 dots to place one each on the threats they believe are the most significant to the NMV Planning area. The purpose of this exercise was to determine the Group's collective view of threat importance and help determine level of effort for threats description.

Dot's Ranking Exercise Results

# Dots Received	Rank	Threat <i>(including sub threats as shown above)</i>
10	1	Urban / Rural Development
9	2	Annual Grasslands / Wildfire; prescribed fire
8	3	Poor Livestock Management
7	4	Infrastructure; mines, gravel, landfills
7	4	Disease; West Nile Virus
6	5	Agricultural Practices; sagebrush control, insecticides
4	6	Predation
2	7	Human Disturbance
1	8	Sport Hunting; falconry
0	9	Isolated Populations
0	9	Agricultural Expansion
0	9	Seeded Perennial Grasslands
0	9	Conifer Encroachment

### 3.1.9 Data Gaps identified by U.S. Fish and Wildlife Service

In the discussion of the factors contributing to the greater sage-grouse not warranted Finding, participants in the USFWS structured range-wide science panel identified a number of data gaps that if resolved, could reduce uncertainty in their assessment of the likelihood of extinction within a certain time frame or even change their estimates (USDI-FWS 2005). This information is included in this Plan because it provides an important window into some of the uncertainties and research, monitoring and evaluation needs that exist at the broad-scale (e.g., state or range-wide) and that might factor into future decisions regarding potential listing of the species.

The areas of uncertainty identified by the USFWS experts included:

- Systematic (e.g., species, subspecies) relationships among various grouse species;
- Underlying mechanisms by which sage-grouse populations respond to habitat changes;
- How to scale grouse habitat preference up to the level at which federal land is managed;
- Lack of studies across the range limits inferences;
- Effects of invasive plants;

- Application of grazing techniques to favor sagebrush habitat;
- Underutilization of the case study approach for sage-grouse management
  
- Future gas and oil development impacts;
- Future advances in horticulture and fire suppression;
- The role of crested wheatgrass in sagebrush management; and
- The effectiveness of USDA Conservation Reserve Program or other easement and incentive programs.

## **Appendix A: Rationale for Landuse management Coordination in Camas County**

The people of Camas County have historically and traditionally earned their livelihood from activities reliant upon natural resources. The economy of the County has always been, and is today, still largely dependent upon ranching and agricultural operations, activities critically and economically related to ranching and farming, and other activities reliant upon the availability of natural resources and reasonably accessible water supplies.

Privately owned land is intermingled with the federal and state lands. Management decisions for the federal and state lands directly impact use of, and the economic value of, private land. Restrictions on, and reductions of, grazing on federal lands, for example, will require the rancher to reduce the size of his herd, to find alternative grazing land, increase reliance on expensive harvested feed, or seek relief through a combination of these measures. If he must graze the herd solely on his private ground, he will lose the source of winter forage for his herd. His forage costs will dramatically increase because he will have to buy feed for the herd. There is no alternative land available in Camas County, so even if forage is found outside the County, the transport costs would be extremely high. Either reduction in herd size, or much higher feed costs, or severely increased transport costs would result in a critically adverse outcome. Economists hold that for every dollar loss to the rancher, there will be a resulting impact to business income in the surrounding areas of the County. Specific economic impact models have been completed and included in other county landuse plans such as Owyhee County.

The economic stability of Camas County incorporates continued multiple uses of the federal lands. Tax revenue is available to the County mainly through the ad valorem property tax. Secondarily is the County's share of sales tax receipts. The limited amount of private property greatly restricts the tax revenue of the County. That limited tax base must be protected, and the continued vitality of that tax base is dependent upon continued multiple use of the federal lands. If multiple uses are restricted, business income will suffer and sales tax will be reduced. If grazing is restricted, financial pressure will be placed on the rancher which may even result in his going out of business. When that happens, the tax base of the County suffers, and the business income within the county and in the surrounding region is also reduced.

### **MULTIPLE USE AND COORDINATION WITH FEDERAL AND STATE AGENCIES**

This Plan provides a positive guide for the Land Use Committee and the Board to coordinate their efforts with federal and state land management agencies in the development and implementation of land use plans and management actions which are compatible with the best interests of Camas County and its citizens. The Plan is designed to facilitate continued and revitalized multiple use of federally and state managed lands in the County. The Natural Resources Committee, the Board, and the citizens of Camas County recognize that federal law mandates multiple uses of federally managed lands and they positively support multiple uses. Maintenance of such multiple uses necessarily includes continued maintenance of the historic and traditional economic uses which have been made of federally managed and state managed lands in the County. It is therefore the policy of Camas County that the Natural Resources

Committee and the Board work constantly to assure that federal and state agencies shall inform the Board of all pending or proposed actions affecting land use, local communities and County citizens and coordinate with the Board in the planning and implementation of those actions. (See Appendix I, Federal Land Policy and Management Act)

Camas County has previously developed its Comprehensive Plan related to privately owned lands in the County. This Land Use Plan is now directed toward management of federally and state managed lands. With adoption of this Plan the County puts in place a "Comprehensive Plan" which includes "all land within the jurisdiction of the governing Board" as directed by the legislature. Idaho Code § 67-6528 provides that "the state of Idaho, and all its agencies, Boards, departments, institutions, and local special purpose districts, shall comply with all plans and ordinances adopted under the Local Planning Act."

A long series of decisions by the United States Supreme Court set forth the position that when a validating or confirming statute is passed, the legal title to the possessory right passes as completely as though a patent had been issued. Title to allotments of federal land for grazing have been validated or confirmed for over a century, and the boundaries of those allotments have been adjudicated. The Stock Raising Homestead Act of 1916 culminated development of the settlement acts regarding the lands "chiefly valuable for grazing and raising forage crops" when it completely split the surface estate from the mineral estate in order to allow for the disposal of legal surface title to ranchers, while retaining undiscovered mineral wealth to the United States.

The individual preference for use of usual and customary range by local established ranches was recognized by the Idaho Statutes long before passage of the Taylor Grazing Act of 1934. A series of early Idaho laws (including, I.C. 25-1302 in 1881; I.C. 25-1907 in 1883 and I.C. 25-1004 in 1941) were adopted to regulate and legally protect the use of usual and customary range from grazers without a historic use right. Subsequent Idaho law confirmed the appurtenance of grazing preference right to the base ranch property I.C. 25-901. Grazing preference rights owned by Camas County ranchers were acknowledged and secured by passage of the Taylor Grazing Act in 1934. Every subsequent Act regarding management of the federal lands has protected and preserved all "existing rights" such as the grazing preference right.

The ranchers of Camas County who graze livestock on the federal lands have a preference to graze there. The grazing preference owned by Camas County ranchers was acknowledged and secured by passage of the Taylor Grazing Act in 1934. Every subsequent Act regarding management of the federal lands has protected and preserved all "existing rights" such as the grazing preference.

## **LIVESTOCK GRAZING:**

The Taylor Grazing Act of 1934, 43 U.S.C. § 315, was passed primarily to provide for stabilization of the western livestock industry; and that Act is still sound law. The Act authorized the Secretary of Interior to establish grazing districts in those federally managed lands which were "chiefly valuable for grazing and raising forage crops." The Secretary was authorized to act in a way that would "promote the highest use of the public lands." 43 U.S.C. § 315. The Act authorized the Secretary to issue grazing permits on a preferential basis with preference to be given to those "land owners engaged in the livestock business," "bonafide occupants or settlers," or "owners of water or water rights." 43 U.S.C. § 315 (b). The Secretary was authorized to take action to stabilize the livestock industry which was recognized as necessary to the national well being.

The Act also recognized the property interests of a permittee in the form of an investment backed expectation in § 315 (b). That Section provided that no preference would be given to any person whose rights were acquired during the year 1934 except that the Secretary could not deny the renewal of any such permit "if such denial will impair the value of the grazing unit of the permittee, when such unit is pledged as security for any bonafide loan." Emphasis added.

The Federal Land Policy and Management Act of 1976, 43 U.S.C. § 1701 et seq., did not limit, restrict or amend the purposes and provisions stated in the Taylor Grazing Act. Section 1701 stated the policy of the Congress as follows: "The Congress declares that it is the policy of the United States that --- .

(2) "The national interest will be best realized if the public lands and their resources are periodically and systematically inventoried and their present and future use is projected through a land use planning process coordinated with other federal and state planning efforts; . . .

(8) The public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource and archaeological values; that, where appropriate, will preserve and protect certain public lands in their natural conditions; that will provide food and habitat for fish and wildlife and domestic animals; and that will provide for outdoor recreation and human occupancy and use; . . .

(12) The public lands are managed in a manner which recognizes the Nation's need for domestic sources of minerals, food, timber, and fiber from the public lands including implementation of the Mining Minerals Policy Act of 1970 . . . as it pertains to the public lands".

The Public Rangelands Improvement Act of 1978, 43 U.S.C. § 1901-1908, once again revitalized the purposes of the Taylor Grazing Act, providing that the Secretary of Interior "shall manage the public rangelands in accordance with the Taylor Grazing Act, the Federal Land Policy and Management Act of 1976 and other applicable law consistent with the public rangelands improvement program pursuant to this Act." See 43 U.S.C. § 1903, which also provides that:

"the goal of such management shall be to improve the range conditions of the public rangelands so that they become as productive as feasible in accordance with the rangeland management

objectives established through the land use planning process, and consistent with the values and objectives listed in [Section 1901]."

The values and objectives listed in Section 1901 by which the Secretary was to be guided include a finding and declaration by the Congress that:

"to prevent economic disruption and harm to the western livestock industry, it is in the public interest to charge a fee for livestock grazing permits and leases on the public lands which is based on a formula reflecting annual changes in the costs of production." 43 U.S.C. § 1901 (a) (5)."

The Congress further found and declared that one of the reasons the Public Rangelands Improvement Act was necessary is that segments of the public rangelands were producing less "than their potential for livestock" and that unsatisfactory conditions on some public rangelands prevented "expansion of the forage resource and resulting benefits to livestock and wildlife production." 43 U.S.C. § 1901 (a) (3). The Act mandates improvement of the rangelands in order to increase the potential for livestock development and to prevent economic harm to the "western livestock industry."

In accordance with these Federal Acts - - - The Taylor Grazing Act, The Federal Land Policy and Management Act and The Public Rangelands Improvement Act - - - the Bureau of Land Management is required to preserve the stability of the western livestock industry and to provide for multiple use management including necessary range improvements for the benefit of livestock production, wildlife habitat, watershed protection, and recreation. These federal mandates can be met only by management of all federally managed lands within Camas County in such a way as to provide for continued use of allocated forage by permitted livestock and to work toward the restoration of forages to recover suspended Animal Unit Months (AUMs). The Act requires management practices designed to improve the range so that it will support "expansion of the forage resource" to the benefit of livestock production as well as wildlife.

Range improvements necessary to maintain current levels of livestock production; wildlife habitat, watershed protection, and recreation opportunity must be identified by the Bureau of Land Management and will be identified by Camas County, with appropriate input from affected interests. The Secretary of Interior, and therefore the Bureau of Land Management, is committed by statute to preserving the stability of the livestock industry. The stability of that industry as a whole is directly related to the stability of the individual ranches that make up the industry, including those in Camas County. The stability of the livestock industry in the County requires that the statutory mandates be followed.

The quality of economic life of Camas County as well as the scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archaeological values which are part of life in the County protected by the Federal Land Policy and Management Act require that the statutory mandates for stabilizing the livestock industry be followed.

However rural counties' socioeconomic wellbeing, safety, and culture are intimately tied to the management of the surrounding public lands. Moreover, counties are required by state law to

oversee the economic, social, and general wellbeing of the people and resources within their jurisdictions. In light of this, local land use plans are used to state the general requirements a county (or other local government) has of the surrounding federal land in order to meet these responsibilities. But in the end, all local land use plans have the same purpose: to serve as an officially adopted document laying out—in general terms—what management approaches on the neighboring federal lands a local government body requires to be taken in order to fulfill its statutory responsibilities.

Here are just a few examples of issues a local land use plan might address:

Specific goals as stated in the Camas Comprehensive Plan require that Rangeland in Camas County will develop landuse plans for including wildlife management which contains:

- Grazing plans developed rest and deferred rotation with independent monitoring targeted to maximize quality of range habitat and condition and trend, and tailored with season of use consideration.
- Be based on best/current science. Wildlife mitigation measures and habitat will utilize or be compatible to USDA-NRCS BMPs.
- Habitat and grazing plans will be developed for each allotment based on current inventory. Range land monitoring will be completed annually by establishment of transects or permanent photo points to insure habitat stability.
- Adjustments to grazing plans will be based on specifically identified impacts. Adjustments to grazing AUM's resulting from outside trailing use will be first deducted from voluntary reduced AUM set aside.
- Provide no loss of economic productivity
- Have no loss in demonstrated beneficial multiple use
- View grazing as management tool to control fire and invasive grasses (downy brome following fire)
- Balance productivity, sustainability and benefits when considering desired use of native grasses in restoration seeding.

**Attachments:** BLM Addressing of FWS COT Cross-Walk Recommendations\_07-08-14.docx

IDMT\_PUB\_9803  
3.3

Hey Folks –

I am sharing with you a paper that Quincy put together this morning in preparation for a meeting with the FWS today. He basically took the cross-walk table and their accompanying letter from the Draft EIS and identified how the issues had OR HAD NOT been resolved in the Proposed Plan. During today's meeting, some of them were further resolved, and others "popped-up". Quincy will be refining this paper based on today's meeting and future meetings with FWS yet to happen.

In effect, the remaining issues will probably surface again at the FFM in August, and thus, it is a good idea to provide this information to us in preparation for the FFM.

**SO.....a new homework assignment for all of you: Could you each do something similar to Quincy's paper and forward to me by the end of next week? Please display where you had problems in your cross-walk table, as well as what was provided in the FWS letter and show how you have or have not resolved those issues and comments. I will be sharing your information with the WO as we prepare our FFM agenda and talking points.**

It will be very important for us to know where the discrepancies are with FWS at the local level for the FFM.

Sorry to create more work for all of you.....but if you have been coordinating closely with FWS, the right hand column should show how it's all been resolved, or not!

Thanks,  
Lauren

## How FWS COT Cross-Walk Recommendations were Addressed in the Utah Sub-Region GRSG Proposed Plan

COT Issue	FWS COT Cross-Walk Recommendation	BLM Proposed Plan Action/Notes
Fire	1) Emphasize fire management within the natural variability of fire activity as defined by the best available science. Natural variability is defined as the ecological conditions, and the spatial and temporal variation in these conditions, that are relatively unaffected by people, within a period of time and geographical area appropriate to an expressed goal (Landres et al. 1999 in Baker 2011 ).	Pending consistent language for the Great Basin Region related to FIAT. No change specifically made, since "natural variability" may not provide for GRSG habitat objectives in every instance.
Fire	2) address the need to eliminate prescribed burning in GRSG breeding habitats unless biologically justified; if prescribed fire is retained as a management option, then a risk analysis (e.g., currently in development by WAFSA) should be required;	MA- FIRE-3
Fire	3) commit that GRSG populations must exist for restoration to be considered successful (i.e., inclusion of MA-GRSG-4 from Alternative C);	<b>No change made.</b> Discussed in various meetings, as well as in Portland and Denver with the other sub-regions. We are managing the habitat. We did include occupancy as one of the two components of no longer being considered "disturbed" but not the sole piece.
Fire	4) include a comprehensive framework of the monitoring framework that will be used;	Updated the monitoring appendix with the NPT recommended Monitoring Framework.
Fire	5) Include the ability to close fire-prone areas to OHV use during the fire season. We believe that Alternative D (MA-TTM-3) could meet this conservation option; however, we recommend modifying it to include specific language that will allow BLM/FS the flexibility to close OHV routes during the fire season.	MA-TTM-11
Fire	6) implement a collaborative system to allow effective coordination across jurisdictional boundaries as recommended by Alternative E1 (MA-FIRE-1);	MA- FIRE-1
Fire	7) apply limits to the use of vegetative stripping in healthy, unfragmented habitats unless fire and ecological conditions warrant;	MA- FIRE-3
Fire	8) add a specific discussion that ties the use of invasive pinyon-juniper removal as a potential fire management tool;	MA- FIRE-3
Fire	9) include the ability to develop and maintain sufficient native seed storage, rather than emphasizing the use of non-native seeds to address shortages;	<b>No change made.</b> Not an RMP decision.
Fire	10) Include the use of mechanical pinyon-juniper removal as a fire management tool;	MA-FIRE-3 and MA-VEG-1
Fire	11) Apply limits to the use of vegetative stripping in healthy, unfragmented habitats unless fire and ecological conditions warrant.	Same as Fire #7 above.
Fire	From main letter: Implement BLM Instruction Memorandum (IM) No. 2013-128, or its most recent iteration, for fuels management and fire operations direction.	MA-FIRE-2
Non-Native Invasive Plant Species	Implement Alternative C's 3 percent surface disturbance cap (inclusive of existing disturbances and fire) to PPMAs to maximize the integrity of large, intact sagebrush patches--at a minimum, if Alternative D is selected it should be modified such that the 5 (we recommend 3) percent disturbance cap includes fire disturbances because these disturbance play a large roll in the invasion of non-native plant species.	Proposed plan adopts a 3% disturbance objective with fire considered in the equation by affecting habitat availability (denominator). Consistent with regional coordination in Portland and Denver meetings.
Non-Native Invasive Plant Species	The Vegetation Management section of Alternative D clarify that BMPs (with respective citation/appendix reference) will be applied to all types of construction projects in sagebrush habitats.	<b>No change made.</b> The comments didn't include any BMPs to consider. There are already RDFs for fluid, non-energy leasables, and locatables, and some have been added for ROWs. In addition, there are many stipulations for mineral materials, Rec, travel, etc. Plus, MA-GRSG-7 addresses the need to additional site-specific mitigation.

COT Issue	FWS COT Cross-Walk Recommendation	BLM Proposed Plan Action/Notes
Sagebrush Removal	We...recommend adding a management action to avoid sagebrush removal in winter and breeding habitats unless otherwise biologically justified--in part utilizing the Connelly et al. (2000) and Hagen et al. (2007) guidelines. Exceptions should also consider the need for ecosystem management, including the conservation of other special status species.	MA-VEG-1
Grazing	1) Including a specific management decision to develop an educational component for grazing permittees;	No change made. This is not an RMP decision.
Grazing	2) addressing drought in habitat objectives and apply BLM IM No. 2013-094 and similar USFS guidance on FS lands;	MA-GRA-3 – RMPs do not tier to IMs.
Grazing	3) including specific discussion of the timeline for allotment habitat assessments (minimally a rotation of fewer than ten years) and the process by which adjustments in grazing management could be implemented;	No change made. This was discussed in our 6/27 coordination meeting. Timelines are not RMP decisions.
Grazing	4) including a commitment to ensure that all allotments located within PPMA have a current land health assessment. For those allotments that do not have a current assessment, we recommend prioritizing these for completion.	No change made. What is "current"? Rangeland Health Standards are evaluated prior to making term permit renewals. Can change MA-GRA-3 to note that monitoring and management actions would be focused...
Pinyon-Juniper Expansion	1) The selected alternative should include a no net gain commitment for juniper stands in phase 1 and 2 state of incursion in GRSG seasonal habitats with a target of removing all pinyon-juniper incursions;	Objective-GRSG-2; MA-VEG-1
Pinyon-Juniper Expansion	2) The selected alternative should include a commitment to a zero percent pinyon juniper incursion within 1kilometer (0.6 miles) of leks (Baruch-Mordo et al. 2013). An old-growth exception to the conservation measure should be included; if the lek is within 0.6 miles of an old growth pinyon-juniper stand the old growth should be retained for its value to the ecosystem and other species. Please include a management decision that describes the factors that will be used to determine what constitutes old growth juniper;	MA-VEG-1
Pinyon-Juniper Expansion	3) The selected alternative should include a management action, objective, or desired future condition for the elimination or reduction of juniper canopy cover to a maximum 5 percent cover (Freese 2009, Cassaza et al. 2010, Baruch-Mordo et al. 2013);	Objective-GRSG-2 points to this issue. In December and January, BLM, FS, and FWS talked about this and the potential difficulties with monitoring such an objective as FWS proposed.
Pinyon-Juniper Expansion	4) We recommend prioritizing areas for treatment based on the potential to improve or restore GRSG habitats (e.g., phase 1 or 2 state of incursion), with specific emphasis on lek sites, nesting habitats, and brood rearing habitats (Freese 2009, Casazza et al. 2010, Baruch-Mordo et al. 2013); and monitoring the long-term success of these prioritized sites;	MA-VEG-1
Pinyon-Juniper Expansion	5) prioritize mechanical removal of juniper as the preferred treatment method. If fire is being considered for juniper removal, we recommend BLM include a risk analysis (i.e. develop criteria) to evaluate whether the use of fire for juniper removal will potentially spread non-native invasive plants (see COT Crosswalk Comments, Fire, #2);	MA-VEG-1; MA-FIRE-3
Pinyon-Juniper Expansion	6) include specifics for how the BLM/FS will monitor the success of pinyon-juniper removal projects should be addressed in the final EIS.	Updated the monitoring appendix with the NPT recommended Monitoring Framework.
Range Management Structures	We recommend that either Alternative C is selected or Alternative D be expanded to apply conservation measures for range management structures to all GRSG habitat in PPMA.	All the grazing management actions apply to all GRSG habitat within PPMA.

COT Issue	FWS COT Cross-Walk Recommendation	BLM Proposed Plan Action/Notes
Fences	The COT report (option 1) recommends marking existing fences within high risk areas of collision (e.g., 1.2 miles of leks). We also recommend a 1.25 mile exclusion buffer for construction of new fences, particularly when fence densities in the area exceed 1.0 km/km <sup>2</sup> ) (Stevens 2012; also see Table 1, above). However, we acknowledge there may be scenarios where placement of fences is necessary to improve or enhance GRSG habitat (e.g. around springs or riparian areas, etc.). Therefore, we recommend that existing fences or newly constructed fences (installed for the benefit of GRSG), within 1.25 of a lek be marked using established methodology (NRCS 2012).	MA-GRA-17
Fences	We also recommend that you include the use of the NRCS fence collision risk tool (NRCS 2012), but also include our recommendations from Fences, #1, above;	MA-GRA-17
Fences	Consider prioritizing, and removing or avoiding the placement of fences in all GRSG habitats, particularly where bird collisions with the fence are documented or in flat terrain (Stevens 2012). Published research to date is limited to breeding habitats. Unpublished reports suggest sage-grouse fence collisions occur in other seasonal habitats including late brood rearing habitat and winter concentration areas (NRCS 2012).	MA-GRA-17
Recreation	We recommend you add language (from Alternative C, MA-REC-2 and MA-TTM-7) that excludes campground facilities, dispersed camping and non-motorized recreation (seasonally, during the lekking period), and prohibits new route construction within 4 miles of a lek in PPMA.	No change made. There is insufficient scientific evidence that this is needed to address threats described in the COT Report, 2010 listing, or DEIS.
Recreation	We recommend it include a timeline for completion of all travel management plans and	No change made. This was discussed in our 6/27 coordination meeting. Timelines are not RMP decisions, though MA-TTM-3 addresses regularly updating a prioritization timeline and MA-TTM-4 establishes priorities for completing transportation planning.
Recreation	Add the following management decision: Limit roads to less than 0.09 kilometers/kilometer <sup>2</sup> (Wisdom et al. 2011) in GRSG habitats in PPMA. This density should apply to new and existing roads, and if existing road density is above the recommended limits the existing roads should be closed or rerouted to the extent possible.	No change made. Discussed this issue in Portland. Wisdom et. al. used a specific data set of roads that is far less detailed than what is truly on the ground. Applying thresholds that are based on an incomplete data does not reflect the on-the-ground effects. Several TTM management actions address limiting route density.
Recreation	Include protection of other seasonal sage grouse habitats (i.e., brood rearing, and wintering) by minimizing the development of new recreational facilities. However, we also recommend adding a management decision that allows the consolidation of otherwise dispersed recreation sites. This may require some additional limited development of campgrounds or picnic areas but would overall reduce dispersed effects to GRSG and their habitats, thus benefiting the species in site-specific circumstances.	MA-REC-2
Energy	1) NSO stipulations are applied to new leases in GRSG habitat within PPMA. The proposed CSU stipulations for Alternative D state that PPMA outside of 4 miles of a lek include noise, tall structure, and timing restrictions. As discussed above, your proposed implementation of noise and seasonal stipulations appears to be applied only to initial construction activities, which would provide insufficient protection to GRSG habitats from long-term operation of energy facilities. It is important that protection of all important PPMA habitats applies to the long-term operation of energy facilities, and is not limited to initial construction activities;	MA-MIN-18. All PPMA would be managed as NSO.

COT Issue	FWS COT Cross-Walk Recommendation	BLM Proposed Plan Action/Notes
Energy	2) Permit Conditions of Approval (COA) are applied to existing fluid mineral leases that were issued without adequate stipulations for the protection of GRSG or their habitats. The COAs, including timing and CSU restrictions and appropriate Required Design Features (RDF), are applied to existing leases to eliminate or minimize surface-disturbing and disruptive activities within and adjacent to important nesting and brood-rearing habitat and winter concentration areas. We recommend these mechanisms be used to: a) preclude new surface occupancy (e.g., well pads, associated structures, roads) in GRSG habitats within PPMA (exceptions could apply as per Alternative B in MA-MIN-22); b) preclude new surface occupancy in all habitat types within 1 mile of leks within PPMA; c) apply noise, tall structure, and timing restrictions within all GRSG habitats in PPMA; and d) utilize BLM/FS authority to move well pads and other ancillary facilities to the extent necessary per the Yates court decision to ensure no new well pads for existing leases are constructed within the 1 mile lek buffer regardless of habitat type (not just a timing restriction on pad construction/drilling, but a year-round restriction on new pad siting/construction). We believe that our recommended stipulations on existing leases constitute reasonable measures to minimize adverse effects to GRSG while maintaining flexibility in planning future development;	MA-MIN-20 though MA-MIN-28, as well as MA-MIN-2  In the FWS letter, the following note is included: The Yates Petroleum Corp. (2008) decision states, "when making a decision regarding discrete surface-disturbing oil and gas development activities following site-specific environmental review, BLM has the authority to impose reasonable measures to minimize adverse impacts on other resource values, including restricting the siting or timing of lease activities."  In other public comments, additional information related to the Yates decision was provided: "in Yates, the IBLA merely affirmed the imposition of an additional COA based on site-specific information including recent and directly applicable scientific research. Yates, 176 IBLA at 157; William P. Maycock, 177 IBLA 1, 16-17 (2009). The Yates decision does not stand for the proposition that BLM can impose COAs whenever it deems necessary or in broad programmatic documents such as the Sage-grouse DLUPA. Rather, in Yates, the IBLA merely affirmed the imposition of an additional COA based on site-specific information including recent and directly applicable scientific research. See Conner v. Burford, 84 F.2d 1441, 1449-50 (9th Cir. 1988); 43 C.F.R. § 3101.1-2 (BLM can impose only "reasonable mitigation measures...to minimize adverse impacts...to the extent consistent with lease rights granted").
Energy	3) We recommend that a density (calculated as an average across PPMA habitats) of no more than 1 disturbance per section (640 acres) for existing and new fluid mineral development leases (e.g., one pad or one compressor station or one centralized water facility) should be incorporated into the FEIS as a standard Condition of Approval for existing leases. Well densities of 8 pads per square mile have been shown to exceed the species threshold of tolerance (Holloran 2005, Walker et al. 2007, Doherty et al. 2008) and GRSG breeding populations and lek attendance respond negatively when well pad densities exceeded 1 pad per square mile (Holloran 2005, Naugle et al. 2011). Our recommended disturbance density would also result in the clustering of surface disturbances, thereby minimizing fragmentation of habitats.	MA-MIN-2
Free Roaming Equid Mgmt.	From the letter: Conduct an analysis of the current AMLs to determine if they maintain suitable GRSG habitat parameters.	MA-WHB-4
Free Roaming Equid Mgmt.	We recommend selecting Alternatives B or C with the following revisions: 1) Include a commitment to support additional research to quantitatively determine impacts of wild horses and burros on sage-grouse habitat parameters;	<b>No change made.</b> Commitments to support research are not RMP decisions. MA-WHB-4, MA-WHB-3, and MA-WHB-1 get at this issue without adding a non-RMP decision.
Free Roaming Equid Mgmt.	2) add a commitment to consider drought conditions when establishing AMLs;	<b>No change made.</b> RMPs are not the place to establish AML criteria. BLM has a drought policy that is already referenced in the Proposed Plan (MA-GRA-7).
Free Roaming Equid Mgmt.	3) Include a measure to develop scientific procedures that can be replicated to count horses so that proper management actions can be implemented when numbers exceed AMLs; and	<b>No change made.</b> RMPs do not scientific procedures.
Free Roaming Equid Mgmt.	4) Commit to a comprehensive monitoring program with prescriptive management triggers to conserve GRSG and the species habitat;	Updated the monitoring appendix with the NPT recommended Monitoring Framework. Also added adaptive management triggers. Plus, Standards for Rangeland Health, addressed in the grazing section, apply to all land uses, included horses.
Free Roaming Equid Mgmt.	5) Specifically identify the processes (i.e., HMAs, NEPA) through which management activities will be considered and implemented (i.e., from Alternative B—MA-WHB-3, MA-WHB-4, MA-WHB-6).	<b>No change made.</b> An RMP does not identify processes through which management actions will be implemented. It identifies the management actions to be implemented.

COT Issue	FWS COT Cross-Walk Recommendation	BLM Proposed Plan Action/Notes
Mining	Alternative D could be modified as follows: 1) implement a 4-mile lek buffer exclusion area for all surface mining to provide assurance that mines will not be placed in seasonally-important habitats near leks;	Applied recommendations from NPT related to mining, plus a closure to protect leks and adjacent habitats (1 mile) – MA-MIN-3; MA-MIN-15. This is a closure to new mines, unless they are a free-use site (mineral materials), or are adjacent to existing operations. There are problems applying this same approach with coal and locatables, since they operate under different laws.
Mining	2) Add noise restrictions for all GRSG habitats in PPMA, i.e., leks, nesting, wintering, brood-rearing, and transition habitats (see General Comment section). Noise restrictions should apply to initial construction and long-term operation of project facilities.	MA-GRSG-3
Mining	3) include a requirement of restoration of all GRSG habitats in PPMA regardless of the existing percent surface disturbance	Objective-GRSG-3; MA-GRSG-7
Mining	5) (no 4 in the comments) include a specific commitment to discontinue leasing if needed to ensure successful restoration of prior disturbances;	Objective-GRSG-3; MA-MIN-3; MA-MIN-7
Mining	6) include a commitment that GRSG populations exist for restoration to be considered successful; and	<b>No change made.</b> Discussed in various meetings, as well as in Portland and Denver with the other sub-regions. We are managing the habitat. We did include occupancy as one of the two components of no longer being considered “disturbed” but not the sole piece.
Mining	7) include provisions specifically for abandoned mine reclamation.	<b>No change made.</b> Reclamation of abandoned mines is not an RMP decision. It is a health and safety issue that has its own program with the bureau.
Ex-Urban Development/Urbanization	Exclude new infrastructure from all important GRSG habitats within PPMA unless it can be demonstrated by the BLM/FS that these corridors will have no impacts on the maintenance of neutral or positive GRSG population trends and habitats.	Per recommendation from the NPT, adopted avoidance areas for ROWs in all PPMA.
Ex-Urban Development/Urbanization	Add a minimum 1-mile lek buffer exclusion area for all ROWs.	MA-LAR-2
Ex-Urban Development/Urbanization	Apply noise restrictions within all important seasonal GRSG habitats in PPMA (i.e., lek, nesting, wintering, brood-rearing, and transition habitats).	MA-GRSG-3
Infrastructure	We believe that Alternative D (primarily yellow) could meet this conservation objective with the following modifications: 1) exclude new infrastructure from all seasonal GRSG habitats within PPMA unless it can be demonstrated that a corridor would have no impacts on the maintenance of neutral or positive GRSG population trends and habitats;	Per recommendation from the NPT, adopted avoidance areas for ROWs in all PPMA.
Infrastructure	2) add a 1-mile lek buffer exclusion area (habitat and non-habitat) for all ROWs;	MA-LAR-2
Infrastructure	3) Require new power lines to be buried or modified (e.g., constructed in a way that reduces or eliminates nesting and perching by avian predators or collisions by GRSG) in all GRSG habitat within PPMA.	MA-LAR-2, MA-GRSG-3
Infrastructure	4) include mitigation for both direct and indirect impacts with GRSG occupancy as a primary success criteria;	<b>No change made.</b> Discussed in various meetings, as well as in Portland and Denver with the other sub-regions. We are managing the habitat. We did include occupancy as one of the two components of no longer being considered “disturbed” but not the sole piece. MA-GRSG-7 addresses mitigation.
Infrastructure	5) add a stipulation (in the Lands and Realty section of the EIS) that provides specific measures to ensure that roads associated with infrastructure corridors are closed or limited for public use;	Not addressed specifically, because there may be instances where this isn't the least impacting approach for GRSG. The concept is addressed in MA-LAR-2; MA-LAR-3; MA-TTM-3.
Infrastructure	6) include in the Lands and Realty section specific commitment to removal or decommissioning of roads associated with infrastructure in GRSG habitats;	Not addressed specifically, because there may be instances where this isn't the least impacting approach for GRSG. The concept is addressed in MA-LAR-2; MA-LAR-3; MA-TTM-3.

COT Issue	FWS COT Cross-Walk Recommendation	BLM Proposed Plan Action/Notes
Infrastructure	7) add a commitment to use available methods to restrict nesting and perching by avian predators in all seasonal GRSG habitats; and	MA-GRSG-3, but is tied to breeding and nesting habitats.
Infrastructure	8) Apply noise restrictions within all GRSG habitats (i.e, lekking, nesting, brood-rearing, wintering, transition) within PPMA. Noise restrictions should apply to initial construction and long-term operation of project facilities.	MA-GRSG-3
Infrastructure	9) Apply a minimum 4-mile lek exclusion buffer for compressor stations because of their associated size and noise levels.	<b>No change made.</b> Between the noise restrictions (MA-GRSG-3), the 1/640 requirement (MA-MIN-2), the disturbance threshold (Objective-GRSG-3), and the ROW allocations (MA-LAR-2), there is really no need for a specific action only for compressor stations. All these actions address the size and noise threats.
Infrastructure	10) Provide management decisions to ensure that roads associated with infrastructure corridors are closed or limited for public use.	Same as Infrastructure #5 above.
Infrastructure	From the Letter: Please review MA-LAR-3 for Alternative D, which states that additional mitigation will be implemented [only] if the disturbance exceeds 5 percent. We believe this is inconsistent with MA-GRSG-9, which appropriately mitigates for all disturbances regardless of disturbance cap.	That language was removed. All action would be required to comply with Objective-GRSG-3 and MA-GRSG-7, both of which address no-net-unmitigated loss in PPMA and PGMA, as well as mitigation of impacts.
PACs	The selected Alternative B, C, or D should include: 1) The Anthro Mountain and West Tavaputs areas in northeastern Utah as PPMA;	MA-GRSG-1 and associated map. They are PPMA in the proposed plan.
PACs	2) The entirety of the Bald Hills and Panguitch areas as PPMA;	MA-GRSG-1 and associated map. Through explanations and discussions of biological rationale, some of the Bald Hills area is still PGMA. All Panguitch area is PPMA.
PACs	3) a commitment to incorporate available scientific literature (e.g., Connelly et al. 2000, Hagen et al. 2007) in the restoration of GRSG habitat;	Objective-GRSG-2
PACs	4) a commitment that GRSG occupy an area for restoration to be consider successful;	<b>No change made.</b> Discussed in various meetings, as well as in Portland and Denver with the other sub-regions. We are managing the habitat. We did include occupancy as one of the two components of no longer being considered "disturbed" but not the sole piece. MA-GRSG-7 addresses mitigation.
PACs	5) a collaborative approach to fuels management and landscape scale conservation which should increase effectiveness of habitat restoration; and	Objective-GRSG-2; Objective-GRSG-5; MA-FIRE-1; MA-FIRE-3
PACs	6) a comprehensive monitoring framework and an adaptive management framework, which we understand are in development;	Updated the monitoring appendix with the NPT recommended Monitoring Framework, and have developed the adaptive management triggers. Still working on identifying the management response if a hard trigger is tripped.
PACs	6) (duplicated in the comment letter) consideration of a 3 percent disturbance cap in PPMA.	Proposed plan adopts a 3% disturbance objective with fire considered in the equation by affecting habitat availability (denominator). Consistent with regional coordination in Portland and Denver meetings.

Hi Peggy,

Since Kathy is out, are you able to help us get these letters sent out? I have also attached the mailing list for creating labels. Thank you so much!

To: Kathy Mondor <[kmondor@blm.gov](mailto:kmondor@blm.gov)>, Brent Ralston <[bralston@blm.gov](mailto:bralston@blm.gov)>

Hi Kathy,

Here are the two letters for the sage-grouse draft plan package, which we will be sending along with the package to cooperating agencies and tribes.

So, are we good to go for Tim's signature? Of course, since you are so good at editing/catching any mistakes, if you want to read through these really quickly, I'd appreciate it!

Of course, let me know if you need any help from me. Thank you so much!

Dear Cooperating Agency:

The BLM and Forest Service (FS) in the Idaho and Southwestern Montana Sub Region have prepared an administrative draft proposed plan (ADPP). Due to your involvement with BLM for this effort, you have an opportunity to provide feedback on this ADPP before it is published in the Proposed Plan/Final Environmental Impact Statement (FEIS). The BLM Preliminary Proposed Plan goals, objectives, management actions, associated maps and supporting appendices are enclosed for your cooperating agency review. The USFS Preliminary Proposed Plan Amendments will be included in the Final EIS/LUPA, but are not included at this time for review as they are still under development. Enclosed is a CD with the applicable electronic files for review and associated directions and comment form.

Please make any comments electronically within the comment form and upon completion of your review please send them electronically, preferably via email to:

Brent Ralston at [bralston@blm.gov](mailto:bralston@blm.gov)

In order to meet the timeline for providing our Final EIS/LUPA to the U.S. Fish and Wildlife Service, we ask that you review these documents and provide your comments and input back to us by July 18, 2014. We realize this is a short timeframe and we apologize for the inconvenience. Providing information regarding the consistency of the Preliminary Proposed Plan Amendment with your respective federal, Tribal, State or County plans will present a useful, accurate response from your perspective and will allow us to specifically address any inconsistencies in the Final EIS.

Please remember these are not public documents and are being provided for your review based on your Cooperating Agency relationship with the BLM. We request that you maintain the confidentiality of these documents throughout your review until the BLM and USFS release this information to the public.

If you have any questions, contact Brent Ralston (BLM Idaho) at (208) 373-3812. Thank you in advance for your review and input throughout this planning process; we look forward to receiving your comments.

Sincerely,

Timothy M. Murphy  
Acting Idaho State Director  
Bureau of Land Management

Dear Chairman Small:

The BLM and Forest Service (FS) in the Idaho and Southwestern Montana Sub Region have prepared an administrative draft proposed plan (ADPP). Due to your involvement with BLM for this effort, you have an opportunity to provide feedback on this ADPP before it is published in the Proposed Plan/Final Environmental Impact Statement (FEIS). The BLM Preliminary Proposed Plan goals, objectives, management actions, associated maps and supporting appendices are enclosed for your review. The USFS Preliminary Proposed Plan Amendments will be included in the Final EIS/LUPA, but are not included at this time for review as they are still under development. Enclosed is a CD with the applicable electronic files for review and associated directions and comment form.

Please make any comments electronically within the comment form and upon completion of your review, please send them electronically, preferably via email to:  
Brent Ralston at [bralston@blm.gov](mailto:bralston@blm.gov)

We request that you provide specific information regarding the consistency of the ADPP with your respective Tribal Plans and Tribal rights and interests; noting any inconsistencies you feel may exist. This will allow us to specifically address your comments and concerns as we develop the Final EIS.

This review precedes release to the public. As such, these are not public documents and are being provided for your review based on your unique status and governmental relationship with the BLM. We request that you maintain the confidentiality of these documents throughout your review until the BLM and USFS release this information to the public.

If you have any questions, contact Brent Ralston (BLM Idaho) at (208) 373-3812. Thank you in advance for your review and input throughout this planning process; we look forward to receiving your comments.

SUBJECT

IDL Proposed Greater Sage-Grouse Conservation Plan

BACKGROUND

Greater Sage-grouse (sage-grouse) is a candidate species currently being reviewed by the US Fish and Wildlife Service (USFWS) to determine listing status under the Endangered Species Act (ESA). As a direct outcome of the proposed ESA listing review, the US Bureau of Land Management (BLM) initiated a draft Land Use Plan Amendment and Environmental Impact Statement (EIS) pertaining to the sage-grouse throughout BLM's management zones within sage-grouse habitat.

The State of Idaho engaged in similar efforts and Governor Otter submitted an Idaho Plan to be considered by the BLM in the EIS alternative analysis. It now appears that much of the Idaho Plan will become the BLM's Preferred Alternative for management of BLM's lands in Idaho.

As part of Idaho's commitment to conserving sage-grouse, the Idaho Department of Lands (IDL) has developed draft Conservation Measures for Endowment Trust Land management programs and for Regulatory and Assistance programs that complement the Governor's Sage-grouse Plan for federal land management in Idaho.

DISCUSSION

In October 2014, the IDL Director Tom Schultz established a working group which consisted of various IDL staff which oversee programs that could be affected by the listing of the sage-grouse. This group held regular meetings over the last three months to develop recommended conservation measures as part of IDL's *Proposed Greater Sage-Grouse Conservation Plan* based on the group's review of the science and what other western states are proposing. The conservation measures were also designed to be complementary to BLM's Preferred Alternative for Idaho.

Attachment 1 is IDL's *Proposed Greater Sage-Grouse Conservation Plan*. For proposed activities by third parties on state endowment trust lands, IDL will implement sage-grouse conservation measures as enforceable stipulations in authorizing documents such as leases, permits and easements. The authorized activities include: alternative energy development (solar, wind, and geothermal); oil and gas exploration and development; mining; grazing; miscellaneous commercial activities; and the granting of access through rights-of-way, including easements. In addition, IDL as the land manager will implement and support fire prevention and mitigation measures and wildfire suppression efforts to minimize the impact to sage-grouse and their habitat.

For regulatory and assistance activities, conservation measures will be voluntary best management practices (BMP's) on private land because IDL does not have the statutory authority within its regulatory programs or assistance activities to require adoption by authorized parties. Regulatory and assistance activities include: Abandoned Mine Lands Projects; Dredge and Placer Mine Permits; Mine Reclamation Plan Approvals; and Oil and Gas Permits (seismic imaging surveys, well drilling). Where appropriate, IDL will include recommended best management practices within its authorizing documents to encourage compliance.

Additionally, for some fire programs, IDL will implement actions through its roles and responsibilities that support enhanced fire preparedness and suppression in sage-grouse habitats.

IDL is planning to bring the *Proposed Greater Sage-Grouse Conservation Plan* back to the Land Board for approval at the regularly scheduled meeting in March. In the meantime, IDL will be conducting several stakeholder outreach meetings to gather feedback on the document from industry, other governmental agencies and several non-governmental organizations.

#### ATTACHMENTS

**DEPARTMENT OF THE INTERIOR**

**Bureau of Land Management**

[LLWO2100000  
 L11100000.DQ0000.LXSISGST0000]

**Notice of Availability of the Great Basin Region Greater Sage-Grouse Proposed Land Use Plan Amendments and Final Environmental Impact Statements for the Sub-Regions of Idaho and Southwestern Montana; Nevada and Northeastern California; Oregon; and Utah**

**AGENCY:** Bureau of Land Management, Interior.

**ACTION:** Notice of availability.

**SUMMARY:** In accordance with the National Environmental Policy Act of 1969 (NEPA), as amended, the Federal Land Policy and Management Act of 1976 (FLPMA), as amended, and the Resources Planning Act of 1974, as amended by the National Forest Management Act of 1976 (NFMA), the Bureau of Land Management (BLM) and U.S. Forest Service (Forest Service) have prepared Proposed Land Use Plan Amendments (LUPA) and Final Environmental Impact Statements (EISs) for planning units in Idaho, Southwestern Montana, Nevada, Northeastern California, Oregon, and Utah. There are four separate Final EISs being conducted in the Great Basin Region and this notice announces the availability of all four.

**DATES:** BLM planning regulations state that any person who meets the conditions as described in the regulations may protest the BLM's and Forest Service's Proposed LUPA/Final EIS. A person who meets the conditions and files a protest must file the protest within 30 days of the date that the Environmental Protection Agency publishes its Notice of Availability in the **Federal Register**. In accordance with 36 CFR 219.59, the Forest Service will waive its objection procedures of this subpart and instead adopt the BLM's protest procedures outlined in 43 CFR 1610.5-2.

**ADDRESSES:** Copies of the Idaho and Southwestern Montana, Nevada and Northeastern California, Oregon, and Utah Greater Sage-Grouse Proposed LUPAs/Final EISs have been sent to affected Federal, State and local government agencies, tribal governments, and to other stakeholders and members of the public who have requested copies. Copies of the Proposed LUPAs/Final EISs are available for public inspection at the addresses listed in the **SUPPLEMENTARY INFORMATION** section. Interested persons

may also review the Proposed LUPAs/ Final EISs on the internet at <http://www.blm.gov/wo/st/en/prog/more/sagegrouse.html>.

All protests must be in writing and mailed to one of the following addresses:

Regular Mail: BLM Director (210), Attention: Protest Coordinator, P.O. Box 71383, Washington, DC 20024-1383.

Overnight Delivery: BLM Director (210), Attention: Protest Coordinator, 20 M Street SE., Room 2134LM, Washington, DC 20003.

**FOR FURTHER INFORMATION CONTACT:** *For the Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/ Final EIS:* Jonathan Beck, BLM Idaho State Office GRSG Planning Lead, telephone 208-373-4070; address 1387 South Vinnell Way, Boise, ID 83709; email [jmbeck@blm.gov](mailto:jmbeck@blm.gov).

*For the Nevada and Northeastern California Greater Sage-Grouse Proposed LUPA/Final EIS:* Lauren Mermejo, BLM Nevada State Office GRSG Project Lead, telephone 775-861-6580; address 1340 Financial Boulevard, Reno, NV 89502; email [lmermejo@blm.gov](mailto:lmermejo@blm.gov).

*For the Oregon Greater Sage-Grouse Proposed LUPA/Final EIS:* Joan Suther, BLM Oregon State Office GRSG Planning Lead, telephone 541-573-4445; address BLM Burns District, 28910 Hwy 20, West Hines, OR 97738; email [jsuther@blm.gov](mailto:jsuther@blm.gov).

*For the Utah Greater Sage-Grouse Proposed LUPA/Final EIS:* Quincy Bahr, BLM Utah State Office GRSG Project Lead, telephone 801-539-4122; address 440 West 200 South, Suite 500, Salt Lake City, UT 84101-1345; email [qfbahr@blm.gov](mailto:qfbahr@blm.gov).

Persons who use a telecommunications device for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 1-800-877-8339 to contact the above individuals during normal business hours. The FIRS is available 24 hours a day, 7 days a week, to leave a message or question with the above individual. You will receive a reply during normal business hours.

**SUPPLEMENTARY INFORMATION:** The BLM and Forest Service prepared the Idaho and Southwestern Montana, Nevada and Northeastern California, and Utah Greater Sage-Grouse LUPAs and EISs. The Oregon LUPA/EIS was prepared solely by the BLM because there were no National Forest System lands involved. All four of these Proposed LUPAs/Final EISs address a range of alternatives focused on specific conservation measures across the range of the Greater Sage-Grouse (GRSG). All four of these EISs are part of a total of 15 separate EISs that make up the BLM

and Forest Service National Greater Sage-Grouse Planning Strategy. These four EISs will amend the following BLM Resource Management Plans (RMPs) and Management Framework Plans (MFPs) and Forest Service Land and Resource Management Plans (LRMP) in the Great Basin Region:

**California**

- Alturas RMP (2008)
- Eagle Lake RMP (2008)
- Surprise RMP (2008)

**Idaho**

- Birds of Prey NCA RMP (2008)
- Bruneau RMP revision (and existing 1983 Bruneau MFP)
- Challis RMP (1999)
- Craters of the Moon NM RMP (2006)
- Four Rivers RMP revision (and existing 1988 Cascade RMP and 1983 Kuna and Bruneau MFPs)
- Jarbidge RMP revision (and existing 1987 Jarbidge RMP)
- Lemhi RMP (1987)
- Owyhee RMP (1999)
- Pocatello RMP revision
- Shoshone-Burley RMP revision (and existing 1980 Bennett Hills/ Timmerman Hills, 1985 Cassia, 1975 Magic, 1985 Monument, 1981 Sun Valley, and 1982 Twin Falls MFPs/RMPs)
- Upper Snake RMP revision (and existing 1983 Big Lost, 1985 Medicine Lodge, 1981 Big Desert, and 1981 Little Lost-Birch Creek MFPs/RMPs)
- Boise National Forest, LRMP (2003)
- Curlew National Grassland Management Plan, LRMP (2002)
- Caribou National Forest, Revised LRMP (2003)
- Caribou-Targhee National Forest, Targhee National Forest LRMP (1997)
- Salmon-Challis National Forest, Challis National Forest LRMP (1987)
- Salmon-Challis National Forest, Salmon National Forest LRMP (1988)
- Sawtooth National Forest, Revised LRMP (2003)

**Montana**

- Dillon RMP (2006)
- Beaverhead-Deerlodge National Forest, LRMP (2009)

**Nevada**

- Battle Mountain RMP revision (and existing 1997 Tonopah and 1986 Shoshone-Eureka RMPs)
- Black Rock Desert-High Rock Canyon NCA RMP (2004)
- Carson City RMP revision (and existing 2001 Carson City Consolidated RMP)
- Elko RMP (1987)
- Ely RMP (2008)

- Wells RMP (1985)
- Winnemucca RMP revision (and existing 1982 Paradise-Denio MFP and 1982 Sonoma-Gerlach RMP)
- Humboldt National Forest, LRMP (1986)
- Toiyabe National Forest, LRMP (1986)

### Oregon

- Andrews RMP (2005)
- Baker RMP revision (and existing 1989 Baker RMP)
- Brothers-LaPine RMP (1989)
- Lakeview RMP amendment (and existing 2003 Lakeview RMP)
- Southeastern Oregon RMP amendment (and existing 2003 Southeastern Oregon RMP)
- Steens RMP (2005)
- Three Rivers RMP (1992)
- Upper Deschutes RMP (2005)

### Utah

- Box Elder RMP (1986)
- Cedar/Beaver/Garfield/Antimony RMP (1986)
- Grand Staircase-Escalante National Monument Management Plan (2000)
- House Range RMP (1987)
- Kanab RMP (2008)
- Park City MFP (1975)
- Pinyon MFP (1978)
- Pony Express RMP (1990)
- Price RMP (2008)
- Randolph MFP (1980)
- Richfield RMP (2008)
- Salt Lake District Isolated Tracts Planning Analysis (1985)
- Vernal RMP (2008)
- Warm Springs RMP (1987)
- Dixie National Forest, LRMP (1986)
- Fishlake National Forest, LRMP (1986)
- Uinta National Forest, Revised LRMP (2003)
- Wasatch-Cache National Forest, Revised LRMP (2003)
- Ashley National Forest, LRMP (1986)
- Manti-La Sal National Forest, LRMP (1986)

Management decisions made as a result of these Proposed LUPAs/Final EISs will apply only to BLM-administered and National Forest System lands in the planning area. The planning areas for all four EISs includes approximately 194.0 million acres of BLM, National Park Service, Forest Service, U.S. Bureau of Reclamation, State, tribal, local, and private lands located in 28 Idaho counties (Ada, Adams, Bear Lake, Bingham, Blaine, Bonneville, Butte, Camas, Caribou, Cassia, Clark, Custer, Elmore, Fremont, Gem, Gooding, Jefferson, Jerome, Lemhi, Lincoln, Madison, Minidoka, Oneida, Owyhee, Payette, Power, Twin Falls, and Washington), 7 Montana counties

(Montana, Beaverhead, Deer Lodge, Fremont, Clark, Madison, and Silver Bow), 16 Nevada counties (Carson City, Churchill, Douglas, Elko, Esmeralda, Eureka, Humboldt, Lander, Lincoln, Lyon, Mineral, Nye, Pershing, Storey, Washoe, and White Pine), 5 California counties (Lassen, Modoc, Plumas, Siskiyou, and Sierra), 8 Oregon counties (Baker, Crook, Deschutes, Grant, Harney, Lake, Malheur, and Union), 24 Utah counties (Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Morgan, Piute, Rich, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Wayne, and Weber), and 2 Wyoming counties (Sweetwater and Uinta). The decision area for these Proposed LUPAs/Final EISs is defined as those BLM-administered and National Forest System lands and Federal mineral estate within the following habitat management categories:

- Priority Habitat Management Area (PHMA)—Areas identified as having the highest conservation value for maintaining sustainable GRSG populations; includes breeding, late brood-rearing, and winter concentration areas.

- Important Habitat Management Area (IHMA) (applicable to Idaho only)—Areas identified as having generally moderate to high conservation value habitat and/or populations that provide a management buffer for the PHMA and to connect patches of PHMA.

- General Habitat Management Area (GHMA)—Areas of seasonal or year-round GRSG habitat outside of PHMAs.

The Notice of Intent (NOI) to prepare the Idaho and Southwestern Montana, Nevada and Northeastern California, Oregon, and Utah Greater Sage-Grouse LUPAs/EISs was published in the **Federal Register** on December 9, 2011. A Notice of Availability (NOA) for the Idaho and Southwestern Montana, Nevada and Northeastern California, and Utah Draft LUPAs/EISs was published in the **Federal Register** on November 1, 2013. The Oregon Draft LUPA/EIS was released to the public on November 26, 2013. Comments on the Draft LUPAs/EISs received from the public and internal BLM and Forest Service review were considered and incorporated, as appropriate, into the Proposed Plan.

The alternatives presented in Proposed LUPAs/Final EISs are described below:

- Alternative A would retain the current management goals, objectives and direction specified in the existing

BLM RMPs and the Forest Service LRMPs.

- Alternative B is based on the conservation measures developed by the National Technical Team (NTT) planning effort in Washington Office Instructional Memorandum (IM) Number 2012–044. As directed in the IM, the conservation measures developed by the NTT must be considered and analyzed, as appropriate, through the land use planning process and NEPA by all BLM state and field offices that contain occupied GRSG habitat. Most management actions included in Alternative B would be applied to PHMA.

- Alternative C is based on a citizen groups' recommended alternative. This alternative emphasizes improvement and protection of habitat for GRSG and is applied to all occupied GRSG habitat. Alternative C would limit commodity development in areas of occupied GRSG habitat, and would close or designate portions of the planning area to some land uses. The Utah LUPA/Draft EIS combined this alternative with Alternative F (discussed below).

- Alternative D, which was identified as the Preferred Alternative in the Draft EIS, balances opportunities to use and develop the planning area and protects GRSG habitat based on scoping comments and input from Cooperating Agencies involved in the alternatives development process. Protective measures would be applied to GRSG habitat.

- Alternative E is the alternative provided by the State or Governor's offices for inclusion and analysis in the EISs. It incorporates guidance from specific State Conservation strategies and emphasizes management of greater sage-grouse seasonal habitats and maintaining habitat connectivity to support population objectives. This alternative was identified as a co-Preferred Alternative in the Idaho and Southwestern Montana Draft EIS.

- Alternative F is also based on a citizen group recommended alternative. This alternative emphasizes improvement and protection of habitat for GRSG and defines different restrictions for PHMA and GHMA.

Alternative F would limit commodity development in areas of occupied GRSG habitat, and would close or designate portions of the planning area to some land uses. This alternative does not apply to the Utah sub-regional planning effort, as it was combined with Alternative C.

- The Proposed LUPA incorporates guidance from specific State Conservation strategies, as well as

additional management based on the NTT recommendations. This alternative emphasizes management of GRSG seasonal habitats and maintaining habitat connectivity to support population objectives.

The BLM and Forest Service received approximately 4,990 substantive comments, contained in 74,240 submissions during the four Draft EISs' comment periods. Based on comments received during the NEPA process, the following comment topics were frequently identified:

- General (Process/Policy);
- Lands and Realty;
- Livestock Grazing;
- Minerals and Energy;
- Predation;
- Recreation;
- Socioeconomic;
- Special Management Area

Designations;

• Special Status Species (Including GRSG);

- Travel and Access Management;
- Vegetation;
- Wildland Fire Management;
- Wildlife and Fisheries.

For the Idaho and Southwestern Montana GRSG Proposed LUPA/Final EIS, the BLM and Forest Service conducted seven public meetings. These meetings were held in Murphy, Idaho Falls, Salmon, Pocatello, Twin Falls, and Boise in Idaho and Dillon in Montana during January 2014. For the Nevada and Northeastern California GRSG Proposed LUPA/Final EIS, the BLM and Forest Service conducted seven public meetings. These meetings were held in Cedarville and Susanville, California, and in Reno, Tonopah, Ely, Elko, and Winnemucca, Nevada in early December 2013. For the Oregon GRSG Proposed LUPA/Final EIS, the BLM conducted seven public meetings. These meetings were held in Baker City, Burns, Durkee, Jordan Valley, Lakeview, Ontario and Prineville, Oregon during January 2014. For the Utah GRSG Proposed LUPA/Final EIS, the BLM and Forest Service conducted eight public meetings. These meetings were held in Cedar City, Panguitch, Price, Randolph, Richfield, Salt Lake City, Snowville, and Vernal, Utah during November and December 2013. Comments on the Draft LUPAs/Draft EISs received from the public and internal BLM and Forest Service review were carefully considered and incorporated as appropriate into the proposed LUPAs/Final EISs. The BLM and Forest Service, via the Western Association of Fish and Wildlife Agencies (WAFWA) Management Zone Greater Sage-Grouse Conservation Team, will develop a Regional Mitigation Strategy to guide

the application of the mitigation hierarchy to address impacts within that Zone. The Regional Mitigation Strategy should consider any State-level GRSG mitigation guidance that is consistent with the requirements. The Regional Mitigation Strategy will be developed in a transparent manner, based on the best science available and standardized metrics.

*Copies of the Idaho and Southwestern Montana GRSG Proposed LUPA/Final EIS are available for public inspection at:*

- BLM Idaho State Office, 1387 S. Vinnell Way, Boise, ID 83709
- BLM Boise District Office, 3948 Development Avenue, Boise, ID 83705
- BLM Owyhee Field Office, 20 First Avenue West, Marsing, ID 83639

Instructions for filing a protest with the Director of the BLM regarding the Proposed LUPAs/Final EISs may be found in the "Dear Reader" Letter of the Proposed LUPAs/Final EISs and at 43 CFR 1610.5-2. All protests must be in writing and mailed to the appropriate address, as set forth in the **ADDRESSES** section above. Emailed protests will not be accepted as valid protests unless the protesting party also provides the original letter by either regular mail or overnight delivery postmarked by the close of the protest period. Under these conditions, the BLM and Forest Service will consider an emailed protest as an advance copy and it will receive full consideration. If you wish to provide the BLM and Forest Service with such advance notifications, please direct emails to [protest@blm.gov](mailto:protest@blm.gov).

Before including your address, phone number, email address, or other personal identifying information in your protest, you should be aware that your entire protest—including your personal identifying information—may be made publicly available at any time. While you may ask us in your protest to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

**Authority:** 36 CFR 219.59, 40 CFR 1506.6, 40 CFR 1506.10, 43 CFR 1610.2; 43 CFR 1610.5

**Amy Lueders,**

*Acting Assistant Director, Renewable Resources & Planning.*

**Notice of Availability of the Proposed Resource Management Plan and Final Environmental Impact Statement for the Billings and Pompeys Pillar National Monument Resource Management Plan Revision, Billings Field Office, Montana**

**AGENCY:** Bureau of Land Management, Interior.

**ACTION:** Notice of availability.

**SUMMARY:** In accordance with the National Environmental Policy Act of 1969 (NEPA), as amended, and the Federal Land Policy and Management Act of 1976 (FLPMA), as amended, the Bureau of Land Management (BLM) has prepared a Proposed Resource Management Plan (RMP) and Final Environmental Impact Statement (EIS) for the Billings planning area, including Pompeys Pillar National Monument, and by this notice is announcing its availability.

**DATES:** The BLM planning regulations state that any person who meets the conditions as described in the regulations may protest the BLM's Proposed RMP/Final EIS. A person who meets the conditions and files a protest must file the protest within 30 days of the date that the Environmental Protection Agency publishes its notice of availability in the **Federal Register**.

**ADDRESSES:** Copies of the Billings and Pompeys Pillar National Monument Proposed RMP/Final EIS have been sent to affected Federal, State, and local government agencies, tribal governments, and to other stakeholders and members of the public. Copies of the Proposed RMP/Final EIS are available for public inspection at the following locations:

- BLM, Montana State Office and Billings Field Office, 5001 Southgate Drive, Billings, MT 59101.

Interested persons may also review the Proposed RMP/Final EIS on the Internet at <http://on.doi.gov/1EJBdaE>.

All protests must be in writing and mailed to one of the following addresses:

Regular Mail: BLM Director (210),  
Attention: Protest Coordinator, P.O.  
Box 71383, Washington, DC 20024-  
1383.

Overnight Delivery: BLM Director (210),  
Attention: Protest Coordinator, 20 M  
Street SE., Room 2134LM,  
Washington, DC 20003.

**FOR FURTHER INFORMATION CONTACT:**

Carolyn Sherve-Bybee, Billings and Pompeys Pillar National Monument RMP Team Leader, telephone: 406-896-5234; address: 5001 Southgate Drive, Billings, MT 59101; email: [billings\\_pompeyspillar\\_rmp@blm.gov](mailto:billings_pompeyspillar_rmp@blm.gov). Persons who use a telecommunications device for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 1-800-877-8339 to contact the above individual during normal business hours. The FIRS is available 24 hours a day, 7 days a week, to leave a message or question with the above individual. You will receive a reply during normal business hours.

**SUPPLEMENTARY INFORMATION:** The planning area includes lands within the BLM Billings Field Office's administrative boundaries, including Carbon, Golden Valley, Musselshell, Stillwater, Sweet Grass, Wheatland, and Yellowstone Counties in Montana, and portions of Big Horn County, Montana and Big Horn County, Wyoming. The planning area includes all lands, regardless of jurisdiction, totaling approximately 10.37 million acres; however, the BLM will only make decisions on lands that fall under the BLM's jurisdiction. The BLM decision area is comprised of approximately 434,154 acres of the surface estate in the planning area and 889,479 acres of Federal mineral estate. The revised RMP will replace the 1984 Billings RMP, as amended. The Draft RMP/EIS was made available for public review for a 90-day period on March 29, 2013 (78 FR 19291). The Draft RMP/EIS included a series of management actions, within four management alternatives, designed to address management challenges and issues raised during scoping. These included, but were not limited to, trails and travel management, wildlife habitat management including that of the Greater Sage-Grouse, energy development (coal and oil and gas), livestock grazing, recreation, lands with wilderness characteristics, special management areas including Areas of Critical Environmental Concern (ACEC) and the Pryor Mountain Wild Horse Range, and management of the cultural and historic resources at Pompeys Pillar National Monument. In accordance with 43 CFR 1610.7-2(b), the Notice of Availability for the Draft RMP/EIS announced a concurrent public comment period on proposed ACECs.

Comments on the Draft RMP/Draft EIS received from the public and internal BLM review were considered and incorporated as appropriate into the Proposed RMP/Final EIS which analyzes four alternatives:

**DEPARTMENT OF THE INTERIOR**

**Bureau of Land Management**

[LLWO2100000

**Notice of Availability of the Great Basin Region Greater Sage-Grouse Proposed Land Use Plan Amendments and Final Environmental Impact Statements for the Sub-Regions of Idaho and Southwestern Montana; Nevada and Northeastern California; Oregon; and Utah**

**AGENCY:** Bureau of Land Management, Interior.

**ACTION:** Notice of availability.

**SUMMARY:** In accordance with the National Environmental Policy Act of 1969 (NEPA), as amended, the Federal Land Policy and Management Act of 1976 (FLPMA), as amended, and the Resources Planning Act of 1974, as amended by the National Forest Management Act of 1976 (NFMA), the Bureau of Land Management (BLM) and U.S. Forest Service (Forest Service) have prepared Proposed Land Use Plan Amendments (LUPA) and Final Environmental Impact Statements (EISs) for planning units in Idaho, Southwestern Montana, Nevada, Northeastern California, Oregon, and Utah. There are four separate Final EISs being conducted in the Great Basin Region and this notice announces the availability of all four.

**DATES:** BLM planning regulations state that any person who meets the conditions as described in the regulations may protest the BLM's and Forest Service's Proposed LUPA/Final EIS. A person who meets the conditions and files a protest must file the protest within 30 days of the date that the Environmental Protection Agency publishes its Notice of Availability in the **Federal Register**. In accordance with 36 CFR 219.59, the Forest Service will waive its objection procedures of this subpart and instead adopt the BLM's protest procedures outlined in 43 CFR 1610.5-2.

**ADDRESSES:** Copies of the Idaho and Southwestern Montana, Nevada and Northeastern California, Oregon, and Utah Greater Sage-Grouse Proposed LUPAs/Final EISs have been sent to affected Federal, State and local government agencies, tribal governments, and to other stakeholders and members of the public who have requested copies. Copies of the Proposed LUPAs/Final EISs are available for public inspection at the addresses listed in the **SUPPLEMENTARY INFORMATION** section. Interested persons

may also review the Proposed LUPAs/ Final EISs on the internet at <http://www.blm.gov/wo/st/en/prog/more/sagegrouse.html>.

All protests must be in writing and mailed to one of the following addresses:

Regular Mail: BLM Director (210), Attention: Protest Coordinator, P.O. Box 71383, Washington, DC 20024-1383.  
Overnight Delivery: BLM Director (210), Attention: Protest Coordinator, 20 M Street SE., Room 2134LM, Washington, DC 20003.

**FOR FURTHER INFORMATION CONTACT:** *For the Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/ Final EIS:* Jonathan Beck, BLM Idaho State Office GRSG Planning Lead, telephone 208-373-4070; address 1387 South Vinnell Way, Boise, ID 83709; email [jmbeck@blm.gov](mailto:jmbeck@blm.gov).

*For the Nevada and Northeastern California Greater Sage-Grouse Proposed LUPA/Final EIS:* Lauren Mermejo, BLM Nevada State Office GRSG Project Lead, telephone 775-861-6580; address 1340 Financial Boulevard, Reno, NV 89502; email [lmermejo@blm.gov](mailto:lmermejo@blm.gov).

*For the Oregon Greater Sage-Grouse Proposed LUPA/Final EIS:* Joan Suther, BLM Oregon State Office GRSG Planning Lead, telephone 541-573-4445; address BLM Burns District, 28910 Hwy 20, West Hines, OR 97738; email [jsuther@blm.gov](mailto:jsuther@blm.gov).

*For the Utah Greater Sage-Grouse Proposed LUPA/Final EIS:* Quincy Bahr, BLM Utah State Office GRSG Project Lead, telephone 801-539-4122; address 440 West 200 South, Suite 500, Salt Lake City, UT 84101-1345; email [qfbahr@blm.gov](mailto:qfbahr@blm.gov).

Persons who use a telecommunications device for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 1-800-877-8339 to contact the above individuals during normal business hours. The FIRS is available 24 hours a day, 7 days a week, to leave a message or question with the above individual. You will receive a reply during normal business hours.

**SUPPLEMENTARY INFORMATION:** The BLM and Forest Service prepared the Idaho and Southwestern Montana, Nevada and Northeastern California, and Utah Greater Sage-Grouse LUPAs and EISs. The Oregon LUPA/EIS was prepared solely by the BLM because there were no National Forest System lands involved. All four of these Proposed LUPAs/Final EISs address a range of alternatives focused on specific conservation measures across the range of the Greater Sage-Grouse (GRSG). All four of these EISs are part of a total of 15 separate EISs that make up the BLM

and Forest Service National Greater Sage-Grouse Planning Strategy. These four EISs will amend the following BLM Resource Management Plans (RMPs) and Management Framework Plans (MFPs) and Forest Service Land and Resource Management Plans (LRMP) in the Great Basin Region:

**California**

- Alturas RMP (2008)
- Eagle Lake RMP (2008)
- Surprise RMP (2008)

**Idaho**

- Birds of Prey NCA RMP (2008)
- Bruneau RMP revision (and existing 1983 Bruneau MFP)
- Challis RMP (1999)
- Craters of the Moon NM RMP (2006)
- Four Rivers RMP revision (and existing 1988 Cascade RMP and 1983 Kuna and Bruneau MFPs)
- Jarbidge RMP revision (and existing 1987 Jarbidge RMP)
- Lemhi RMP (1987)
- Owyhee RMP (1999)
- Pocatello RMP revision
- Shoshone-Burley RMP revision (and existing 1980 Bennett Hills/ Timmerman Hills, 1985 Cassia, 1975 Magic, 1985 Monument, 1981 Sun Valley, and 1982 Twin Falls MFPs/RMPs)
- Upper Snake RMP revision (and existing 1983 Big Lost, 1985 Medicine Lodge, 1981 Big Desert, and 1981 Little Lost-Birch Creek MFPs/RMPs)
- Boise National Forest, LRMP (2003)
- Curlew National Grassland Management Plan, LRMP (2002)
- Caribou National Forest, Revised LRMP (2003)
- Caribou-Targhee National Forest, Targhee National Forest LRMP (1997)
- Salmon-Challis National Forest, Challis National Forest LRMP (1987)
- Salmon-Challis National Forest, Salmon National Forest LRMP (1988)
- Sawtooth National Forest, Revised LRMP (2003)

**Montana**

- Dillon RMP (2006)
- Beaverhead-Deerlodge National Forest, LRMP (2009)

**Nevada**

- Battle Mountain RMP revision (and existing 1997 Tonopah and 1986 Shoshone-Eureka RMPs)
- Black Rock Desert-High Rock Canyon NCA RMP (2004)
- Carson City RMP revision (and existing 2001 Carson City Consolidated RMP)
- Elko RMP (1987)
- Ely RMP (2008)

- Wells RMP (1985)
- Winnemucca RMP revision (and existing 1982 Paradise-Denio MFP and 1982 Sonoma-Gerlach RMP)
- Humboldt National Forest, LRMP (1986)
- Toiyabe National Forest, LRMP (1986)

### Oregon

- Andrews RMP (2005)
- Baker RMP revision (and existing 1989 Baker RMP)
- Brothers-LaPine RMP (1989)
- Lakeview RMP amendment (and existing 2003 Lakeview RMP)
- Southeastern Oregon RMP amendment (and existing 2003 Southeastern Oregon RMP)
- Steens RMP (2005)
- Three Rivers RMP (1992)
- Upper Deschutes RMP (2005)

### Utah

- Box Elder RMP (1986)
- Cedar/Beaver/Garfield/Antimony RMP (1986)
- Grand Staircase-Escalante National Monument Management Plan (2000)
- House Range RMP (1987)
- Kanab RMP (2008)
- Park City MFP (1975)
- Pinyon MFP (1978)
- Pony Express RMP (1990)
- Price RMP (2008)
- Randolph MFP (1980)
- Richfield RMP (2008)
- Salt Lake District Isolated Tracts Planning Analysis (1985)
- Vernal RMP (2008)
- Warm Springs RMP (1987)
- Dixie National Forest, LRMP (1986)
- Fishlake National Forest, LRMP (1986)
- Uinta National Forest, Revised LRMP (2003)
- Wasatch-Cache National Forest, Revised LRMP (2003)
- Ashley National Forest, LRMP (1986)
- Manti-La Sal National Forest, LRMP (1986)

Management decisions made as a result of these Proposed LUPAs/Final EISs will apply only to BLM-administered and National Forest System lands in the planning area. The planning areas for all four EISs includes approximately 194.0 million acres of BLM, National Park Service, Forest Service, U.S. Bureau of Reclamation, State, tribal, local, and private lands located in 28 Idaho counties (Ada, Adams, Bear Lake, Bingham, Blaine, Bonneville, Butte, Camas, Caribou, Cassia, Clark, Custer, Elmore, Fremont, Gem, Gooding, Jefferson, Jerome, Lemhi, Lincoln, Madison, Minidoka, Oneida, Owyhee, Payette, Power, Twin Falls, and Washington), 7 Montana counties

(Montana, Beaverhead, Deer Lodge, Fremont, Clark, Madison, and Silver Bow), 16 Nevada counties (Carson City, Churchill, Douglas, Elko, Esmeralda, Eureka, Humboldt, Lander, Lincoln, Lyon, Mineral, Nye, Pershing, Storey, Washoe, and White Pine), 5 California counties (Lassen, Modoc, Plumas, Siskiyou, and Sierra), 8 Oregon counties (Baker, Crook, Deschutes, Grant, Harney, Lake, Malheur, and Union), 24 Utah counties (Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Morgan, Piute, Rich, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Wayne, and Weber), and 2 Wyoming counties (Sweetwater and Uinta). The decision area for these Proposed LUPAs/Final EISs is defined as those BLM-administered and National Forest System lands and Federal mineral estate within the following habitat management categories:

- Priority Habitat Management Area (PHMA)—Areas identified as having the highest conservation value for maintaining sustainable GRSG populations; includes breeding, late brood-rearing, and winter concentration areas.

- Important Habitat Management Area (IHMA) (applicable to Idaho only)—Areas identified as having generally moderate to high conservation value habitat and/or populations that provide a management buffer for the PHMA and to connect patches of PHMA.

- General Habitat Management Area (GHMA)—Areas of seasonal or year-round GRSG habitat outside of PHMAs.

The Notice of Intent (NOI) to prepare the Idaho and Southwestern Montana, Nevada and Northeastern California, Oregon, and Utah Greater Sage-Grouse LUPAs/EISs was published in the **Federal Register** on December 9, 2011. A Notice of Availability (NOA) for the Idaho and Southwestern Montana, Nevada and Northeastern California, and Utah Draft LUPAs/EISs was published in the **Federal Register** on November 1, 2013. The Oregon Draft LUPA/EIS was released to the public on November 26, 2013. Comments on the Draft LUPAs/EISs received from the public and internal BLM and Forest Service review were considered and incorporated, as appropriate, into the Proposed Plan.

The alternatives presented in Proposed LUPAs/Final EISs are described below:

- Alternative A would retain the current management goals, objectives and direction specified in the existing

BLM RMPs and the Forest Service LRMPs.

- Alternative B is based on the conservation measures developed by the National Technical Team (NTT) planning effort in Washington Office Instructional Memorandum (IM) Number 2012–044. As directed in the IM, the conservation measures developed by the NTT must be considered and analyzed, as appropriate, through the land use planning process and NEPA by all BLM state and field offices that contain occupied GRSG habitat. Most management actions included in Alternative B would be applied to PHMA.

- Alternative C is based on a citizen groups' recommended alternative. This alternative emphasizes improvement and protection of habitat for GRSG and is applied to all occupied GRSG habitat. Alternative C would limit commodity development in areas of occupied GRSG habitat, and would close or designate portions of the planning area to some land uses. The Utah LUPA/Draft EIS combined this alternative with Alternative F (discussed below).

- Alternative D, which was identified as the Preferred Alternative in the Draft EIS, balances opportunities to use and develop the planning area and protects GRSG habitat based on scoping comments and input from Cooperating Agencies involved in the alternatives development process. Protective measures would be applied to GRSG habitat.

- Alternative E is the alternative provided by the State or Governor's offices for inclusion and analysis in the EISs. It incorporates guidance from specific State Conservation strategies and emphasizes management of greater sage-grouse seasonal habitats and maintaining habitat connectivity to support population objectives. This alternative was identified as a co-Preferred Alternative in the Idaho and Southwestern Montana Draft EIS.

- Alternative F is also based on a citizen group recommended alternative. This alternative emphasizes improvement and protection of habitat for GRSG and defines different restrictions for PHMA and GHMA. Alternative F would limit commodity development in areas of occupied GRSG habitat, and would close or designate portions of the planning area to some land uses. This alternative does not apply to the Utah sub-regional planning effort, as it was combined with Alternative C.

- The Proposed LUPA incorporates guidance from specific State Conservation strategies, as well as

additional management based on the NTT recommendations. This alternative emphasizes management of GRSG seasonal habitats and maintaining habitat connectivity to support population objectives.

The BLM and Forest Service received approximately 4,990 substantive comments, contained in 74,240 submissions during the four Draft EISs' comment periods. Based on comments received during the NEPA process, the following comment topics were frequently identified:

- General (Process/Policy);
- Lands and Realty;
- Livestock Grazing;
- Minerals and Energy;
- Predation;
- Recreation;
- Socioeconomic;
- Special Management Area Designations;
- Special Status Species (Including GRSG);
- Travel and Access Management;
- Vegetation;
- Wildland Fire Management;
- Wildlife and Fisheries.

For the Idaho and Southwestern Montana GRSG Proposed LUPA/Final EIS, the BLM and Forest Service conducted seven public meetings. These meetings were held in Murphy, Idaho Falls, Salmon, Pocatello, Twin Falls, and Boise in Idaho and Dillon in Montana during January 2014. For the Nevada and Northeastern California GRSG Proposed LUPA/Final EIS, the BLM and Forest Service conducted seven public meetings. These meetings were held in Cedarville and Susanville, California, and in Reno, Tonopah, Ely, Elko, and Winnemucca, Nevada in early December 2013. For the Oregon GRSG Proposed LUPA/Final EIS, the BLM conducted seven public meetings. These meetings were held in Baker City, Burns, Durkee, Jordan Valley, Lakeview, Ontario and Prineville, Oregon during January 2014. For the Utah GRSG Proposed LUPA/Final EIS, the BLM and Forest Service conducted eight public meetings. These meetings were held in Cedar City, Panguitch, Price, Randolph, Richfield, Salt Lake City, Snowville, and Vernal, Utah during November and December 2013. Comments on the Draft LUPAs/Draft EISs received from the public and internal BLM and Forest Service review were carefully considered and incorporated as appropriate into the proposed LUPAs/Final EISs. The BLM and Forest Service, via the Western Association of Fish and Wildlife Agencies (WAFWA) Management Zone Greater Sage-Grouse Conservation Team, will develop a Regional Mitigation Strategy to guide

the application of the mitigation hierarchy to address impacts within that Zone. The Regional Mitigation Strategy should consider any State-level GRSG mitigation guidance that is consistent with the requirements. The Regional Mitigation Strategy will be developed in a transparent manner, based on the best science available and standardized metrics.

Instructions for filing a protest with the Director of the BLM regarding the Proposed LUPAs/Final EISs may be found in the "Dear Reader" Letter of the Proposed LUPAs/Final EISs and at 43 CFR 1610.5-2. All protests must be in writing and mailed to the appropriate address, as set forth in the **ADDRESSES** section above. Emailed protests will not be accepted as valid protests unless the protesting party also provides the original letter by either regular mail or overnight delivery postmarked by the close of the protest period. Under these conditions, the BLM and Forest Service will consider an emailed protest as an advance copy and it will receive full consideration. If you wish to provide the BLM and Forest Service with such advance notifications, please direct emails to [protest@blm.gov](mailto:protest@blm.gov).

Before including your address, phone number, email address, or other personal identifying information in your protest, you should be aware that your entire protest—including your personal identifying information—may be made publicly available at any time. While you may ask us in your protest to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

**Authority:** 36 CFR 219.59, 40 CFR 1506.6, 40 CFR 1506.10, 43 CFR 1610.2; 43 CFR 1610.5

**Amy Lueders,**

*Acting Assistant Director, Renewable Resources & Planning.*

BILLING CODE 4310-22-P

**DEPARTMENT OF THE INTERIOR**

**Bureau of Land Management**

[LLMT001000.L16100000.DP0000.  
LXSS065E0000 MO# 4500079413]

**Notice of Availability of the Proposed Resource Management Plan and Final Environmental Impact Statement for the Billings and Pompeys Pillar National Monument Resource Management Plan Revision, Billings Field Office, Montana**

**AGENCY:** Bureau of Land Management, Interior.

**ACTION:** Notice of availability.

**SUMMARY:** In accordance with the National Environmental Policy Act of 1969 (NEPA), as amended, and the Federal Land Policy and Management Act of 1976 (FLPMA), as amended, the Bureau of Land Management (BLM) has prepared a Proposed Resource Management Plan (RMP) and Final Environmental Impact Statement (EIS) for the Billings planning area, including Pompeys Pillar National Monument, and by this notice is announcing its availability.

**DATES:** The BLM planning regulations state that any person who meets the conditions as described in the regulations may protest the BLM's Proposed RMP/Final EIS. A person who meets the conditions and files a protest must file the protest within 30 days of the date that the Environmental Protection Agency publishes its notice of availability in the **Federal Register**.

**ADDRESSES:** Copies of the Billings and Pompeys Pillar National Monument Proposed RMP/Final EIS have been sent to affected Federal, State, and local government agencies, tribal governments, and to other stakeholders and members of the public. Copies of the Proposed RMP/Final EIS are available for public inspection at the following locations:

- BLM, Montana State Office and Billings Field Office, 5001 Southgate Drive, Billings, MT 59101.

Interested persons may also review the Proposed RMP/Final EIS on the Internet at <http://on.doi.gov/1EJbdaE>.

All protests must be in writing and mailed to one of the following addresses:

Regular Mail: BLM Director (210),  
Attention: Protest Coordinator, P.O.  
Box 71383, Washington, DC 20024-  
1383.

Overnight Delivery: BLM Director (210),  
Attention: Protest Coordinator, 20 M  
Street SE., Room 2134LM,  
Washington, DC 20003.

**FOR FURTHER INFORMATION CONTACT:**

Carolyn Sherve-Bybee, Billings and Pompeys Pillar National Monument RMP Team Leader, telephone: 406-896-5234; address: 5001 Southgate Drive, Billings, MT 59101; email: [billings\\_pompeyspillar\\_rmp@blm.gov](mailto:billings_pompeyspillar_rmp@blm.gov). Persons who use a telecommunications device for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 1-800-877-8339 to contact the above individual during normal business hours. The FIRS is available 24 hours a day, 7 days a week, to leave a message or question with the above individual. You will receive a reply during normal business hours.

**SUPPLEMENTARY INFORMATION:** The planning area includes lands within the BLM Billings Field Office's administrative boundaries, including Carbon, Golden Valley, Musselshell, Stillwater, Sweet Grass, Wheatland, and Yellowstone Counties in Montana, and portions of Big Horn County, Montana and Big Horn County, Wyoming. The planning area includes all lands, regardless of jurisdiction, totaling approximately 10.37 million acres; however, the BLM will only make decisions on lands that fall under the BLM's jurisdiction. The BLM decision area is comprised of approximately 434,154 acres of the surface estate in the planning area and 889,479 acres of Federal mineral estate. The revised RMP will replace the 1984 Billings RMP, as amended. The Draft RMP/EIS was made available for public review for a 90-day period on March 29, 2013 (78 FR 19291). The Draft RMP/EIS included a series of management actions, within four management alternatives, designed to address management challenges and issues raised during scoping. These included, but were not limited to, trails and travel management, wildlife habitat management including that of the Greater Sage-Grouse, energy development (coal and oil and gas), livestock grazing, recreation, lands with wilderness characteristics, special management areas including Areas of Critical Environmental Concern (ACEC) and the Pryor Mountain Wild Horse Range, and management of the cultural and historic resources at Pompeys Pillar National Monument. In accordance with 43 CFR 1610.7-2(b), the Notice of Availability for the Draft RMP/EIS announced a concurrent public comment period on proposed ACECs.

Comments on the Draft RMP/Draft EIS received from the public and internal BLM review were considered and incorporated as appropriate into the Proposed RMP/Final EIS which analyzes four alternatives:

## **Coalition challenges science behind Interior grouse protections**

Scott Streater, E&E reporter

Published: Wednesday, March 18, 2015

A coalition of the oil and gas industry, mining groups and local governments in four states is formally challenging some of the core scientific documents the Interior Department is using to protect greater sage grouse habitat covering millions of acres of public lands across the West.

Specifically, the coalition is challenging three reports under the Data Quality Act that the Interior Department is using to justify amending as many as 98 Bureau of Land Management resource management plans (RMPs) and Forest Service land-use plans to add grouse conservation measures.

These scientific reports produced in the last five years by BLM, the U.S. Geological Survey and the Fish and Wildlife Service are likely to be core documents FWS uses in deciding by September whether to propose listing the greater sage grouse for protection under the Endangered Species Act.

But the influential 2011 grouse management report by BLM's National Technical Team (NTT) of sage grouse experts and an FWS-commissioned report in 2013 by a conservation objectives team (COT) that outlined rangewide sage grouse protection goals are riddled with factual errors, the coalition alleges. So, too, is a 2010 report from USGS that the service "relied extensively upon" in order to justify its determination in March of that year that the grouse warranted federal protection, the groups said.

Taken together, the three reports "advance a one-sided narrative that is simply not supported by the full body of scientific literature and data," according to an executive summary outlining the three challenges that was researched and written by a team led by Kent Holsinger, a Denver-based natural resources attorney.

The coalition -- which includes the Denver-based Western Energy Alliance, the American Exploration & Mining Association, and a total of 19 counties in Colorado, Montana, Nevada and Utah -- asks Interior to "retract" the three reports "and their use in land use plan amendments and the upcoming listing decision" by FWS, the summary says.

"Alternatively, the agencies could issue amended reports that use sound analytical methods and the best data available while ensuring transparency and objectivity, and adjust their policies accordingly," it concludes.

Emily Beyer, an Interior spokeswoman in Washington, D.C., said the agency is reviewing the latest challenges from the coalition.

It is up to Interior whether to agree to revise the reports or continue to use them. BLM has 60 days to respond to the complaint regarding the NTT report; FWS and USGS have 90 days to respond.

Beyer, however, pointed to comments from Interior Secretary Sally Jewell yesterday during a speech to the Center for Strategic and International Studies regarding sage grouse research and efforts by FWS to get right whatever decision they make on the status of the grouse.

"We are using sound science. We are using the best available science we have," Jewell said during a question-and-answer session after the speech. "We will take, at the Fish and Wildlife Service, all of the science into account, and we must do that because if we don't do that and we come out with a decision on whether or not a listing or not is warranted, we know it's going to be challenged in court. The question is will it be defensible."

The challenges drew immediate condemnation from conservation groups.

Mark Salvo, director of federal lands conservation with Defenders of Wildlife, said few other species "have been studied so thoroughly as sage grouse and their habitat requirements."

"Just because you don't agree with recommendations to conserve the species doesn't mean they're wrong," Salvo added. "These data challenges will only drain resources away from current efforts to protect and recover sage grouse."

But Holsinger said the three challenges document "real issues with transparency and scientific integrity" that need to be addressed.

He said a careful analysis of data they obtained under the Freedom of Information Act "found extensive flaws in the agencies' science, and demonstrated how they exaggerate impacts from human activities while ignoring real threats like predation, as well as natural fluctuations," he said. "The steadfast reliance and perpetuation of flawed information reveals these agencies aren't as much interested in sage-grouse conservation as they are in controlling our economy and western way of life."

The challenges underscore how political the issue of sage grouse conservation has become, in large part because the bird has such a broad range covering millions of acres of public and private lands.

In 2010, FWS ruled that the greater sage grouse deserves federal protection but that other species took higher priority amid limited resources and placed the bird on a candidate list of species that may be given protections in the future.

Since that time, federal and state leaders have launched what the service acknowledges is an unprecedented effort to save the greater sage grouse, fearing that an ESA listing would cripple the energy, farming and ranching industries across the West.

Western leaders and energy industry officials have complained for some time that they want more information on the criteria FWS will use to determine whether the conservation measures and policies in place are enough to protect the grouse and keep it off the endangered species list.

While FWS is under a court-mandated Sept. 30 deadline to decide whether to propose listing the bird for ESA protection, Republicans in Congress last year successfully attached a legislative rider to the \$1.1 trillion spending bill preventing the service from formally listing the sage grouse.

Jewell has said the legislative rider will not prevent FWS from issuing a decision by the deadline on the status of the bird.

The letter from the coalition of groups comes less than a week after a group of scientists wrote in [a letter](#) to Jewell and Agriculture Secretary Tom Vilsack that strictly following the NTT and COT reports isn't enough to accomplish the goal of keeping the bird from being listed as threatened or endangered ([Greenwire](#), March 12).

While the scientists said "many portions of the NTT Report provide a scientific baseline for managing greater sage-grouse habitat using consistent, measurable conservation standards," they noted that "other parts of the report contained questionable statements that are not supported by the best available science."

The industry and state coalition focuses on that point, accusing the NTT and COT reports, along with the USGS report, of "fundamentally and erroneously" ignoring "accurate population data" concerning grouse and the health of grouse breeding grounds, called leks, according to the executive summary of the challenges.

"The Reports were developed with unsound research methods resulting in a partial and biased presentation of information, and peer reviewers have found them to be inaccurate, unreliable, and biased," the summary says. "They contain substantial technical errors, including misleading use of authority and failure to address studies that do not support a federal, one-size-fits-all narrative."

The summary adds, "As a result, the Reports impetuously reach conjectural conclusions that are not scientifically supported, especially the frequently repeated but flawed assumption that a temporary decrease in lek counts equates to a population decline. Driven by policy considerations rather than defensible biological criteria, the Reports do not address specific cause and effect threats to [sage grouse]. Rather, they selectively present biased information while ignoring contrary information and the scientific method."

## Idaho Department of Lands outlines plan to protect sage grouse habitat

FOR IMMEDIATE RELEASE  
Feb. 17, 2015

(BOISE) - The Idaho Department of Lands (IDL) laid out **proposed conservation measures to protect sage grouse habitat** on rangelands owned by the state endowment trust. It also outlined proposed conservation measures for the department's roles in wildfire prevention and suppression, and regulating oil and gas development and some mining activity.

The State Board of Land Commissioners (Land Board) heard an informational update on the draft plan today.

[View the draft IDL Proposed Greater Sage-Grouse Conservation Plan here.](#)

**The IDL draft plan complements Governor Otter's sage grouse plan for federal land management in Idaho.**

The Governor's plan was submitted to the U.S. Department of Interior Bureau of Land Management (BLM) and U.S. Fish and Wildlife Service (USFWS) in September 2012. The Governor's Plan was incorporated in the November 2013 BLM Draft Idaho and Southwest Montana Sub-Regional Sage-grouse Land Use Management Plan Amendment and Environmental Impact Statement, where it was presented as a "co-preferred alternative."

With the development of federal land management practices for sage-grouse, the USFWS asked 11 western states with sage-grouse habitat to develop complementary conservation measures for state lands. The Governor's Office of Species Conservation and IDL Director Tom Schultz began developing conservation measures for endowment trust lands in Idaho to **further demonstrate Idaho's commitment to conserving sage-grouse to prevent a listing of the species** under the Endangered Species Act (ESA).

In October 2014 Schultz tasked the development of the draft plan to a group of IDL experts who oversee programs that could be affected by a sage-grouse listing.

**Governor Otter backed up Idaho's commitment with a budget recommendation** of \$750,000 for sage-grouse conservation activities, including \$250,000 for IDL to implement cooperative fuel breaks on endowment rangelands and money to refurbish firefighting equipment for use by Idaho's rangeland fire protection associations - groups of ranchers trained and legally authorized to fight range fires in Idaho.

**The IDL is soliciting feedback from the public on the draft plan through March 2, 2015.** Comments can be e-mailed to Pat Seymour, Endangered Species Program Manager at [pseymour@idl.idaho.gov](mailto:pseymour@idl.idaho.gov). The IDL also is working with natural resource industry user groups, environmental organizations, and relevant state agencies to fine-tune the draft plan. Many of the participants also are members of the Governor's Sage Grouse Task Force.

**In March the Land Board and Oil and Gas Conservation Commission will vote to approve portions of the plan that have to do with their respective authorities.**

The USFWS will consider the Idaho

### IDL Proposed Greater Sage-Grouse Conservation Plan

#### **Conservation Measures for Activities on State Endowment Trust Lands**

More than 600,000 acres of state endowment rangeland in southern Idaho fall within identified "core" and "important" habitat zones. The acreage makes up about 44 percent of endowment rangeland ownership in Idaho.

For proposed activities by third parties on state endowment trust lands, IDL will implement sage-grouse conservation measures as enforceable stipulations in authorizing documents such as leases, permits, and easements. Authorized activities include:

- Alternative energy development (solar, wind and geothermal)
- Oil and gas exploration and development
- Mining
- Grazing
- Miscellaneous commercial activities
- The granting of access through rights-of-way, including easements

Additionally, IDL as the land manager will implement and support fire prevention and mitigation measures and wildfire suppression efforts to minimize the impact to sage-grouse and their habitat.

#### **Conservation Measures for Regulated Activities in the Oil & Gas and Minerals Programs**

For regulatory and assistance activities, conservation measures will be voluntary best management practices (BMPs) on private land. Where appropriate, IDL will include recommended BMPs in its authorizing documents to encourage compliance. Activities include:

- Abandoned Mine Lands projects
- Dredge and Placer Mine permits
- Mine Reclamation Plan approvals
- Oil and Gas Permits (seismic imaging surveys, well drilling)
- Oil and Gas Development

## Idaho Department of Lands Proposed Greater Sage-Grouse Conservation Plan

### 1. Introduction to the Proposed Plan (Plan)

Sage-grouse is a candidate species currently being reviewed by the US Fish and Wildlife Service (USFWS) to determine listing status under the Endangered Species Act (ESA). In 2010, the USFWS determined Greater Sage-grouse (sage-grouse) warranted protection under the Endangered Species Act, but it was precluded from listing due to higher priority species. In the USFWS decision, the primary threats listed for Idaho were: wildfire, invasive species, and infrastructure development.

The timeline for USFWS analysis was further accelerated when in 2011 a multi district litigation in the US District Court of the District of Columbia resulted in a settlement agreement between the litigants and the USFWS. The settlement agreement required the USFWS to implement a six year work plan that will enable the agency to systematically review and address the needs of more than 250 species listed on the 2010 *Candidate Notice of Review* to determine if they should be added to the Federal Lists of Endangered and Threatened Wildlife and Plants. The USFWS agreed to determine the listing status of sage-grouse in 2015. Later in 2012, the United States District Court for the District of Idaho ruled that pursuant to the D.C. District Court settlement, the USFWS must reevaluate the status of sage-grouse under the ESA by September 30, 2015. In response to these deadlines, Secretary of the Interior Salazar invited the eleven western states impacted by a potential listing of the species to develop state-specific regulatory mechanisms to address these cited deficiencies in an effort to preclude a listing under the ESA.

As a direct outcome of the proposed ESA listing review, the US Bureau of Land Management (BLM) initiated a draft Land Use Plan Amendment and Environmental Impact Statement (EIS) pertaining to the sage-grouse throughout BLM's management zones within sage-grouse habitat.

In March 2012, Governor Otter issued Executive Order No. 2012-02 which established the Governor's Sage-grouse Task Force. The task force goal was to ultimately develop state-specific regulatory mechanisms to enable the BLM to incorporate the State's plan as an alternative in BLM's environmental analysis pursuant to the National Environmental Policy Act (NEPA) EIS. The Governor's Plan was submitted to the BLM and USFWS in September 2012. The Governor's Plan was incorporated as Alternative E in the November 2103 BLM Draft Idaho and Southwest Montana Sub-Regional Sage-grouse Land Use Plan Amendment and EIS, where it was presented as a "co-preferred Alternative" along with BLM's Alternative D.

As part of Idaho's commitment to conserving sage-grouse, the Idaho Department of Lands (IDL) has developed draft conservation measures (CMs) for Endowment Trust Land Management programs and for Regulatory and Service programs that complement the Governor's Sage-grouse Plan for federal land management in Idaho.

For proposed activities by third parties on state endowment trust lands, IDL will implement sage-grouse conservation measures as enforceable stipulations in authorizing documents such as leases, permits and easements. The authorized activities include: alternative energy development (solar, wind, and geothermal); oil and gas exploration and development; mining; grazing; miscellaneous commercial activities; and the granting of access through rights-of-way, including easements. In addition, IDL as the land manager will implement and support fire prevention and mitigation measures and wildfire suppression efforts to minimize the impact to sage-grouse and their habitat.

For regulatory and assistance activities, conservation measures will be voluntary best management practices (BMP's) on private land because IDL does not have the statutory authority within its regulatory programs or assistance activities to require adoption by authorized parties. Regulatory and assistance activities include: Abandoned Mine Lands Projects; Dredge and Placer Mine Permits; Mine Reclamation Plan Approvals; and Oil & Gas Permits (seismic imaging surveys, well drilling). Where appropriate, IDL will include recommended best management practices within its authorizing documents to encourage compliance.

For some fire programs, IDL will implement actions through its roles and responsibilities that support enhanced fire preparedness and suppression in sage-grouse habitats.

The Plan format follows the headings used in the USDI Bureau of Land Management (BLM) *Administrative Draft Proposed Plan* as an organizational outline and reader courtesy.

The Plan utilizes the *State of Idaho Habitat Zone* classifications defined in 2012 by the Idaho Department of Fish & Game (IDFG). Consistent with the Governor's Plan, IDL will focus conservation efforts on the Core and Important habitat zones which include the great majority of the sage-grouse populations in Idaho. Idaho has over 10,500,000 acres in Core and Important sage-grouse habitat zones, with the vast majority of these acres under Federal management (Table 1.1). IDL has surface or mineral ownership of almost 690,000 acres of Core and Important habitat, with about 619,000 acres of surface ownership in these habitat zones. While the IDL ownership is a relatively small proportion of the 10.5 million acres of habitat (less than 6%), almost half of the endowment trust rangelands are found within the Core and Important habitat zones.

## **2. Purpose of the Plan**

The Plan has a threefold purpose. (1) It summarizes conservation measures for state endowment trust land programs and IDL regulatory/service programs that are complementary to the Governor's Plan for management of federal land. (2) It communicates to the USFWS that, along with the Governor's Plan, there are adequate existing regulatory mechanisms to alleviate the primary threats to sage-grouse and sage-grouse habitat in Idaho. (Such certainty will be necessary to prevent the sage-grouse from being listed under the Endangered Species Act). (3) It preserves the statutory responsibility of IDL to manage 2.4 million acres of [state endowment trust land](#) under a constitutional mandate to maximize long-term financial returns to state institutions, mainly public schools.

### 3. Coordination

Utilizing available funding, IDL will collaborate, coordinate, and utilize cooperative planning efforts to implement and monitor proposed conservation measures to protect and potentially improve sage-grouse habitat. Coordination efforts could include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups, lease/permit holders, and nongovernmental organizations.

Current sage-grouse coordination efforts in which IDL is involved include:

- a. *Bruneau-Owyhee Sage-Grouse Habitat Project (Federal Register- NOI, 01/20/2015),*
- b. *Burley Interagency Landscape Sage-Grouse Habitat Restoration Project,*
- c. *Tri-State Interagency Fuel Break Project (Federal Register-NOI, 2015),*
- d. *Paradigm Fuel Break Project (BLM Draft EA, 01/24/2014), and*
- e. *Draft BLM/IDFG/IDL Rangeland Rehabilitation MOU (Final MOU 02/2015).*

### 4. Greater Sage-Grouse Management Areas

The Plan utilizes the *State of Idaho Habitat Zone* classifications defined in 2012 by the IDFG. It uses a *Core* and *Important* habitat zone classification that is somewhat different from the BLM habitat classification of *Primary*, *Important*, and *General* habitat management areas. The BLM and State classifications do not perfectly overlay or intersect each other. Currently, the BLM and State of Idaho are finalizing the delineation of the habitat management zones to correct these discrepancies between the mapping processes. The result will be a classification structure utilizing the *Primary*, *Important*, and *General* habitat management areas. The Plan will be revised to reflect any changes resulting from using the revised habitat classification. IDL will recognize any habitat management updates resulting from the five-year formal map review.

### 5. Adaptive Management

The BLM's *Administrative Draft Proposed Plan* utilizes hard and soft population and habitat triggers to determine an appropriate management response. For example, a hard trigger would be tripped by the 20% loss of key habitat within BLM determined Biologically Significant Units (BSUs). BSUs are the modeled nesting and wintering habitat within the Core and Important habitat zones. When this 20% criterion had been exceeded, then the management measures for federal land applied to the core habitat zone would now also be applied to the important habitat zone.

IDL recognizes that the soft and hard triggers described in the BLM's *Administrative Draft Proposed Plan* apply to federally managed land. Where a trigger is tripped, and the BLM Implementation Team identifies measures or recommendations that IDL determines to be applicable to IDL managed land or IDL regulatory programs, IDL commits to full consideration and if applicable, will forward such recommendations to the State Board of Land Commissioners (Land Board) for their consideration as amendments to the Plan.

IDL will also utilize monitoring results to make any recommendations to the Land Board for their consideration as amendments to the Plan.

## **6. Anthropogenic Disturbance**

Impacts caused by anthropogenic disturbances on sage-grouse can vary depending on the type of activity and local habitat conditions. In addition, cumulative impacts of multiple activities can have significant, negative impacts on sage-grouse populations. In the *Administrative Draft Proposed Plan*, the BLM utilizes a 3% disturbance limit across all landowners within eight BSU areas. Because state endowment trust lands make up such a small percentage of Core and Important habitat zones, IDL will not place a disturbance limit within any defined areas on state endowment trust lands.

## **7. Mitigation**

At this time, the State of Idaho has not finalized a mitigation plan, nor has there been any funding sources identified or allocated to implement such a mitigation plan. Idaho's proposed mitigation plan is described in the "Framework for Mitigation of Impacts from Infrastructure Projects on Sage-grouse and Their Habitats" (Sage-Grouse Mitigation Subcommittee of the Idaho Sage-Grouse Advisory Committee, December 2010).

IDL will commit to following Idaho's mitigation plan once fully developed to the extent adequate funding exists.

### **Plan Format**

The Plan format uses 2 PARTS. PART I presents the conservation measures IDL will implement in its authorizing documents (e.g. leases) for third party activities on state endowment trust lands. In addition, PART I identifies activities to be undertaken by IDL as the land manager related to fire prevention, wildfire suppression, and land transactions (e.g. land exchanges).

PART II presents the conservation measures IDL will recommend as voluntary best management practices for mining operators and oil and gas operators on non-state lands. In addition, PART I identifies activities to be undertaken by IDL under its statutory roles regarding fire prevention, wildfire suppression, and abandoned mine land reclamation.

Each Part then follows the numbered headings used in the USDI Bureau of Land Management (BLM) *Administrative Draft Proposed Plan* as an organizational outline and reader courtesy.

**TABLE 1.1 IDL Ownership within Sage-grouse Habitat by Conservation Area and Habitat Zones**

		<b>Total Acres All Owners</b>	<b>Total IDL Ownership</b>		<b>IDL Surface Ownership</b>		<b>IDL Minerals Ownership Only</b>	
Conservation Area	Habitat Zone	Acres	Acres	%	Acres	%	Acres	%
Idaho Desert	Core	1,017,180	31,702	3.12	29,853	2.93	1,849	0.18
	Important	1,064,653	43,510	4.09	38,710	3.64	4,800	0.45
	Total	2,081,833	75,212	3.61	68,563	3.29	6,649	0.32
Idaho Mountain Valleys	Core	2,110,685	177,006	8.39	164,286	7.78	12,720	0.60
	Important	1,602,894	135,004	8.42	120,881	7.54	14,124	0.88
	Total	3,713,578	312,010	8.40	285,166	7.68	26,844	0.72
Idaho Southern	Core	856,442	47,207	5.51	38,352	4.48	8,855	1.03
	Important	1,225,756	70,727	5.77	51,073	4.17	19,654	1.60

	Important	609,354	50,345	8.26	45,616	7.49	4,729	0.78
	Total	2,643,412	183,843	6.95	176,417	6.67	7,425	0.28
All Conservation Areas	CHZ and IHZ	10,521,022	688,999	6.55	619,571	5.89	69,428	0.66

---

## **PART I. CONSERVATION MEASURES FOR ACTIVITIES ON STATE ENDOWMENT TRUST LANDS**

For proposed activities by third parties on state endowment trust lands in Core and Important habitat zones, IDL will implement conservation measures as enforceable stipulations in authorizing documents such as leases, permits and easements. The authorized activities include: alternative energy development (solar, wind, and geothermal); oil and gas exploration and development; mining; grazing; miscellaneous commercial activities; and the granting of access through rights-of-way, including easements.

Also, IDL as the land manager will implement and support fire prevention and mitigation measures and wildfire suppression efforts to conserve sage-grouse habitat. In addition, IDL will include an analysis of sage-grouse habitat impacts when considering land transactions that are located in Core or Important habitat zones.

### **8. Fire Prevention on Endowment Land**

IDL is committed to conserving habitat for the sage-grouse in Idaho, which is under threat from the invasion of annual grasses and the loss of habitat from fire. IDL has developed wildfire preparedness and prevention measures that are complementary with the January 5, 2015 US Department of Interior, Secretary of Interior Order Number 3336. This Order from Secretary Jewell sets forth enhanced policies and strategies for preventing and suppressing rangeland fire and for restoring sagebrush landscapes impacted by fire across the West.

In Idaho, there are 619,571 acres of state endowment trust lands located within Core (363,211 acres) and Important (256,280 acres) habitat zones. These zones contain about 82,000 Animal Unit Months (AUMs) of leased forage. As a primary threat wildland fire has the potential to significantly impact state endowment trust rangelands located in Core and Important habitat zones. Between 2009 and 2014, over 19,000 acres of Core and Important sage-grouse habitat burned on state endowment trust rangelands due to wildland fire. Based on historical averages, about 3,200 acres of state endowment trust rangelands can be expected to burn each year within Core and Important habitat zones with significant impacts to grazing lessees and state endowment trust beneficiaries.

During the 2014 fire season, 2,957 acres of Core Habitat Zone burned on state endowment trust rangelands making 470 AUMs of livestock forage unavailable for one to two years. In 2014, Core habitat restoration costs on 2,088 acres of those state endowment trust lands totaled nearly \$45,000. Left unaddressed, the primary threat of wildland fire within Core and Important habitat zones on state endowment trust rangelands is expected to continue at the same rate.

The following conservation measures will be incorporated as stipulations for any authorizing documents issued within Core and Important sage-grouse habitat:

**8.1.** Authorized parties will be required to develop and be prepared to implement a fire prevention and an emergency response plan that covers all aspects of operations, which will include: coordination with local jurisdictions, such as the cities, counties, landowners, IDL, Rangeland Fire Protection Associations, and Federal land agencies; emergency contact numbers and information, including 911 and local fire dispatch centers; and fire prevention and safety procedures that will include evacuation routes and procedures, the designated safety meeting place, and emergency shutdown procedures.

**8.2.** Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.

**8.3.** Authorized parties will ensure that field personnel are aware of:

- a. fire prevention and emergency response plan,
- b. evacuation routes and procedures,
- c. designated safety meeting places, and
- d. emergency shutdown procedures.

**8.4.** Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

## **9. Wildfire Suppression on Endowment Land**

IDL is committed to conserving habitat for sage-grouse in Idaho, which is under threat from the invasion of annual grasses and the loss of habitat from fire. IDL has developed wildfire suppression guidance that is complementary with the January 5, 2015 US Department of Interior, Secretary of Interior Order Number 3336. This Order from Secretary Jewell sets forth enhanced policies and strategies for suppressing rangeland fire and for restoring sagebrush landscapes impacted by fire across the West.

None of IDL's fire districts have suppression responsibilities within any currently identified Core or Important habitat zones. Likewise, as of December 2014, none of IDL's fire districts have suppression responsibilities within any currently identified General habitat zone. When IDL fire suppression resources are dispatched as a cooperating agency to another agency's incidents within sage-grouse habitat, they will utilize that agency's best management practices as applicable for sage-grouse habitat and as instructed in the dispatched resource's briefing.

For extended attack fires involving state endowment trust rangelands, in or near Core or Important habitat zones:

**9.1.** IDL may assign a Resource Advisor (primarily a Resource Specialist-Range) to provide local information regarding sage-grouse habitat during the in-brief and continually throughout the incident. The Resource Advisor will also be engaged with the incident to assess sage-grouse habitat that may be affected by the fire or suppression activities.

## **10. Fuels Management on Endowment Land**

Wildfires in a rangeland ecosystem can grow quickly and affect hundreds of thousands of acres of sage-grouse habitat in a matter of days or within a single burning period. Due to rapid fire spread, the potentially long response times due to remoteness, and limited sites for firefighters to establish safe anchor points to engage wildfires in some of these areas, these fires can be difficult to manage. Additionally, only one of the three legs of the fire triangle (fuel, oxygen, and heat) can be modified, which is fuel. This is why fuels management is a key in wildfire control in sage-grouse habitat.

**10.1.** Unless otherwise specified as part of a land use plan, IDL will consider the full array of fuels management treatment types (prescribed fire, mechanical, chemical, and biological) when implementing Conservation Measures and Best Management Practices on state endowment trust rangelands.

**10.2.** Where applicable IDL will design fuels treatment objectives on state endowment trust rangelands to protect existing Core and Important habitat zones, modify fire behavior, restore native plants, and create landscape patterns to benefit sage-grouse habitat, as resources permit.

**10.3.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to use proper livestock management and targeted grazing as a treatment to reduce vegetative fire fuels, reduce annual grass densities, and to protect Core and Important habitat zones.

**10.4.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically remove standing and encroaching conifer near sage-grouse leks, nesting, wintering and brood-rearing habitat, as resources permit.

- a. *Bruneau-Owyhee Sage-Grouse Habitat Project (Federal Register- NOI, 01/20/2015)*
- b. *Burley Interagency Landscape Sage-Grouse Habitat Restoration Project*

**10.5.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically implement brush management treatments and rehabilitate annual grasslands to reduce vegetative fire fuels within and to protect Core and Important habitat zones, as resources permit.

**10.6.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically establish fuel breaks along existing roads and other disturbances to protect Core and Important habitat zones; identify and target higher-risk roads for fuel break construction and maintenance based on fire history maps. Fuel breaks to include annual monitoring and maintenance.

- a. *Tri-State Interagency Fuel Break Project (Federal Register-NOI, 2015)*
- b. *Paradigm Fuel Break Project (BLM Draft EA, 01/24/2014)*

**10.7.** IDL will analyze the cost benefit of fuel breaks in relation to additional loss of sage steppe habitat, increased forage with green stripping, increased cost/risk of controlling invasive weeds in brown stripping, and cost of annual fuel break monitoring and maintenance.

**10.8.** IDL will authorize private, state and federal contractor fuel break construction across IDL managed land.

## **11. Wildfire Restoration and Rehabilitation on Endowment Land**

Wildfire restoration/rehabilitation is essential for conserving sage-grouse habitat. The increasing frequency and intensity of rangeland fire poses a significant threat to habitat as well as increasing opportunity for the accelerated invasion of non-native annual grasses, in particular cheatgrass and medusahead rye, and the spread of pinyon-juniper across the sagebrush-steppe ecosystem. By quickly taking action to restore/rehabilitate following wildfire, this opportunity is decreased as we increase the likelihood of native vegetation reestablishing.

**11.1.** IDL will form partnerships, agreements, and cooperate with lessees, working groups, and other federal, state, county and private partners in post-fire restoration treatments of Core and Important habitat zones on state endowment trust rangelands damaged by fire.

- a. *Draft BLM/IDFG/IDL Rangeland Rehabilitation MOU (Final MOU 02/2015)*

## **12. Habitat Restoration and Vegetation Management on Endowment Land**

**12.1.** As resources permit, IDL will give high priority to vegetation restoration, rehabilitation or manipulation projects that include:

- a. Cooperative efforts that may improve Core and Important habitat zones over multiple ownerships.
- b. Projects that may provide connectivity between suitable habitats or expand existing good quality habitat within Core and Important habitat zones on state endowment trust rangelands.
- c. Sites where environmental variables contribute to improved chances for project success.
- d. Projects that address conifer encroachment within Core and Important habitat zones. Priority for treatment as Phase 1 (<10% conifer cover), Phase 2 (10-30%), and Phase 3 (>30%).

- e. Where desirable perennial bunchgrasses and/or forbs are deficient in existing sagebrush stands, use appropriate mechanical, aerial, or other techniques to re-establish desired species.
- f. Re-establish sagebrush cover on recently burned native areas within suitable Core and Important habitat zones, with consideration to state endowment trust rangeland forage productivity, local needs and conditions.

**12.2.** Assess existing on-site vegetation to ascertain if enough desirable perennial vegetation exists to consider techniques to increase on-site seed production to facilitate an increase in density of desired species.

**12.3.** Use available plant species based on their adaptation to the site when developing seed mixes.

**12.4.** Use post-treatment control to reduce annual grass densities, invasive and noxious weed competition through targeted livestock grazing and herbicide applications.

### **13. Invasive Plant Species on Endowment Lands**

Exotic annual grasses and other invasive plants alter habitat suitability for sage-grouse by reducing or eliminating native forbs and grasses essential for food and cover. Exotic annual grasses, in particular cheatgrass and medusahead rye, also facilitate an increase in mean fire frequency. For Idaho endowment trust lands, the following five conservation measures for invasive plant species will be applied through lease stipulations or other recordable instrument stipulations.

**13.1.** All vehicles and equipment that will travel off approved/designated transportation routes or will be utilized during operations will be cleaned to prevent the spread of seeds and propagules.

**13.2.** Weeds will be inventoried and monitored pre-disturbance by the lessee, and throughout the life of the project.

**13.3.** Reclamation activities will include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) will be certified weed free by the appropriate Federal or State of Idaho agency.

**13.4.** Authorized parties will use Idaho licensed professional applicators to treat any noxious weed with the appropriate, approved, and properly-documented herbicides. Weeds will be treated promptly whenever they are located on a project site.

## **14. Infrastructure Development/ Lands and Realty on State Endowment Trust Land**

Infrastructure development on state endowment trust lands can vary from minor road or fencing construction to utility-scale renewable energy facilities including wind farms, geothermal power plants, and solar power plants. These developments regardless of their size can have a measurable and substantial impact on sage-grouse and their habitat. All infrastructure developments require some form of road construction to deliver materials for construction and perform regular maintenance to facilities. These roads are often graded gravel roads and are maintained periodically for easy access to sites. Other smaller roads are developed for access to geothermal well pads, wind turbines, or pipelines. Roads may also be necessary for third-party access to private or federal lands.

Transmission lines must be built in order to harness power from wind turbines, geothermal sites, or solar sites. Additionally, fences are often erected to protect facilities such as turbines or substations from vandalism. These features all have the potential to directly, or indirectly, affect sage-grouse at multiple scales and over time.

IDL's assessment of the potential for renewable energy development to occur on state endowment trust lands located in Core and Important sage-grouse habitat zones is very low. However, any proposed development will be required to comply with the conservation measures identified in the following sections. These same conservations measures will also be included as stipulations in rights-of-way, when IDL authorizes parties to access other lands by using state endowment trust lands.

### **14.1. Surface Use and Timing**

**14.1.1.** Controlled surface use and timing limitations will be applied within Core and Important habitat zones, unless species occupancy and distribution determined by the Idaho Department of Fish and Game (IDFG) recommends otherwise.

**14.1.2.** No surface occupancy is allowed within 1 km (0.62 mi.) of an occupied lek in the designated Core and Important habitat zones.

**14.1.3.** During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse.

**14.1.4.** Major construction and maintenance activity should be avoided by authorized parties in sage-grouse winter range from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

### **14.2. Noise**

Limit noise levels from discretionary activities within Core and Important habitat zones to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before to 2 hours after sunrise and sunset during breeding season.

Ambient noise levels will be determined by measurements taken at the perimeter of a lek at sunrise.

### **14.3. Fencing**

**14.3.1.** New and existing wire fence segments constructed by authorized parties within Core and Important habitat zones will be marked with collision-diverter fence markers, as defined by National Resources Conservation Services (NRCS) design practices (Stevens, 2011).

**14.3.2.** As feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important habitat zones.

### **14.4. Water Supply Structures**

**14.4.1.** New or modified spring developments (including pipelines) should be designed by authorized parties to enhance the free-flowing characteristics of springs and wet meadows, which will help maintain continuity of the pre-developed riparian areas.

**14.4.2.** The construction of new ponds or reservoirs by authorized parties will be minimized, except as needed to meet important resource management or restoration objectives, to reduce the potential impact from West Nile Virus on sage-grouse. For necessary livestock water, non-pond or non-reservoir watering facilities, such as free-flowing troughs and “bottomless” tanks, will be maintained or developed.

**14.4.3.** Wildlife escape ramps in new and existing water troughs and open-water storage tanks should be developed to facilitate the use of and escape by wildlife.

### **14.5. Constructed Improvements**

**14.5.1.** Construction methods will be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.

**14.5.2.** Infrastructure will be placed by authorized parties in already-disturbed locations where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed for access to facilities.

**14.5.3.** Surface disturbances will be clustered in order to limit surface occupancy.

**14.5.4.** New utility developments and transportation routes will be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.

**14.5.5.** Transmission towers will be outfitted by authorized parties with anti-perch devices in occupied sage-grouse habitat.

**14.5.6.** Newly-constructed structures with a height over five feet (e.g. corrals, loading facilities storage tanks, windmills) will not be constructed by authorized parties within line-of-sight or at least 2 km of occupied leks.

**14.5.7.** Construction plans developed by authorized parties will include options that deter raptor perching and raven nesting on elevated structures.

**14.5.8.** Permanent structures that create movement will be minimized within Core and Important habitat zones.

**14.6. Site Reclamation** (non-fire related rehabilitation/reclamation)

**14.6.1.** Site reclamation will be completed by authorized parties as soon as phases of operations or construction are completed.

**14.6.2.** Reclamation activities and plans will consider the ecological site potential. The goal of the reclamation will be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.

**14.6.3.** Sites will be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

**Transition Lands/Land Tenure**

IDL considers opportunities to sell, purchase, develop, or exchange state endowment trust lands to meet its constitutional mandate to maximize long term returns to the owning beneficiaries by diversifying land holdings, maximizing the rate of return to the trusts, improving public access to state trust lands, and consolidating state trust lands for more efficient management. In order to accomplish these objectives, IDL must be able to maintain the flexibility to move lands into and out of the identified habitat zones. Lands identified for potential ownership changes are termed “transition lands.”

The ultimate decision authority for determining to auction or exchange state endowment trust lands lies with the Land Board. IDL commits to providing the Land Board relevant data and analysis to inform them on potential impacts to sage-grouse habitat of land transitions within Core or Important sage-grouse habitat zones through the following Conservation Measures.

**14.7.** Any tract proposed for sale or exchange within Core or Important habitat zones will include an analysis on the impact to sage-grouse habitat resulting from the transition. This analysis will include, but not limited to:

- Acres in and percentages of Core and Important habitat zones.
- Quality/type of habitat (number of leks, breeding, nesting, early brood rearing, summer/late brood rearing, fall, winter).
- Any knowledge of new owner's implementation/commitment for sage-grouse conservation measures to estimate overall impact to sage-grouse habitat conservation.
- Idaho Fish and Game Comments.

**14.8.** New state endowment trust lands acquired within the Core and Important habitat zones will be managed according to IDL's sage-grouse Conservation Measures.

## **15. Mineral Leasing on Endowment Land**

For all mineral leasing activities on state endowment trust lands, conservation measures for the sage-grouse will be applied through lease stipulations or other recordable instrument stipulations that are enforceable. Mineral leasing can be slightly more complex due to the potential for split estate scenarios, where the surface owner is different than the mineral estate owner. In these cases, IDL would still include conservation measures as lease stipulations when leasing involves only the mineral estate (where the endowed beneficiary is not the surface owner).

### **15.1. Fluid Mineral Leasing on Endowment Land**

For state endowment trust lands, the following oil and gas lease stipulations will be included in the lease document and advertised prior to lease auction on tracts within Core and Important habitat zones

#### **15.1.1. Surface Use and Timing**

- a. Controlled surface use and timing limitations will be applied within Core and Important habitat zones, unless species occupancy and distribution determined by the Idaho Department of Fish and Game (IDFG) recommends otherwise.
- b. No surface occupancy is allowed within 1 km (0.62 mi.) of an occupied lek in the designated Core and Important habitat zones.
- c. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse.
- d. Major construction and maintenance activity will be avoided by authorized parties in sage-grouse winter range from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

### **15.1.2. Noise**

Limit noise levels from discretionary activities within Core and Important habitat zones to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before to 2 hours after sunrise and sunset during breeding season. Ambient noise levels will be determined by measurements taken at the perimeter of a lek at sunrise.

### **15.1.3. Fencing**

New wire fence segments constructed by authorized parties within Core and Important habitat zones will be marked with collision-diverter fence markers, as defined by National Resources Conservation Services (NRCS) design practices (Stevens, 2011).

### **15.1.4. Water Supply Structures**

Wildlife escape ramps in new open-water storage tanks will be developed to facilitate the use of and escape by wildlife.

### **15.1.5. Constructed Improvements**

- a. Construction methods will be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- b. Infrastructure will be placed by authorized parties in already-disturbed locations where the habitat has not been established. Infrastructure, such as pipelines, will be located along roads already in existence or required to be newly constructed for access to facilities.
- c. Surface disturbances will be clustered in order to limit surface occupancy.
- d. New utility developments and transportation routes will be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- e. Transmission towers will be outfitted by authorized parties with anti-perch devices in occupied sage-grouse habitat.
- f. Newly-constructed structures with a height over five feet (e.g. loading facilities, storage tanks) will not be constructed by authorized parties within line-of-sight or at least 2 km of occupied leks.
- g. Construction plans developed by authorized parties should include options that deter raptor perching and raven nesting on elevated structures.
- h. Permanent structures that create movement, such as pump jacks will be minimized or hidden within Core and Important habitat zones.

### **15.1.6. Site Reclamation for Leases**

- a. Site reclamation will be completed by authorized parties as soon as phases of operations or construction are completed.
- b. Reclamation activities and plans will consider the ecological site potential. The goal of the reclamation will be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native

- forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- c. Sites will be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

## **15.2. Mining Activities On State Endowment Trust Lands**

Mineral leasing and any subsequent mining activities on state endowment trust lands require authorization and oversight by IDL. IDL uses written procedures, including mineral lease pre-auction inspections, quarterly or yearly mineral lease inspections, and mineral lease enforcement to ensure compliance by authorized parties. The following conservation measures will be incorporated into the IDL mineral leases that are in Core and Important sage-grouse habitat zones.

### **15.2.1. Surface Use and Timing**

- a. Controlled surface use and timing limitations will be applied within Core and Important habitat zones, unless species occupancy and distribution determined by the Idaho Department of Fish and Game (IDFG) recommends otherwise.
- b. No surface occupancy is allowed within 1 km (0.62 mi.) of an occupied lek in the designated Core and Important habitat zones.
- c. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse.
- d. Major construction and maintenance activity will be avoided by authorized parties in sage-grouse winter range from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

### **15.2.2. Noise**

Limit noise levels from discretionary activities within Core and Important habitat zones to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before to 2 hours after sunrise and sunset during breeding season. Ambient noise levels will be determined by measurements taken at the perimeter of a lek at sunrise.

### **15.2.3. Fencing**

New wire fence segments constructed by authorized parties within Core and Important habitat zones will be marked with collision-diverter fence markers, as defined by National Resources Conservation Services (NRCS) design practices (Stevens, 2011).

#### **15.2.4. Water Supply Structures**

Wildlife escape ramps in new open-water storage tanks will be developed to facilitate the use of and escape by wildlife.

#### **15.2.5. Constructed Improvements**

- a. Construction methods will be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- b. Infrastructure will be placed by authorized parties in already-disturbed locations where the habitat has not been established. Infrastructure, such as pipelines, will be located along roads already in existence or required to be newly constructed for access to facilities.
- c. Surface disturbances will be clustered in order to limit surface occupancy.
- d. New utility developments and transportation routes will be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- e. Transmission towers will be outfitted by authorized parties with anti-perch devices in occupied sage-grouse habitat.
- f. Newly-constructed structures with a height over five feet (e.g. loading facilities, storage tanks) will not be constructed by authorized parties within line-of-sight or at least 2 km of occupied leks.
- g. Construction plans developed by authorized parties should include options that deter raptor perching and raven nesting on elevated structures.
- h. Permanent structures that create movement, such as pump jacks will be minimized or hidden within Core and Important habitat zones.

#### **15.2.6. Site Reclamation for Leases**

- a. Site reclamation will be completed by authorized parties as soon as phases of operations or construction are completed.
- b. Reclamation activities and plans will consider the ecological site potential. The goal of the reclamation will be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- c. Sites will be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

### **16. Range Management/Livestock Grazing**

Grazing has been determined to not be a primary threat to sage-grouse in Idaho, but the measures listed above in 13. and 14. will also apply to grazing leases.

## **17. Wild Horses and Burros**

No direct measures, this item included to maintain sequential numbering system utilized for the BLM *Administrative Draft Proposed Plan*.

## **18. Travel Management**

**18.1.** On site traffic should be reduced by use of telemetry and other remote sensing tools.

**18.2.** During operations, existing roads or trails should be employed and activities should be contained as close to existing roads and trails as feasible.

**18.3.** Roads should be designed by authorized parties to an appropriate minimum standard necessary to accommodate their intended purpose.

**18.4.** Road crossings should be constructed by authorized parties at right angles to ephemeral drainages and stream crossings.

## **19. Recreation**

Recreation has been determined to not be a primary threat to sage-grouse in Idaho, but the measures listed above in 13. and 14. will also apply to recreation leases.

## **20. Implementation and Monitoring**

Implementation of the conservation measures through lease/permit/easement stipulation will be incorporated into existing lease/permit/easement issuance procedures. A copy of the applicable conservation measures will be provided to all interested applicants for a lease, permit or easement on state endowment trust lands located in Core or Important habitat zones, so the applicant is informed of the expected requirements when entering the application process. The conservation measures will be incorporated into the authorizing document either directly or by separate addendum.

Monitoring of conservation measures required through lease/permit/easement stipulation will be incorporated into existing lease/permit inspection procedures. Inspection forms will be amended to include a section for documenting that conservation measures were implemented and an assessment of their effectiveness.

Procedures for land transactions will be amended to include an analysis of the impacts on sage-grouse when the transaction includes transition lands within Core or Important habitat zones. The results of this analysis will be included in the information provided to the Land Board for their review of the proposed transaction.

---

## **PART II. CONSERVATION MEASURES FOR IDL ACTIVITIES IN THE FIRE PROGRAM AND FOR REGULATED ACTIVITIES IN THE OIL & GAS AND MINERALS PROGRAMS**

For regulatory and assistance activities, conservation measures will be voluntary best management practices on private land because IDL does not have the statutory authority within its regulatory or assistance programs to require adoption by authorized parties. Regulatory and assistance activities include: Abandoned Mine Lands Projects; Dredge and Placer Mine Permits; Mine Reclamation Plan Approvals; and Oil & Gas Permits (seismic imaging surveys, well drilling).

In addition, IDL has roles and responsibilities in its fire program where conservation measures will be implemented by IDL to address conservation of sage-grouse habitat in Core and Important habitat zones.

### **8. Wildfire Preparedness/Prevention**

IDL is committed to conserving habitat for the greater sage-grouse in Idaho, which is under threat from the invasion of annual grasses and the loss of habitat from fire. IDL has developed the following wildfire preparedness and prevention conservation measures that are complementary with the January 5, 2015 US Department of Interior, Secretary of Interior Order Number 3336. This Order from Secretary Jewell sets forth enhanced policies and strategies for preventing and suppressing rangeland fire and for restoring sagebrush landscapes impacted by fire across the West.

**8.1.** IDL will continue to support the ongoing operations of taxing and non-taxing fire districts in Idaho, when requested and as available, through equipment acquired through the Federal Excess Personal Property (FEPP) program and Firefighter Property (FFP) program, and through Volunteer Fire Assistance (VFA) grant fund allocations.

**8.2.** IDL will continue to support the formation and ongoing operations of Rangeland Fire Protection Associations (RFPAs) through the South Idaho Fire Liaison Program. This position is the point of contact for any needs or issues raised by RFPAs and their cooperators. The position coordinates information needs on an annual cycle as well as facilitating an annual meeting for all RFA Board of Directors and their cooperators, held following fire season.

**8.3.** IDL will continue to support the formation and operation of RFPAs through start-up funding that provides personal protective equipment, radios, firefighting equipment, and training materials.

**8.4.** IDL will continue to utilize burning permits (per Idaho Code 38-115, Rule IDAPA 20.04.01.060) during the designated closed fire season as a fire prevention and control tool. Burning permits acquaint the permit holder with the laws and requirements for safe burning. During times of critical fire hazard, all burning may be stopped by the suspension of burning permits. Closed fire season provides for public safety and the protection of land resources by ensuring that all burning operations which may occur during periods of high fire danger are conducted under safe conditions and in such manner that the danger of uncontrolled fire spread is minimized.

**8.5.** IDL will continue to participate in the Idaho Fire Restrictions Plan (per Idaho Code 38-115, Rule IDAPA 20.04.01.060; IDAPA 20.04.01.070; IDAPA 20.04.01.090; and IDAPA 20.04.01.120), which is an interagency document that outlines coordination efforts regarding fire restrictions and closures. The purpose of fire restrictions is to reduce the risk of human-caused fires during unusually high fire danger and/or burning conditions. An interagency approach for initiating restrictions or closures helps provide consistency among the land management partners, while defining the restriction boundaries so they are easily distinguishable to the public.

## **9. Wildfire Suppression**

None of IDL's fire districts have suppression responsibilities within any currently identified Core or Important habitat zones. Likewise, as of December 2014, none of IDL's fire districts have suppression responsibilities within any currently identified General habitat zone. When IDL fire suppression resources are dispatched as a cooperating agency to another agency's incidents within sage-grouse habitat, they will utilize that agency's best management practices as applicable for sage-grouse habitat and as instructed in the dispatched resource's briefing.

## **10. Fuels Management**

IDL does not have general regulatory authority over fuels management on non-state rangelands.

## **11. Wildfire Restoration and Rehabilitation**

IDL does not have general regulatory authority over wildfire restoration and rehabilitation on non-state rangelands.

## **12. Habitat Restoration and Vegetation Management**

IDL has limited authority to regulate habitat restoration and vegetation management, but will address vegetation management through voluntary BMPs and permit stipulations. See section 15.

### **13. Invasive Plant Species**

IDL has limited authority to regulate invasive species, but will address invasive species management through voluntary BMPs and permit stipulations. See Section 15.

### **14. Infrastructure Development**

IDL has limited authority to regulate infrastructure development, but will address infrastructure development through voluntary BMPs and permit stipulations. See Section 15.

### **15. Minerals**

#### **15.1. Fluid Minerals**

Fluid minerals are resources of oil, natural gas (gas), and natural gas condensate. The first commercially-viable resources of gas were discovered in Payette County in 2010. Exploration activity is also located in adjacent counties to Payette. Recent leasing in south central and southeast Idaho suggests exploration interests in these areas. Additional resource discoveries are possible in all of these areas. Presently, IDL has no exploration activities to regulate for fluid minerals located in Core or Important sage-grouse habitat zones.

The resources in Payette County were discovered with conventional drilling operations, which utilized vertical well bores that penetrated permeable gas accumulations within site-specific gas traps. These types of deposits are termed conventional gas (or oil) resources. In contrast, unconventional resources are continuously-distributed oil or gas accumulations in fine-grained rocks, which generally cannot be exploited through conventional methods and techniques. Unconventional resources have not been identified in Idaho, but the potential for their discovery does exist.

#### **15.1.2. Oil and Gas Activities – Regulatory Compliance**

The IDL is the administrative arm of the Idaho Oil and Gas Conservation Commission (Commission) pursuant to § 47-319(2) which states that the commission is authorized to; "...regulate the exploration for and production of oil and gas, prevent waste of oil and gas and to protect correlative rights, and otherwise to administer and enforce this act. It has jurisdiction over all persons and property necessary for such purposes. In the event of a conflict, the duty to prevent waste is paramount." Under this authority, § 47-321 provides for the commission to establish spacing units which are legally described boundaries overlaying the resource and set a fixed acreage per well, with the well located in the center of the boundary. § 47-321(b) states that these spacing units are established by the Commission in order to; "...result in the efficient and economical development of the pool as a whole..."

At this time for conventional drilling techniques, the default spacing, set by the Commission, is 640 acres for gas and 40 acres for oil. As surface use restrictions grow, the Commission could see requests to modify the default spacing unit in order to limit surface disturbance. As the Commission receives these requests, IDL will provide sage-grouse habitat data so that the Commission, if it chooses, can incorporate such information into its decision establishing a new spacing unit.

The best management practices (BMPs) listed below will be provided to all applicants seeking permit issuance for operations in Core or Important sage-grouse habitat zones. If they agree to voluntarily comply with some or all of the practices, those practices will be incorporated as a stipulation in the permit.

#### **15.1.2.1. Oil and Gas Activities**

The following BMPs will be provided to all operators making application to drill a well, treat a well, or conduct seismic explorations in Core or Important habitat zones.

##### **a. Wildfire Prevention**

- i. Authorized parties will be required to develop and be prepared to implement a fire prevention and an emergency response plan that covers all aspects of operations, which will include: coordination with local jurisdictions, such as the cities, counties, landowners, IDL, Rangeland Fire Protection Associations, and Federal land agencies; emergency contact numbers and information, including 911 and local fire dispatch centers; and fire prevention and safety procedures that will include evacuation routes and procedures, the designated safety meeting place, and emergency shutdown procedures.
- ii. Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.
- iii. Authorized parties will ensure that field personnel are aware of:
  - a. fire prevention and emergency response plan,
  - b. evacuation routes and procedures,
  - c. designated safety meeting places, and
  - d. emergency shutdown procedures.
- iv. Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

## **b. Invasive Species**

- i. All vehicles and equipment that should travel off approved/designated transportation routes or will be utilized during operations will be cleaned before and after entry to prevent the spread of seeds and propagules.
- ii. Weeds should be inventoried and monitored pre-disturbance by IDL, and throughout the life of the project.
- iii. Reclamation activities should include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) should be certified weed free by the appropriate Federal or State of Idaho agency.
- iv. Authorized parties should use Idaho licensed professional applicators to treat any noxious weed with the appropriate, approved, and properly-documented herbicides. Weeds should be treated promptly whenever they are located on a project site.

## **c. Surface Use and Timing**

- i. Conventional well activity and exploration will not be conducted within 0.6 miles of an active lek.
- ii. All pipelines and collector lines will be emplaced utilizing horizontal boring methods with a minimum setback of 0.6 miles of a lek.
- iii. Construction of pipelines will be in accordance with seasonal stipulations regarding no operations or construction from March to July.
- iv. Pipeline maintenance will not be conducted between 6 a.m. to 8 a.m., except in an emergency situation.
- v. Compressor stations and other vital operations shall be placed a minimum of 0.6 miles from a lek.

## **d. Noise**

- i. Noise on permitted well sites will be at or below 65db threshold from March to July, within 0.6 miles of an active lek.
- ii. Noise levels may be exceeded for emergency situations including well control and threats to freshwater resources.

### **e. Fencing**

- i. New and existing wire fence segments constructed by authorized parties within Core and Important habitat zones should be marked with collision-diverter fence markers, as defined by National Resources Conservation Services (NRCS) design practices (Stevens, 2011).
- ii. As feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important habitat zones.

### **f. Constructed Improvements**

- i. Construction methods should be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- ii. Infrastructure should be placed by authorized parties in already-disturbed locations where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed for access to facilities.
- iii. Surface disturbances should be clustered in order to limit surface occupancy.
- iv. New utility developments and transportation routes should be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- v. Transmission towers should be outfitted by authorized parties with anti-perch devices in occupied sage-grouse habitat.
- vi. Newly-constructed structures with a height over five feet (e.g. storage tanks, buildings) should not be constructed by authorized parties within line-of-sight or at least 2 km of occupied leks.
- vii. Construction plans developed by authorized parties should include options that deter raptor perching and raven nesting on elevated structures.
- viii. Permanent structures that create movement should be minimized within Core and Important habitat zones.

## **g. Site Reclamation**

- i. Site reclamation should be completed by authorized parties as soon as phases of operations or construction are completed.
- ii. Reclamation activities and plans should consider the ecological site potential. The goal of the reclamation should be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- iii. Sites should be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

## **15.2. Abandoned Mine Lands Program**

This program operates on private, federal, and state lands. IDL works with landowners to address safety closures of dangerous mine openings and reclaim areas to protect human health. Reclamation is also performed to improve water quality and wildlife habitat. IDL develops and controls these projects, and can incorporate sage-grouse conservation measures into the projects. Abandoned mine land projects will implement the following best management practices within Core and Important sage-grouse habitat zones.

### **a. Wildfire Prevention**

- i. Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.
- ii. Authorized parties will ensure that field personnel are aware of:
  - a. fire prevention and emergency response plan,
  - b. evacuation routes and procedures,
  - c. designated safety meeting places, and
  - d. emergency shutdown procedures.
- iii. Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

### **b. Invasive Species**

- i. All vehicles and equipment that should travel off approved/designated transportation routes or will be utilized

during operations will be cleaned before and after entry to prevent the spread of seeds and propagules.

- ii. Weeds should be inventoried and monitored pre-disturbance by IDL, and throughout the life of the project.
- iii. Reclamation activities should include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) should be certified weed free by the appropriate Federal or State of Idaho agency.
- iv. Authorized parties should use Idaho licensed professional applicators to treat any noxious weed with the appropriate, approved, and properly-documented herbicides. Weeds should be treated promptly whenever they are located on a project site.

#### **c. Surface Use and Timing**

- i. Controlled surface use and timing limitations should be applied within Core and Important habitat zones, unless species occupancy and distribution determined by the Idaho Department of Fish and Game (IDFG) recommends otherwise.
- ii. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse.
- iii. Major construction and maintenance activity should be avoided by authorized parties in sage-grouse winter range from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

#### **d. Noise**

Limit noise levels from discretionary activities within Core and Important habitat zones to no more than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before to 2 hours after sunrise and sunset during breeding season. Ambient noise levels should be determined by measurements taken at the perimeter of a lek at sunrise.

#### **e. Fencing**

- i. New and existing wire fence segments constructed by authorized parties within Core and Important habitat zones should be marked with collision-diverter fence markers, as defined by National Resources Conservation Services (NRCS) design practices (Stevens, 2011).

- ii. As feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important habitat zones.

#### **f. Water Supply Structures**

- i. New or modified spring developments (including pipelines) should be designed by authorized parties to enhance the free-flowing characteristics of springs and wet meadows, which will help maintain continuity of the pre-developed riparian areas.
- ii. The construction of new ponds or reservoirs by authorized parties should be minimized, except as needed to meet important resource management or restoration objectives, to reduce the potential impact from West Nile Virus on sage-grouse. For necessary livestock water, non-pond or non-reservoir watering facilities, such as free-flowing troughs and “bottomless” tanks, should be maintained or developed.
- iii. Wildlife escape ramps in new and existing water troughs and open-water storage tanks should be developed to facilitate the use of and escape by wildlife.

#### **g. Constructed Improvements**

- i. Construction methods should be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- ii. Infrastructure should be placed by authorized parties in already-disturbed locations where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed for access to facilities.
- iii. Surface disturbances should be clustered in order to limit surface occupancy.
- iv. New utility developments and transportation routes should be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- v. Transmission towers should be outfitted by authorized parties with anti-perch devices in occupied sage-grouse habitat.

- vi. Newly-constructed structures with a height over five feet (e.g. storage tanks, buildings) should not be constructed by authorized parties within line-of-sight or at least 2 km of occupied leks.
- vii. Construction plans developed by authorized parties should include options that deter raptor perching and raven nesting on elevated structures.
- viii. Permanent structures that create movement should be minimized within Core and Important habitat zones.

#### **h. Site Reclamation**

- i. Site reclamation should be completed by authorized parties as soon as phases of operations or construction are completed.
- ii. Reclamation activities and plans should consider the ecological site potential. The goal of the reclamation should be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- iii. Sites should be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

### **15.3. Mining Regulatory Program**

This program operates on private, federal, and state lands and covers all dredge and placer mining and surface mining operations. Activities classified as exploration, such as drilling or trenching, only require a notification to IDL. Dredge and placer mining operations over ½ acre require a permit and bond. Surface mining operations that produce materials for immediate or ultimate sale require a reclamation plan and bond. Coordinated reviews with Idaho Department of Environmental Quality, Idaho Department of Water Resources, and Idaho Department of Fish and Game are required for operations that may impact water quality.

The best management practices listed below will be provided to all applicants seeking reclamation plan approval or permit issuance for mining operations in Core or Important sage-grouse habitat zones. If they agree to voluntarily comply with some or all of the practices, those practices will be incorporated as a condition of reclamation plan or permit approval.

To further contribute to conservation of sage-grouse habitat, IDL will also coordinate with Idaho Department of Fish and Game to evaluate existing mines and their potential impact on sage-grouse habitat. The following best management practices will be suggested to these mine operators. IDL will also work with Idaho Department Fish and Game to develop an informational brochure for new mine operators so they may consider adopting these best management practices into their proposed operations.

### **a. Wildfire Prevention**

- i. Authorized parties will be required to develop and be prepared to implement a fire prevention and an emergency response plan that covers all aspects of operations, which will include: coordination with local jurisdictions, such as the cities, counties, landowners, IDL, Rangeland Fire Protection Associations, and Federal land agencies; emergency contact numbers and information, including 911 and local fire dispatch centers; and fire prevention and safety procedures that will include evacuation routes and procedures, the designated safety meeting place, and emergency shutdown procedures.
- ii. Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.
- iii. Authorized parties will ensure that field personnel are aware of:
  - a. fire prevention and emergency response plan,
  - b. evacuation routes and procedures,
  - c. designated safety meeting places, and
  - d. emergency shutdown procedures.
- iv. Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

### **b. Invasive Species**

- i. All vehicles and equipment that should travel off approved/designated transportation routes or will be utilized during operations will be cleaned before and after entry to prevent the spread of seeds and propagules.
- ii. Weeds should be inventoried and monitored pre-disturbance by IDL, and throughout the life of the project.
- iii. Reclamation activities should include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) should be certified weed free by the appropriate Federal or State of Idaho agency.
- iv. Authorized parties should use Idaho licensed professional applicators to treat any noxious weed with the appropriate, approved, and properly-documented herbicides. Weeds should be treated promptly whenever they are located on a project site.

### **c. Surface Use and Timing**

- i. Controlled surface use and timing limitations should be applied within Core and Important habitat zones, unless species occupancy and distribution determined by the Idaho Department of Fish and Game (IDFG) recommends otherwise.
- ii. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse.
- iii. Major construction and maintenance activity should be avoided by authorized parties in sage-grouse winter range from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

### **d. Noise**

- i. Limit noise levels from discretionary activities within Core and Important habitat zones to no more than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before to 2 hours after sunrise and sunset during breeding season. Ambient noise levels should be determined by measurements taken at the perimeter of a lek at sunrise.
- ii. Authorized party will keep noise levels on existing infrastructure within the 0.6 mile buffer to 65 decibels or less.

### **e. Fencing**

- i. New and existing wire fence segments constructed by authorized parties within Core and Important habitat zones should be marked with collision-diverter fence markers, as defined by National Resources Conservation Services (NRCS) design practices (Stevens, 2011).
- ii. As feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important habitat zones.

#### **f. Water Supply Structures**

- i. New or modified spring developments (including pipelines) should be designed by authorized parties to enhance the free-flowing characteristics of springs and wet meadows, which will help maintain continuity of the pre-developed riparian areas.
- ii. The construction of new ponds or reservoirs by authorized parties should be minimized, except as needed to meet important resource management or restoration objectives, to reduce the potential impact from West Nile Virus on sage-grouse. For necessary livestock water, non-pond or non-reservoir watering facilities, such as free-flowing troughs and “bottomless” tanks, should be maintained or developed.
- iii. Wildlife escape ramps in new and existing water troughs and open-water storage tanks should be developed to facilitate the use of and escape by wildlife.

#### **g. Constructed Improvements**

- i. Construction methods should be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- ii. Infrastructure should be placed by authorized parties in already-disturbed locations where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed for access to facilities.
- iii. Surface disturbances should be clustered in order to limit surface occupancy.
- iv. New utility developments and transportation routes should be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- v. Transmission towers should be outfitted by authorized parties with anti-perch devices in occupied sage-grouse habitat.
- vi. Newly-constructed structures with a height over five feet (e.g. storage tanks, buildings) should not be constructed by authorized parties within line-of-sight or at least 2 km of occupied leks.
- vii. Construction plans developed by authorized parties should include options that deter raptor perching and raven nesting on elevated structures.

- viii. Permanent structures that create movement should be minimized within Core and Important habitat zones.

#### **h. Site Reclamation**

- i. Site reclamation should be completed by authorized parties as soon as phases of operations or construction are completed.
- ii. Reclamation activities and plans should consider the ecological site potential. The goal of the reclamation should be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- iii. Sites should be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

### **16. Range Management/Livestock Grazing**

IDL does not have general regulatory authority over livestock grazing on non-state lands.

### **17. Wild Horses and Burros**

IDL does not have regulatory authority over wild horses and burros.

### **18. Travel Management**

IDL does not have general regulatory authority over travel management on non-state lands.

### **19. Recreation**

IDL does not have general regulatory authority over recreation on non-state lands.

### **20. Implementation and Monitoring**

Implementation of the conservation measures through voluntary agreement will be incorporated into existing permit procedures. A copy of the applicable conservation measures will be provided to all applicants for a permit on lands located in Core or Important habitat zones. As part of the application, applicants will acknowledge which, if any, conservation measures they are willing to voluntarily comply with. Those conservation measures will then be incorporated into the permit as an enforceable stipulation of the permit.

Monitoring of conservation measures stipulated in the permit will be incorporated into existing permit inspection procedures. Inspection forms will be amended to include a section for documenting that conservation measures were implemented and an assessment of their effectiveness.

Procedures for Abandoned Mine Lands projects will be amended to include an assessment of the impact on sage-grouse when the project includes lands within Core or Important habitat zones. The results of this assessment will be used to determine the appropriate conservation measures to be implemented as part of the project.

DRAFT

plan, including the IDL plan nested within the broader state effort, and conservation measures outlined by ten other western states and regulatory mechanisms for federal lands in the states, before it makes a decision whether to list sage-grouse under the ESA.

# Birds of a Feather

*Information contained in feathers is helping to understand sage-grouse populations*

## Feather Collecting on a Grand Scale

Dawn breaks over an expansive Nevada sagebrush landscape, disturbed only by the rumbling of a truck moving along U.S. Route 50. It is late April and prime time for sage-grouse mating. The biologist driving the truck is headed to a communal breeding ground for sage-grouse known as a lek. After taking several side roads, she parks and walks a short distance to a relatively flat, nondescript opening in the sagebrush landscape. The day's round of mating is over, the shuffles and scuffles have ended, and the birds have dispersed for the day. Feathers lost during the dust-ups between males are the main object of the biologist's visit. She collects 20 feathers, packaging each in a labeled envelope and placing the stack in her pack before heading to the next lek. She is part of a team collecting feathers from more than 7,000 leks spread across 11 Western States and 2 Canadian provinces. The feathers contain genetic information, which when extracted and analyzed, will reveal information about movement patterns and population structure useful for management of greater sage-grouse throughout their North American range. The biologist and this project are part of a much larger integrated effort helping to solve one of the most difficult ecological challenges in North America.

Greater sage-grouse gather in groups at a lek to court and mate with females. (Photograph taken by T. Gettelman, USGS, Western Ecological Research Center, March 30, 2012.)

## A Complex Conservation Challenge

Greater sage-grouse (*Centrocercus urophasianus*, hereafter sage-grouse) are broadly distributed, occupy a diversity of sagebrush habitats, and face multiple threats. As a result of these threats, sage-grouse populations are declining and are now absent from almost one-half of their estimated range prior to Euro-American settlement. The risks to sage-grouse are

### General facts about greater sage-grouse

- Largest grouse species in North America
- Resident bird managed by state agencies as a native game bird
- Uses communal breeding grounds called leks
- Ground nesting, usually underneath a sagebrush and concealed by grass
- Sagebrush dependent, particularly in winter
- Occurs in 11 States and 2 Canadian provinces, across a range that spans 259,000 square miles
- Annual home-range size can cover 230 square miles or more
- Seasonal ranges can be widely dispersed
- Routinely monitored by state management agencies by counting males at lek sites

### General facts about sagebrush

- Most widespread vegetation in Western North America
- Dominant land cover on more than 190,000 square miles within sage-grouse range
- Includes 18 woody plant species of various shapes and sizes
- Co-occurs with native grasses and forbs as a shrub steppe system
- Essential habitat for 350 species, including sage-grouse
- In jeopardy due to altered fire regimes, invasions of nonnative plants, encroachment of trees, anthropogenic land uses, and climate change
- More than 70 percent of sagebrush habitats used by sage-grouse are on public lands managed by Federal or State agencies

significant enough to merit candidate status for this species for listing under the U.S. Endangered Species Act (Federal Register Notice, March 5, 2010). According to this decision by the U.S. Fish and Wildlife Service in 2010, population and habitat fragmentation coupled with lack of regulatory mechanisms warranted listing, although implementation of actions has been precluded by other priorities.

Candidate status for listing under the Endangered Species Act and possible regulatory action in the near future provide strong motivation to better understand the dynamics of sage-grouse populations and their habitat requirements. The general approach currently taken by managers focuses on maintaining or enhancing sage-grouse populations across their distribution in regions containing the highest densities of breeding birds and their important seasonal habitats, also known as priority areas for conservation (PACs). The rationale behind this approach is that it permits limited resources to be applied in regions that have the greatest potential to benefit the largest proportion of sage-grouse. Development and other forms of land use can then proceed under standard regulations in areas outside PACs. Implementation of this approach requires detailed information about habitat, connections among sage-grouse populations, and approaches to restore and maintain sagebrush. These are important topics of study by the U.S. Geological Survey (USGS) and its research partners.

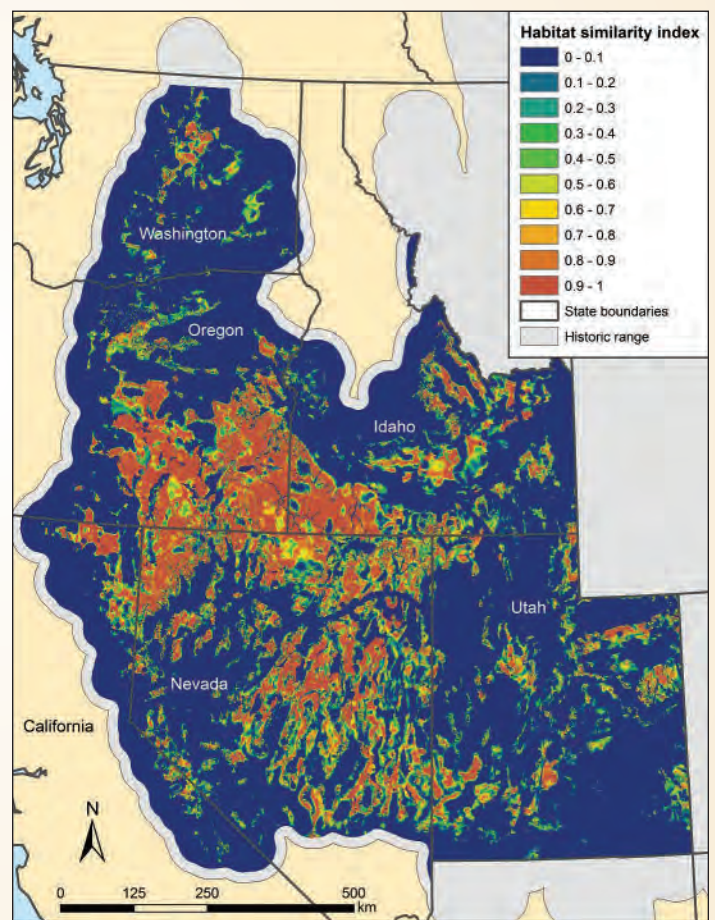

### Minimum Ecological Requirements

Efforts to stabilize or reverse population and habitat declines as well as minimize effects from land use and climate change would benefit from accurate maps delineating where suitable habitats occur, including movement corridors between populations. Defining what constitutes suitable habitat is an essential step toward these goals.

Sage-grouse require sagebrush-dominated landscapes for cover, food, and water. However, not all sagebrush supports sage-grouse because not all sagebrush landscapes are alike. For example, sagebrush can be a dominant feature across large landscapes, as in many parts of Idaho and Oregon, or it can be mixed with agriculture and other habitats, as in parts of Washington and Montana. Site-specific sage-grouse distribution models have contributed to the understanding of relationships between sage-grouse and their habitat. However, translating these habitat relationships into the broad regional maps useful for managers is restricted by limited availability of accurate, consistent data spanning large areas. To alleviate this situation, researchers developed a habitat model for sage-grouse that captured the spatial variability in local environments used by

Some sagebrush landscapes are dominated by sagebrush, but others may be a mosaic of sagebrush and other habitats. (Photograph taken by Steve Knick, USGS, July 2006.)

**Figure 1.** Habitat similarity index values for sage-grouse across their western range. Values represent the relationship of the surrounding environment at map locations to a model of minimum requirements for sage-grouse defined by land cover, anthropogenic variables, soil, topography, and climate (from Knick and others, 2013).

sage-grouse and also maximized accuracy in applications across broad spatial extents (Knick and others, 2013). This was done by examining the environment surrounding active leks within the western portion of the current sage-grouse range. Leks were used as the basis for developing these models because they are important breeding locations and most females nest within the surrounding region.

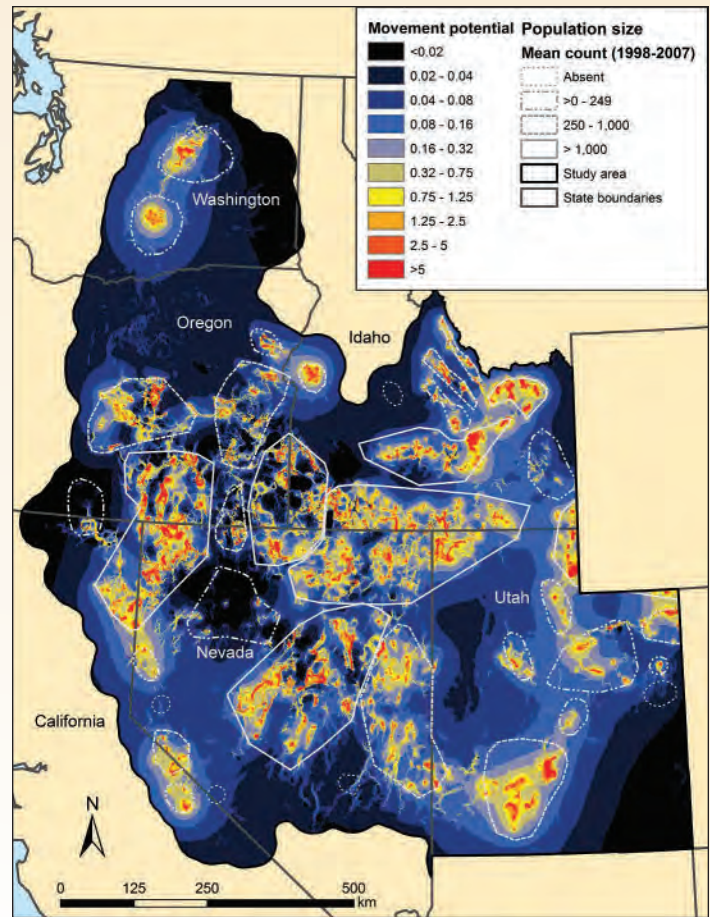

The importance of sagebrush as required habitat for sage-grouse was affirmed by the assessments made on the environments in which leks were found. The majority of leks occurred where there was at least 40 percent of the surrounding landscape dominated by sagebrush. Most of these leks also contained minimal to no levels of human land use and were further characterized by broad expanses of sagebrush. Other forms of vegetation and climate also influenced lek location. Almost all leks were located in areas containing few conifer trees and few grassland expanses. These results were consistent with other evidence that sage-grouse are vulnerable to decreases in sagebrush due to the spread of invasive plants and the encroachment of junipers and conifer trees.

This is important information for managers because the characteristics identified in the analyses represent the most essential environments required by sage-grouse (table 1) that can be used to target conservation actions (fig. 1)

### Population Connectivity

Another challenge for managers of sage-grouse and sagebrush habitats is the potential for human activities to further fragment sagebrush habitat and increase isolation of individual sage-grouse populations. In general, species with multiple interconnected populations are more likely to persist than those with isolated populations. For sage-grouse, leks and the large populations within the interior of their range are highly interconnected by corridors of surrounding lands that had moderate-to-high potential for animal movement. In contrast, smaller populations along the range periphery are isolated and had limited movement potential through habitat corridors to neighboring populations (fig. 2; Knick and others, 2013). This information can be used to consider how habitat changes in the connecting corridors that limit or disrupt sage-grouse movement could further isolate peripheral populations, putting them at greater risk of loss. By developing maps of these habitat corridors, areas critical for connecting sage-grouse populations can be targeted for conservation.

Documenting and addressing how populations actually interact is the next step, and that requires monitoring of animal movement across large areas. This process can be costly and difficult using methods that involve capture, marking, and re-capture. However, the critical information about dispersal and gene flow in sage-grouse populations can be obtained from the DNA coded in the sage-grouse feathers collected at leks.

**Figure 2.** Estimated potential for sage-grouse movement among sage-grouse leks (from Knick and others, 2013).

Monitoring using genetic information is now underway across the entire range of sage-grouse through the efforts of a large consortium of scientists and managers.<sup>1</sup> The biologist mentioned at the beginning is contributing to this effort by collecting feathers. The genetic data extracted from the collected feathers is used to map relatedness among breeding locations and delineate population structure within the range of sage-grouse. When coupled with habitat maps and movement corridors, this genetic data can further the understanding of how geographic distance, topographic characteristics, and land use influence sage-grouse dispersal and genetic diversity. A comprehensive picture emerges of where the pathways for dispersing individuals are located throughout the sage-grouse range and how those pathways will shift in the future.

<sup>1</sup>This research involves the USGS, the Natural Resources Conservation Service through the Sage-Grouse Initiative, the Western Association of Fish and Wildlife Agencies, the U.S. Department of Agriculture Forest Service, University of Montana, and Colorado State University. For more information, visit <https://my.usgs.gov/feathers/>.

## More on the Horizon

Sagebrush restoration and rehabilitation are additional considerations for sagebrush conservation. Many scientists and managers are addressing these subjects, often with an appreciation that effective restoration will require a regional approach for prioritizing and identifying management options (Pyke, 2011). Sagebrush restoration and rehabilitation are topics too expansive for this fact sheet, but a few points stand out:

- Managers have a great need for scientific data that can help increase their success at restoring and rehabilitating sagebrush. Efforts are underway to acquire this information to create effective guidelines for restoration.
- Spatial models based on land classification are being developed that indicate where to focus resources to best protect and interconnect intact quality habitats through restoration.
- To determine the intensity of future management, models of how plant communities change in sagebrush landscapes can help managers choose between vegetation manipulation and passive management for restoration.

The biologist collecting feathers in the early morning hours at sage-grouse leks appreciates the difficulties associated with understanding sage-grouse and this iconic species' response to management. She is part of a collaborative effort to assemble scientific information for future management decisions. Her work and that of many others can be an important foundation for rigorously and objectively considering options for sage-grouse and sagebrush management so that future generations also will have a chance to head out at dawn over a dusty road in search of sage-grouse.

**Table 1.** Average values of selected environmental variables measured at active lek sites and historical, but not longer used, lek locations in western part of the greater sage-grouse range, U.S.A.

[Adapted from Knick and others, 2013. **Abbreviations:** km, kilometer; km/km<sup>2</sup>, kilometer per square kilometer]

Environmental variables	Active leks (percent)	Historically occupied leks (percent)
Sagebrush land cover within 5 km of lek	79	28
Conifer forest cover within 5 km of lek	1	3
Grassland cover within 5 km of lek	2	10
Agriculture within 5 km of lek	2	2
Power lines	0.03 (km/km <sup>2</sup> )	0.14 (km/km <sup>2</sup> )

## **EXECUTIVE SUMMARY**

Greater sage-grouse (*Centrocercus urophasianus*, hereafter sage-grouse) are large, ground-dwelling birds that reside primarily in sagebrush ecosystems which are ubiquitous across much of the intermountain regions of western North America. The U.S. Fish & Wildlife Service (USFWS) has until September 2015 to determine whether they will list the species under the Endangered Species Act (ESA).

For many years, oil and natural gas companies that operate within sage-grouse range have made significant efforts to avoid, minimize, mitigate, and reduce impacts to the species and its habitat. This report documents the specific conservation measures that companies commit to in Bureau of Land Management (BLM) and U.S. Forest Service (USFS) National Environmental Policy Act (NEPA) decisions on oil and natural gas project approvals. Project NEPA documents specify the terms by which a project is approved, and govern how companies must operate, thereby providing regulatory certainty that sage-grouse conservation measures will be implemented and enforced.

Of the 103 NEPA documents reviewed and summarized in this report, 773 conservation measures were catalogued and an average of 6.5 Conditions of Approval (COA) or conservation measures to protect sage-grouse per project were committed to in the NEPA decision records. For example, via the NEPA documents operators commit to reduce the footprint of development and associated traffic through clustered activity, pad drilling and remote monitoring of producing wells, as well as to implement specific measures to protect the species. Collectively, measures were implemented across 18 BLM Field Offices and National Forests that are responsible for managing 68,404 square miles of public lands with occupied sage-grouse habitat, representing 37 percent of the species' current occupied range and the majority of the range in Wyoming, Colorado, Utah, Montana, and Nevada. These projects represent a sample of NEPA documents and are not exhaustive for all projects in the species' range.

Because Operators commit to these conservation measures via BLM and USFS NEPA decisions, there is regulatory certainty that these conservation measures will be implemented. While there is variability in the measures due to site-specific conditions, project types, rate of development, and well density, the conservation measures that companies commit to result in the conservation and protection of sage-grouse populations or the avoidance and minimization of impacts to the species and its habitat. This demonstrates that oil and natural gas operators are committed to measures that conserve and mitigate impacts to sage-grouse through the NEPA process, which provides a robust regulatory mechanism to protect, conserve, and enhance the status of the species. Given the regulatory certainty that NEPA provides, USFWS should recognize and consider this information on these project commitments as it makes its listing determination for the species.

## **INTRODUCTION**

The sage-grouse is a candidate species for listing under the Endangered Species Act (ESA). Sage-grouse are large, ground-dwelling birds that reside primarily in sagebrush ecosystems which are ubiquitous across much of the intermountain regions of western North America. Sage-grouse population trends are variable across their distribution, and though some populations appear stable, population numbers show long-term declines collectively and in several regions (Connelly et al. 2004).

Much of its range in the western states is overlapped by energy development. The basins where most sagebrush ecosystems reside are also the center of major oil and natural gas reserves (e.g., Green River, Niobrara, Powder River, Uinta-Piceance, and Williston basins), and many of these are on public lands managed by the Bureau of Land Management (BLM) or the U.S. Forest Service (USFS).

On public and split-estate lands (i.e. lands with private or state surface and federal minerals), oil and natural gas operators (Operators) are required to comply with management prescriptions outlined in lease stipulations in BLM Resource Management Plans (RMPs) and USFS Land and Resource Management Plans (LRMPs), as well as Conditions of Approval (COAs) and mitigation measures for project-specific documents prepared in compliance with the National Environmental Policy Act (NEPA). Of the existing 92 BLM RMPs that include sage-grouse habitat, 82 RMPs currently contain specific measures or direction pertinent to management of sage-grouse or their habitats (BLM 2008:1). BLM is currently completing RMP amendments to ensure that measures for conservation and protection of sage-grouse are contained in all planning areas that overlap with the current occupied range of sage-grouse.

Combined, the BLM and USFS manage or have NEPA decision-making authority on more than 60% of the current occupied range of the sage-grouse. As a result of the NEPA decisions made by the BLM, required and consistent COAs, conservation efforts, and avoidance, minimization, and mitigation measures will be applied across the majority of the species' occupied habitat.

BLM manages special status species and the ecosystems upon which they depend on BLM-administered lands in order to reduce threats and minimize the likelihood of listing these species under the ESA (BLM manual 6840). The BLM and USFS currently manage sage-grouse as a sensitive species and have used NEPA as a regulatory mechanism to minimize threats to sage-grouse due to oil and natural gas development within its range. Under Manual 6840 the BLM is instructed to:

- ...conserve and/or recover ESA-listed species and the ecosystems on which they depend so that ESA protections are no longer needed for these species.
- initiate proactive conservation measures that reduce or eliminate threats to [BLM] sensitive species to minimize the likelihood of and need for listing of these species under the ESA.

As a result of the implementation of the guidance contained in BLM Manual 6840, the agency's actions must be evaluated to ensure that decisions made do not lead to the eventual

listing of a sensitive species or degradation of the status of a sensitive species. As a result, the decisions made as part of NEPA processes associated with oil and natural gas development activities as well as all other BLM NEPA decisions are required to comply with Manual 6840, and generally, should not contribute to the listing of a species.

In 2010, the U.S. Fish and Wildlife Service (USFWS) found that the sage-grouse warrants listing as threatened or endangered under the ESA based on anthropogenic habitat impacts and lack of regulatory mechanisms to protect against further losses, but immediate listing action was precluded due to higher priority listing actions. As part of a settlement agreement reached in 2011, the USFWS is now required to make a final listing decision for sage-grouse by September 2015.

Five listing factors provided in Section 4(a)(1) of the ESA are used to determine if a species should be listed as endangered or threatened (Factors A–E; Table 1). Under each listing factor, the USFWS 12-month finding (USFWS 2010) describes several threats to sage-grouse. Some of the primary factors linked to population declines are attributed to habitat loss, habitat fragmentation caused by energy development, invasive species, wildfire, agricultural use, and inadequate regulatory mechanisms.

In the 2010 listing decision, it appears that the USFWS did not review the adequacy of existing regulatory protections provided under NEPA as they relate to the avoidance, minimization, and mitigation of impacts associated with oil and natural gas development.

In preparation for the September 2015 listing decision for sage-grouse and to facilitate a better understanding of the adequacy of NEPA as a regulatory mechanism for protecting and conserving sage-grouse, NEPA documents related to oil and natural gas exploration, development, and production activities within the range of sage-grouse were reviewed. These included RMPs, environmental assessments (EAs), environmental impact statements (EISs), and their associated decision records from across the range of the species, including all BLM field offices and National Forests across Colorado, Montana, Nevada, Utah, and Wyoming (Figure 1). Each document was reviewed to identify operator commitments and COAs that were included in the decision records for each NEPA document to avoid, minimize, or mitigate impacts to sage-grouse and protect or conserve the species and its habitat during development and operations. A total of 103 NEPA documents for oil and natural gas documents within the current range of sage-grouse were reviewed (Appendix A). The NEPA documents included in this review were generally those finalized between 2008 and 2013 to demonstrate commitments under NEPA made by Operators. In addition to the 103 NEPA documents, numerous documents and reports demonstrating implementation and compliance with the COAs and Operator commitments were reviewed. Collectively, these documents describe the measures currently being implemented by oil and natural gas operators as required by BLM and USFS NEPA decisions.

**Table 1. ESA listing factors and threats for the greater sage-grouse.**

<b>Listing Factor - ESA Section 4(a)(1)</b>	<b>Threats</b>
Factor A: The Present or Threatened Destruction, Modification, or Curtailment of Habitat or Range	Habitat conversion for agriculture
	Urbanization
	Infrastructure in sagebrush habitats (powerlines, fences, roads, railroads, communication towers)
	Fire (wildfire, change in wildfire frequency)
	Invasive plants (annual grasses and other noxious weeds)
	Pinyon-juniper encroachment
	Grazing
	Energy development (nonrenewable and renewable)
	Climate change
Factor B: Overutilization for Commercial, Recreational, Scientific, or Educational Purposes	Commercial hunting
	Recreational hunting
	Recreational use (bird watching, lek visits, photography)
	Religious use
	Scientific and educational use
Factor C: Disease and Predation	Disease (West Nile virus)
	Predation
Factor D: Inadequacy of Existing Regulatory Mechanisms	Local land use laws, processes, and ordinances
	State laws and regulations
	Federal laws and regulations
	Canadian federal and provincial laws and regulations
	Non-regulatory conservation measures
Factor E: Other Natural or Manmade Factors Affecting the Species' Continued Existence	Pesticides
	Contaminants (e.g., oil in wastewater pits)
	Recreational activities
	Life history traits affecting population viability
	Drought

All NEPA documents and supporting information or reports were characterized, cataloged, and indexed in a relational database. Each COA or required conservation measure was characterized according to the threat and listing factor that it is meant to address as well as location in which the measure is or will be implemented. In some circumstances, these lease stipulations may be excepted, modified, or waived based on site-specific information and conditions. Nonetheless, BLM may only grant exceptions, modifications, and waivers where potential adverse effects are eliminated or notably reduced.

Each measure or group of similar measures was assessed using the USFWS Policy for Evaluation of Conservation Efforts When Making Listing Decisions (“PECE Policy”). The PECE Policy evaluates the certainty that each COA or conservation measure will be implemented (Certainty of Implementation) and the certainty that, when implemented, the COA or conservation measure will be effective (Certainty of Effectiveness).

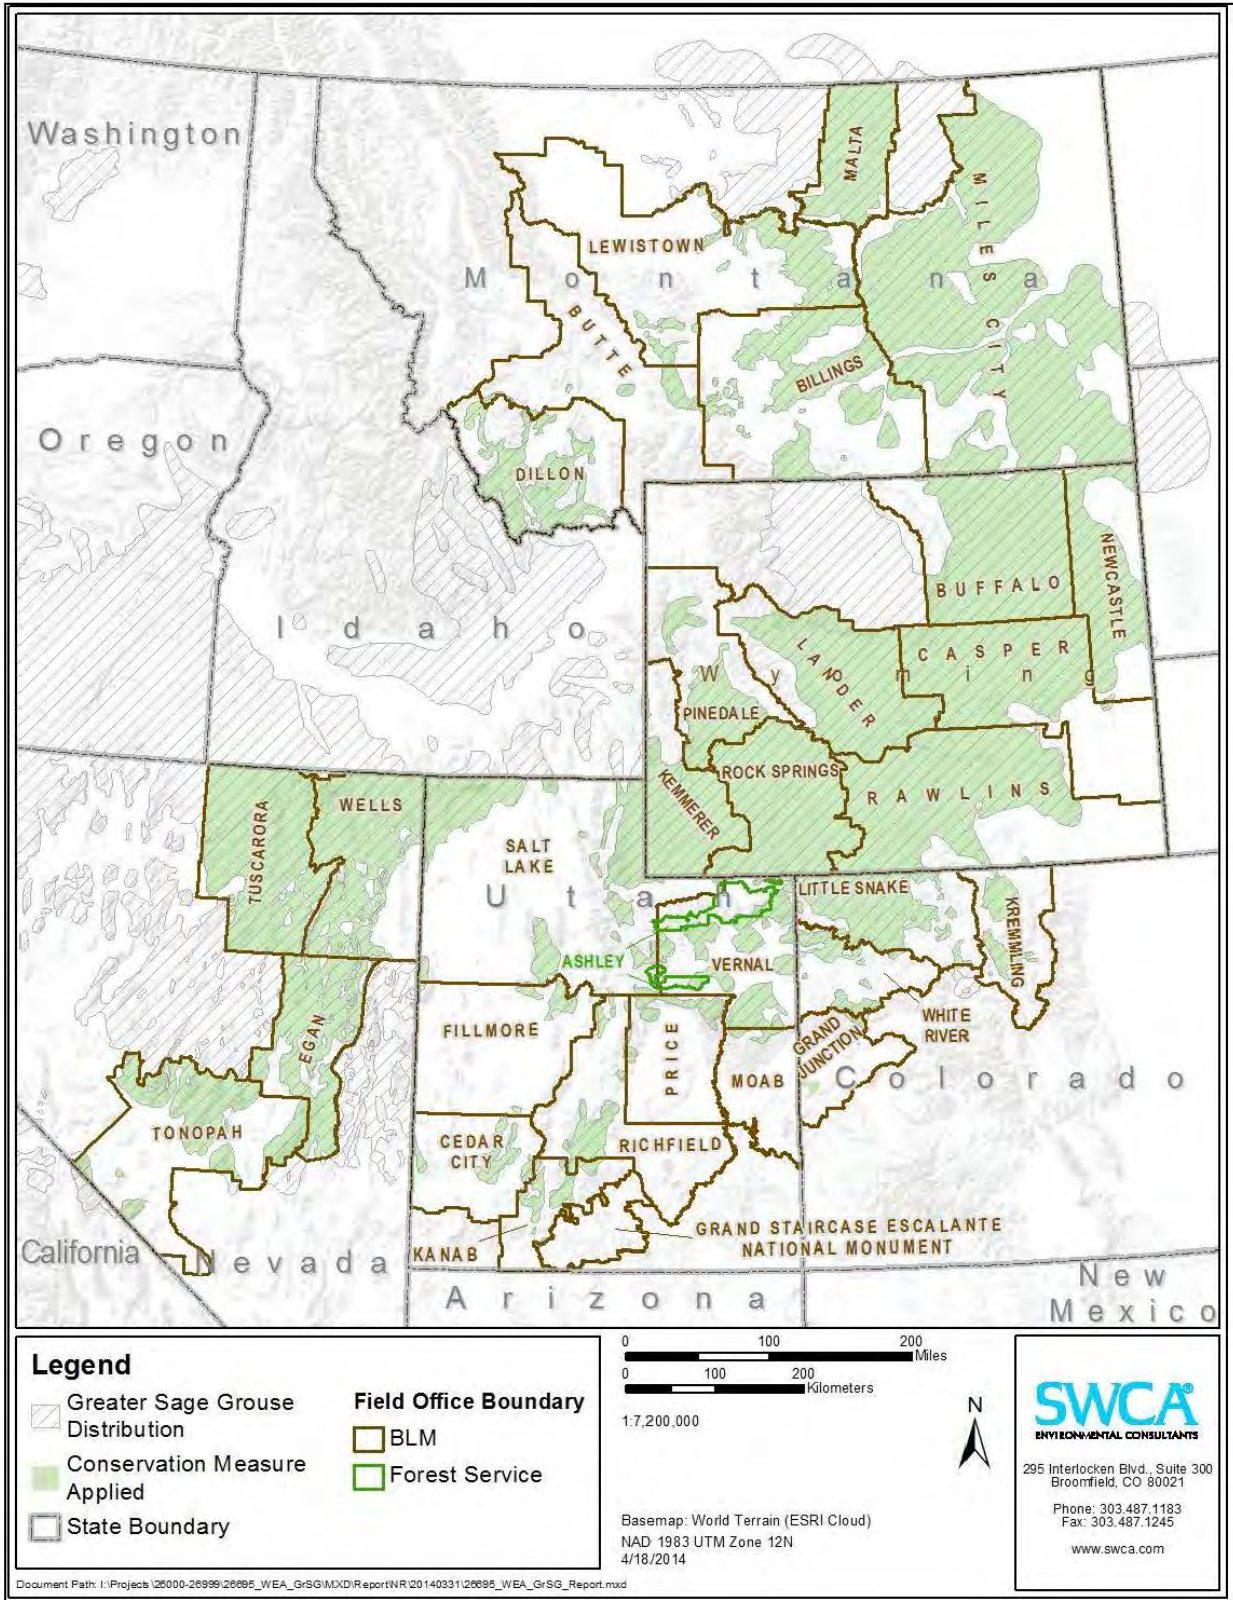

Figure 1. BLM Field Offices and National Forests Included in Review of Oil and Natural Gas NEPA Documents and RMPs.

## **SUMMARY OF NEPA REVIEW**

Many Operators within sage-grouse range have been making great efforts to reduce their projects' impacts on the environment, even prior to the NEPA process. They have designed their projects to reduce the footprint of their development, reduce traffic, and reduce human activity. These efforts are not always specific to sage-grouse, but rather aim to protect habitat at a landscape scale through decreased direct and indirect habitat loss and fragmentation. Protection at the landscape scale protects not only sage-grouse but also many other wildlife species and natural resources including big game, migratory birds, habitats, water quality, soils, etc. These measures are important in the conservation of sage-grouse, but are not always reflected in the COAs because they are already part of the plan of development or alternatives analyzed in NEPA documents.

In addition to implementation of best management practices, including the efforts described above, NEPA documents and decision records include additional Operator-committed conservation measures to protect wildlife, including sage-grouse, which will be implemented over the life of each project. These operator-committed measures and additional COAs become required elements of oil and natural gas development when they are contained in the decision records for BLM and USFS NEPA processes. When included in the decision records, these measures must be implemented to be in compliance with agency requirements.

To identify the COAs and conservation measures that are being implemented by oil and natural gas Operators and the federal land management agencies to conserve sage-grouse, NEPA documents and decision records related to development were reviewed from lands administered by BLM and USFS field offices across the range of greater sage-grouse. As a result of this review, 773 conservation measures were cataloged from 103 NEPA documents. Of the NEPA documents reviewed and summarized in this report, an average of 6.5 COAs or conservation measures that directly address threats to sage-grouse were required per decision record. These conservation measures were categorized into 14 general categories (Table 2).

Collectively, measures were implemented across 18 BLM Field Offices and National Forests responsible for managing 68,404 square miles of public land with occupied sage-grouse habitat representing 37 percent of the species' current occupied range and the majority of the species range in Wyoming, Colorado, Utah, Montana, and Nevada. No oil and natural gas related NEPA decisions were identified for the other BLM Field Offices and National Forests within the range of greater sage-grouse. This is primarily a result of lower levels of oil and natural gas activity in the states of Idaho, Oregon, and portions of Nevada. However, it is likely that similar measures discussed in this document would be implemented in those field offices if oil and natural gas activities were to occur in these areas in the future. These public lands plus the split-estate lands with federal minerals and private ownership represent the area in which BLM and USFS required COAs, conservation measures, and avoidance, minimization and mitigation measures would be reasonably certain to occur as a result of NEPA decisions made for past, ongoing, and future oil and natural gas activities.

**Table 2. Occurrence of conservation measures and COAs in NEPA documents.**

<b>COA/Conservation Measure Category</b>	<b>Number of Field Offices (%)</b>	<b>Number of NEPA Documents (%)</b>
Monitoring/adaptive management	15 (83%)	59 (57%)
Seasonal limitations and year-round development	18 (100%)	87 (84%)
Reclamation	18 (100%)	93 (90%)
Reduce surface disturbance/multi-well pads	13 (72%)	45 (44%)
Dust suppression	18 (100%)	59 (57%)
No surface occupancy	16 (89%)	35 (34%)
Noxious/invasive weed management	16 (89%)	51 (50%)
Reduce traffic	12 (67%)	30 (29%)
Reduce noise/visual impacts	11 (61%)	33 (32%)
Reduce perching predators	12 (67%)	27 (26%)
Produced water management	13 (72%)	27 (26%)
Timing limitation	13 (72%)	24 (23%)
Vegetation treatments	3 (17%)	3 (3%)
<b>Total</b>	<b>18</b>	<b>103</b>

The inventory of required COAs and conservation measures under NEPA, included cataloging all measures specific to sage-grouse and any measure or development practice that was not specific to sage-grouse but would reasonably be expected to benefit sage-grouse due to overlap with sage-grouse habitat or sage-grouse sensitive seasons. Voluntary initiatives (surface disturbance reductions, timing restrictions, conservation easement purchase, etc.) implemented by the operators were also evaluated where these measures became part of the agency’s NEPA decision record.

The majority of the NEPA documents that were reviewed implement the following standard measures:

- Adaptive management and monitoring of the effectiveness of measures or the response of sage-grouse to those measures.
- Seasonal, timing, and spatial restrictions of activities to protect leks, nesting habitat, brood-rearing habitat, and winter habitat.
- Interim and final reclamation with monitoring to restore natural habitat.
- Noxious weed monitoring and control.
- Dust suppression on roads and operations areas that reduces impacts on adjacent vegetation/wildlife habitat.
- Speed limits to reduce dust, noise, and wildlife collisions.
- NSO buffers to protect wetlands and riparian areas (important for sage-grouse brood rearing).

- Noise abatement requirements to reduce noise impacts on receptors including leks.

A description of each of the conservation measure categories and examples of COAs/conservation measures in the categories are described in the following sections. All 773 conservation measures are provided as they appeared in the NEPA decision records in Appendices B through O. Demonstration of each measure's compliance with the USFWS PECE process and maps showing federally administered lands where these measures are implemented are also provided in Appendices B through O. Collectively, these measures, when implemented, would result in the conservation and protection of sage-grouse populations or the avoidance and minimization of impacts to the species and its habitat and provide Certainty of Implementation and Certainty of Effectiveness under the PECE Policy.

## **SEASONAL LIMITATIONS**

Seasonal limitations are intended to limit new surface disturbance and disruptive activities (construction, drilling, completion, reclamation, and other activities potentially disruptive to sage-grouse) in certain areas during breeding, nesting and brood-rearing, and/or winter seasons. These measures were applied in 100% of all BLM Field Offices and National Forests for which NEPA documents were reviewed (Table 2 and Appendix B). These activities may directly or indirectly impact sage-grouse and their nests due to increase traffic, noise, human presence, and dust. High traffic volumes may influence female behavior, nest-initiation, and nest success (Manier et al. 2013:50; Lyon and Anderson 2003).

Seasonal limitations are intended to minimize the potential for disturbing breeding, egg-laying, incubating, wintering, and brooding sage-grouse. The area protected is based on the concept that females nest and rear broods near leks and therefore seasonal limitations typically apply to the area within 2 miles of leks. However, BLM and USFS seasonal limitations are often applied to all nesting habitats across a project area. The proximity, configuration, and abundance of nesting habitat are key factors influencing lek locations and therefore leks are indicative of nesting habitat (USFWS 2010:13915). After breeding, females typically nest within 4 miles of leks, with most nests located within 2 miles of leks (Schroeder et al. 1999:12). Based on studies in Wyoming, hens rear their broods within 0.1 to 3.1 miles of the nest site for the first 2 to 3 weeks following hatching (Connelly et al. 2004:4–8).

Unless habitat studies have been completed in order to map nesting/brood-rearing habitat within a project area, the nesting/brood-rearing habitat is often assumed to be the area within a 2-mile buffer around leks (i.e., 8,043 acres per lek). The nesting/brood-rearing season is typically defined as March 15 to July 15, although this varies by field office.

To protect wintering birds, seasonal limitations on disruptive activities may be applied to winter concentration areas. These limitations typically apply from November 15 through March 14, although this may vary slightly. Winter seasonal limitations for other species (i.e., big game) may also benefit wintering sage-grouse where habitats overlap. Examples of commonly implemented seasonal limitations include the following.

- “Construction, drilling, reclamation and other potentially disruptive activities are prohibited during the period of March 1 to July 15 for the protection of strutting and

nesting sage-grouse.” (Double Eagle Petroleum, Catalina Plans of Development [PODs] C and D in the Atlantic Rim)

- “No surface-disturbing activities shall occur within sage-grouse nesting habitat, from 15 March through 30 June, annually.” (Devon Energy Company, L.P., Grayling POD EA)
- “A 3-mile buffer zone would be established around known leks, and construction activity in this buffer zone would be restricted between March 15 and July 15 to minimize effects to breeding, egg-laying, incubating, and brooding sage-grouse.” (EnCana, Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project EA)
- “No surface disturbing activities are permitted within 2 miles of sage grouse lek(s) between March 1 and June 15, prior to completion of a greater sage grouse lek survey. This condition will be implemented on an annual basis for the duration of surface disturbing activities” (Anadarko Petroleum Corporation, Dry Willow III POD EA)

BLM frequently requires operators to develop projects with seasonal stipulations which prohibit drilling and associated activities during winter, typically December to May, for various species. Seasonal stipulations, however, have significant consequences for operators because they limit the time available for construction, drilling, and reclamation, and double the number of rig moves and truck hauling. As a consequence, seasonal stipulations can extend development over multiple years, prolonging impacts to species. In contrast, year-round drilling in combination with multiple-well pads significantly benefits wildlife by reducing the duration of drilling and well pad density. Utilizing year-round drilling and multiple-well pads, Operators can plan phased development that confines activities to limited areas; reduce pad density and associated roads; reduce overall drilling duration; and promote efficient project execution. This leaves large areas of habitat undisturbed, which facilitates timely interim reclamation and allows sage-grouse and other wildlife species to better acclimate and avoid development activities.

The review of NEPA documents recorded five documents with five measures that discuss year-round drilling as a means to reduce the duration of a project (Appendix B). The following is an example of such measures.

- “Year round drilling would reduce drilling duration to 4-7 years compared to 21 years if no winter drilling from 11/1 to 5/15.” (BBC, EIS [UT-070-05-055] for West Tavaputs Plateau Natural Gas Full Field Development Plan)

## **RECLAMATION**

Reclamation is required in all BLM Field Offices and National Forests. There are two phases of reclamation: interim and final reclamation. Interim reclamation occurs when disturbed areas such as construction, storage, and temporary work areas, and portions of well pads are no longer needed during the production phase. These areas are recontoured as much as possible to natural topography, have topsoil redistributed, and are revegetated with native and/or BLM recommended seed mixtures. Interim reclamation partially restores habitat function by stabilizing soils, reducing erosion, and facilitating vegetative regrowth during

the production phase. Final reclamation involves recontouring, replacement and stabilization of topsoil, and revegetation of remaining disturbed areas upon abandonment. After wells are closed, the pads, roads, facility sites and other disturbed areas undergo final reclamation according to the specified methods and seed mixture. Successful reclamation may offset the negative effects of direct habitat disturbance from energy development (USFWS 2010:13948).

Reclamation ensures surface and subsurface stability and growth of a sustainable, naturally functioning permanent vegetation and habitat. NEPA documents typically describe goals for reclamation that include diverse, native vegetation similar in composition to adjoining vegetation (typically a minimum cover and composition of 80% of the desired plant community). Some NEPA documents specify using sagebrush seed in sage-grouse areas. COAs include annual monitoring and reporting to ensure successful reclamation. In some large developments, disturbance caps are used to encourage successful reclamation. With the exception of some seismic exploration projects, all oil and natural gas projects are required to reclaim areas of surface disturbance. A total of 93 documents with 112 measures related to reclamation were reviewed (Appendix C). Examples of such measures include the following.

- “Utilize native plant species for reclamation purposes (preferably local seeds and species that are preferred by sage grouse).” (Elk Petroleum, EA for the Grieve Unit CO2 Enhanced Recovery Project)
- “Sage-grouse oriented reclamation (e.g., specialized seed mix, lengthened cut and fill slopes) is expected to involve all pipeline acreage and about  $\frac{3}{4}$  of pad acreage (about 18 acres). Depending on subsequent ungulate use, this reclaimed acreage would serve increasingly effective brood and summer habitat function prior to the redevelopment of a suitable sagebrush canopy (10-15 years).” (EnCana Oil and Gas, 28 Applications for Permit to Drill [APDs] on new well pad D36 496. DOI-BLM-CO-110-2011-0169-EA)
- “Reclamation will be considered successful if the following Interim Reclamation criteria are met... 80 percent of predisturbance ground cover, 90 percent dominant species, No noxious weeds present in the seeding, and Erosion features equal to or less than surrounding area. The vegetation will consist of species included in the seed mix, and/or occurring in the surrounding natural vegetation or as deemed desirable by the BLM in review and approval of the reclamation plan. The goal is no single species will account for more than 30 percent total vegetative composition. Vegetation canopy cover production and species diversity shall approximate the surrounding undisturbed area.” (ROD and EIS for the Atlantic Rim Natural Gas Field Development Project)
- “Within 2 miles of an active greater sage-grouse lek, interim reclamation seed mixes will be designed to provide habitat for greater sage-grouse.” (Kerr-McGee Oil & Gas Onshore LP [KMG], Greater Natural Buttes EIS)
- “Operators will be allowed no more than 250 acres of surface disturbance per-year, no more than 1,250 acres of new surface disturbance at any given time, and no more than 1,500 acres of cumulative surface disturbance (i.e., new surface disturbance added to past and present surface disturbance associated with oil and gas development.” (BBC,

EIS [UT-070-05-055] for West Tavaputs Plateau Natural Gas Full Field Development Plan)

## **REDUCE SURFACE DISTURBANCE / MULTI-WELL PADS**

Habitat loss from energy development was identified as a threat in the USFWS 12-month finding for greater sage-grouse. Efforts to reduce the surface disturbance and fragmentation from oil and natural gas projects decrease this threat. As part of best management practices and voluntary measures, Operators conserve key habitats for sage-grouse during project planning through use of existing disturbance (i.e., add new well(s) on existing pads), use of clustered development and facility planning (co-location of facilities), and multi-well pads.

The density and distribution of oil and natural gas infrastructure may also affect sage-grouse. Male sage-grouse lek attendance has been shown to decrease in natural gas fields with a density of five or more wells within approximately 2 miles of leks, and sage-grouse are less likely to occupy areas with wells at 80-acre spacing compared to 988-acre spacing (USFWS 2010). Well location and density is determined in large part by geology and reservoir conditions. In addition, on BLM-administered lands, locations are often based on the spacing decision of individual state oil and natural gas boards. Wyoming has developed the density disturbance calculation tool (DDCT) to limit development in core sage-grouse habitats and other states have followed this model (e.g., South Unit EIS in Utah).

Multi-well pads, clustered development, and facility planning dramatically reduce the direct and indirect impacts from increased infrastructure, noise, traffic, and human activity related to oil and natural gas development. Traditionally, one vertical well was drilled on individual well pads. However, with recent advances in technology (i.e., horizontal drilling, directional drilling, and multi-well pads), it is now common for Operators to locate multiple wells on a single pad. Multi-well pads are beneficial in many ways, including reduction of disturbance to sage-grouse from habitat destruction, fragmentation, and traffic. Surface disturbance is greatly reduced by eliminating additional well pads and associated access roads. Consolidating operations to one pad also reduces surface disturbance associated with storage tanks and liquid separators on pads. Traffic associated with moving drill rigs from one well to the next is greatly reduced when wells are only 12 to 30 feet apart. Decreased time and traffic involved with rig setup, breakdown, and movement minimizes the environmental impact of drill rigs. Truck traffic to service multiple wells is also reduced since they need to visit fewer pads.

As an example, traditional oil and natural gas developments such of those evaluated in the USFWS 12-month finding on sage-grouse require 16 wells at 40 acre spacing to effectively recover oil and natural gas resources. Assuming that each single well pad averages 8 acres, the total surface disturbance in a 640 acre section would be 128 acres (20 percent of the surface area). This estimate does not include individual roads and pipeline right-of-ways (ROWs) for each well which would further increase surface disturbance, habitat fragmentation, and operational disturbances associated with well visits. Through colocation efforts, if these 16 wells were drilled from one 12-acre pad (less than 2 percent of the surface area of a section), then a minimum of 116 acres of disturbance would be eliminated. If drilled from two 12-acre pads the surface disturbance is reduced by 104 acres. The actual decrease in

surface disturbance would be greater than the 116 or 104 acres because only a single road and pipeline ROW is necessary for each multi-well pad. In both cases, the total disturbance per section would generally be less than 5%. In addition to surface disturbance reductions, this measure dramatically reduces habitat fragmentation, traffic, and other related disturbances.

Results of the NEPA review showed that the agencies and Operators made efforts to reduce surface disturbance of projects during the planning and NEPA process. Surface reduction measures were implemented in 72% of all BLM Field Offices and National Forests reviewed. These measures are also becoming more common with technological improvements and it is likely that more than 72% of Field Offices are currently implementing these measures. Ways to reduce overall surface disturbance from the project (in all habitats) and minimize fragmentation of sage-grouse habitat included collocating facilities, using existing disturbance, minimizing the size of well pads, and limiting the density of development. Some projects conserve habitat by locating project-related disturbance outside of sagebrush habitat. Disturbance caps were included in some COAs in order to incentivize decreased disturbance and increased reclamation.

A total of 45 documents were reviewed with 77 measures to reduce surface disturbance and conserve sage-grouse habitat, including 33 measures intended to reduce surface impacts by using multi-well pads, horizontal drilling, and directional drilling; and 14 measures intended to limit density of oil and natural gas development (Appendix D). Limitations for density varied from one to eight well pads per section and 5% to 6.25% disturbance per section. Examples of such measures include the following.

- “The proposal includes drilling 16 additional wells on the existing P28 496 well pad (for a total of 32 wells). No additional acreage is required to expand the existing well pad.” (EnCana Oil and Gas, 16 APDs on existing well pad P28-496)
- “28 wells on one new well pad. The well pad is proposed to have working surface dimensions of 778 feet long by 302 feet wide for total well pad surface disturbance of 9.7 acres. Following interim reclamation 2.2 acres will be needed for production.” (EnCana Oil and Gas, 28 APDs on new well pad D36 496)
- “The operator's development designs for multi-well pads and centralized production facilities were undertaken specifically as a means to reduce habitat loss and the scope of behavioral impacts imposed on sage-grouse.” (EnCana Oil and Gas, Master Development Plan for the SG E34 496, SG L27 796 and SG F22 496)
- “Operators would utilize directional drilling to access resources beneath the 0.25-mile active greater sage-grouse lek buffers if reserves beneath these locations are deemed economic. Operators would utilize directional drilling to access resources beneath the 600-foot wide (or tall sagebrush-dominated) buffer associated with the Sand Draw protection areas if deemed economic.” (ROD for the Jonah Infill Drilling Project EIS)
- “Production facilities will be consolidated when possible, to reduce disturbance from traffic, habitat fragmentation, and total surface area impacts.” (ROD, South Unit Oil and Gas Development Final EIS)

- “Identify non-greater sage-grouse habitat, or the lowest quality greater sage-grouse habitat, to determine a surface development pattern that may be least impacting to greater sage-grouse and may allow a viable population of greater sage-grouse to continue to persist in the East Bench area until total reclamation has been achieved.” (KMG, Greater Natural Buttes EIS)
- “Well pad surface density will be no more than one pad per approximately 160 acres.” (Gasco Energy Inc., Uinta Basin Natural Gas Development Project, EIS)
- “In development area MA-5 a maximum of two well pads per section will be allowed. A maximum of 40 acres of surface disturbance per section will be allowed (6.25% disturbance).” (ROD and Final Supplemental EIS for the Pinedale Anticline Oil and Gas Exploration and Development Project)

## **DUST SUPPRESSION**

Dust from unpaved road traffic accumulates on vegetation and may decrease the value of plants used by sage-grouse. Access roads and other exposed soils in oil and natural gas developments increase the amount of fugitive dust that spreads and lands on vegetation. Increased dust on vegetation could reduce the health and quality of habitat as well as decrease the forage potential for sage-grouse.

The 12-month finding describes how fugitive dust from road use and wind erosion may impact sage-grouse habitats. Heavy equipment operations and truck traffic on unpaved roads and other exposed areas produce dust that may interfere with plant photosynthesis and impact insect populations (USFWS 2010:13949). Indirect impacts to sage-grouse also include reduced air quality and changes in vegetation.

Dust suppression is commonly used in the industry due to air quality standards, but controlling dust is also recognized for the benefits to sage-grouse and its habitat. Dust abatement techniques discussed in the NEPA documents include application of water or chemical suppressant to roadways, enforcing speed limits, and seeding of all disturbed areas that are not used during the well production phase (e.g., borrow ditches and topsoil and spoil piles). The NEPA review found 59 documents with 59 measures intended to reduce impacts of fugitive dust (Appendix E). Examples of such measures include the following.

- “The operator shall implement dust abatement measures as needed to prevent fugitive dust from vehicular traffic, equipment operations, or wind events.” (EA of the Orchard Master Development Plan for Oil and Gas Development)
- “Operators on federal leases will be required to post and enforce speed limits to reduce fugitive dust emissions. Dust inhibitors will be used as necessary on unpaved collector, local and resource roads to reduce fugitive dust emissions to the air and resources adjacent to the road.” (ROD for the Final Statewide Oil and Gas EIS and Proposed Amendment of the Powder River and Billings RMPs)

- “Emissions of particulate matter from well pad, road, and other facility construction, operation, and reclamation activities will be minimized by application of water or other dust suppressants.” (Samson, Endurance/Barricade Gas Infrastructure Project Sweetwater County, Wyoming, EA)

## **NO SURFACE OCCUPANCY (YEAR-ROUND)**

In addition to seasonal and timing limitations, development is often precluded within buffers around sage-grouse leks year-round. Well pads, roads, and other structures must be located outside of these NSO buffers in order to protect leks that sage-grouse return to each breeding season. Hens move their broods to areas of more succulent vegetation in late summer and fall. Therefore, NSO/CSU buffers that are implemented near surface water and riparian areas to protect water quality and aquatic habitats also protect sage-grouse brood-rearing habitat within these buffers.

Based on the results of the NEPA review, the NSO restriction was typically applied to a 0.25- to 0.60-mile radius around occupied leks, regardless of season. Only projects with leks within the project boundary or immediate area would have the need for applying this NSO restriction. The NSO restriction for riparian areas and surface waters, which helps conserve brood-rearing habitat, was typically 100 to 500 feet.

Thirty-five documents with 53 instances of NSO/CSU restrictions around leks (41 NSO/CSU restrictions) and riparian areas and surface waters (12 NSO/CSU restrictions) were recorded (Appendix F). Examples of such measures include the following.

- “Numerous well pads, roads, and corridors were relocated so that all were located outside the established 0.25 mile Controlled Surface Use (CSU) area for the lek.” (Doty Mountain POD C in Atlantic Rim EA)
- “Surface occupancy and/or disruptive activities are prohibited on or within a six tenths (0.6) mile radius of the perimeter of occupied sage-grouse leks.” (Elk Petroleum, EA for the Grieve Unit CO2 Enhanced Recovery Project)
- “To reduce potential disturbance to strutting birds (and the likelihood of lek abandonment), nesting birds, and habitat, no well pads or permanent structures will be allowed within 0.6 mile of an occupied lek. This measure would distance structures away from leks that raptors may use for perching.” (ROD for South Unit Oil and Gas Development Final EIS)
- “Avoid activities within identified 100-year flood plain, within 500 feet of perennial waters, springs, wells, and wetlands, and areas within 100 feet of the inner gorge of ephemeral channels...” (Samson, Endurance/Barricade Gas Infrastructure Project)

## **NOXIOUS/INVASIVE WEED MANAGEMENT**

Noxious weeds and other invasive plants have altered vegetation communities and caused declines in native plant diversity and populations throughout much of the western U.S.

Noxious weeds are a threat to sage-grouse because they reduce the abundance of plants that sage-grouse use for food and cover. Noxious and invasive weeds may increase fragmentation in existing sage-grouse habitat and increase the potential for wildfires resulting in loss of sage-grouse habitat. Surface disturbance from oil and natural gas development may facilitate the spread of noxious and invasive weeds unless managed properly.

The NEPA documents reviewed included measures to prevent the introduction and reduce the spread of noxious and invasive weeds. Many projects develop Weed Management Plans that include pre-construction surveys and post-construction monitoring and control. Review of NEPA documents recorded 51 documents with 52 measures related to controlling the introduction and spread of weeds (Appendix G). Examples of such measures include the following

- “The operator has prepared a Weed Management Plan... Weeds would be controlled on all disturbed areas during the life of the project.” (Elk Petroleum, EA for the Grieve Unit CO2 Enhanced Recovery Project)
- “Invasive species/noxious weed monitoring forms would be completed and submitted to the BLM. A weed control plan would be prepared and implemented based on BLM’s approval.” (EnCana, Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project EA)
- “All weed control programs in sage-grouse habitat will use integrated weed management techniques to reduce the area of treatment and minimize adverse side effects.” (Exxon, Piceance Development Project, Finding of No Significant Impact and DR)
- “Inventories for the presence of noxious weeds shall be conducted at least once early in the growing season for all areas disturbed by oil and gas exploration and development. Weeds shall be treated in an appropriate manner if found during inventories. Follow-up inventories and re-treatment during the same growing season may be necessary to provide additional control and/or eradication.” (EnCana, Story Gulch APDs [32] for 16 additional wells on F25 pad & B36 pad each)

## **REDUCE TRAFFIC**

This category includes transportation planning and other ways to reduce the number of roads and volume of traffic in sage-grouse habitat through project planning by operators, use of pad drilling, use of remote well monitoring, liquid gathering pipelines, and other means. The 12-month finding discusses the negative effects of roads and traffic on sage-grouse under Factor A. Some literature suggests that sage-grouse tend to avoid roads because of the associated noise, visual disturbance, human activity, and predators that move along roads (USFWS 2010). Male sage-grouse lek attendance may decline near haul roads with traffic volumes that exceeded one vehicle per day and daily traffic along oil and natural gas roads may cause lek abandonment. However, as discussed in Ramey (2013), these studies were located in heavily developed fields where more invasive technologies were used and do not reflect the conditions of advanced reclamation, methods to limit surface disturbance, and other protective

measures that are now mainstream in development that takes place in sage-grouse habitat. Ramey also points out that traffic effects to lek attendance are typically temporary and do not translate into a population decline.

Review of available NEPA documents found various measures that would reduce impacts to sage-grouse due to traffic. Some measures specifically address sage-grouse and others are general wildlife measures that also benefit grouse. For example, enforcing speed limits in order to reduce wildlife collisions benefits grouse by reducing direct wildlife-vehicle collisions which in turn decrease the number of predators attracted to the area due to available road kill. Other measures include minimizing traffic seasonally through measures such as carpooling. Road projects are designed to avoid habitat, using existing routes that are not within high-quality habitat or near occupied sites. Gathering system pipelines and remote monitoring are used to reduce truck traffic to well sites. For example, the Pinedale Anticline EIS estimated that the required liquids gathering system would eliminate approximately 165,000 truck trips annually during peak production. A total of 30 documents were identified with 48 measures to reduce traffic-related impacts in sage-grouse habitats (Appendix H). Examples of such measures include the following.

- “Reasonable efforts would be made to organize transportation and access routes that minimize traffic volumes and avoid suitable sagebrush habitats to the greatest extent practicable.” (EnCana Oil and Gas, Master Development Plan for the SG E34 496, SG L796 and SG F22 496, EA and Decision Record [DR])
- “Roads within 1/2 mile of sage grouse leks will be posted (with signs shorter than four feet) by the operator at 10 mph during daylight hours between March 1-June 15.” (Yates Petroleum Corporation, Gauge POD EA)
- “The applicant chose access routes that minimize traverse lengths through higher quality or more consistently occupied habitats.” (EnCana Oil and Gas, Master Development Plan for the SG E34 496, SG L796 and SG F22 496, EA and DR)
- “Resource protection/mitigation design features associated with this project include using telemetry and remote monitoring equipment and techniques that reduce the number of physical visits to each well pad.” (EOG Resources, Inc., Ballista Flatbow Multi-Well Pad Project EA)

## **REDUCE NOISE AND VISUAL IMPACTS**

Oil and natural gas development increases noise within sage-grouse habitat. As discussed in the 12-month finding (USFWS 2010:13947) if the noise reaches high enough levels in occupied habitat, sage-grouse may be affected due to increased stress and disruption of mating display. In the absence of stipulations to minimize the effects of noise, mechanical activities at well sites and traffic on access roads may disrupt sage-grouse breeding and nesting activities and lead to decreased lek attendance (Aldridge and Brigham 2003:32). By using noise-control mufflers and strategically locating noise sources, such as compressors, Operators could significantly reduce noise levels in sage-grouse habitat. Visual disturbances, such as lighting, may also disturb sage-grouse and can be mitigated to reduce these impacts.

Oil and natural gas operators consider noise levels when siting compressor stations and other facilities and use the best available technology to reduce noise near leks. The goal is to reduce decibels to levels slightly higher than local background noise. In the NEPA documents reviewed for this project, the typical goal was to not exceed 49 decibels. Technology used to reduce noise levels include multi-cylinder pumps, high-efficiency mufflers, and exhaust systems. Topographic features can be used to shield leks from noise and visual impacts. Intense lighting could be minimized using shields and area-directing fixtures. These measures are typically applied in areas within 0.5 to 2.0 miles of leks; one EIS required noise mufflers within 3.1 miles of leks.

A total of 33 documents were identified with 41 measures intended to reduce impacts to sage-grouse due to noise or visual impacts (Appendix I). Examples of such measures include the following.

- “The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.” (Anadarko Petroleum Corporation, Dry Willow III POD EA)
- “The applicant will make efforts to muffle and redirect noise emanating from on-site compression facilities (if used) in a manner that would substantially reduce noise-reception from occupied sage-grouse habitats on adjacent ridgelines (for example, using heavy side-slope vegetation and distance to attenuate noise and considering prevailing winds to align residual transmission down-canyon for F22, downwards NNE into canyon for E34/L27).” (EnCana Oil and Gas, Master Development Plan for the SG E34 496, SG L27 796 and SG F22 496)
- “To reduce noise levels down to an acceptable level so as not to disturb strutting birds or cause lek abandonment, all wells within 3.1 miles of a lek will be muffled with the latest technology to reduce noise levels from wells down to no more than 45dB at a lek. All wells within 3.1 miles of a lek will have mufflers oriented away from leks.” (ROD South Unit Oil and Gas Development Final EIS)
- “The applicant will use the lowest intensity lights that safety requirements will allow and make efforts to shield fixtures to reduce the intensity of light visible from adjacent ridgeline habitats.” (EnCana Oil and Gas, Master Development Plan for the SG E34 496, SG L27 796 and SG F22 496)

## **REDUCE PERCHING PREDATORS**

Tall structures such as powerlines, tanks, and tank batteries, and other high-profile facilities may provide perches for raptors or ravens that prey on sage-grouse. The increased abundance of raptors and corvids within sage-grouse habitats may result in increased predation, which is a threat discussed in the 12-month finding (USFWS 2010) (see Table 1). Buried powerlines, restricting high-profile facilities, and the use of perch deterrents may reduce the threat of increased predation on sage-grouse due to perching predators. Additionally, reduction of

surface disturbance as described earlier in this document also reduces perching, scavenging, and foraging opportunities for potential predators.

As detailed in the 12-month finding, raptors and corvids are attracted to power poles and other tall structures where natural perches are limited, including areas occupied by sage-grouse. The 12-month finding states that while sage-grouse are prey for numerous species, and that nest predation by ravens and other human-subsidized predators may be increasing and of potential concern in areas of human development, no information indicates that predation is having or is expected to have an overall adverse effect on the species (USFWS 2010:13987). Oil and natural gas developers can use various measures to prevent an increase in human-subsidized predators in sage-grouse habitat.

In oil and natural gas developments, new powerlines are either buried or fitted with raptor anti-perching devices. Tanks or other high-profile structures are often located outside of active sage-grouse habitat; squat tanks (low profile) are used near leks. The NEPA documents reviewed typically apply these measures within 0.25 to 2.00 miles of an occupied sage-grouse lek. Review of NEPA documents identified 27 documents with 40 measures intended to reduce predation due to perching predators (Appendix J). Examples of such measures include the following.

- “No powerlines or electrical transmission lines will be constructed that would provide perch sites for raptors within 2 miles of sage grouse habitat” (QEP, Greater Deadman Bench Oil and Gas Producing Region EIS and ROD)
- “Raptor deterrent perches would be used on powerlines structures within 0.5 miles of active sage-grouse leks to minimize raptors perching in the immediate area of the lek and reduce the potential for increased raptor predation during the sage-grouse breeding season.” (Encana, Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project EA)
- “Construction of structures that could be used for raptor perches would be avoided or designed to prevent raptor perching.” (Luman Rim Natural Gas Development EA and DR)
- “Tanks for wells within 2 miles of an active greater sage-grouse lek will be located out of line-of-sight of the lek, or will be squat tanks.” (KMG, Greater Natural Buttes EIS)

## **PRODUCED WATER MANAGEMENT**

Produced water from drilling and operations may be stored in reserve pits or tanks on-site, or trucked or piped off site to injection wells/storage ponds. Produced water management is an important tool for oil and natural gas producers to control mosquitos and to prevent sage-grouse contamination or drowning. As discussed in the 12-month finding, if the wastewater pits are not appropriately screened, sage-grouse may have access to them and could ingest water and/or become oiled while pursuing insects. Wastewater pits also provide potential breeding habitat for mosquitoes that could transmit WNV. The management of produced water addresses the threats of disease (WNV) and contamination (Factors C and E, Table 1).

The NEPA review found 27 documents with 33 measures that would reduce the impacts of water storage (Appendix K). The measures fell into three main categories: closed-loop drilling, screening pits, and mosquito control. Examples of such measures include the following.

- “Closed-loop drilling will be used in sensitive areas such as locations proposed within or near 100-year floodplains or drainages, cultural resources or archaeological sites, and within important wildlife habitats.” (BBC, EIS [UT-070-05-055] for West Tavaputs Plateau Natural Gas Full Field Development Plan)
- “Use closed loop drilling to eliminate the need for reserve pits, reduce closure and waste management costs, and reduce potential for contamination from leaking.” (ROD, South Unit Oil and Gas Development Final EIS)
- “It will be the responsibility of the operator to effectively preclude migratory bird access to, or contact with, reserve pit contents that possess detrimental properties.” (Exxon, Piceance Development Project)
- “Reserve pits shall be fenced to prevent sage-grouse entry and potential mortality.” (Luman Rim Natural Gas Development EA)
- “When water quality may allow the propagation of mosquitoes, then fresh water storage pits would be treated with biological mosquito controls (from June through September).” (EnCana Oil and Gas, Master Development Plan for the SG E34 496, SG L796 and SG F22 496, EA)
- “Manage produced water to reduce the spread of West Nile virus within sage-grouse habitat areas. Implement the following impoundment construction techniques and measures to eliminate water sources that support breeding mosquitoes...” (Fidelity Exploration & Production Company, Bowdoin Natural Gas Development Project).

## **TIMING LIMITATIONS**

Sage-grouse use audio and visual display behaviors to attract and select mates, and depend on audio communication between females and nestlings during brood rearing. As discussed in the 12-month finding, noise associated with human activity, such as noise from oil and natural gas development and production, may disrupt these behaviors or reduce lek attendance. Sage-grouse typically congregate at leks during dusk to sunset and dawn to sunrise. Increased traffic volumes on roads near leks may cause lek attendance to decrease. Vehicle activity during the early morning strutting period may decrease male lek attendance compared to roads with no vehicle activity during early morning. To prevent the disturbance of breeding sage-grouse and potential lek abandonment during the breeding season, timing limitations are used to restrict traffic and other activities during the evening and early morning hours.

Within the NEPA documents, typical timing limitations are from 5:00 p.m. to 9:00 a.m. during the breeding season (March 1–May 31), although specific times and the definition of breeding season varied. This stipulation is commonly applied to the area within 0.25 mile of occupied leks. However, some NEPA documents expand the timing limitation to 0.6 mile

around leks, within “occupied sage-grouse habitat,” within “sage-grouse habitat,” or “within 0.6 mile of sage-grouse habitat.” Timing limitations specifically protect sage-grouse during strutting on identified leks. Only projects with leks within the project boundary or immediate area would have the need for applying timing restrictions.

The NEPA review recorded 24 documents with 27 measures to reduce impacts to lekking grounds by establishing timing limitations (Appendix L). Examples of such measures include the following.

- “Disruptive activity is restricted on or within six tenths (0.6) mile radius of the perimeter of occupied sage-grouse leks from 6 pm to 8 am from March 1 to May 15.” (Elk Petroleum, EA for the Grieve Unit CO2 Enhanced Recovery Project)
- “A 0.6 mile radius “No Disturbance” buffer would be applied around active lek sites (documented activity within the last 5 years) from 5:00 a.m. to 9:00 a.m., March 15th through May 15th.” (EnCana Oil and Gas, Master Development Plan for the SG E34 496, SG L796 and SG F22 496, EA)
- “Disruptive activity is restricted on or within one quarter (0.25) mile radius of the perimeter of occupied or undetermined sage-grouse leks from 6 pm to 8 am from March 15-May 15.” (Lance Oil & Gas Company, Inc., Bear Draw Gamma EA)
- “In order to prevent disturbing breeding greater sage-grouse during their breeding season, no nonemergency traffic should use JCR 23A road between 6pm and 9am during the peak lek attendance, March 1 to May 30.” (Wellstar, EA for APDs Bush Draw Federal 18-1 and 3-2 in Jackson County)

## **VEGETATION TREATMENTS**

Vegetation treatments can be used to enhance sage-grouse habitat including sagebrush and wet meadow areas, such as when pinyon-juniper woodlands encroach upon sagebrush habitat. As discussed in the 12-month finding under Listing Factor A, pinyon-juniper encroachment may reduce or eliminate sage-grouse occupancy in these areas (USFWS 2010). Pinyon-juniper removal has been shown to increase the use of sagebrush habitat by Gunnison sage-grouse, and the same is assumed for sage-grouse. Also, fire in sage-brush habitats would impact sage-grouse by reducing available habitat. Operators can implement measures to prevent fires during project activities.

The NEPA review recorded one document with two measures for off-site vegetation treatments to improve sage-grouse habitat and two documents with two measures intended to reduce impacts of fire (Appendix M). These treatments are site-specific and project-specific and are not expected to be prevalent across all NEPA documents or Field Offices, however, where monitoring and mitigation plans are required in RODs (see next section) habitat treatments benefitting sage-grouse are often applied. Measures include the following.

- “Habitat improvement and connectivity projects designed to remove encroaching pinyon and juniper (e.g., lop and scatter) and increase the sagebrush park size to

benefit sage grouse.” (BBC, EIS [UT-070-05-055] for West Tavaputs Plateau Natural Gas Full Field Development Plan)

- “Wet meadow/summer range enhancement projects designed to increase this type of habitat for sage-grouse brood survival. Up to six projects will be implemented. Acres enhanced will be counted under the habitat improvement tally at an equal or greater acreage value based on the qualitative benefits of the enhancement.” (BBC, EIS [UT-070-05-055] for West Tavaputs Plateau Natural Gas Full Field Development Plan)
- “Due to the sensitive nature of the sagebrush habitat in the project area and the past history of fire impacts to grazing and sage-grouse, Noble would prepare and implement a Fire Prevention Plan.” (Noble, EA Huntington Valley 3D Seismic Project; and Noble, Marys River 3D Seismic Project)

## **MONITORING, MITIGATION, AND ADAPTIVE MANAGEMENT**

This category includes pre- and post-construction wildlife mitigation plans, sage-grouse surveys, planning/funding monitoring and mitigation projects, and adaptive management. Some state wildlife agencies encourage the use of wildlife mitigation plans to facilitate long-term mitigation strategies for species including sage-grouse. Wildlife mitigation plans identify particular development areas and the mitigation measures to be used, and may include BMPs and other measures such as wildlife surveys and habitat improvement projects. Monitoring is necessary to show long-term population trends (i.e., annual lek counts) and to quantify the effects of various threats such as vehicle collisions and WNV. Monitoring also determines the effectiveness of conservation measures such as reclamation and invasive species control. Adaptive management allows adjustments to a mitigation approach once information from monitoring shows improvements are necessary. Adaptive management has also led to improvements in future project planning.

Some possibility exists that a required COA or conservation measure could be excepted, waived, or modified by the BLM or Forest Service. Occasionally, the BLM may grant an exception, waiver, or modification of a COA. However, this can occur only if the authorized officer determines that the factors requiring the COA have changed sufficiently to make the protection provided by the stipulation no longer justified or if the proposed operations would not cause unacceptable impacts (BLM IM 2008-032). Additionally, exceptions, waivers, or modification may be granted if additional mitigation is applied to remove or reduce impacts such that the required COA or conservation measure is no longer needed. Exceptions, waivers, and modifications provide a viable and effective means of applying Adaptive Management techniques to oil and natural gas activities to meet changing circumstances. These decisions are made during the adaptive management process and are informed by monitoring and mitigation efforts that are implemented by the agencies and Operators. Exceptions do not get rid of requirements; rather they increase the level of documentation and protection needed to enable the exception of the requirement.

A total of 59 NEPA documents with 113 monitoring and adaptive management measures were recorded (Appendix N). All field offices identified some type of adaptive management,

monitoring, or mitigation that would benefit sage-grouse. Types of monitoring included annual lek surveys, pre-construction clearance surveys, aerial and ground surveys, winter use surveys, and assisting state agencies with monitoring. In addition to those items identified in NEPA documents, multiple examples of voluntary, proactive monitoring and mitigation strategies have been developed by the Operators to benefit sage-grouse and other species. These documents are included in NEPA documents as operator committed measures or, in the cases of the plans with a Memorandum of Understanding (MOU) or other signed agreements, are included as required elements of all NEPA alternatives and decision records. Examples of these include:

- Noble Energy's Greater Sage-grouse Mitigation Plan and MOU for Mary's River Exploration Project, Elko County, Nevada. Noble Energy developed the Mary's River mitigation plan in compliance with WO IM No. 2012-043 to reduce the level of impacts on sage-grouse to an insignificant level through the implementation of Design Features, BMP's, and Mitigation Measures. In addition, compensation for impacts would be sought for temporary, long term and permanent impacts. Noble would agree to a maximum of \$600 per disturbed acre at 3:1 ratio for PPH/ Category 1 & 2 and 2:1 ratio for PGH/Category 3 for mitigation off-sets to be put in an Impact Compensation Fund (escrow or similar account) for later use on offsite sage grouse habitat mitigation projects. Types of projects that would be considered include but are not limited to: Habitat enhancement projects; Invasive species treatments (as offsite mitigation only, onsite treatments would remain the responsibility of Noble); Sagebrush plantings; Conservation easements; Restoring or preserving habitat connectivity; Sage Grouse Research (maximum of 10% total funds)
- Exxon/XTO Piceance Basin Wildlife Mitigation Plan. In 2010, XTO and Colorado Parks and Wildlife signed a Wildlife Management Plan regarding future development plans on 150,000 acres in the Piceance Basin, potential mitigations to reduce environmental impacts to wildlife, and strategies to obtain approval of year-round and continuous activities. A Wildlife Management Plan is one method approved by the Colorado Oil and Gas Conservation Commission to facilitate APD approvals by avoiding the need for individual well or well pad consultations with CPW for development in sensitive wildlife areas, including for sage-grouse. The Plan requires annual meetings between XTO and Colorado Parks and Wildlife to review the effectiveness of applied mitigation measures, revise these measures as necessary to ensure their efficiency, consistent with the principles of adaptive management, and provide an updated three-year development plan.

### **Monitoring Efforts Required Under NEPA**

- “The Operators will establish a fund for compensatory mitigation as part of their operation. This fund will be administered by the Jonah Interagency Monitoring and Mitigation Office (JIO) established by this ROD (see Appendix C). The JIO will evaluate monitoring and mitigation effectiveness and provide annual adaptive management recommendations as appropriate to the BLM for consideration. WGFD and the Governor of Wyoming have coordinated on these strategies.” (Record of Decision [ROD] for the Jonah Infill Drilling Project EIS)

- “Establish a Pinedale Anticline Project Office to obtain, collect, store, and distribute monitoring information to support adaptive management and analyze mitigation projects.” (ROD, Final Supplemental EIS for the Pinedale Anticline Oil and Gas Exploration and Development Project)
- “The operators will contribute to UDWR for monitoring greater sage-grouse, whether the continued telemetry study or other, more aggressive means of monitoring, if necessary, including experimental designs.” (Bill Barrett Corporation [BBC], EIS [UT-070-05-055] for West Tavaputs Plateau Natural Gas Full Field Development Plan)
- “Sage-grouse surveys are required throughout the project area for the current breeding season and results reviewed by a BLM biologist. This condition will be implemented on an annual basis for the duration of surface disturbing activities.” (Anadarko Petroleum Corporation, Double Tank Phase II POD EA, WY-070-07 015)
- “XTO, BLM, and the Colorado Parks and Wildlife (CPW) initiated in discussions regarding future development plans in the Piceance Basin, potential mitigations to reduce environmental impacts to wildlife, and strategies to obtain approval of year-round and continuous activities. The objective of the discussions was to develop a Wildlife Mitigation Plan (WMP) for XTO's leases.” (Exxon, North Hatch Gulch Project, EA DOI-BLM-CO-110-2010-0200-EA)

#### **Mitigation Efforts Required Under NEPA**

- “The Operators will establish a fund for compensatory mitigation as part of their operation. This fund will be administered by the Jonah Interagency Monitoring and Mitigation Office (JIO) established by this ROD (see Appendix C). The JIO will evaluate monitoring and mitigation effectiveness and provide annual adaptive management recommendations as appropriate to the BLM for consideration. WGFD and the Governor of Wyoming have coordinated on these strategies.” (Record of Decision [ROD] for the Jonah Infill Drilling Project EIS)
- “Establish a Pinedale Anticline Project Office to obtain, collect, store, and distribute monitoring information to support adaptive management and analyze mitigation projects.” (ROD, Final Supplemental EIS for the Pinedale Anticline Oil and Gas Exploration and Development Project)
- “The operators will contribute to UDWR for monitoring greater sage-grouse, whether the continued telemetry study or other, more aggressive means of monitoring, if necessary, including experimental designs.” (Bill Barrett Corporation [BBC], EIS [UT-070-05-055] for West Tavaputs Plateau Natural Gas Full Field Development Plan)
- “XTO, BLM, and the Colorado Parks and Wildlife (CPW) initiated in discussions regarding future development plans in the Piceance Basin, potential mitigations to reduce environmental impacts to wildlife, and strategies to obtain approval of year-round and continuous activities. The objective of the discussions was to develop a Wildlife Mitigation Plan (WMP) for XTO's leases.” (Exxon, North Hatch Gulch Project, EA DOI-BLM-CO-110-2010-0200-EA)

- “In order to mitigate the impacts of winter drilling, BBC has included a detailed Wildlife Mitigation Plan as part of their Proposed Action. The goal of BBC’s Wildlife Mitigation Plan is to improve habitats for sage-grouse, mule deer, elk, and raptors in an effort to offset the effects of winter drilling and other potential impacts of the project.” (BBC, EIS [UT-070-05-055] for West Tavaputs Plateau Natural Gas Full Field Development Plan)

### **Adaptive Management Efforts Required Under NEPA**

- The Operators will establish a fund for compensatory mitigation as part of their operation. This fund will be administered by the Jonah Interagency Monitoring and Mitigation Office (JIO) established by this ROD (see Appendix C). The JIO will evaluate monitoring and mitigation effectiveness and provide annual adaptive management recommendations as appropriate to the BLM for consideration. WGFD and the Governor of Wyoming have coordinated on these strategies.” (Record of Decision [ROD] for the Jonah Infill Drilling Project EIS)
- “Establish a Pinedale Anticline Project Office to obtain, collect, store, and distribute monitoring information to support adaptive management and analyze mitigation projects.” (ROD, Final Supplemental EIS for the Pinedale Anticline Oil and Gas Exploration and Development Project)
- “Drilling development and reclamation activities in the ARPA will be managed through a performance-based, adaptive management process as described in appendix B. The process includes a requirement for Operators to submit an annual operating plan to the BLM RFO AO. The overall purpose of this process is to meet resource management objectives and ensure Performance Goals are achieved to the greatest extent possible. A monitoring and mitigation process will be required, and its development will begin within 30 days of the effective date of the ROD. This process will be developed by the Review Team (BLM, cooperating and interested agencies, and Operators) and will provide quantifiable criteria to identify trends associated with the Performance Goals. The process will include the types of mitigation responses that will be considered in the event that monitoring data indicate a downward trend relative to the Performance Goals. Throughout the life of the project, monitoring data will be reviewed to determine if mitigation measures are effective and leading to the achievement of reclamation and Performance Goals. The monitoring data will be evaluated on a regular basis (at least annually) and best management practices (BMPs), conditions of approval (COAs), protective measures, reclamation criteria, and mitigation measures may be modified, as appropriate, based on the monitoring results.” (ROD, Environmental Impact Statement for the Atlantic Rim Natural Gas Field Development Project)

### **IMPLEMENTATION OF COAS AND CONSERVATION MEASURES REQUIRED UNDER NEPA**

Implementation of COAs and conservation measures required by NEPA decisions occurs as part of post-NEPA adaptive management and monitoring efforts. Implementation of required

COAs and mitigation measures are generally identified and tracked by the lead federal agency and the Operators. In the case of those implemented under adaptive management, the COAs and conservation measures are not directly identified in the decision record but, nonetheless, result from the NEPA decision and the COAs that establish the adaptive management process.

Documentation was provided by the Operators to demonstrate implementation of sage-grouse conservation measures and COAs that were identified as part of adaptive management and monitoring efforts required by various NEPA decisions (Appendix O). As described above, monitoring and adaptive management are an important part of determining the effectiveness of sage-grouse COAs and conservation measures and for identifying new measures that can be used when others are ineffective or do not have the desired result. Monitoring and adaptive management are incorporated into these conservation projects, as described below.

### **Adaptive Management Implementation**

Adaptive management processes have been implemented on many of the large oil and natural gas development projects throughout the current occupied range of greater sage-grouse. BLM, the Forest Service, and most other federal and state agencies utilize an adaptive management process to monitor progress towards mitigation and conservation goals as well as to identify impacts occurring as a result of project operations and appropriate additional measures to reduce those impacts. As a result of NEPA requirements for adaptive management processes, additional required COAs, mitigation measures, and conservation objectives are identified and implemented cooperatively between the Operators and federal, state, and local stakeholder. Examples of adaptive management processes that are being implemented as required under BLM NEPA decision records include:

- The Jonah Interagency Mitigation and Reclamation Office (JIO). The JIO “was created by the Jonah Project Record of Decision (ROD) to provide overall management of on-site monitoring and off-site mitigation activities. To perform these functions, the JIO manages a \$24.5 million monitoring and mitigation fund committed by EnCana Oil & Gas (USA), Inc. and BP America Production Company.” (<http://www.wy.blm.gov/jio-papo/jio/index.htm>)
- The Pinedale Anticline Project Office (PAPO). The PAPO “was created by the Anticline Project Record of Decision (SEIS ROD) to provide overall management of on-site monitoring and off-site mitigation activities. The PAPO obtains, collects, stores and distributes monitoring information to support the adaptive management process and analyzes mitigation projects primarily focusing on mule deer, pronghorn and Greater sage-grouse.” (<http://www.wy.blm.gov/jio-papo/papo/index.htm>)
- The Atlantic Rim adaptive management process includes establishment of performance standards required under the BLM’s ROD. Performance Standards have been established for surface disturbance thresholds, reclamation, and wildlife monitoring and management. Annual stakeholder meetings are held to review progress towards the performance standards and compliance with the Atlantic Rim ROD requirements.

### **Conservation Easement Purchase and Monitoring**

Land conservation may include conservation easements for the benefit of sage-grouse and other affected species. Management plans for these areas incorporate monitoring and adaptive management as described above. Conservation easements may not be feasible or applicable in all development scenarios, but has proven to be useful in some areas across the species' range. For the Jonah Infill project in Wyoming, Operators established a fund for compensatory mitigation as part of their operation. This fund is administered by the JIO that was established by the ROD. Conservation easements were purchased and conservation plans developed to preserve and enhance pristine habitat for sage-grouse and other wildlife. A comprehensive conservation plan for the Cottonwood Ranches I, II, III, and McNeel Trust conservation easements was developed to guide the management of a contiguous block of 50,000 acres of habitat to benefit sage-grouse and other wildlife. The JIO also contributed to the acquisition of over 22,000 acres of other conservation easements and associated monitoring and conservation/habitat management plans (Carney Ranch, Cross Lazy Two Ranch, Diamond H Ranch, Espenscheid Ranches, McNeel Ranch, and MJ Ranch).

Similarly, Pinedale Anticline Project Office (PAPO) was created by the Anticline Project ROD to provide overall management of on-site monitoring and off-site mitigation activities. The PAPO obtains, collects, stores and distributes monitoring information to support the adaptive management process and analyzes mitigation projects. For example, the PAPO contributed to the acquisition of the Sommers-Grindstone Conservation Easement and associated conservation plan (over 19,500 acres, including 4,988 acres of key sage-grouse habitat) to meet the goal of offsetting impacts from the oil and natural gas development project (Appendix P).

### **Monitoring and Mitigation Efforts to Reduce Threats**

As described under Listing Factor A, infrastructure, including fences and powerlines, and noise from energy development are threats to sage-grouse. Some Operators have implemented monitoring programs for fences in oil and natural gas development areas. Fences are monitored for sage-grouse strikes and if sage-grouse fence strike areas are identified, those problem fences are subsequently equipped with strike deterrents in accordance with the methods developed by Sutton Avian Research Center. These areas are then monitored to determine the effectiveness of markers. Some Operators have implemented projects to monitor predator densities near sage-grouse habitat to study predation risk. Information from monitoring could be used to determine where perch deterrents need to be installed. Monitoring noise levels in oil and natural gas fields is used by some Operators to determine where noise levels may be affecting sage-grouse so that modifications can be made to reduce this risk. Monitoring is also used to determine if adjustments for the threshold noise levels defined in RODs are warranted as part of adaptive management.

Numerous additional efforts have been required, implemented, and monitored under adaptive management processes. Examples of activities include reclamation monitoring and revegetation; habitat improvement and habitat monitoring; sage-grouse and wildlife research; and development of new strategies for managing and improving habitats to offset impacts associated with development and operations. Examples of the various measures that have

been identified and implemented under adaptive management and the COAs and conservation measures contained in NEPA decisions are described in Appendix P.

## **CONCLUSIONS/DISCUSSION**

BLM and USFS land management decisions are increasingly focused on improving or maintaining habitat for sage-grouse. This increased focus is reflected in the required COAs and conservation measures contained in the decision records of oil and natural gas projects reviewed and approved by BLM and USFS. Of the NEPA documents reviewed and summarized in this report, an average of 6.5 COAs or conservation measures that directly address threats to greater sage-grouse were required per decision record. Additionally, on average, there was more than one required COA or conservation measure per NEPA decision that required implementation of adaptive management and monitoring efforts.

This report documents the COAs and conservation measures that are required as part of BLM and USFS NEPA decisions and documents their compliance with the PECE Policy, as they relate to sage-grouse conservation. Each category of COA and conservation measure identified in this review has been evaluated under the PECE policy (see Appendices B through N). As required elements of the BLM and USFS NEPA decisions, there is reasonable certainty that these COAs and conservation measures will be implemented with the intent of benefiting and/or avoiding and minimizing impacts to sage-grouse. While there is often variability in the implementation of these measures due to site-specific issues, project type, rate of development, and well density, all COAs and conservation measures included in the decision records for BLM or USFS NEPA processes meet the first evaluation criteria under the PECE Policy (Certainty of Implementation). This demonstrates that when appropriate conservation and mitigation measures are used, NEPA is a valid regulatory mechanism to protect and conserve sage-grouse as there is certainty that each COA or conservation measure will be implemented. The effectiveness of the NEPA process is enhanced when coupled with monitoring performed by oil and natural gas operators as well as state and federal agencies.

The COAs and conservation measures implemented under NEPA and reviewed in this report were developed using the best available science for sage-grouse. Collectively, these measures, when implemented, would result in the conservation and protection of sage-grouse populations or the avoidance and minimization of impacts to the species and its habitat and provide Certainty of Effectiveness under the PECE Policy. Because the measures required under BLM and USFS NEPA decisions would be applied across the majority of the range of the sage-grouse and meet the PECE Policy standards for Certainty of Implementation and Certainty of Effectiveness, NEPA is an adequate regulatory mechanism to protect, conserve, and enhance the status of the species and should be seriously considered as such for the 2015 USFWS listing determination.

**APPENDIX B**  
**Seasonal Limitations and Year-Round Development**

**Table B-1. PECE Policy Evaluation – Seasonal Limitations**

Conservation Measure	Seasonal Limitations
<b>Certainty of Implementation</b>	
The conservation effort, the party(ies) to the agreement or plan that will implement the effort, and the staffing, funding level, funding source, and other resources necessary to implement the effort are identified.	The BLM/USFS decision records require implementation as a condition of the agency authorization. Funding and implementation is generally identified as the responsibility of the operator(s).
The legal authority of the party(ies) to the agreement or plan to implement the formalized conservation effort, and the commitment to proceed with the conservation effort are described.	NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed these evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.

<b>Conservation Measure</b>	<b>Seasonal Limitations</b>
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	Seasonal limitation COAs and conservation measures address threats associated with Energy Development under Listing Factor A.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	Timing for implementation of seasonal restrictions is explicitly stated in each NEPA document. These are implemented annually for the life of the project.
The steps necessary to implement the conservation effort are identified in detail.	Steps are identified and include avoidance of activities surrounding leks within given distance buffers.
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	Lek attendance monitoring, monitoring of nesting and brood-rearing hens, etc. provide quantifiable parameters to measure success of the measure. Multiple sources identify that avoidance of activities surrounding leks during lekking, nesting, and early brood-rearing periods provide conservation benefit and protective measures for sage-grouse.
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Annual lek counts are tracked by state game and fish agencies and federal land management agencies for purposes of evaluating grouse populations. Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

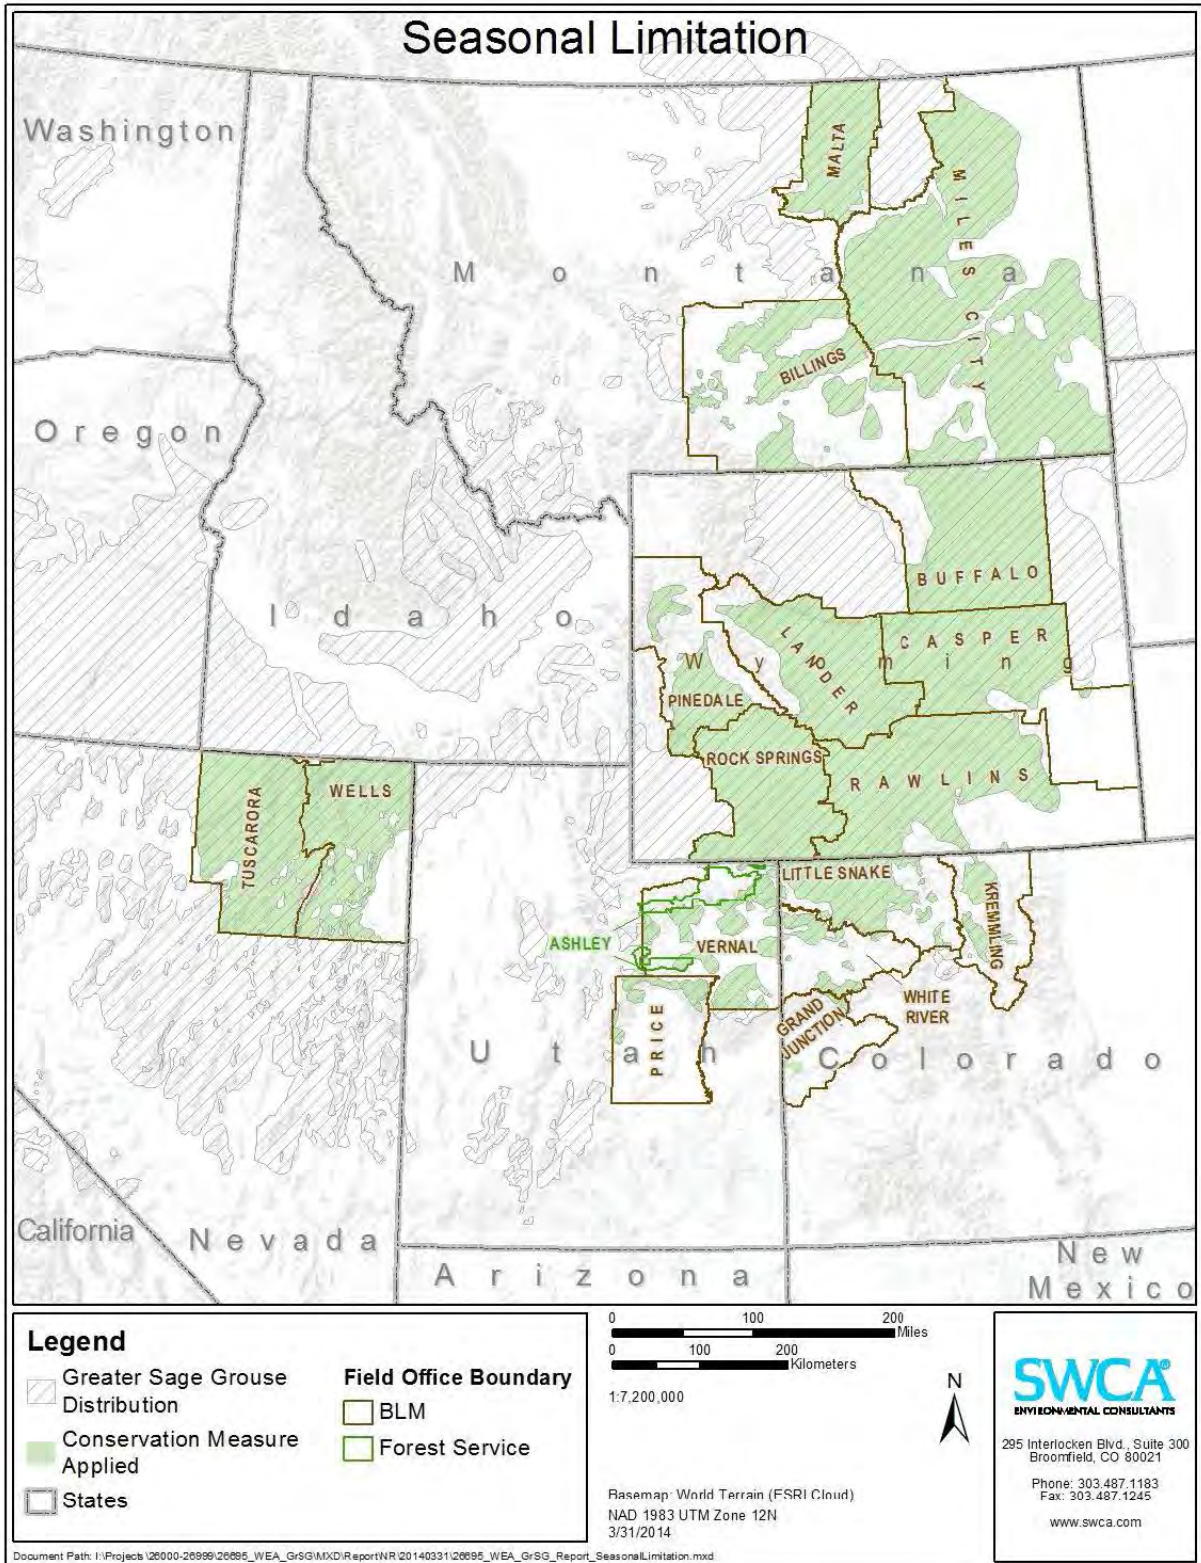

Figure B-1. Map of FOs where Seasonal Limitations are applied.

**Table B-2. Seasonal Limitation COAs and Conservation Measures**

Citation	Field Office	Description
Anadarko Petroleum Company, Powder River 2D Seismic Survey Environmental Assessment (EA), WY-070-EA11-343 Buffalo Field Office, Bureau of Land Management, 2011.	Buffalo Field Office, BLM	No surface disturbing activities are permitted within 2 miles of known sage-grouse leks, or within the boundaries of designated core/connectivity between March 1 and June 15, prior to completion of a greater sage-grouse lek survey.
Anadarko Petroleum Corp. Big Corral Jewel Draw Unit Gamma EA # WY-070-EA08-168 Buffalo Field Office, Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	No surface disturbing activities are permitted within 2 miles of sage grouse lek(s) between March 1 and June 15, prior to completion of a greater sage grouse lek survey. This condition will be implemented on an annual basis for the duration of surface disturbing activities. If an active lek is identified during the survey, the 2 mile timing restriction (March 1-June 15) will be applied and surface disturbing activities will not be permitted until after the nesting season. If surveys indicate that the identified lek is inactive during the current breeding season, surface disturbing activities may be permitted within the 2 mile buffer until the following breeding season (March 1). The required sage grouse survey will be conducted by a biologist following the most current WGFD protocol. All survey results shall be submitted in writing to a Buffalo BLM biologist and approved prior to surface disturbing activities. Well metering, maintenance and other site visits within 2.0 miles of documented sage grouse lek sites should be minimized as much as possible during the breeding season (March 1– June 15).
Anadarko Petroleum Corporation, Double Tank Phase II POD EA, WY-070-07 015, Buffalo Field Office Buffalo, Wyoming, 2009.	Buffalo Field Office, BLM	A sage-grouse timing restriction shall apply to the entire Double Tank phase 2 project area. No surface disturbing activities are permitted within 2 miles of the Cottonwood lek (March 1-June 15), until sage-grouse surveys have been completed and determine the lek to be inactive.
Anadarko Petroleum Corporation, Double Tank Phase II POD EA, WY-070-07 015, Buffalo Field Office Buffalo, Wyoming, 2009.	Buffalo Field Office, BLM	If an active lek is identified during the survey, the 2 mile timing restriction (March 1-June 15) will be applied and surface disturbing activities will not be permitted until after the nesting season.
Anadarko Petroleum Corporation, Dry Willow III POD EA, WY-070-08-036, Buffalo Field Office Buffalo, Wyoming, 2009.	Buffalo Field Office, BLM	No surface disturbing activities are permitted within 2 miles of sage grouse lek(s) between March 1 and June 15, prior to completion of a greater sage grouse lek survey. This condition will be implemented on an annual basis for the duration of surface disturbing activities. If an active lek is identified during the survey, the 2 mile timing restriction (March 1-June 15) will be applied and surface disturbing activities will not be permitted until after the nesting season. Well metering, maintenance and other site visits within 2.0 miles of documented sage grouse lek sites should be minimized as much as possible during the breeding season (March 1– June 15).
Anadarko Petroleum Corporation, Dry Willow Phase V POD EA, WY-070-10-186, Buffalo Field Office, 2010.	Buffalo Field Office, BLM	Anadarko has prepared a wildlife conditions of approval map for the POD and will abide by the timing limitations and restrictions as laid out on the map. See MSUP Wildlife COA map dated 06/01/2010). The PRB FEIS programmatic document requires WL surveys for threatened and endangered or other special-concern species to be completed yearly. The WL COA map will be updated yearly to reflect the changes.
Anadarko. Doty Mountain Plan of Development D in Atlantic Rim. DOI-BLM-WY-030-2012-0093-EA. 2012.	Rawlins Field Office, BLM	Construction, drilling, reclamation, and other potentially disruptive activities in suitable Greater Sage-Grouse identified nesting and early-brood rearing habitat within two (2) miles of the perimeter of an occupied Greater Sage-Grouse lek, or in identified Greater Sage-Grouse nesting and early brood rearing habitat, would be prohibited from March 1 to July 15 for all well pad locations.
Anadarko. Doty Mountain POD C in Atlantic Rim EA. WY-030-07-EA-240. 2008.	Rawlins Field Office, BLM	Construction, drilling, reclamation and other potentially disruptive activities are prohibited during the period of March 1 to July 15 for the protection of strutting and nesting sage-grouse.
Anadarko. Doty Mountain Unit B Plan of Development in Atlantic Rim EA. WY-030-08-EA-049. 2008.	Rawlins Field Office, BLM	Construction, drilling, reclamation and other potentially disruptive activities are prohibited during the period of March 1- July 15 for the protection of sage grouse.
Anadarko. Environmental Assessment for Jack Sparrow POD. WY-030-08-EA-238. 2008.	Rawlins Field Office, BLM	Construction, drilling, reclamation and other activities potentially disruptive are prohibited during the period of March 1 to July 15 for the protection of strutting and nesting sage grouse.
Anadarko. Environmental Assessment for Jack Sparrow POD. WY-030-08-EA-238. 2008.	Rawlins Field Office, BLM	Construction, drilling, reclamation and other activities potentially disruptive to wintering sage grouse are prohibited during the period of November 15 to March 14 for the protection of sage grouse winter concentration areas, delineated by BLM and WGFD for the project area.
Anadarko/Lance Oil & Gas. Rose Draw Unit Beta Environmental Assessment WY-070-EA08-186, 2008.	Buffalo Field Office, BLM	No surface disturbing activities are permitted within 2 miles of the active sage-grouse lek(s) between March 1 and June 15, prior to completion of a greater sage grouse lek survey.
Anadarko/Lance Oil & Gas. Rose Draw Unit Beta Environmental Assessment WY-070-EA08-186, 2008.	Buffalo Field Office, BLM	Well metering, maintenance and other site visits within 2.0 miles of documented sage grouse lek sites should be minimized as much as possible during the breeding season (March 1– June 15).

Citation	Field Office	Description
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	Surface disturbing and disruptive activities will not be allowed between November 15 and March 14 in delineated winter concentration areas.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	Surface disturbing and disruptive activities will not be allowed within two miles of an occupied greater sage-grouse lek or in nesting and early brood-rearing habitat associated with individual leks (when identified and delineated) from March 1 to July 15.
Ballard Petroleum. Nipple Butte 3-D Seismic Project, Categorical Exclusion WY-070-CX12-196. 2013.	Buffalo Field Office, BLM	Disruptive activities are prohibited or restricted on public surface in the project area from March 15th through June 30 in suitable sage-grouse nesting and early brood-rearing habitat.
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest, USFS	From March 1 through June 30, no surface-disturbing activities (including construction, drilling, and well flaring) will be allowed for wells located within sage-grouse habitat in order to protect nesting sage-grouse.
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest, USFS	To avoid disruption of sage-grouse migration activities, no well pad construction, road construction, drilling, or work-over rigs will be allowed on ridge tops from November 15 to March 1 within 4 miles of a lek.
Bill Barrett Corporation, Merganser 3-Dd Seismic Project. Categorical Exclusion WY-070-CX12-197. 2012.	Buffalo Field Office, BLM	Disruptive activities are prohibited or restricted on public surface in the project area from March 15th through June 30 in suitable sage-grouse nesting and early brood-rearing habitat.
Bill Barrett Corporation, Beaver Creek Add II, Beaver Creek Add II SGP PODs, Beaver Creek Little Buffalo 32-24 APD & Beaver Creek Little Buffalo 34-24 APD, EA # WY-070-09-065, Buffalo Field Office Buffalo, Wyoming, 2010.	Buffalo Field Office, BLM	No surface disturbing activities are permitted from March 1 to June 15 in the locations near sage-grouse for the life of the project
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	No exceptions will be granted to seasonal restrictions in areas that the UDWR and the BLM have identified as the core winter-use sage grouse areas.
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	No winter development (i.e., construction, drilling, or completion activities) will be allowed in core winter use areas on Prickly Pear Bench or in the Peters Point area between December 1 - March 14.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	Surface use is prohibited between March 1 – June 15 in grouse nesting habitat within 2 miles of a known lek. This measure does not apply to the operation and maintenance of production facilities. This measure will be implemented to protect sharptail and sage grouse nesting habitat from disturbance during spring and early summer in order to maximize annual production of young, and to minimize disturbance to nesting activities adjacent to nesting sites for the long-term maintenance of grouse populations in the area.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	Winter range- Surface use is prohibited from December 1 through March 31 within designated crucial winter range to protect sage grouse from disturbance during winter season use.
Chevron. Table Rock Unit Oil and Gas Development EA and DR. WY-040-EA11-175. January 2012.	Rawlins Field Office, BLM Rock Springs Field Office, BLM	In accordance with BLM Instruction Memorandum 2010-012 and the Green River and Rawlins RMPs, no surface disturbing and/or disruptive activities are allowed within 2 miles of any occupied or undetermined lek between March 1 and July 15 to protect nesting greater sage-grouse.
Coleman Oil & Gas. Wilkinson POD. EA # WY-070-11-38. 2010.	Buffalo Field Office, BLM	No surface disturbing activities are permitted within 2 miles of the Spring Creek lek (S06 T42N R72W) between March 15 and June 30, prior to completion of a sage-grouse lek survey. This condition will be implemented on an annual basis for the duration of surface disturbing activities. See attached map for affected wells and infrastructure.
Devon Energy Company, L.P., Grayling POD EA, WY-070-10-332, Buffalo Field Office, 2011.	Butte Field Office, BLM	No surface-disturbing activities shall occur within sage-grouse nesting habitat, from 15 March through 30 June, annually.
Devon Energy Production Company L.P. Harrier Plan of Development Juniper Draw Unit Environmental Assessment WY-070-EA08-189. 2008.	Buffalo Field Office, BLM	No surface disturbing activities are permitted within 2 miles of sage grouse lek(s) between March 1 and June 15, prior to completion of a greater sage grouse lek survey. This condition will be implemented on an annual basis for the duration of surface disturbing activities.
Devon Energy Production Company L.P. Harrier Plan of Development Juniper Draw Unit Environmental Assessment WY-070-EA08-189. 2008.	Buffalo Field Office, BLM	Well metering, maintenance and other site visits within 2.0 miles of documented sage grouse lek sites should be minimized as much as possible during the breeding season (March 1– June 15)

Citation	Field Office	Description
Devon Energy Production Company, L.P., Golden Eagle- Juniper Draw CBNG Field POD EA, WY-070-EA07-111, Buffalo Field Office Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	No surface disturbing activities are permitted within 2 miles of the Tear Drop lek (NESW Section 33, T50N, R79W) and the Tear Drop II lek (SWNE Section 32, T50N, R79W) between March 1 and June 15, prior to completion of a greater sage-grouse lek survey. This condition will be implemented on an annual basis for the duration of surface disturbing activities. If an active lek is identified during the survey, the 2 mile timing restriction (March 1-June 15) will be applied and surface disturbing activities will not be permitted until after the nesting season.
Devon Energy Production Company. West Pine Tree Unit – Brook Trout POD Environmental Assessment WY-070-EA08-129, 2008.	Buffalo Field Office, BLM	If an active lek is identified during the survey, the 2 mile timing restriction (March 1-June 15) will be applied and surface disturbing activities will not be permitted until after the nesting season.
Devon Energy Production Company. West Pine Tree Unit – Brook Trout POD Environmental Assessment WY-070-EA08-129, 2008.	Buffalo Field Office, BLM	Well metering, maintenance and other site visits within 2.0 miles of documented sage grouse lek sites should be minimized as much as possible during the breeding season (March 1– June 15).
Double Eagle Petroleum. Catalina PODs C and D in the Atlantic Rim. WY-030-08-EA-115. 2008.	Rawlins Field Office, BLM	Construction, drilling, reclamation and other activities potentially disruptive to wintering sage-grouse are prohibited during the period of November 15 to March 14 for the protection of sage grouse winter concentration areas. Several years of data compiled by BLM and WGFD was used to identify wintering sage grouse locations and their associated wintering habitat.
Double Eagle Petroleum. Catalina PODs C and D in the Atlantic Rim. WY-030-08-EA-115. 2008.	Rawlins Field Office, BLM	Construction, drilling, reclamation and other potentially disruptive activities are prohibited during the period of March 1 to July 15 for the protection of strutting and nesting sage-grouse.
Double Eagle Petroleum. Catalina PODs E and F in the Atlantic Rim. WY-030-08-EA-222. 2008.	Rawlins Field Office, BLM	Construction, drilling, reclamation and other activities potentially disruptive to wintering sage-grouse are prohibited during the period of November 15 to March 14 for the protection of sage grouse winter concentration areas. Several years of data compiled by BLM and WGFD was used to identify wintering sage grouse locations and their associated wintering habitat.
Double Eagle Petroleum. Catalina PODs E and F in the Atlantic Rim. WY-030-08-EA-222. 2008.	Rawlins Field Office, BLM	Construction, drilling, reclamation and other potentially disruptive activities are prohibited during the period of March 1 to July 15 for the protection of strutting and nesting sage-grouse.
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	Surface disturbing and/or disruptive activities are prohibited from March 15 to June 30 in all nesting and early brood-rearing habitats inside core regardless of distance from the lek.
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	Surface disturbing and/or disruptive activities are prohibited in winter concentration areas from December 1 to March 14.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	Avoid disturbance to big game (American elk and mule deer) production areas (from April 15 to July 15) and winter range (January 1 to April 15) wherever possible; however, this will be a secondary consideration to preserving sage-grouse habitat.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	Multiple rig moves would not occur simultaneous; however, EnCana would use reasonable efforts to schedule rig moves outside of the Critical Habitat Season.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	New disturbance would be restricted within nesting and brood-rearing habitat as much as possible from April 15th to July 1st.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	Pipeline construction and installation would be scheduled outside the Critical Habitat Season.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	Upon completion of new disturbance, EnCana would leave the new disturbance area undisturbed for a minimum of two, and preferably three, full sage-grouse Critical Habitat Seasons (April 15 to August 1) during which no new disturbance would be conducted.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	Well maintenance will not be considered new disturbance, but would be minimized to the extent practicable during the Critical Habitat Season. EnCana would provide the CPW and BLM notice of well maintenance and would maintain records of these operations.
EnCana Oil and Gas. Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project Environmental Assessment. WY-050-EA08-88. Approved 9/5/08 by the Lander BLM Field Office.	Lander Field Office, BLM	A 3-mile buffer zone would be established around known leks, and construction activity in this buffer zone would be restricted between March 15 and July 15 to minimize effects to breeding, egg-laying, incubating, and brooding sage-grouse. BLM may grant exceptions in the absence of suitable nesting and brooding habitats and is also in the process of evaluating whether to increase the buffer zone.

Gasco Energy Inc. Uinta Basin Natural Gas Development Project, Environmental Impact Statement FES 12-5, Record of Decision, Bureau of Land Management Vernal Field Office, June 2012.	Vernal Field Office, BLM	No new construction or surface-disturbing activities will be conducted between March 1 and June 30 each year within greater sage-grouse nesting areas (a 2-mile radius of strutting grounds in areas of sagebrush vegetation) until an activity survey was completed. The survey will be conducted by a qualified biologist to determine the presence or absence of nesting greater sage-grouse. The activity survey will be conducted each year between April 1 and April 15, or as determined in coordination with the AO to account for annual climate fluctuations, and the results will be reported to the AO. If active nesting areas are documented during the annual survey, no new construction and surface-disturbing activities will take place within 0.5 mile of those nesting areas during the nesting period identified by the AO.
Geokinetics. Jim Bridger Power Plant 3-D Seismic and Electromagnetic Surveys EA and Decision Record. WYW167761. WY-040-EA10-111. September 2010.	Rock Springs Field Office, BLM	Project activities are scheduled to avoid wildlife conflicts; however, if the schedule changes, the following seasonal restrictions would be enforced: Avoid greater sage-grouse nesting areas March 15 through July 15.
Greencore Pipeline Company. Environmental Assessment. Bureau of Land Management. EA No. WY-060-EA11-32. January 2011.	Buffalo Field Office, BLM Casper Field Office, BLM Lander Field Office, BLM Miles City Field Office, BLM	Greencore has committed to not constructing during the greater sage-grouse breeding season (March 15 – June 30).
Gulfport Energy Corporation/Quicksilver Corporation. Craig Dome/Bell Rock 3D Seismic Survey. DOI-BLM-CO-N010-2011-0006 EA. Little Snake Field Office, 2011.	Little Snake Field Office, BLM	To minimize the potential for disturbing grouse during the nesting season and preventing accidental destruction of nests, no seismic activities (including driving vibroseis trucks or OHVs) would be allowed within mapped nesting habitat from March 1 through June 30. This mitigation does not apply to casual use, such as hiking in to an area to lay down receiving lines. This timing limitation would apply to BLM lands located in T6N, R91W, Sections 29 and 30 and T6N, R92W, Sections 19, 20, 23, 25, 29, 31, 34, 35 and 36.
Jonah Infill Drilling Project Environmental Impact Statement and Record of Decision, Sublette County, Wyoming. 2006. QEP. Drilling of 180 Wells and Constructing or Expanding 6 Pads. WY-100-EA13-72. Approved by BLM Pinedale July 2013.	Pinedale Field Office, BLM	Disturbance and disruptive activities are prohibited in sage-grouse winter concentration areas November 15 to March 15. <sup>1</sup>
QEP. Drilling of 180 Wells and Constructing or Expanding 6 Pads. WY-100-EA13-72. Approved by BLM Pinedale July 2013.	Pinedale Field Office, BLM	Surface disturbing and disruptive activities are prohibited in suitable sage-grouse nesting and early brood-rearing habitat within 2 miles of an occupied lek, or in identified sage-grouse nesting and early brood-rearing habitat outside the 2 mile buffer March 15-July 15. <sup>1</sup>
QEP. EA to re-enter the existing WRB 16-17-10-17 EA, DOI-BLM-UT G010-2012-0151, BLM Vernal Field Office. 2012.	Vernal Field Office, BLM	No surface disturbing activities allowed within 2 miles of active lek from March 1 - June 15.
QEP. Greater Deadman Bench Oil and Gas Producing Region EIS and ROD March 2008. UT 080-2003-0369V. BLM Vernal Field Office. 2008.	Vernal Field Office, BLM	No surface disturbance will be allowed within greater sage grouse strutting and nesting habitat between March 1 and June 30.
Quicksilver Resources. 9 Mile 3D Seismic Project. CO-100-2008-048 EA. BLM Little Snake Field Office, 2008.	Little Snake Field Office, BLM	No surface disturbing activities will occur between March 1 and June 30 within a 2 mile radius of leks within suitable nesting habitat (projected timeframe for seismic exploration is late summer and fall). No exceptions will be granted for this restriction.
Samson Resources Company. Environmental Assessment for the Scott Field Development Project. WY-060-EA13-067. Approved 9/9/13 by the BLM Casper Field Office.	Casper Field Office, BLM	Surface disturbing and disruptive activities will be avoided from March 15 to July 15 in suitable greater sage-grouse nesting and brood-rearing habitats within 2 miles of an occupied lek.
Samson. Endurance/Barricade Gas Infrastructure Project Sweetwater County, Wyoming. Environmental Assessment. DOI-BLM-WY-030-2013-0151-EA. August 2013	Rawlins Field Office, BLM	Avoid surface disturbing and disruptive activities, geophysical surveys, and organized recreational activities (events) that require a special use permit within identified Greater Sage-Grouse nesting and early brood rearing habitat of a sharp-tailed grouse lek, or in Greater Sage-Grouse and sharptailed grouse nesting and early brood rearing habitat from March 1 to July 15.
Summit Gas Resources, Inc. Cabin Creek VII Federal POD WY-070-EA12-183, Buffalo Field Office, 2012.	Buffalo Field Office, BLM	No surface disturbing activities are permitted during sage-grouse breeding and nesting periods (March 15 – June 30), for all federal wells and all associated infrastructure wells in the portions of the Cabin Creek 7 POD within T58N, R77W Sections 20, 21, 27, 28, 29, 31, 32, and 33.
Wellstar. EA for Applications for Permits to Drill (APDs) Bush Draw Federal 18-1 and 3-2 in Jackson County. DOI-BLM-CO-120-2009-0057-EA. Bureau of Land Management Kremmling Field Office. 2009.	Kremmling Field Office, BLM	CO-30: No surface disturbing activities between March 1 and June 30 in order to protect nesting greater sage-grouse.
Wellstar. EA for Applications for Permits to Drill (APDs) Federal #9-1, Bush Draw Federal #10-2, and Bush Draw Federal #15-1 wells in Jackson County. OI-BLM-CO-120-2009-0002-EA. Bureau of Land Management Kremmling Field Office. 2009.	Kremmling Field Office, BLM	If Wellstar's drilling activity does not occur in the planned timeframe (winter 2008 or prior to March 1, 2009) on Federal 9-1, they would be required to consult with the BLM to discuss a potential closure period where no construction activities (i.e. road construction and drilling) could occur during the sage grouse breeding season (March 1 –June 30).
Williams Production RMT Company, Cedar Draw Unit 2 POD, EA WY-070-07-137, Buffalo Field Office Buffalo, Wyoming, 2010.	Buffalo Field Office, BLM	No surface disturbing activities are permitted within 2 miles of a sage grouse lek between March 1 and June 15, prior to completion of a greater sage grouse lek survey. This condition will be implemented on an annual basis for the duration of surface disturbing activities. If an active lek is identified during the survey, the 2 mile timing restriction (March 1-June 15) will be applied and surface disturbing activities will not be permitted until after the nesting season.
Williams Production RMT Company, Cedar Draw Unit 3, WY-070-EA11-236, Bureau of Land Management, Buffalo Field Office, 2011.	Buffalo Field Office, BLM	No surface-disturbing activities shall occur within 2 miles of the Laramore lek (Section 26, T53N R75W), from March 15 through June 30 (Buffalo RMP Maintenance Action September 17, 2010), annually.
WPX Energy Rocky Mountain, LLC, Plans of Development North Butte 4, North Butte 3, J Christensen Federal 21-35 and Tex Draw Add 1, Environmental Assessment (EA), WY-070-EA12-123, 2013.	Buffalo Field Office, BLM	No surface disturbing activities are permitted during sage-grouse breeding and nesting periods (March 15-June 30), for the following federal wells and all associated infrastructure.
Yates Petroleum and Pinnacle Gas Resources. Luman Rim Natural Gas Development EA and DR. WYW128688. WY-040-EA10-139. December 2010.	Rock Springs Field Office, BLM	No disruptive activity within 2 miles of a lek from March 1 to July 15 to protect breeding, nesting and brood rearing greater sage-grouse.
Yates Petroleum Company. NEO Coal Bed Natural Gas Environmental Assessment WY-070-10-331, 2010.	Buffalo Field Office, BLM	No surface-disturbing activities are permitted in suitable nesting and brood-rearing habitat within the NEO POD boundary between March 15 and June 30.
Yates Petroleum Corporation, Congaree POD EA, WY-070-10-195, Buffalo Field Office, 2010.	Buffalo Field Office, BLM	No surface disturbing activities are permitted from March 1 to June 15. This condition will be implemented on an annual basis for the life of the project. This condition affects the entire POD.

Citation	Field Office	Description
Yates Petroleum Corporation, Gauge POD EA, WY-070-EA09-75, Buffalo Field Office, 2009.	Buffalo Field Office, BLM	No surface disturbing activities are permitted for the locations, access roads, and impoundments listed below between March 1-June 15. This condition will be implemented on an annual basis for the duration of surface disturbing activities. If a previously unknown lek is identified during surveys, additional areas may be included in the above referenced timing restriction (March 1-June 15).
Yates Petroleum Corporation. All Day POD. EA # WY-070-08-026 and COAs. Buffalo Field Office, Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	To further minimize impacts to sage-grouse using habitat affected by the proposed action, surface-disturbing activities will be restricted during sage-grouse breeding and nesting periods (March 1 to June 15) for project components located in sage-grouse habitat for the life of the project.
Yates Petroleum Corporation. Lazurite POD Environmental Assessment WY-070-EA09-095, 2009.	Buffalo Field Office, BLM	The following wells and infrastructure will have timing limitation stipulations of no surface disturbing activities (to include maintenance, unless an emergency) from March 1-June 15 for the life of the project:
Yates Petroleum Corporation. Napier Road POD Environmental Assessment WY-070-EA10-280, 2010.	Buffalo Field Office, BLM	No surface disturbing activities are permitted during sage-grouse breeding and nesting periods (March 15 – June 30), for project components located in the sage-grouse habitat depicted as shaded areas in map below. This condition will be implemented on an annual basis for the duration of surface disturbing activities.

<sup>1</sup>Excepted in most years under year-round development authorizations defined in the Supplement EIS/ROD for the Pinedale Anticline.

**Table B-3. PECE Policy Evaluation – Year-Round Development**

Conservation Measure	Year-Round Development
<b>Certainty of Implementation</b>	
The conservation effort, the party(ies) to the agreement or plan that will implement the effort, and the staffing, funding level, funding source, and other resources necessary to implement the effort are identified.	The BLM/USFS decision records require implementation as a condition of the agency authorization. Funding and implementation is generally identified as the responsibility of the operator(s).
The legal authority of the party(ies) to the agreement or plan to implement the formalized conservation effort, and the commitment to proceed with the conservation effort are described.	NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed this evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.

<b>Conservation Measure</b>	<b>Year-Round Development</b>
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	Year-round drilling COAs and conservation measures address threats associated with Energy Development under Listing Factor A.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	The objectives for year-round drilling are stated in NEPA documents and include making the drilling process more efficient, reducing the overall number of active drilling years, concentrating development into selected areas while other areas remain less disturbed, and accelerating reclamation operations.
The steps necessary to implement the conservation effort are identified in detail.	Steps necessary to implement year-round drilling are generally stated and analyzed in the NEPA documents.
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	Year-round drilling is used to reduce project footprints, overall duration of the drilling phase of development, and to focus development activities in localized areas for longer durations rather than spreading the impact across the landscape for short durations. This decreases traffic, noise, and other impacts and accelerates reclamation operations in areas away from where year-round drilling is occurring.
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions. In Colorado, Wildlife Conservation Plans prepared in coordination with Colorado Parks and Wildlife often require monitoring of sage-grouse and other species in areas where year-round drilling is used.
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

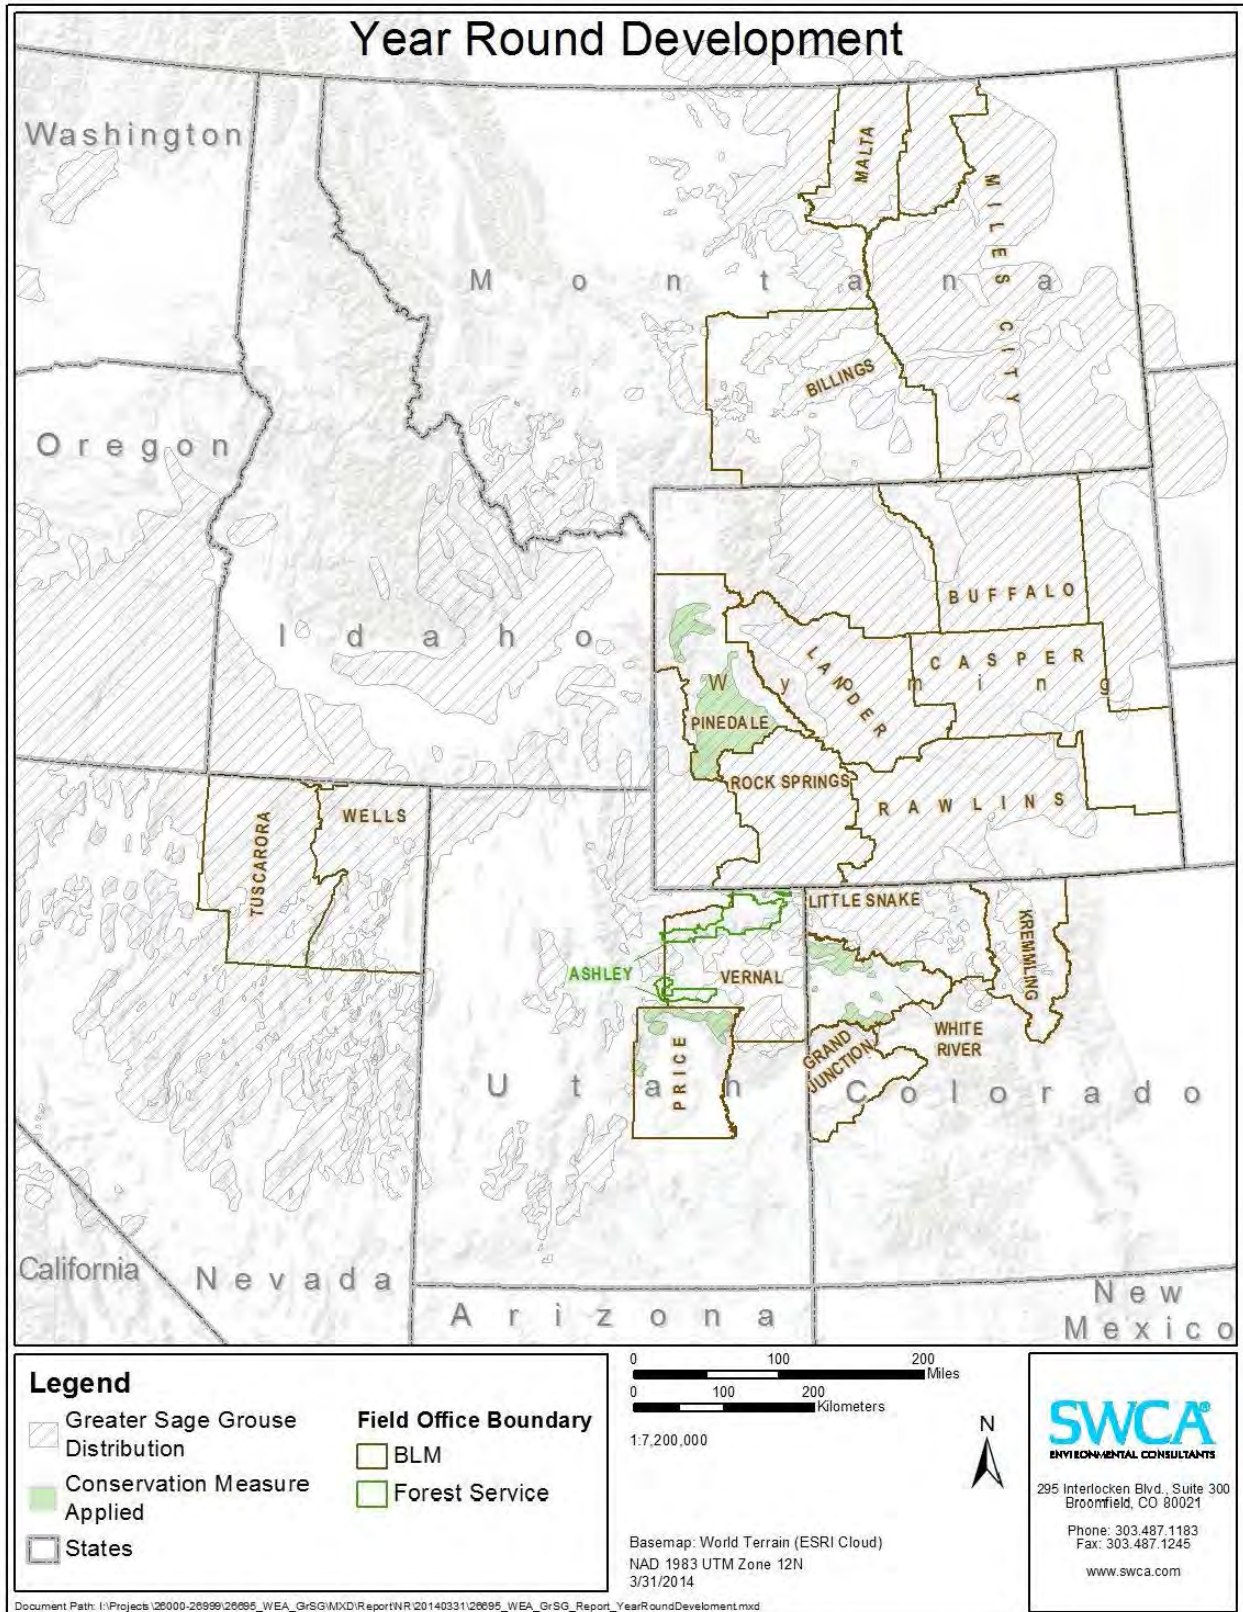

Figure B-2. Map of FOs where Year-Round Development COAs are applied.

**Table B-4. Year-Round Development COAs and Conservation Measures**

Citation	Field Office	Description
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	Year round drilling would reduce drilling duration to 4-7 years compared to 21 years if no winter drilling from 11/1 to 5/15. Approval of winter drilling would be subject to annual review requirements.
EnCana Oil and Gas. 28 APDs on new well pad D36 496. DOI-BLM-CO-110-2011-0169-EA. Approved 9/23/11 by the White River Field Office.	White River Field Office, BLM	Based on this analysis, this circumstance warrants an exception to BLM White River ROD/RMP TL-06-Timing Limitation for Sage Grouse Nest Habitat. With input by the BLM WRFO, all sage-grouse oriented best management practices and mitigation strategies have been integrated into the Proposed Action via a formal agreement between CPAW and EnCana.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	The project area represents suitable and occupied nest habitat that is subject to White River ROD/RMP-approved timing limitations designed to reduce disruption of nest and early brood activities of sage-grouse. These measures, which cannot be practically applied to year-round drilling practices, can be 'excepted' by the WRFO Manager pending coordination with the CPW. Based on this analysis, this circumstance warrants an exception to BLM White River ROD/RMP TL-06-Timing Limitation for Sage Grouse Nest Habitat.
EnCana Oil and Gas. Story Gulch Well Pads (2). DOI-BLM-CO-110-2009-0229-EA. Approved 2/3/10 by White River Field Office.	White River Field Office, BLM	These measures, which cannot be practically applied to year-round drilling practices, can be 'excepted' by the WRFO Manager pending consultation with the CDOW. Based on this analysis, this circumstance warrants an exception to BLM White River ROD/RMP TL-06-Timing Limitation for Sage Grouse Nest Habitat. With input by the BLM WRFO, all sage-grouse oriented best management practices and mitigation strategies have been integrated into the proposed action via a formal agreement between the Colorado Division of Wildlife and EnCana.
Exxon. North Hatch Gulch Project Environmental Assessment, DOI-BLM-CO-110-2010-0200-EA, 2012.	White River Field Office, BLM	For a development scenario restricting development to one surface pad for every 400 acres to be economically viable, the use of clustered drilling for the NHGP requires that operations be conducted continuously, without interruptions, until all of the development activities on a pad are completed. A critical component of the Proposed Action is XTO's request for the granting of a modification to big game seasonal stipulation TL-08 within a buffer area of 50 meters around all proposed surface disturbance. XTO's proposed year-round and continuous drilling and operations program offers significant environmental and efficiency benefits over seasonal operations. Authorization of year-round and continuous drilling and construction would minimize the duration of operations. Assuming each well takes an average of 30 days to drill, each proposed 20-well pad can be drilled and completed in approximately 20 months using year-round and continuous operations; compared to 36 months for seasonal drilling. With 3 rigs and year-round drilling, the 120 wells could be completed within 4 years, compared to 6 years with seasonal shut downs. Year round drilling also requires less surface disturbance and interim reclamation can begin sooner. For seasonal drilling, each move and rig-up or rig-down will require more cranes and truck hauling which means increased vehicular traffic, noise and manpower compared to year-round drilling. Year-round drilling reduces rig moves and truck hauling by 75-80% depending on the number of rigs used.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	This ROD allows for year-round development and delineation activity within big game (pronghorn and mule deer) and greater sage-grouse seasonal use areas by granting exceptions to the big game and greater sage-grouse seasonal restrictions. The extent, location, and duration of relief from seasonal habitat restrictions will be determined at the annual planning meeting. No surface occupancy (NSO) restrictions for all species will remain in effect.

**APPENDIX C**  
**Reclamation**

**Table C-1. PECE Policy Evaluation – Reclamation**

Conservation Measure	Reclamation
<b>Certainty of Implementation</b>	
The conservation effort, the party(ies) to the agreement or plan that will implement the effort, and the staffing, funding level, funding source, and other resources necessary to implement the effort are identified.	The BLM/USFS decision records require implementation as a condition of the agency authorization. Funding and implementation is generally identified as the responsibility of the operator(s).
The legal authority of the party(ies) to the agreement or plan to implement the formalized conservation effort, and the commitment to proceed with the conservation effort are described.	NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed this evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.

<b>Conservation Measure</b>	<b>Reclamation</b>
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	Reclamation COAs and conservation measures address threats associated with Energy Development and Invasive Plants under Listing Factor A.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	Reclamation Plans contain incremental objectives, such as reaching a certain percent cover of native vegetation after a set number of growing seasons.
The steps necessary to implement the conservation effort are identified in detail.	Steps are identified in COAs and Reclamation Plans, including implementation measures that describe soil preparation and seed mixes to use during reclamation.
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	Reclamation must meet quantifiable standards to be considered successful, typically a minimum cover and composition of 60-80% of the desired plant community.
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Annual monitoring and reporting are a part of reclamation COAs. If reclamation is determined to be unsuccessful, adaptive management allows the reclamation approach to be re-evaluated.
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

Double Eagle Petroleum. Catalina PODs C and D in the Atlantic Rim. WY-030-08-EA-115. 2008.	Rawlins Field Office, BLM	The Operator shall select and use a seed mix most applicable to each disturbed location with the goal of restoring individual sites to closely resemble the predisturbance native plant communities, as provided in Appendix A of the ROD "Project Reclamation Plan"
Double Eagle Petroleum. Catalina PODs E and F in the Atlantic Rim. WY-030-08-EA-222. 2008.	Rawlins Field Office, BLM	The Operator shall select and use a seed mix most applicable to each disturbed location with the goal of restoring individual sites to closely resemble the predisturbance native plant communities, as provided in Appendix A of the ROD "Project Reclamation Plan"
Double Eagle Petroleum. Catalina PODs G and I in the Atlantic Rim. DOI-BLM-WY-030-2009-0155-EA. 2011.	Rawlins Field Office, BLM	Additional site specific vegetation inventory data would be collected by the company and submitted as part of any approved Reclamation Plan as per the Wyoming Reclamation Policy (March 2009), the Rawlins Resource Management Plan (RMP) Appendix 36 (Dec. 2008) and the ROD (March 2007) (p. A-3, Section 1.3.1) prior to any surface disturbance.
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	Utilize native plant species for reclamation purposes (preferably local seeds and species that are preferred by sage grouse).
EnCana Oil and Gas. 28 APDs on new well pad D36 496. DOI-BLM-CO-110-2011-0169-EA. Approved 9/23/11 by the White River Field Office.	White River Field Office, BLM	Sage-grouse oriented reclamation (e.g., specialized seed mix, lengthened cut and fill slopes) is expected to involve all pipeline acreage and about ¾ of pad acreage (about 18 acres). Depending on subsequent ungulate use, this reclaimed acreage would serve increasingly effective brood and summer habitat function prior to the redevelopment of a suitable sagebrush canopy (10-15 years).
EnCana Oil and Gas. APDs- N22-496 (16)& P28-496 (16). DOI-BLM-CO-110-2011-0006-EA. White River Field Office. Approved 5/24/11 by White River Field Office.	White River Field Office, BLM	All disturbed surfaces shall be promptly revegetated with certified weed-free seed per agency policy. BLM policy is to use native species for revegetation. Exceptions may be granted under certain conditions, such as the use of noninvasive non-native forbs when native forbs are unavailable or unlikely to succeed due to adverse conditions.
EnCana Oil and Gas. L24 496 New Well Pad - 28 APDs. DOI-BLM-CO-110-2012-0021-DNA. Approved 3/20/12 by White River Field Office.	White River Field Office, BLM	Re-vegetate with the native seed mix number six (listed below) prior to the first full growing season following completion of drilling (unless a different seed mix is recommended in any of the wildlife sections or the surface owner requests a different seed mix).
EnCana Oil and Gas. L24 496 New Well Pad - 28 APDs. DOI-BLM-CO-110-2012-0021-DNA. Approved 3/20/12 by White River Field Office.	White River Field Office, BLM	Successful re-vegetation should be achieved within three years. Successful reclamation and re-vegetation is defined by the following: A functioning vegetation community will present a minimum cover and composition of 80 percent of the Desired Plant Community as defined by the ecological site description or in relation to the seed mix applied. In cases where wildlife objectives are dependent upon presence of forbs within the community BLM will require their presence at the 80 percent calculation. The functioning vegetation community established on the reclaimed site is capable of persisting on the site without continued intervention and will allow plant community successional processes to develop to the climax community.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	BLM recommends that the interim and final reclamation seed mix for this project refrain from the use of deciduous shrubs (i.e., Utah serviceberry, Wood's rose, and snowberry). Optional forb components that best meet the nutritional demands of grouse broods should be considered a priority, including sulphur flower, Utah sweetvetch, and yarrow. Due to general absence or tendency to naturally recolonize disturbed sites in the project locale, the use of lupine and, especially, white sage should be avoided.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	Interim reclamation would be completed as quickly as possible to redevelop ground cover that provides for secure ground movements of sage-grouse and is an effective precursor to the reestablishment of appropriate sagebrush cover. Disturbances exceeding 15 feet in width in mapped sage-grouse priority occupied habitat would be reseeded with local sagebrush seed, where topography and weather conditions allow safe access to do so. Detailed guidelines and practices for interim and final reclamation are outlined in EnCana's NPR Integrated Vegetation Management Guidance (WWE 2009).
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	The applicant voluntarily uses enhanced interim reclamation procedures and seed mixes that offer improved herbaceous forage and cover redevelopment opportunities for grouse.

Citation	Field Office	Description
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	The reclamation success criteria should result in a minimum cover and composition of 80 percent of the Desired Plant Community (as defined by the ecological site, in an early seral state) or in relation to the seed mix applied within three growing seasons after the application of seed. This community should be capable of persisting on the site without intervention and allow for successional processes consistent with achieving the seral stage on the site prior to surface disturbance. Reclamation achievement should be evaluated using the Public Land Health Standards that include Indicators of Rangeland Health.
EnCana Oil and Gas. Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project Environmental Assessment. WY-050-EA08-88. Approved 9/5/08 by the Lander BLM Field Office.	Lander Field Office, BLM	Disturbed areas would be seeded and stabilized in accordance with BLM-approved reclamation guidelines. During reclamation, a variety of native forage species would be used to return disturbed areas to conditions similar to those that existed before the proposed project.
EnCana Oil and Gas. Story Gulch Well Pads (2). DOI-BLM-CO-110-2009-0229-EA. Approved 2/3/10 by White River Field Office.	White River Field Office, BLM	All areas of the well pads not used during any production phase, including cut and fill slopes, should be re-contoured as much as possible to natural topography, and have topsoil redistributed where likely to revegetate successfully (e.g., along appropriate cut and fill slopes or at the top edge of the borrow ditches), where it will not be disturbed during regular road maintenance activities. Re-vegetated with the native seed mix #6 (listed below) prior to the first full growing season following completion of drilling (unless a different seed mix is recommended in any of the wildlife sections or the surface owner requests a different seed mix). Seeding rates listed in the table below are shown as pounds of Pure Live Seed (PLS) per acre and apply to drill seeding. When drill seeding is not feasible (e.g. steep slopes, etc.), then broadcast seed using double the seeding rate followed by harrowing to ensure seed coverage. Applied seed should be certified and free of noxious weeds.
EnCana Oil and Gas. Story Gulch Well Pads (2). DOI-BLM-CO-110-2009-0229-EA. Approved 2/3/10 by White River Field Office.	White River Field Office, BLM	Successful re-vegetation should be achieved within three years. Successful reclamation and re-vegetation is defined by the following: A functioning vegetation community will present a minimum cover and composition of 80% of the Desired Plant Community as defined by the ecological site description or in relation to the seed mix applied. In cases where wildlife objectives are dependent upon presence of forbs within the community BLM will require their presence at the 80% calculation. The functioning vegetation community established on the reclaimed site is capable of persisting on the site without continued intervention and will allow plant community successional processes to develop to the climax community
EnCana. Environmental Assessment of the Orchard Master Development Plan for Oil and Gas Development. GJFO # DOI-BLM-CO-130-2009-0001-EA and GSFO # DOI-BLM-CO-140-2008-0032-EA. Grand Junction Field Office and Glenwood Springs Energy Office, October 2008.	Grand Junction Field Office, BLM	Seeding: Perennial vegetation must be established and additional work shall be required in cases of failure. A. Interim Reclamation: Seed all disturbed areas outside the production area, according to specified methods and seed mixture. B. Final Reclamation: Seed all recontoured and disturbed areas, according to specified methods and seed mixture. C. Hydroseeding and hydro-mulching may be used in areas of temporary seeding or in areas where drill-seeding or broadcast-seeding/raking are impractical. Hydro-seeding and hydro-mulching must be conducted in two separate applications to ensure adequate seed-to-soil contact. The seeded species will be considered firmly established when at least 50 percent of the new plants are producing seed. Reclaimed areas shall be monitored annually. The annual report shall document whether attainment of reclamation objectives appears likely. If one or more objectives appear unlikely to be achieved, the report shall identify appropriate corrective actions. Upon review and approval of the report by the BLM, the operator shall be responsible for implementing the corrective actions or other measures specified by the authorized officer.

White River Field Office, BLM	Contouring, soil stabilization and preparation , and reseeding would proceed according to site-specific conditions and in compliance with XTO-committed reclamation measures in the applicant-committed design features and with BLM requirements for interim reclamation and for final reclamation of pipelines...
Exxon. Piceance Development Project EA, Finding of No Significant Impact and Decision Record, CO-110-2005-219-EA, 2007.	White River Field Office, BLM	A Reclamation Status Report will be submitted to the WRFO biannually for all actions that require disturbance of surface soils on BLM-administered lands as a result of Alternative B. Actions may include, but are not limited to, well pad and road construction, construction of ancillary facilities, or power line and pipeline construction. The Reclamation Status Report will be submitted by 15 April and 15 August of each calendar year, and will include the well number, legal description, project description (e.g., well pad or pipeline), reclamation status (e.g., interim or final), whether the well pad or pipeline has been re-vegetated and/or recontoured, date seeded, photos of the reclaimed site, estimate of acres seeded and seeding method (e.g., disk-plowed, drilled, or both). Internal and external review of this plan and the process used to acquire the necessary information will be conducted annually, and new information or changes in the reporting process will be incorporated into the plan.
Exxon. Piceance Development Project EA, Finding of No Significant Impact and Decision Record, CO-110-2005-219-EA, 2007.	White River Field Office, BLM	Disturbed areas will be seeded with a mix designed to reestablish sagebrush and forb species.
Exxon. Piceance Development Project EA, Finding of No Significant Impact and Decision Record, CO-110-2005-219-EA, 2007.	White River Field Office, BLM	Sagebrush seed will be collected from local populations of appropriate species. Distribution will be dependent upon range site (i.e., <i>Artemisia tridentata</i> spp. <i>Vaseyana</i> and spp. <i>Wyomingensis</i> ). A mosaic of sagebrush seeded and unseeded areas is recommended. Reclamation on these sites should use seed mixes and seeding methods that include and promote successful establishment of a full complement of grasses and favored native forbs. The following forbs will be included in reclamation seed mixes as appropriate throughout sage-grouse range on lands administered by the BLM WRFO and it is recommended that these components be applied to fee-lands under ExxonMobil's control or lease: 1) scarlet globemallow, 2) Utah sweetvetch, 3) arrowleaf balsamroot, 4) Lewis flax, and 5) Rocky Mountain penstemon. (See sage-grouse seed mixes in Vegetation.)
Exxon. Piceance Development Project EA, Finding of No Significant Impact and Decision Record, CO-110-2005-219-EA, 2007.	White River Field Office, BLM	The operator will be responsible for achieving a reclamation success rate for interim reclamation and final abandonment of sufficient vegetative ground cover from reclaimed plant species within three growing seasons after the application of seed. Additional reclamation efforts will be undertaken at the operator's expense if after the first growing season there are no positive indicators of successful establishment of seeded species (e.g. Germination); after the second year seeded species are not yet established (e.g. producing seed); and after the third growing season seeded vegetative communities lack persistence (e.g. reproductively capable of enduring drought conditions and sustaining the seeded community). Following the third growing season, ground cover of reclaimed seed species shall be at a Desired Plant Community (DPC) in relation to the seed mix as deemed appropriate by the BLM. Reclamation achievement will be evaluated using the Public Land Health Standards that include indicators of rangeland health. Rehabilitation efforts must be repeated if it is concluded that the success rate is below an acceptable level as determined by the BLM.
Fidelity Exploration & Production Company. Bowdoin Natural Gas Development Project Phillips and Valley Counties, Montana. Environmental Assessment MT-92234-07-59. December, 2008.	Malta Field Office, BLM	Reclamation success will be evaluated using defined performance standards. Reclamation should be monitored to evaluate the success of both interim and final reclamation efforts and determine if the techniques used are effective or if additional measures are needed.

Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	The operators will monitor and evaluate reclamation success and shall prepare an annual monitoring and evaluation report to be submitted to BLM and the cooperating agencies... An interagency review team will annually review and analyze the annual monitoring results and methods.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	On all areas to be reclaimed, seed mixtures will be required to be site-specific, composed of native species, and will be required to include species promoting soil stability. A predisturbance species composition list must be developed for each site if the project encompasses an area where there are several different plant communities present. Livestock palatability and wildlife habitat needs will be given consideration in seed mix formulation.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Streams, wetlands, and riparian areas disturbed during project construction will be restored to as near pre-project conditions as practical, and if impermeable soils contributed to wetland formation, soils will be compacted to reestablish impermeability.
Samson Resources Company. Environmental Assessment for the Scott Field Development Project. WY-060-EA13-067. Approved 9/9/13 by the BLM Casper Field Office.	Casper Field Office, BLM	Approximately 26% of the well pad disturbance, 30% of new road disturbance, and 100% of pipeline disturbance will be reclaimed in accordance with BLM interim reclamation policy
Samson. Endurance/Barricade Gas Infrastructure Project Sweetwater County, Wyoming. Environmental Assessment. DOI-BLM-WY-030-2013-0151-EA. August 2013	Rawlins Field Office, BLM	Re-vegetation would consist of species occurring in the surrounding natural vegetation and/or included in the approved seed mix, as deemed desirable by the BLM or private surface owner in review and approval of the reclamation plan. Inter-seeding, secondary seeding, or staggered seeding may be required to accomplish re-vegetation objectives.
Summit Gas Resources, Inc. Cabin Creek VII Federal POD WY-070-EA12-183, Buffalo Field Office, 2012.	Buffalo Field Office, BLM	BLM will not release the performance bond until the area has been successfully revegetated (evaluation will be made after the second complete growing season) and has met all other reclamation goals of the surface owner and surface management agency.
Wellstar. EA for Applications for Permits to Drill (APDs) Bush Draw Federal 18-1 and 3-2 in Jackson County. DOI-BLM-CO-120-2009-0057-EA. Bureau of Land Management Kremmling Field Office. 2009.	Kremmling Field Office, BLM	The lessee is required to use the reclamation practices necessary to reclaim all disturbed areas. Reclamation will ensure surface and subsurface stability, growth of a self-regenerating permanent vegetative cover and compatibility with post land use. The vegetation will be diverse and of the same seasonal growth as adjoining vegetation.
Wellstar. EA for Applications for Permits to Drill (APDs) Federal #9-1, Bush Draw Federal #10-2, and Bush Draw Federal #15-1 wells in Jackson County. OI-BLM-CO-120-2009-0002-EA. Bureau of Land Management Kremmling Field Office. 2009.	Kremmling Field Office, BLM	The lessee is required to use the reclamation practices necessary to reclaim all disturbed areas. Reclamation will ensure surface and subsurface stability, growth of a self-regenerating permanent vegetative cover and compatibility with post land use. The vegetation will be diverse and of the same seasonal growth as adjoining vegetation.
Williams Production RMT Company, Cedar Draw Unit 2 POD, EA WY-070-07-137, Buffalo Field Office Buffalo, Wyoming, 2010.	Buffalo Field Office, BLM	BLM will not release the performance bond until the area has been successfully revegetated (evaluation will be made after the second complete growing season) and has met all other reclamation goals of the surface owner and surface management agency.
Williams Production RMT Company, Cedar Draw Unit 3, WY-070-EA11-236, Bureau of Land Management, Buffalo Field Office, 2011.	Buffalo Field Office, BLM	BLM will not release the performance bond until the area has been successfully revegetated (evaluation will be made after the second complete growing season) and has met all other reclamation goals of the surface owner and surface management agency.
WPX Energy Rocky Mountain, LLC, Plans of Development North Butte 4, North Butte 3, J Christensen Federal 21-35 and Tex Draw Add 1, Environmental Assessment (EA), WY-070-EA12-123, 2013.	Buffalo Field Office, BLM	BLM will not release the performance bond until the area has been successfully revegetated (evaluation will be made after the second complete growing season) and has met all other reclamation goals of the surface owner and surface management agency.
XTO Energy. River Bend Unit Infill Development Environmental Assessment and Biological Assessment, UT-080-07-772, January 2013.	Vernal Field Office, BLM	Site preparation and reclamation activities on BLM lands would follow the Green River District Reclamation Guidelines for Reclamation Plans (BLM 2009a) and XTO Energy's Reclamation Plan for Roosevelt and Orangeville, Utah (2010).
Yates Petroleum Corporation, Congaree POD EA, WY-070-10-195, Buffalo Field Office, 2010.	Buffalo Field Office, BLM	BLM will not release the performance bond until the area has been successfully revegetated (evaluation will be made after the second complete growing season) and has met all other reclamation goals of the surface owner and surface management agency.
Yates Petroleum Corporation. All Day POD. EA # WY-070-08-026 and COAs. Buffalo Field Office Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	Vegetation canopy cover (on unforested sites), production and species diversity (including shrubs) shall approximate the surrounding undisturbed area. The vegetation shall stabilize the site and support the planned post disturbance land use, provide for natural plant community succession and development, and be capable of renewing itself.
Yates Petroleum Corporation. Lazurite POD Environmental Assessment WY-070-EA09-095, 2009.	Buffalo Field Office, BLM	BLM will not release the performance bond until the area has been successfully revegetated (evaluation will be made after the second complete growing season) and has met all other reclamation goals of the surface owner and surface management agency.

Citation	Field Office	Description
Yates Petroleum Corporation. Napier Road POD Environmental Assessment WY-070-EA10-280, 2010.	Buffalo Field Office, BLM	BLM will not release the performance bond until the area has been successfully revegetated (evaluation will be made after the second complete growing season) and has met all other reclamation goals of the surface owner and surface management agency.
Yates Petroleum and Pinnacle Gas Resources. Luman Rim Natural Gas Development EA and DR. WYW128688. WY-040-EA10-139. December 2010.	Rock Springs Field Office, BLM	To avoid permanent loss of species diversity and vegetative cover, topsoil would be stockpiled, and reclaimed areas would be seeded with site-specific mixes during appropriate planting periods, according to the committed practices detailed in Chapter 2 and the Reclamation Plan found in Appendix B
Yates Petroleum Company. NEO Coal Bed Natural Gas Environmental Assessment WY-070-10-331, 2010.	Buffalo Field Office, BLM	Minimizing disturbance areas and developing a reclamation plan that speeds recovery of habitat function
Yates Petroleum Corporation, Gauge POD EA, WY-070-EA09-75, Buffalo Field Office, 2009.	Buffalo Field Office, BLM	Reclamation activities (other than locations having a 30 day interim reclamation COA), including seeding, will take place in the fall.
Environmental Assessment for East Converse Exploratory Oil and Gas Development Project. WY-060-EA12-227. Approved 11/20/12 by BLM Casper Field Office.	Casper Field Office, BLM	This alternative assumes that 33% of the well pad/location, 50% of well pad excess, 0% of access roads, and 100% of the pipelines and utilities would be reclaimed.
Environmental Assessment for Highland Loop Road Exploratory Oil and Gas Development Project. WY-060-EA12-226. Approved 11/20/12 by BLM Casper Field Office.	Casper Field Office, BLM	This alternative assumes that 33% of the well pad/location, 50% of well pad excess, 0% of access roads, and 100% of the pipelines and utilities would be reclaimed.
Environmental Assessment for Spearhead Ranch Exploratory Oil and Gas Development Project. Y-060-EA12-225. Approved 11/20/12 by BLM Casper Field Office.	Casper Field Office, BLM	Reclamation assumption is 33% of the each well pad/location; 50% of well pad excess; 0% of access roads and 100% of the pipelines and utilities.

**APPENDIX D**  
**Reduce Surface Disturbance /**  
**Multi-well Pads**

**Table D-1. PECE Policy Evaluation – Reduce Surface Disturbance/Multi-well Pads**

Conservation Measure	Reduce Surface Disturbance/Multi-well Pads
<b>Certainty of Implementation</b>	
The conservation effort, the party(ies) to the agreement or plan that will implement the effort, and the staffing, funding level, funding source, and other resources necessary to implement the effort are identified.	The BLM/USFS decision records require implementation as a condition of the agency authorization. Funding and implementation is generally identified as the responsibility of the operator(s).
The legal authority of the party(ies) to the agreement or plan to implement the formalized conservation effort, and the commitment to proceed with the conservation effort are described.	NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed this evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.

<b>Conservation Measure</b>	<b>Reduce Surface Disturbance/Multi-well Pads</b>
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	Reduced surface disturbance and multi-well pad COAs and conservation measures address threats associated with Energy Development and Infrastructure under Listing Factor A.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	Many documents specify surface disturbance and/or well density thresholds above which additional development is not authorized without further approval or additional mitigations. Limiting the number of wells or disturbances per section is often identified by state or federal agencies. Multi-well pads reduce total surface disturbance and fragmentation as well as noise and traffic.
The steps necessary to implement the conservation effort are identified in detail.	Steps are identified and include collocating facilities, using existing disturbance, and minimizing the size of well pads.
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	Many documents specify surface disturbance and/or well pad density thresholds above which additional development is not authorized without further approval or additional mitigations. The density of surface disturbance is commonly used as an indicator of potential impacts including in Wyoming's core area policy and BLM's RMP updates.
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

---

<b>Conservation Measure</b>	<b>Reduce Surface Disturbance/Multi-well Pads</b>
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

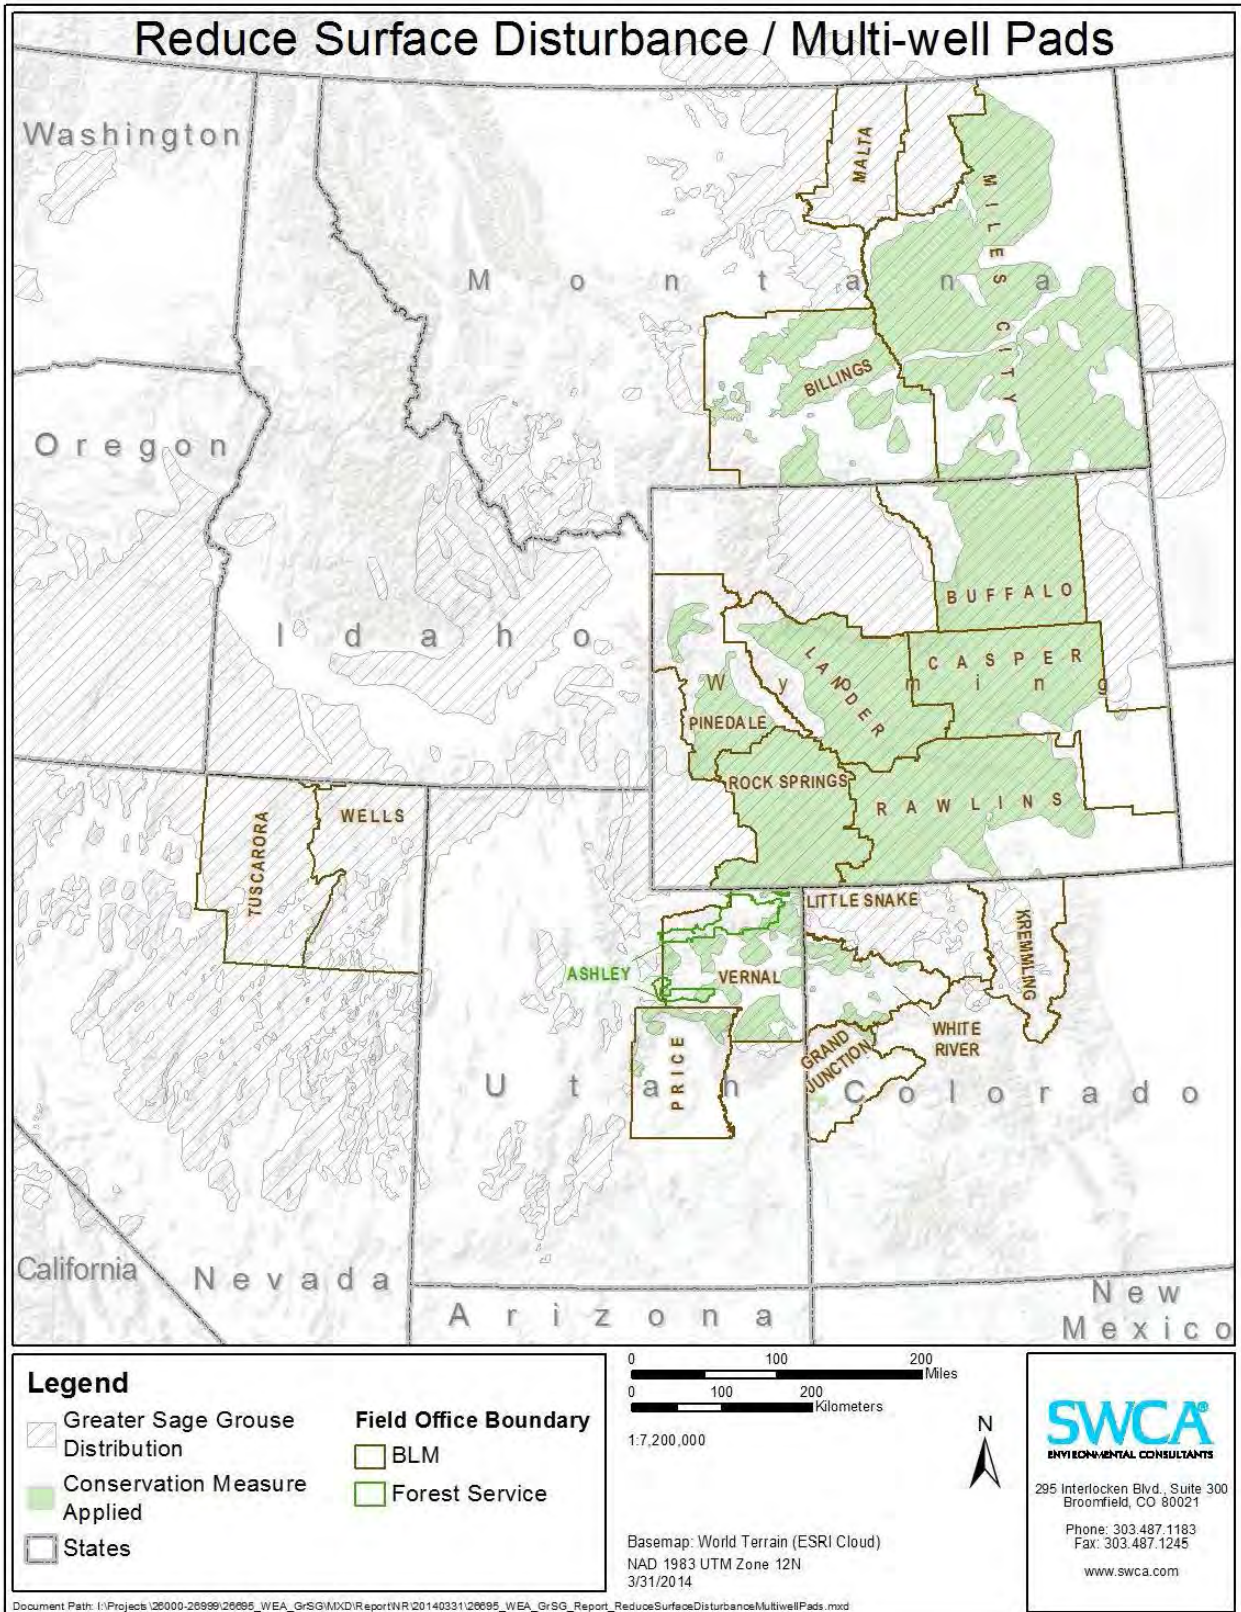

Figure D-1. Map of FOs where Reduce Surface Disturbance / Multi-well Pad COAs are applied.

**Table D-2. Reduce Surface Disturbance / Multi-well Pad COAs and Conservation Measures**

Citation	Field Office	Description
Anadarko Petroleum Corporation, Dry Willow III POD EA, WY-070-08-036, Buffalo Field Office Buffalo, Wyoming, 2009.	Buffalo Field Office, BLM	To minimize disturbance in sagebrush habitat, brush hogging a maximum 75' radius is authorized for all the wells. To minimize disturbance in sagebrush habitat, brush hogging and other surface disturbance is not to exceed 35' for all primitive access corridors.
Anadarko. Doty Mountain Unit B Plan of Development in Atlantic Rim EA. WY-030-08-EA-049. 2008.	Rawlins Field Office, BLM	Anadarko is committed to working with BLM and other cooperators through the Review Team to identify and reclaim approximately 1.5 miles of existing disturbed road corridors, seismic lines, or user created tracks in the Doty B POD. All restored lands once revegetated will be credited to APC and an equal amount of lands will be avoided under the disturbance cap.
Anadarko. Environmental Assessment for Jack Sparrow POD. WY-030-08-EA-238. 2008.	Rawlins Field Office, BLM	The average short term per well disturbance is 5.3 acres, and meets the AREIS disturbance goal. The proposed action is located outside of Category A areas and is subject to a disturbance goal of 6.5 acres per well.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	Surface disturbance in the ARPA is limited to 7,600 acres (2.8 percent of the project area) at any given time. Once the surface disturbance limit is reached, further development will cease until disturbed land has been reclaimed according to the reclamation standards established by the BLM for the ARPA. Operators will track surface disturbance acreage (including total disturbance and successful interim reclamation) and provide BLM with Federal Geographic Data Committee (FGDC)-compliant metadata and geographic information system/global positioning system (GIS)/(GPS) showing the "as-built" location data for all newly developed facilities and reclaimed areas annually no later than December of each year based upon successful reclamation.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	These Best Management Practices (BMPs) will be applied under all alternatives as Conditions of Approval where proposals conflict with identified resources. 1) Directional drilling...
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	These Best Management Practices (BMPs) will be applied under all alternatives as Conditions of Approval where proposals conflict with identified resources. 2) Drilling of multiple wells from a single pad.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	Natural gas development is limited to eight well sites per 640-acre section. Operators can install multiple well-bores (e.g., coalbed natural gas (CBNG), conventional, or injection) on a single well site (FEIS, section 2.2.4).
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	Within 4 miles of a lek, sage grouse habitat will be buffered by 0.6 mile. Within this buffer well pad construction will not exceed an average of one well pad/square mile (640 acres). This mitigation will be applied to the Project Area. Additionally, no more than 5% of sage grouse habitat is allowed to be disturbed within the Project Area. This will reduce the amount of disturbance to sage grouse and maintain the one disturbance/square mile threshold.
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	Production facilities will be consolidated when possible, to reduce disturbance from traffic, habitat fragmentation, and total surface area impacts.
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	The Selected Alternative limits surface development to a maximum of 162 well pads; a maximum of 356 new wells will be drilled.
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	The Anthro Mountain telemetry study has shown that sage-grouse may be using openings in pinyon/juniper during migration events. Therefore within 4 miles of a lek, in openings of the pinyon/juniper (chained or natural openings in pinyon/juniper belt), well pads should be located as close to the edge of the opening as possible.
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	As described in Alternative E – Agency Preferred Alternative of the WTP Final EIS, within the winter core-use sage-grouse habitat 41 well pads. Under the Selected Alternative, there will seven new well pads and 13 re-occupied well pads. Increased directional drilling within winter core-use sage-grouse habitat will also result in less fragmentation from linear disturbance features (i.e., roads and pipelines to individual well locations).
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	Included in the special protection measures for wildlife, is a requirement that BBC and other operators must realign existing roads within core sage-grouse winter habitat, thereby reducing fragmentation (see ROD Figure 1) within 1 year of signing this ROD. Strategic planning will be completed in cooperation with the UDWR to determine appropriate locations for road realignments.

Citation	Field Office	Description
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	626 wells and 120 well pads (63 new pads and 57 re-occupied).
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	Develop offsite mitigation strategies in situations where fragmentation or degradation of Special Status Species habitat is unavoidable.
Chevron. Table Rock Unit Oil and Gas Development EA and DR. WY-040-EA11-175. January 2012.	Rawlins Field Office, BLM Rock Springs Field Office, BLM	Chevron proposes to minimize surface disturbance by utilizing existing well pads by co-locating new wells with existing wells or by establishing multi-well pads throughout the project area to the greatest extent possible.
Devon Energy Production Company, L.P., Golden Eagle- Juniper Draw CBNG Field POD EA, WY-070-EA07-111, Buffalo Field Office Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	Due to sagebrush habitat and reclamation concerns mowing for the access/utility corridor will not exceed 15 feet in width.
Double Eagle Petroleum. Catalina PODs E and F in the Atlantic Rim. DOI-BLM-WY-030-2009-0155-EA. 2011.	Rawlins Field Office, BLM	The construction of Catalina POD G&I wells in combination with other approved or existing wells within the analysis area would result in 3.32 wells per square mile.
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	The Wyoming Sage-grouse Core Area concept (WGFD 2011a) and the Wyoming BLM Instructional Memorandum for Greater Sage-grouse Habitat Management Policy (WY-2012-019) provides habitat protection to leks within the identified Core Areas and increased mitigation flexibility relative to non-Core Area leks and associated seasonal habitats. This BLM IM generally mirrors, and expands on, the protections provided by the Wyoming Core Area concept. The Lander Field Office GIS staff ran the required project specific Density Disturbance Calculation Tool (DDCT, WGFD 2012) exercise. As discussed above, the DDCT analysis demonstrates that the existing density of oil and gas wells and the disturbance of habitat from the existing and proposed projects are within the limits provided in the DDCT and BLM IM WY-2102-019 and will not cause declines in Greater Sage-Grouse populations.
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	One centralized production, separation and CO2 re-pressurization facility is anticipated. This will be constructed at the site of the existing Grieve Unit central facility in an effort to minimize surface disturbance.
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	Multi-well pads will be prepared by clearing an area approximately 325 feet by 200 feet; an average pad disturbance is estimated at 3.3 acres, including cut-and-fill, per pad. Single well pads will measure 325 X 175 feet, resulting in approximately 3.0 acres per site.
EnCana Oil and Gas. 16 APDs on existing well pad P28-496. DOI-BLM-CO-110-2011-0153-CX. Approved 9/6/11 by White River Field Office.	White River Field Office, BLM	The proposal includes drilling 16 additional wells on the existing P28 496 well pad (for a total of 32 wells). No additional acreage is required to expand the existing well pad.
EnCana Oil and Gas. 16 gas wells on existing well pad (N22 496). DOI-BLM-CO-110-2012-0004-CX. Approved 12/8/11 by White River Field Office.	White River Field Office, BLM	The proposal includes drilling 16 additional wells on the existing SG N22 496 well pad (for a total of 32 wells). No additional acreage is required to expand the existing well pad.
EnCana Oil and Gas. 28 APDs on new well pad D36 496. DOI-BLM-CO-110-2011-0169-EA. Approved 9/23/11 by the White River Field Office.	White River Field Office, BLM	28 wells on one new well pad. The well pad is proposed to have working surface dimensions of 778 feet long by 302 feet wide for total well pad surface disturbance of 9.7 acres. Following interim reclamation 2.2 acres will be needed for production.
EnCana Oil and Gas. APDs- N22-496 (16)& P28-496 (16). DOI-BLM-CO-110-2011-0006-EA. White River Field Office. Approved 5/24/11 by White River Field Office.	White River Field Office, BLM	2 new well pads (20.4 acres initial disturbance total) with 16 wells each. An EnCana initiative, and one endorsed by CDOW and WRFO, the development designs for multi-well pads and centralized production facilities in the valley bottoms were undertaken specifically as a means to avoid habitat and behavioral impacts to sage-grouse.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	The applicant is using modern fracing and drilling technologies that reduce surface density of development features.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	The applicant volunteered to a wholesale redesign of original drilling patterns that used existing pads (E34/L27) or pads in non-habitat (F22) that allowed for retention of the largest remaining parcel of sagebrush habitat in the immediate project area and eliminated the need to develop additional pad locations on two adjacent, occupied ridgelines (including Barnes Ridge itself); the applicant's development redesign confined the behavioral influences of human activity to areas of pre-existing disturbance and dramatically reduced the need for initiating surface disturbance in largely undisturbed suitable and occupied habitat.

Gasco Energy Inc. Uinta Basin Natural Gas Development Project, Environmental Impact Statement FES 12-5, Record of Decision, Bureau of Land Management Vernal Field Office, June 2012.	Vernal Field Office, BLM	Proposal for up to 1,298 new gas production wells from up to 575 pads.
Gasco Energy Inc. Uinta Basin Natural Gas Development Project, Environmental Impact Statement FES 12-5, Record of Decision, Bureau of Land Management Vernal Field Office, June 2012.	Vernal Field Office, BLM	No surface disturbance will be permitted in riparian or wetland areas.
Gasco Energy Inc. Uinta Basin Natural Gas Development Project, Environmental Impact Statement FES 12-5, Record of Decision, Bureau of Land Management Vernal Field Office, June 2012.	Vernal Field Office, BLM	Well pad surface density will be no more than one pad per approximately 160 acres.
Greencore Pipeline Company. Environmental Assessment. Bureau of Land Management. EA No. WY-060-EA11-32. January 2011.	Buffalo Field Office, BLM Casper Field Office, BLM Lander Field Office, BLM Miles City Field Office, BLM	Maximum Allowed Disturbance in Greater Sage-grouse Habitat is 5%, but projected cumulative disturbance within Core Areas is 2.66%. Meets WY IM 2010-012 Requirements.
Jonah Infill Drilling Project Environmental Impact Statement and Record of Decision, Sublette County, Wyoming. 2006.	Pinedale Field Office, BLM Rock Springs Field Office, BLM	Operators would avoid optimal greater sage-grouse nesting habitats, where practical. Optimal nesting habitat is defined as areas with sagebrush heights of 20–31 inches and cover of 15–25% and an understory (grasses and forbs) cover of >15%.
Jonah Infill Drilling Project Environmental Impact Statement and Record of Decision, Sublette County, Wyoming. 2006.	Pinedale Field Office, BLM Rock Springs Field Office, BLM	Operators would utilize directional drilling to access resources beneath the 0.25-mile active greater sage-grouse lek buffers if reserves beneath these locations are deemed economic. Operators would utilize directional drilling to access resources beneath the 600-foot wide (or tall sagebrush-dominated) buffer associated with the Sand Draw protection areas if deemed economic.
Kerr-McGee Oil & Gas Onshore LP (KMG), Greater Natural Buttes EIS UT-080-07-807, BLM Vernal Field Office, Record of Decision, May 2012.	Vernal Field Office, BLM	Of the 3,675 new wellbores, approximately 1,484 will be vertically drilled on new well pads and approximately 634 Mesaverde-only completions will be drilled as deepened recompletions or twinned wells on existing well pads. The remaining 1,557 wellbores will be directionally drilled from new and existing well pads.
Kerr-McGee Oil & Gas Onshore LP (KMG), Greater Natural Buttes EIS UT-080-07-807, BLM Vernal Field Office, Record of Decision, May 2012.	Vernal Field Office, BLM	The Selected Alternative was designed to utilize directional drilling within the GNBPA to reduce surface impacts relative to the Proposed Action to a maximum of 1 pad per 40 acres (maximum of 16 well pads per section).
Kerr-McGee Oil & Gas Onshore LP (KMG), Greater Natural Buttes EIS UT-080-07-807, BLM Vernal Field Office, Record of Decision, May 2012.	Vernal Field Office, BLM	As directed by the AO, mats will be used during drilling and other development activities to reduce disturbance impacts to underlying soils.
Kerr-McGee Oil & Gas Onshore LP (KMG), Greater Natural Buttes EIS UT-080-07-807, BLM Vernal Field Office, Record of Decision, May 2012.	Vernal Field Office, BLM	KMG will utilize shared well pads to the extent possible, in consideration of technical, environmental, and economic viability, to minimize the amount of total surface disturbance in the Greater Natural Buttes Project Area (GNBPA). Each new produced water disposal well will be located on existing production locations. KMG will evaluate deepening existing wells to accomplish Mesaverde-only completions before twinning an existing well. KMG will strive to continually improve the development processes in order to minimize the surface impact where practical. KMG will carefully evaluate drilling multiple wells from a single pad on an ongoing basis and has included the potential to use multiple wells from a shared pad in the GNBPA to the extent that KMG determines technically and economically viable.
Kerr-McGee Oil & Gas Onshore LP (KMG), Greater Natural Buttes EIS UT-080-07-807, BLM Vernal Field Office, Record of Decision, May 2012.	Vernal Field Office, BLM	Mats will be utilized where feasible, instead of traditional pad construction, to minimize the disturbance to greater sage-grouse habitat.
Kerr-McGee Oil & Gas Onshore LP (KMG), Greater Natural Buttes EIS UT-080-07-807, BLM Vernal Field Office, Record of Decision, May 2012.	Vernal Field Office, BLM	Prior to siting new well pads or locating new access roads between 0.5 and 2.0 miles of a greater sage-grouse lek, habitat mapping (using available soils and vegetation data, 2009 National Agriculture Imagery Program imagery, and field verification) to determine areas of suitable greater sage-grouse habitat will be conducted with coordination between KMG, the BLM, and the Utah Division of Wildlife Resources. Once these data are available, they will be used to identify non-greater sage-grouse habitat, or the lowest quality greater sage-grouse habitat, to determine a surface development pattern that may be least impacting to greater sage-grouse and may allow a viable population of greater sage-grouse to continue to persist in the East Bench area until total reclamation has been achieved.

Powder River Basin Oil and Gas Project, Record of Decision and Resource Management Plan Amendments. EIS WY-070-02-065. April 2003.	Buffalo Field Office, BLM	The operator will limit vegetation removal and the degree of surface disturbance wherever possible. Where surface disturbance cannot be avoided, all practicable measures will be utilized to minimize erosion and stabilize disturbed soils.
QEP. Drilling of 180 Wells and Constructing or Expanding 6 Pads. WY-100-EA13-72. Approved by BLM Pinedale July 2013.	Pinedale Field Office, BLM	24-40 wells per pad with proposed extension of existing pads.
QEP. APD and COAs for QEP Stewart Point 14-32 pad. 2013.	Pinedale Field Office, BLM	20 wells on one pad
QEP. APD with COAs for QEP Mesa 15-9 pad. 2012.	Pinedale Field Office, BLM	13 wells on one pad
QEP. Greater Deadman Bench Oil and Gas Producing Region EIS and ROD March 2008. UT 080-2003-0369V. BLM Vernal Field Office. 2008.	Vernal Field Office, BLM	QEP has committed to twin 216 wells and directionally drill 132 wells on/from other well pads.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	4,399 wells from no more than 600 well pads
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	In development area MA-5 A maximum of two well pads per section will be allowed. A maximum of 40 acres of surface disturbance per section will be allowed (6.25% disturbance). Similar protections to sage-grouse core area.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	In development area MA-6 A maximum of one well pad per section will be allowed. A maximum of 40 acres of surface disturbance per section will be allowed. Similar to protection afforded by core areas.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Development of 37,019 acres within 2 miles of greater sage-grouse leks was suspended for 5 years. After the 5-year period, an individual lease or Multiple leases under federal suspension and/or term NSO will be considered for conversion to “available for development” when a comparable acreage in the core area (not needed for production operations) has been returned to functioning habitat through the completion of all development operations and successful reclamation of all portions of the well pads within the comparable area.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	The entire PAPA will be developed with no more than 600 well pads on all lands in the PAPA. Throughout the PAPA no more than one well pad per quarter section (160 acres) is authorized, per Operator. Where existing development already exceeds this limit, no additional pads will be authorized.
Samson Resources Company. Environmental Assessment for the Scott Field Development Project. WY-060-EA13-067. Approved 9/9/13 by the BLM Casper Field Office.	Casper Field Office, BLM	40 well pads with 2 to 6 wells and a maximum of 150 wells. The average per well disturbance would initially be 4.6 acres, including roads and pipelines, assuming 150 wells are drilled.
Samson Resources Company. Environmental Assessment for the Scott Field Development Project. WY-060-EA13-067. Approved 9/9/13 by the BLM Casper Field Office.	Casper Field Office, BLM	In order to protect potential greater sage-grouse habitat, disturbance in sagebrush vegetation types will be minimized.

Summit Gas Resources, Inc. Cabin Creek VII Federal POD WY-070-EA12-183, Buffalo Field Office, 2012.	Buffalo Field Office, BLM	During onsite visits, the SGR and BLM adjusted the location of 9 wells and one section of overhead power lines to reduce direct loss and fragmentation of sage-grouse habitat
Williams Production RMT Company, Cedar Draw Unit 2 POD, EA WY-070-07-137, Buffalo Field Office Buffalo, Wyoming, 2010.	Buffalo Field Office, BLM	Due to dense sagebrush habitat at the 41-22 and 42-28 locations, the working area around the well site will be mowed no greater than 120 x 180 feet.
XTO Energy. River Bend Unit Infill Development Environmental Assessment and Biological Assessment, UT-080-07-772, January 2013.	Vernal Field Office, BLM	484 additional wells, of which, 410 would be directionally drilled from new and existing well pads
Yates Petroleum Corporation. All Day POD. EA # WY-070-08-026 and COAs. Buffalo Field Office Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	At the onsite BLM required minimization of disturbance corridors through sagebrush. Brush hogging/mowing will be limited to a 35' radius around wells and 30' width on the access roads and corridors
Yates Petroleum Corporation. All Day POD. EA # WY-070-08-026 and COAs. Buffalo Field Office Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	The operator will limit vegetation removal and the degree of surface disturbance wherever possible. Where surface disturbance cannot be avoided, all practicable measures will be utilized to minimize erosion and stabilize disturbed soils.
Yates Petroleum Corporation. Lazurite POD Environmental Assessment WY-070-EA09-095, 2009.	Buffalo Field Office, BLM	The selected alternative incorporates components of the Wyoming Governor's Sage Grouse Implementation Team's "core population area" strategy and executive order and local research to provide appropriate protections for sage-grouse, while meeting the purpose and need for the Lazurite Project.

**APPENDIX E**  
**Dust Suppression**

**Table E-1. PECE Policy Evaluation – Dust Suppression**

Conservation Measure	Dust Suppression
<b>Certainty of Implementation</b>	
The conservation effort, the party(ies) to the agreement or plan that will implement the effort, and the staffing, funding level, funding source, and other resources necessary to implement the effort are identified.	The BLM/USFS decision records require implementation as a condition of the agency authorization. Funding and implementation is generally identified as the responsibility of the operator(s).
The legal authority of the party(ies) to the agreement or plan to implement the formalized conservation effort, and the commitment to proceed with the conservation effort are described.	NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed this evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

---

<b>Conservation Measure</b>	<b>Dust Suppression</b>
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	Dust suppression COAs and conservation measures address threats associated with Energy Development under Listing Factor A.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	Dust suppression is tracked as part of air quality monitoring efforts for each project.
The steps necessary to implement the conservation effort are identified in detail.	NEPA documents identify steps to take to reduce or eliminate fugitive dust emissions.
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	State and federal standards for dust emissions are generally present and enforced and can be reliably measured.
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

Citation	Field Office	Description
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	Operators may use water for dust abatement on a case-by-case basis. The water should meet state standards for this use and be permitted by the state of Wyoming.
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	Reduce fugitive dust from roads by observing speed limits and applying water as needed.
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	As part of the monitoring plan, a third-party contractor will collect dust samples to determine if dust, generated by industrial traffic, is still being deposited on sites. If the BLM determines that dust is continuing to accumulate on sites, the BLM will mitigate the impacts
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	Operators on federal leases will be required to post and enforce speed limits to reduce fugitive dust emissions. Dust inhibitors will be used as necessary on unpaved collector, local and resource roads to reduce fugitive dust emissions to the air and resources adjacent to the road.
Chevron. Table Rock Unit Oil and Gas Development EA and DR. WY-040-EA11-175. January 2012.	Rawlins Field Office, BLM Rock Springs Field Office, BLM	Other environmental protection measures required by the BLM include the following: Dust abatement to minimize potential adverse effects from increased road use.
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	The production of dust will be significantly reduced through accepted dust abatement techniques. Techniques include, but are not limited to, the seeding of all disturbed areas that are not utilized during the well production phase (i.e. borrow ditches and topsoil and spoil piles) and the application of water to roadways during dry periods.
EnCana Oil and Gas. 28 APDs on new well pad D36 496. DOI-BLM-CO-110-2011-0169-EA. Approved 9/23/11 by the White River Field Office.	White River Field Office, BLM	Dust will be controlled on the roads and locations during construction and drilling by periodic watering of the roads and locations.
EnCana Oil and Gas. Master Development Plan for the SG E34 496, SG L796 and SG F22 496, Environmental Assessment and Decision Record, DOI-BLM-CO-2013-0035-EA, 2013.	White River Field Office, BLM	EnCana will treat all access roads with water and/or a chemical dust suppressant during construction and drilling activities so that there is not a visible dust trail behind vehicles. Any technique other than the use of freshwater as a dust suppressant on BLM lands will require prior written approval from BLM.
EnCana. Environmental Assessment of the Orchard Master Development Plan for Oil and Gas Development. GJFO # DOI-BLM-CO-130-2009-0001-EA and GSFO # DOI-BLM-CO-140-2008-0032-EA. Grand Junction Field Office and Glenwood Springs Energy Office, October 2008.	Grand Junction Field Office, BLM	The operator shall implement dust abatement measures as needed to prevent fugitive dust from vehicular traffic, equipment operations, or wind events.
EnCana Oil and Gas. Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project Environmental Assessment. WY-050-EA08-88. Approved 9/5/08 by the Lander BLM Field Office.	Lander Field Office, BLM	Fugitive dust would be abated immediately by applying water, chemical dust suppressants, or other means when air quality is impaired, soil is lost, or the BLM, WDEQ-AQD, or EnCana identifies safety concerns.
Environmental Assessment for Spearhead Ranch Exploratory Oil and Gas Development Project. Y-060-EA12-225. Approved 11/20/12 by BLM Casper Field Office.	Casper Field Office, BLM	Watering dirt roads during periods of high use to reduce fugitive dust emissions;
Fidelity Exploration & Production Company. Bowdoin Natural Gas Development Project Phillips and Valley Counties, Montana. Environmental Assessment MT-92234-07-59. December, 2008.	Malta Field Office, BLM	The BLM would approve the procedure (e.g., application of water and magnesium chloride) for dust abatement at facility construction sites as well as locations for use and application rates.
Fidelity Exploration & Production Company. Coal Bed Natural Gas Tongue River - Deer Creek North Federal Project. Environmental Assessment MT-020-2008-310. Finding of No Significant Impact and Decision Record, 2008.	Miles City Field Office, BLM	Water or other non-saline dust suppressants with at least 50 percent control efficiency must be applied during well site, battery site and road construction. Dust inhibitors (surfacing materials, non-saline dust suppressants and water) must be used as necessary on unpaved roads that present a fugitive dust problem. The use of chemical dust suppressants on public surface will require prior approval from the BLM Authorized Officer.

**APPENDIX F**  
**No Surface Occupancy**

**Table F-1. PECE Policy Evaluation – No Surface Occupancy**

Conservation Measure	No Surface Occupancy
<b>Certainty of Implementation</b>	
The conservation effort, the party(ies) to the agreement or plan that will implement the effort, and the staffing, funding level, funding source, and other resources necessary to implement the effort are identified.	The BLM/USFS decision records require implementation as a condition of the agency authorization. Funding and implementation is generally identified as the responsibility of the operator(s).
The legal authority of the party(ies) to the agreement or plan to implement the formalized conservation effort, and the commitment to proceed with the conservation effort are described.	NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed this evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.

<b>Conservation Measure</b>	<b>No Surface Occupancy</b>
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	No Surface Occupancy COAs and conservation measures address threats associated with Energy Development and Infrastructure under Listing Factor A.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	No Surface Occupancy restrictions are implemented year-round for the life of the project.
The steps necessary to implement the conservation effort are identified in detail.	Steps are identified and include avoidance of activities and new infrastructure surrounding leks within given distance buffers.
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	Lek attendance monitoring, monitoring of nesting and brood-rearing hens, etc. provide quantifiable parameters to measure success of the measure. Multiple sources identify that avoidance of activities surrounding leks during lekking, nesting, and early brood-rearing periods provide conservation benefit and protective measures for sage-grouse.
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Annual lek counts are tracked by state game and fish agencies and federal land management agencies for purposes of evaluating grouse populations. Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

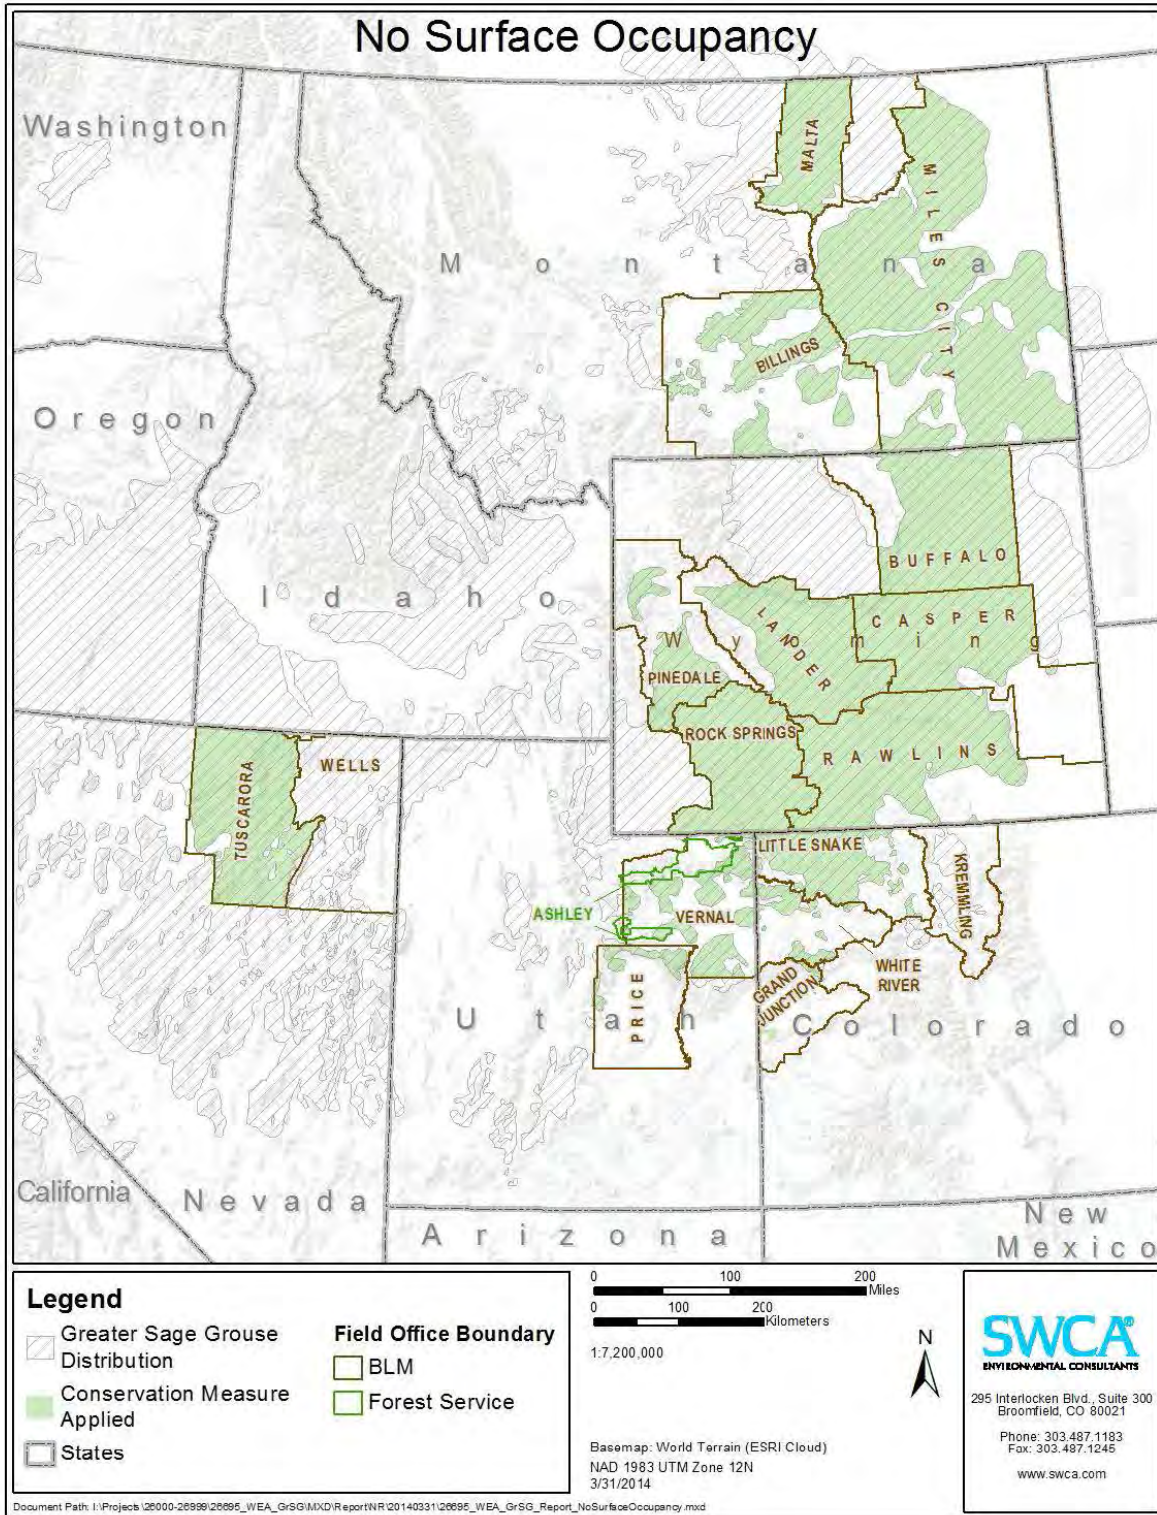

Figure F-1. Map of FOs where No Surface Occupancy COAs are applied.

**Table F-2. No Surface Occupancy COAs and Conservation Measures**

Citation	Field Office	Description
Anadarko. Doty Mountain Plan of Development D in Atlantic Rim. DOI-BLM-WY-030-2012-0093-EA. 2012.	Rawlins Field Office, BLM	0.25 mile lek no surface occupancy restriction.
Anadarko. Doty Mountain POD C in Atlantic Rim EA. WY-030-07-EA-240. 2008.	Rawlins Field Office, BLM	Numerous well pads, roads, and corridors were relocated so that all were located outside the established 0.25 mile Controlled Surface Use (CSU) area for the lek.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	Avoidance areas for surface-disturbing and disruptive activities and linear crossings include the following (FEIS appendix H): Identified 100-year floodplains; Areas within 500 feet from perennial waters, springs, water wells, and wetland riparian areas, and Areas 100 feet from the inner gorge of ephemeral channels.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	Surface disturbance or occupancy will be prohibited within one-quarter mile of the perimeter of occupied leks.
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	A minimum distance of 100 feet will be maintained between surface disturbing activity and springs or seeps, as measured from the outer edge of their associated wetland/riparian vegetation.
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	In the case of intermittent and ephemeral drainages, a minimum distance of 50 feet will be maintained between facilities (such as well pads, tank batteries, and compressor stations) and the active channel and cutbanks of adjacent vertical terraces. For priority watersheds, classified as impaired by the Utah Division of Water Quality, siting of facilities within 100 feet of intermittent/ephemeral channels will be avoided where feasible; and where it occurs, would be subject to more rigorous monitoring and implementation of erosion control measures.
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	In the case of perennial streams (i.e. Sowers Creek), facilities such as well pads, tank batteries, and compressor stations will be located outside the 100-year floodplain or a distance of 150 feet from the high water line, whichever is greater (as per INFISH recommendations for non-fish-bearing perennial streams).
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	To reduce potential disturbance to strutting birds (and the likelihood of lek abandonment), nesting birds, and habitat, no well pads or permanent structures will be allowed within 0.6 mile of an occupied lek. This measure would distance structures away from leks that raptors may use for perching.
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	In accordance with the Price Field Office Record of Decision and Approved Resource Management Plan (Approved RMP) construction, drilling, or completion activities will be precluded within two miles of known leks (or new leks which may be located during the life of the project (LOP)) between March 15 and July 15. In addition, regardless of season, development will be precluded from within ½ mile of known leks.
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	No surface disturbance will be authorized in core winter use areas (during any time of the year) until the operator submits a site-specific plan of development for proposed roads, wells, pipelines, and/or other project features that will be constructed within those areas.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	In order to minimize impacts to sharptail and sage grouse leks, surface occupancy within ¼ mile of known leks is prohibited. The measure may be waived if the AO, in coordination with MFWP, determines that the entire leasehold can be occupied without adversely affecting grouse lek sites, or if all lek sites within ¼ mile of the leasehold have not been attended for 5 consecutive years.
Cimarex. Rands Butte Gas Development Project Final Environmental Assessment, Decision Record and Finding of No Significant Impact, WY-100-EA09-43. 2010.	Pinedale Field Office, BLM	Natural gas and helium pipelines shall be re-located outside of the ¼-mile radius around the perimeter of an occupied Greater sage-grouse lek.
Cimarex. Rands Butte Gas Development Project Final Environmental Assessment, Decision Record and Finding of No Significant Impact, WY-100-EA09-43. 2010.	Pinedale Field Office, BLM	No Surface Occupancy is allowed within the ¼-mile radius around the perimeter of an occupied Greater sage-grouse lek.
Double Eagle Petroleum. Catalina PODs E and F in the Atlantic Rim. DOI-BLM-WY-030-2009-0155-EA. 2011.	Rawlins Field Office, BLM	0.25 mile lek no surface occupancy restriction.
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	Construction of well sites and other non-linear features within 500 feet of surface water and/or riparian areas or within 100 feet of the inner gorge of ephemeral channels will be prohibited.

Citation	Field Office	Description
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	Surface occupancy and/or disruptive activities are prohibited on or within a six tenths (0.6) mile radius of the perimeter of occupied sage-grouse leks.
EnCana. Environmental Assessment of the Orchard Master Development Plan for Oil and Gas Development. GJFO # DOI-BLM-CO-130-2009-0001-EA and GSFO # DOI-BLM-CO-140-2008-0032-EA. Grand Junction Field Office and Glenwood Springs Energy Office, October 2008.	Grand Junction Field Office, BLM	This lease has both NSO and CSU stipulations for riparian and wetland zones... activities may require special design, construction, and implementation measures within 500 feet of the outer edge of riparian or wetland vegetation.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	A "Restricted Surface Occupancy" buffer would be applied to all forms of new disturbance that would alter the vegetative structure or topography or would result in the addition of surface structures.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	A 0.6 mile "Restricted Surface Occupancy" buffer would be applied for active lek sites. A "Restricted Surface Occupancy" buffer would be applied to all forms of new disturbance that would alter the vegetative structure or topography or would result in the addition of surface structures. The BLM would be notified of any new disturbance within the "Restricted Surface Occupancy" buffer.
EnCana Oil and Gas. Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project Environmental Assessment. WY-050-EA08-88. Approved 9/5/08 by the Lander BLM Field Office.	Lander Field Office, BLM	A 0.6-mile buffer zone would be established around known leks, and all construction and surface occupancy not be allowed within this buffer zone.
EnCana Oil and Gas. Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project Environmental Assessment. WY-050-EA08-88. Approved 9/5/08 by the Lander BLM Field Office.	Lander Field Office, BLM	Project sites would be evaluated for the occurrence and distribution of special aquatic sites, including riparian areas and playas. Project facilities would not be allowed within 500 feet of these wetland areas. As of July, 2008 project sites have been evaluated and one well site was moved out of a riparian area.
Environmental Assessment for East Converse Exploratory Oil and Gas Development Project. WY-060-EA12-227. Approved 11/20/12 by BLM Casper Field Office.	Casper Field Office, BLM	Surface-disturbing activities are prohibited within one ¼- mile radius of occupied sage-grouse leks.
Environmental Assessment for Highland Loop Road Exploratory Oil and Gas Development Project. WY-060-EA12-226. Approved 11/20/12 by BLM Casper Field Office.	Casper Field Office, BLM	Surface disturbing activities are prohibited within one quarter (0.25) mile radius of occupied sage-grouse leks.
Environmental Assessment for Spearhead Ranch Exploratory Oil and Gas Development Project. Y-060-EA12-225. Approved 11/20/12 by BLM Casper Field Office.	Casper Field Office, BLM	Surface disturbing activities are prohibited within one quarter (0.25) mile radius of occupied sage-grouse leks.
Exxon. Piceance Creek 3D Seismic Survey Project Environmental Assessment, CO-110-2008-036-EA, 2008.	White River Field Office, BLM	The proposed schedule commences in May with survey activities. If the schedule were to change for some reason, timing restrictions would be imposed within 0.6 mi of active and inactive (i.e. leks used within the last 5 years) sage-grouse leks from March 15 through May 7 in order to minimize disturbance to breeding grouse.
Fidelity Exploration & Production Company. Bowdoin Natural Gas Development Project Phillips and Valley Counties, Montana. Environmental Assessment MT-92234-07-59. December, 2008.	Malta Field Office, BLM	Prohibit surface disturbance within 1/4 mile of Greater sage-grouse leks unless they are considered historic (have not been used in the past 7–10 years).
Fidelity Exploration & Production Company. Bowdoin Natural Gas Development Project Phillips and Valley Counties, Montana. Environmental Assessment MT-92234-07-59. December, 2008.	Malta Field Office, BLM	Prohibit surface disturbance within identified patches of Greater sage-grouse severe winter habitat.
Fidelity Exploration and Production Company. Tongue River - Corral Creek, Plan of Development, Environmental Assessment, Montana Board of Oil and Gas Conservation. 2008.	Miles City Field Office, BLM	The operator also agrees to avoid construction or drilling activities within a quarter-mile of sage grouse or sharp tail grouse leks during the nesting season to protect these species from noise disturbance during this critical period. It is understood that new information regarding grouse set back distances maybe come available in the near future and recommendation from the applicable grouse working groups will be reviewed and considered during development.
Gasco Energy Inc. Uinta Basin Natural Gas Development Project, Environmental Impact Statement FES 12-5, Record of Decision, Bureau of Land Management Vernal Field Office, June 2012.	Vernal Field Office, BLM	New surface-disturbing activities within public water reserves, or within 330 feet of riparian areas, will be avoided unless 1) there are no practical alternatives; 2) impacts could be fully mitigated; or 3) the action is designed to enhance the riparian resources. A buffer strip of vegetation will be maintained between areas of surface disturbance and riparian vegetation. Silt fencing or other erosion control measures will be installed and maintained between areas of surface disturbance and riparian vegetation to protect against erosion or contamination.

Citation	Field Office	Description
Gasco Energy Inc. Uinta Basin Natural Gas Development Project, Environmental Impact Statement FES 12-5, Record of Decision, Bureau of Land Management Vernal Field Office, June 2012.	Vernal Field Office, BLM	No permanent facilities will be constructed within 2 miles of active strutting grounds, when possible.
Gasco Energy Inc. Uinta Basin Natural Gas Development Project, Environmental Impact Statement FES 12-5, Record of Decision, Bureau of Land Management Vernal Field Office, June 2012.	Vernal Field Office, BLM	On BLM land, new construction and surface-disturbing activities will be avoided year-round within 0.25 mile of active or historic greater sage-grouse strutting grounds (leks).
Greencore Pipeline Company. Environmental Assessment. Bureau of Land Management. EA No. WY-060-EA11-32. January 2011.	Buffalo Field Office, BLM Casper Field Office, BLM Lander Field Office, BLM Miles City Field Office, BLM	To avoid potential impacts to breeding greater sage-grouse, Greencore would implement a permanent 0.6 mile No Surface Occupancy (NSO) buffer around occupied leks in Core Areas and a 0.25 mile NSO lek buffer in Non-core Areas. Any site specific modifications to NSO buffers would require authorization by the BLM.
Jonah Infill Drilling Project Environmental Impact Statement and Record of Decision, Sublette County, Wyoming. 2006.	Pinedale Field Office, BLM Rock Springs Field Office, BLM	Compressor stations will be sited at least 2.0 miles away from greater sage-grouse leks and no closer than 0.5 mile to an active raptor nest.
Jonah Infill Drilling Project Environmental Impact Statement and Record of Decision, Sublette County, Wyoming. 2006.	Pinedale Field Office, BLM Rock Springs Field Office, BLM	Surface disturbance and occupancy will be prohibited within 0.25 mile of the perimeter of greater sage-grouse leks, and human activity in these areas will be avoided between 8 p.m. and 8 a.m. from March 1 through May 15.
Jonah Infill Drilling Project Environmental Impact Statement and Record of Decision, Sublette County, Wyoming. 2006.	Pinedale Field Office, BLM Rock Springs Field Office, BLM	To further mitigate potential adverse effects to breeding and nesting greater sage-grouse on the JIDPA, 0.5-mile facility-free buffers would be applied to greater sage-grouse lek 7 south of the JIDPA for as long as Operators continue to hold the leases for these areas. No features requiring repeated human presence would be built within this area.
Kerr-McGee Oil & Gas Onshore LP (KMG), Greater Natural Buttes EIS UT-080-07-807, BLM Vernal Field Office, Record of Decision, May 2012.	Vernal Field Office, BLM	No surface disturbing activities will be allowed within 0.5 mile of active greater sage-grouse leks year round.
Lance Oil & Gas Company Inc. Highland Unit Delta Environmental Assessment WY-070-10-383, 2010.	Buffalo Field Office, BLM	The Operator, in their POD, has committed to remove one well and a water impoundment from the project proposal which were located within a 0.25 mile buffer of a sage-grouse lek
Lance Oil & Gas Company, Inc. Bear Draw Gamma. WY-070-11-172. Bureau of Land Management, Buffalo Field Office. 2011.	Buffalo Field Office, BLM	Surface disturbing activities or surface occupancy is prohibited or restricted on or within one quarter (0.25) mile radius of the perimeter of occupied or undetermined sage-grouse lek.
Lance Oil and Gas Company, Inc. Camp John Unit SMA Phase 1, Year 1; WY-070-EA11-214 Buffalo Field Office, 2011.	Buffalo Field Office, BLM	No occupancy or other surface disturbance will be allowed within a 1,320-foot radius of the center of a sage grouse strutting ground (lek). No exceptions will be granted.
Lance Oil and Gas Company. Coal Gulch Unit Gamma POD Categorical Exclusion WY-070-390CX3-11-64 through WY070-390CX3-11-128 Bureau of Land Management Buffalo Field Office, 2010.	Buffalo Field Office, BLM	If an active lek is identified and construction has not been completed, surface disturbance and occupancy within 0.25 miles of the center of the lek will be prohibited.
Noble Energy. Huntington Valley Proposed Oil & Gas Development. DRAFT. In progress January 2014.	Tuscarora Field Office, BLM	This lease contains lands which have been identified as sage grouse strutting grounds (leks) that are subject to seasonal protection from disturbance. No Surface Occupancy is permitted within 0.5 miles, or other, lesser, appropriate distance based on site-specific conditions, of sage grouse leks.
QEP. Greater Deadman Bench Oil and Gas Producing Region EIS and ROD March 2008. UT 080-2003-0369V. BLM Vernal Field Office. 2008.	Vernal Field Office, BLM	No permanent facilities will be allowed within 1,000 feet of any identified greater sage grouse strutting ground.
QEP. Greater Deadman Bench Oil and Gas Producing Region EIS and ROD March 2008. UT 080-2003-0369V. BLM Vernal Field Office. 2008.	Vernal Field Office, BLM	QEP would avoid placement of roads, pipelines, well pads, and ancillary facilities within 100 meters of riparian habitats. If avoidance is not feasible, then effects to riparian habitats would be minimized where possible.
Quicksilver Resources. 9 Mile 3D Seismic Project. CO-100-2008-048 EA. BLM Little Snake Field Office, 2008.	Little Snake Field Office, BLM	A buffer of 330 feet shall be maintained between vehicles and wetlands, springs, and riparian zones unless on existing roads.
Quicksilver Resources. 9 Mile 3D Seismic Project. CO-100-2008-048 EA. BLM Little Snake Field Office, 2008.	Little Snake Field Office, BLM	No surface occupancy will occur within ¼ mile radius of leks. The NSO area may be modified by a BLM biologist depending on activity status and presence of topographical or vegetative barriers.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	All surface disturbance, permanent facilities, etc., will remain a minimum of 500 feet away from the edge of surface waters, riparian areas, wetlands, and 100-year floodplains unless it is determined through site specific analysis...
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Surface disturbance within 0.25 mile of an occupied greater sage-grouse lek will be avoided.

NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed this evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.

<b>Conservation Measure</b>	<b>Noxious/Invasive Weed Management</b>
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	Noxious weed COAs and conservation measures address threats associated with Energy Development and Invasive Plants under Listing Factor A.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	Weed Management Plans and Reclamation Plans contain incremental objectives, such as staying below a certain percent cover of weeds after a set number of growing seasons.
The steps necessary to implement the conservation effort are identified in detail.	Steps are identified in COAs and Weed Management/Reclamation Plans, including implementation measures that describe soil preparation and seed mixes to use during reclamation, and weed control methods.
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	Reclamation must meet quantifiable standards to be considered successful, including maintaining weeds below a set percent coverage.
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Annual monitoring and reporting are a part of weed management COAs. If weeds are not reaching the set success criteria, adaptive management allows the weed control approach to be re-evaluated.
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

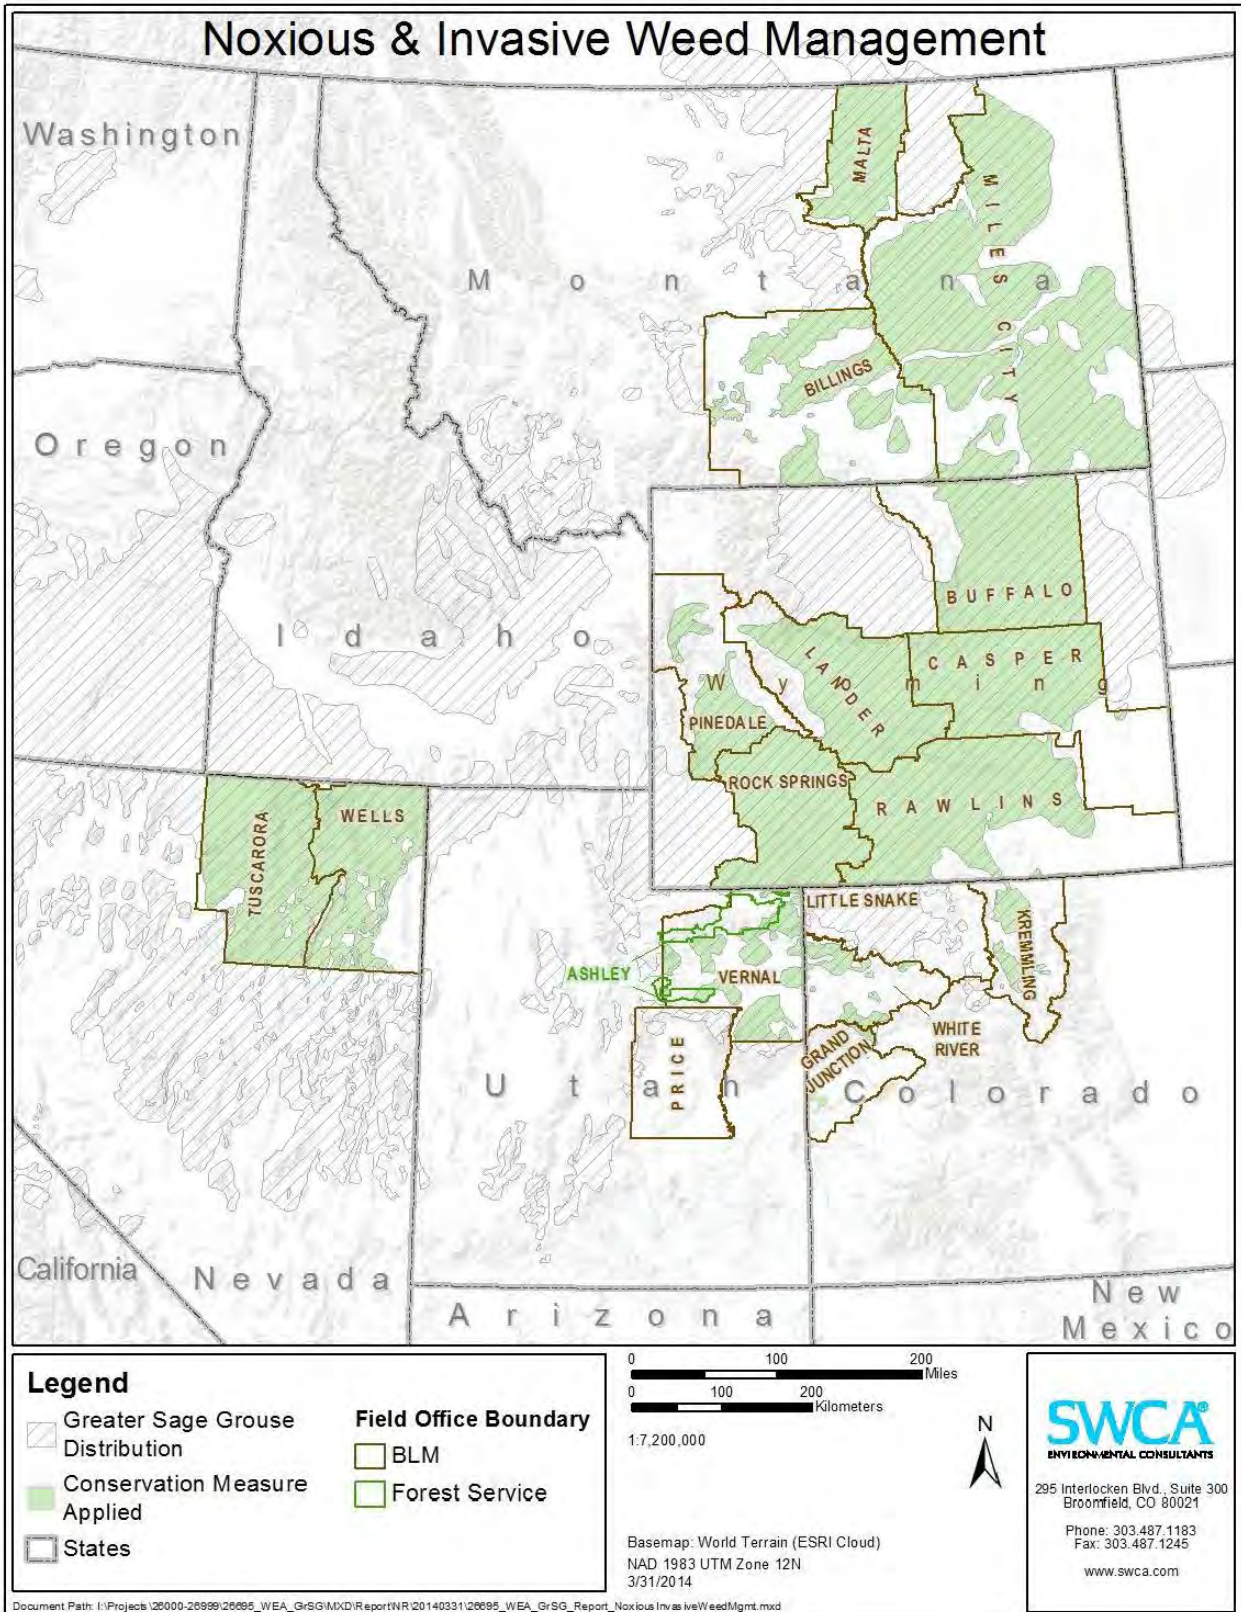

Figure G-1. Map of FOs where Noxious/Invasive Weed Management COAs are applied.

**Table G-2. Noxious/Invasive Weed Management COAs and Conservation Measures**

Citation	Field Office	Description
Anadarko. Doty Mountain POD C in Atlantic Rim EA. WY-030-07-EA-240. 2008.	Rawlins Field Office, BLM	The Anadarko Reclamation Plan includes a weed management plan to address weed control.
Anadarko. Doty Mountain Plan of Development D in Atlantic Rim. DOI-BLM-WY-030-2012-0093-EA. 2012.	Rawlins Field Office, BLM	The Anadarko Reclamation Plan includes a weed management plan to address weed control.
Anadarko Petroleum Corp. Big Corral Jewel Draw Unit Gamma EA # WY-070-EA08-168 Buffalo Field Office, Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	The operator will be responsible for prevention and control of noxious weeds and weeds of concern on all areas of surface disturbance associated with this project (well locations, roads, water management facilities, etc.)
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	Annual monitoring and control of invasive and noxious weeds beginning the first season of disturbance; Monitoring and management of reclamation sites to evaluate weed populations, reclamation success, and to plan and report on the program annually; and Affirmative efforts to resist the spread of weeds including refraining from cleaning out equipment including filters on the site, and power washing machinery and equipment between work sites consistent with the Rawlins Weed Prevention Plan (USDI-BLM 1999).
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	Conduct pre-construction surveys in the spring for weed infestations within the site boundaries and along access roads. Consult Duchesne County Weeds Department to determine treatment for noxious weeds, if identified. Construction vehicles and equipment will be cleaned, power-washed, and free of soil and vegetation debris prior to entry and use of access roads to prevent transporting weed seeds. All seed mixtures, erosion control materials, and reclamation materials will be certified weed free. Revegetated areas will be monitored following seeding to evaluate the need for supplemental seeding and noxious weed control. The ROW and other disturbed areas will be monitored for weed infestations, and new or expanding populations will be controlled or eradicated for the duration of the construction, operation, and reclamation phases. The presence of designated weeds in the Project Area requires that the Operator develop and implement management measures to prevent the spread of noxious weeds and install a monitoring system. During the construction phase of the project, the Operator will implement an intensive reclamation and weed control program after each segment of project completion.
Bill Barrett Corporation, Beaver Creek Add II, Beaver Creek Add II SGP PODs, Beaver Creek Little Buffalo 32-24 APD & Beaver Creek Little Buffalo 34-24 APD, EA # WY-070-09-065, Buffalo Field Office Buffalo, Wyoming, 2010.	Buffalo Field Office, BLM	The operator will be responsible for prevention and control of noxious weeds and weeds of concern on all areas of surface disturbance associated with this project (well locations, roads, water management facilities, etc.)
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	It is the responsibility of the operator to control noxious weeds on lands disturbed in association with oil and gas lease operations. Lease associated weed control strategies are to be coordinated with any involved surface owners and local weed control boards.
Chevron. Table Rock Unit Oil and Gas Development EA and DR. WY-040-EA11-175. January 2012.	Rock Springs Field Office, BLM Rawlins Field Office, BLM	Implementation of environmental protection measures (including the use of a native, weed-free reclamation seed mixture) and the development and implementation of a site-specific reclamation plan and noxious weed management plan, would minimize the potential for the establishment of noxious weeds and invasive species. These plans would be developed during the APD process.
Cimarex. Rands Butte Gas Development Project Final Environmental Assessment, Decision Record and Finding of No Significant Impact, WY-100-EA09-43. 2010.	Pinedale Field Office, BLM	The ROW and other disturbed areas will be monitored for weed infestations, and new or expanding populations will be controlled or eradicated for the duration of the construction, operation, and reclamation phases.
Double Eagle Petroleum. Catalina PODs G and I in the Atlantic Rim. DOI-BLM-WY-030-2009-0155-EA. 2011.	Rawlins Field Office, BLM	The DEPC Reclamation Plan would include a weed management plan to address weed control.
Double Eagle Petroleum. Catalina PODs E and F in the Atlantic Rim. WY-030-08-EA-222. 2008.	Rawlins Field Office, BLM	COAs have been added to control the spread, establishment, and plant community changes associated with weed infestation.
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	The operator has prepared a Weed Management Plan (Appendix E). Weeds would be controlled on all disturbed areas during the life of the project.
EnCana Oil and Gas. 28 APDs on new well pad D36 496. DOI-BLM-CO-110-2011-0169-EA. Approved 9/23/11 by the White River Field Office.	White River Field Office, BLM	Clean all construction equipment to remove seed and soil prior to bringing equipment into the project area.

Citation	Field Office	Description
EnCana Oil and Gas. APDs- N22-496 (16)& P28-496 (16). DOI-BLM-CO-110-2011-0006-EA. White River Field Office. Approved 5/24/11 by White River Field Office.	White River Field Office, BLM	Before entering BLM lands, all construction, heavy or off-road equipment and transport (backhoes, trackhoes, dozers, blades, rollers, lowboys, equipment trailers, etc.), pickup trucks, SUVs, vans, water trucks, pipe trucks, etc., shall be power washed to remove seeds, soil, and vegetative matter. If noxious weeds are found, they shall be treated (if timing is appropriate) or removed (if plants have formed seeds) prior to ground-disturbing activities to limit weed seed production and dispersal. If the treatment timing is not appropriate for the weed species, ground-disturbing activities may proceed.
EnCana Oil and Gas. APDs- N22-496 (16)& P28-496 (16). DOI-BLM-CO-110-2011-0006-EA. White River Field Office. Approved 5/24/11 by White River Field Office.	White River Field Office, BLM	Noxious Weed Inventory record shall be completed each time a List A or B weed infestation is inventoried (with the exception of redstem filaree and quackgrass)... c. Inventories for the presence of noxious weeds shall be conducted at least once early in the growing season for all areas disturbed by oil and gas exploration and development. Weeds shall be treated in an appropriate manner if found.
EnCana Oil and Gas. L24 496 New Well Pad - 28 APDs. DOI-BLM-CO-110-2012-0021-DNA. Approved 3/20/12 by White River Field Office.	White River Field Office, BLM	The operator should monitor the project site for a minimum of three years after construction to detect the presence of noxious/invasive species. Any such species that occur will be eradicated.
EnCana Oil and Gas. Master Development Plan for the SG E34 496, SG L796 and SG F22 496, Environmental Assessment and Decision Record, DOI-BLM-CO-2013-0035-EA, 2013.	White River Field Office, BLM	The operator should eliminate any noxious plants before seed production occurs. The operator should clean all off-road equipment to remove seed and soil prior to commencing operations within the project area. In order to minimize the potential for invasion of noxious and invasive species, the operator should attain sufficient cover of native reclamation species (similar to that of nearby undisturbed native plant, communities in a healthy early-seral state).
EnCana Oil and Gas. Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project Environmental Assessment. WY-050-EA08-88. Approved 9/5/08 by the Lander BLM Field Office.	Lander Field Office, BLM	Invasive species/noxious weed monitoring forms would be completed and submitted to the BLM. A weed control plan would be prepared and implemented based on BLM's approval. On BLM lands, an approved Pesticide Use Proposal would be obtained before the application of herbicides or other pesticides for the control of noxious weeds.
EnCana Oil and Gas. Story Gulch Application for Permit to Drill (32) - 16 additional wells on F25 pad & B36 pad each. OI-BLM-CO-110-2010-0207-DNA. Approved 9/1/10 by White River Field Office.	White River Field Office, BLM	Before entering BLM lands, all construction, heavy or off-road equipment and transport (backhoes, trackhoes, dozers, blades, rollers, lowboys, equipment trailers, etc.), pickup trucks, SUVs, vans, water trucks, pipe trucks, etc., shall be power washed to remove seeds, soil, and vegetative matter. If noxious weeds are found, they shall be treated (if timing is appropriate) or removed (if plants have formed seeds) prior to ground-disturbing activities to limit weed seed production and dispersal. If the treatment timing is not appropriate for the weed species, ground-disturbing activities may proceed. The center points of List A and B weed infestations (with the exception of redstem filaree and quackgrass) shall be marked with a GPS unit, or, GPS lines or polygons along or around weed infestations. b. A Noxious Weed Inventory record shall be completed each time a List A or B weed infestation is inventoried (with the exception of redstem filaree and quackgrass). c. Inventories for the presence of noxious weeds shall be conducted at least once early in the growing season for all areas disturbed by oil and gas exploration and development. Weeds shall be treated in an appropriate manner if found during inventories. Follow-up inventories and re-treatment during the same growing season may be necessary to provide additional control and/or eradication.
EnCana Oil and Gas. Story Gulch Well Pads (2). DOI-BLM-CO-110-2009-0229-EA. Approved 2/3/10 by White River Field Office.	White River Field Office, BLM	The operator should monitor the project site for a minimum of three years after construction to detect the presence of noxious/invasive species. Any such species that occur will be eradicated.
EnCana. Environmental Assessment of the Orchard Master Development Plan for Oil and Gas Development. GJFO # DOI-BLM-CO-130-2009-0001-EA and GSFO # DOI-BLM-CO-140-2008-0032-EA. Grand Junction Field Office and Glenwood Springs Energy Office, October 2008.	Grand Junction Field Office, BLM	Reports regarding invasive species and weed management and reclamation success shall be submitted to the Grand Junction Field no later than December 1 of each year, in compliance with the joint BLM/Forest Service Noxious and Invasive Weed Management Plan for Oil and Gas Operators.
Environmental Assessment for East Converse Exploratory Oil and Gas Development Project. WY-060-EA12-227. Approved 11/20/12 by BLM Casper Field Office.	Casper Field Office, BLM	Noxious and invasive weed species shall be controlled on all surface disturbance areas in the project area by the use of mechanical and/or chemical treatments designed to best control weed species at a specific site.
Environmental Assessment for Highland Loop Road Exploratory Oil and Gas Development Project. WY-060-EA12-226. Approved 11/20/12 by BLM Casper Field Office.	Casper Field Office, BLM	Noxious and invasive weed species shall be controlled on all surface disturbance areas in the project area by the use of mechanical and/or chemical treatments designed to best control weed species at a specific site.
Environmental Assessment for Spearhead Ranch Exploratory Oil and Gas Development Project. Y-060-EA12-225. Approved 11/20/12 by BLM Casper Field Office.	Casper Field Office, BLM	Noxious and invasive weed species shall be controlled on all surface disturbance areas in the project area by the use of mechanical and/or chemical treatments designed to best control weed species at a specific site.

<b>Citation</b>	<b>Field Office</b>	<b>Description</b>
Yates Petroleum and Pinnacle Gas Resources. Luman Rim Natural Gas Development EA and DR. WYW128688. WY-040-EA10-139. December 2010.	Rock Springs Field Office, BLM	Weed control is integral to the success of project reclamation; the RSFO Weed Management Plan found in Appendix E will be followed. Forbs and shrubs may be seeded after grasses have become established and weedy species are under control.

**APPENDIX H**  
**Reduce Traffic**

**Table H-1. PECE Policy Evaluation – Reduce Traffic**

Conservation Measure	Reduce Traffic
<b>Certainty of Implementation</b>	
The conservation effort, the party(ies) to the agreement or plan that will implement the effort, and the staffing, funding level, funding source, and other resources necessary to implement the effort are identified.	The BLM/USFS decision records require implementation as a condition of the agency authorization. Funding and implementation is generally identified as the responsibility of the operator(s).
The legal authority of the party(ies) to the agreement or plan to implement the formalized conservation effort, and the commitment to proceed with the conservation effort are described.	NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed this evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.

<b>Conservation Measure</b>	<b>Reduce Traffic</b>
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	Reduced traffic COAs and conservation measures address threats associated with Energy Development under Listing Factor A.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	NEPA processes generally identify dates and times for implementation of all measures and COAs.
The steps necessary to implement the conservation effort are identified in detail.	Steps are identified and include implementing speed limits, carpooling to reduce traffic, and remote monitoring. These are detailed within the COAs and conservation measures.
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	Parameters can be measured through documentation of animal-vehicle collisions and lek attendance to determine if the standards set in the COAs and conservation measures are met.
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

Citation	Field Office	Description
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	Operators and their contractors will observe and promote adherence to speed limits in the project area, and erect signs in lambing/calving areas, shipping pastures, or adjacent to working corrals to warn vehicle Operators (FEIS, section 4.6.5.4).
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	Remote monitoring of well locations would be required where feasible.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	These Best Management Practices (BMPs) will be applied under all alternatives as Conditions of Approval where proposals conflict with identified resources. 7) Transportation planning to align roads out of sight and sound of leks, and to schedule traffic to avoid greater sage-grouse and Columbian sharptailed grouse activity periods.
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	Project-related activities and vehicle access will not be allowed on the Nutters Ridge Road (FSR 333) or the Wire Fence Ridge Road (FSR 332), south of the Operator’s current lease area. This will prevent disturbance to breeding, nesting, brood rearing, and wintering sage grouse that might otherwise occur if project-related access along these roads were permitted.
Bill Barrett Corporation, Beaver Creek Add II, Beaver Creek Add II SGP PODs, Beaver Creek Little Buffalo 32-24 APD & Beaver Creek Little Buffalo 34-24 APD, EA # WY-070-09-065, Buffalo Field Office Buffalo, Wyoming, 2010.	Buffalo Field Office, BLM	Maximum design speed on all operator-constructed and maintained roads (except county roads) will not exceed 25 miles per hour.
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	Under the Selected Alternative, BBC and other operators may construct/improve an airstrip on each of the mesas. Use of airstrips has the potential to reduce the amount of vehicle traffic. No upgrades will be allowed to the Interplanetary Airstrip to minimize impacts to sage-grouse.
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	Under the Selected Alternative, BBC and other operators will use a combination of pipelines and trucking to transport water and condensate from well pads, pump stations and CTBs to the water management facilities on each mesa. Water/condensate lines will not be required in areas where development is considered exploratory, remote, or where topography prohibits.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	Apply mitigation measures to reduce mountain plover, swift fox or sage grouse mortality caused by increased vehicle traffic. Construct speed bumps, use signing or post speed limits as necessary to reduce vehicle speeds near sage grouse leks, mountain plover habitat, or other important wildlife habitats.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	Avoid, where possible, locating roads in crucial sage grouse breeding, nesting and wintering areas and mountain plover habitats. Develop a route utilizing topography, vegetative cover, site distance, etc. to effectively protect identified wildlife habitats in a cost efficient manner.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	Develop a comprehensive Project Plan prior to POD or full field development activities to minimize road densities.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	Utilize remote monitoring technologies whenever possible to reduce site visits thereby reducing wildlife disturbance and mortalities.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	Well field access roads and other roads with project-related traffic increases will be monitored for wildlife mortality so that specific mitigation can be designed and implemented as deemed necessary by BLM, in consultation with MFWP, for areas with high traffic volume and/or increased wildlife/vehicle collisions and mortality.
Double Eagle Petroleum. Catalina PODs E and F in the Atlantic Rim. DOI-BLM-WY-030-2009-0155-EA. 2011.	Rawlins Field Office, BLM	The use of remote sensing, where technically feasible, would be encouraged.
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	Remote monitoring of wells and pipelines to reduce field visits during operations and reduce stress on raptors and other wildlife.
EnCana Oil and Gas. APDs- N22-496 (16)& P28-496 (16). DOI-BLM-CO-110-2011-0006-EA. White River Field Office. Approved 5/24/11 by White River Field Office.	White River Field Office, BLM	3-Phase Gas gathering system with 6 pipelines to be located within the same trench.

Jonah Infill Drilling Project Environmental Impact Statement and Record of Decision, Sublette County, Wyoming, 2006.	Pinedale Field Office, BLM Rock Springs Field Office, BLM	Operators will utilize remote telemetry or equivalent technology at all wells to minimize well monitoring trips, unless proven to the satisfaction of the Authorized Officer on a case-by-case basis that installation of remote telemetry or equivalent technology would not be technically or economically feasible, or that another method would create less environmental impact.
Kerr-McGee Oil & Gas Onshore LP (KMG), Greater Natural Buttes EIS UT-080-07-807, BLM Vernal Field Office, Record of Decision, May 2012.	Vernal Field Office, BLM	Project wells will utilize centralized compression facilities. The use of telemetry will reduce the frequency of well visits and therefore decrease vehicle traffic within the GNBPA, one objective of combining production facilities.
Kerr-McGee Oil & Gas Onshore LP (KMG), Greater Natural Buttes EIS UT-080-07-807, BLM Vernal Field Office, Record of Decision, May 2012.	Vernal Field Office, BLM	Roads within 2 miles of an active greater sage-grouse lek will be constructed to the minimum standard and width possible to meet safety concerns. In addition, road maintenance activities during the greater sage-grouse breeding season (between February 15 and June 15) will be minimized.
Lance Oil & Gas Company Inc. Highland Unit Delta Environmental Assessment WY-070-10-383, 2010.	Buffalo Field Office, BLM	Maximum design speed on all operator-constructed and maintained roads (except county roads) will not exceed 25 miles per hour except travel along roads within 1/2 mile of the Kinney Draw I, II, III sage-grouse leks and the Nurse Draw lek. These roads will be posted at 10 mph.
Lance Oil & Gas Company Inc. Highland Unit Delta Environmental Assessment WY-070-10-383, 2010.	Buffalo Field Office, BLM	To limit travel through leks, place five "No Oil and Gas Traffic" signs; one at each entrance/exit through leks. There will be three signs placed in section 3, one sign placed in section 9 and one sign in section 10.
Lance Oil & Gas Company, Inc. Quarter Circle 9 Beta Environmental Assessment, 2008.	Buffalo Field Office, BLM	Maximum design speed on all operator-constructed and maintained roads will not exceed 25 miles per hour except travel along roads within 1/2 mile of the Fleetwood Draw sage grouse lek located in. These roads will be posted at 10 mph.
Lance Oil & Gas Inc., Coulter 4 POD EA, WY-070-08-169, Buffalo Field Office Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	Maximum design speed on all operator-constructed and maintained roads will not exceed 25 miles per hour except travel along roads within 1/2 mile of the Indian Creek IV lek. These roads will be posted at 10 mph. This will affect the road accessing the 43-1 well.
Lance Oil & Gas, Powder Valley Unit Delta Environmental Assessment WY-070-EA08-143, 2008.	Buffalo Field Office, BLM	Well metering shall be accomplished by telemetry. Metering would entail 2-3 visits per month during the summer and 4 visits per month during the winter months.
Lance Oil and Gas Company. Coal Gulch Unit Gamma POD Categorical Exclusion WY-070-390CX3-11-64 through WY070-390CX3-11-128 Bureau of Land Management Buffalo Field Office, 2010.	Buffalo Field Office, BLM	LOG will incorporate remote monitoring telemetry to reduce human visitation once wells are producing
Lance Oil and Gas Company. Coal Gulch Unit Gamma POD Categorical Exclusion WY-070-390CX3-11-64 through WY070-390CX3-11-128 Bureau of Land Management Buffalo Field Office, 2010.	Buffalo Field Office, BLM	Pipe all produced water from PVUE POD to a water treatment plant, then discharge into Powder River to reduce potential for West Nile habitat
Powder River Basin Oil and Gas Project, Record of Decision and Resource Management Plan Amendments. EIS WY-070-02-065. April 2003.	Buffalo Field Office, BLM	Maximum design speed on all operator constructed and maintained roads will not exceed 25 miles per hour to minimize the chance of a collision with a bald eagle, other wildlife, or livestock.
Powder River Basin Oil and Gas Project, Record of Decision and Resource Management Plan Amendments. EIS WY-070-02-065. April 2003.	Buffalo Field Office, BLM	Required a Water Management Plan.
QEP. APD and COAs for QEP Stewart Point 14-32 pad. 2013.	Pinedale Field Office, BLM	Produced water from drilling shall be gathered and transported via QEP's authorized liquid gathering system.
QEP. APD with COAs for QEP Mesa 15-9 pad. 2012.	Pinedale Field Office, BLM	Produced water from drilling shall be gathered and transported via QEP's authorized liquid gathering system.
QEP. EA to re-enter the existing WRB 16-17-10-17 EA, DOI-BLM-UT_G010-2012-0151, BLM Vernal Field Office. 2012.	Vernal Field Office, BLM	Well site telemetry would be utilized as feasible for production operations.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Reduction in traffic, disturbance, and human footprint presence decreases impacts to grouse. This ROD requires Ultra, Shell, and Questar to install a liquids gathering system to reduce the amount of truck traffic associated with production. This is expected to eliminate approximately 165,000 truck trips annually during peak production.
Yates Petroleum Company. NEO Coal Bed Natural Gas Environmental Assessment WY-070-10-331, 2010.	Buffalo Field Office, BLM	Yates Petroleum Corporation submitted a mitigation plan to BLM that addresses potential impact mechanisms known, or suspected to affect sage-grouse recruitment and survival. These include: A quantified travel plan that minimizes well site visits

Citation	Field Office	Description
Yates Petroleum Corporation, Gauge POD EA, WY-070-EA09-75, Buffalo Field Office, 2009.	Buffalo Field Office, BLM	After the wells are complete, well metering, maintenance and other site visits will be limited to an average of 3 visits to each well location per week (up to 12 visits per well/month for the first six months). The company will be required to report frequency of site visits, after the wells are complete, along with repairs made and problems identified resulting from the visits. The company will submit these reports to BLM at the end of every month. The BLM will use site visit data in order to determine the necessary frequency of site visits.
Yates Petroleum Corporation, Gauge POD EA, WY-070-EA09-75, Buffalo Field Office, 2009.	Buffalo Field Office, BLM	Roads within 1/2 mile of sage grouse leks will be posted (with signs shorter than four feet) by the operator at 10 mph during daylight hours between March1-June 15.
Yates Petroleum Corporation, Gauge POD EA, WY-070-EA09-75, Buffalo Field Office, 2009.	Buffalo Field Office, BLM	Throughout production, human presence will be limited with the deployment of the most recent technology (For example, cameras and remote sensing )
Yates Petroleum Corporation. All Day POD. EA # WY-070-08-026 and COAs. Buffalo Field Office, Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	Maximum design speed on all operator-constructed and maintained roads (except county roads) will not exceed 25 miles per hour except travel along roads within 1/2 mile of sage grouse leks will be posted (with signs shorter than four feet) by the operator at 10 mph during daylight hours between March1-June 15.
Yates Petroleum Corporation. All Day POD. EA # WY-070-08-026 and COAs. Buffalo Field Office, Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	Well metering, maintenance and other site visits will be allowed monthly, 3 per week for the first six months after the wells are completed. The company will be required to monitor frequency of site visits along with repairs made and problems identified resulting from the visits. Reports containing results of this monitoring will be submitted to BLM at the end of every month. The BLM will use this data to determine the necessity of multiple monthly site visits during the sage-grouse breeding and nesting periods (March 1 to June 15).
Yates Petroleum Corporation. Lazurite POD Environmental Assessment WY-070-EA09-095, 2009.	Buffalo Field Office, BLM	Maximum design speed on all operator-constructed and maintained roads (except county roads) will not exceed 25 miles per hour except travel along roads within 1/2 mile of any known leks.

**APPENDIX I**  
**Reduce Noise and Visual Impacts**

**Table I-1. PECE Policy Evaluation – Reduce Noise and Visual Impacts**

Conservation Measure	Reduce Noise and Visual Impacts
<b>Certainty of Implementation</b>	
The conservation effort, the party(ies) to the agreement or plan that will implement the effort, and the staffing, funding level, funding source, and other resources necessary to implement the effort are identified.	The BLM/USFS decision records require implementation as a condition of the agency authorization. Funding and implementation is generally identified as the responsibility of the operator(s).
The legal authority of the party(ies) to the agreement or plan to implement the formalized conservation effort, and the commitment to proceed with the conservation effort are described.	NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed this evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.

<b>Conservation Measure</b>	<b>Reduce Noise and Visual Impacts</b>
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	Reduced noise and visual impact COAs and conservation measures address threats associated with Energy Development under Listing Factor A.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	In many cases, specific decibel level thresholds are identified or desired.
The steps necessary to implement the conservation effort are identified in detail.	Steps are identified and include installing noise mufflers and shields, siting compressors and other facilities outside of given buffers around leks
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	Parameters can be measured by decibels, with a typical goal not to exceed 49 decibels as provided by state wildlife agencies.
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

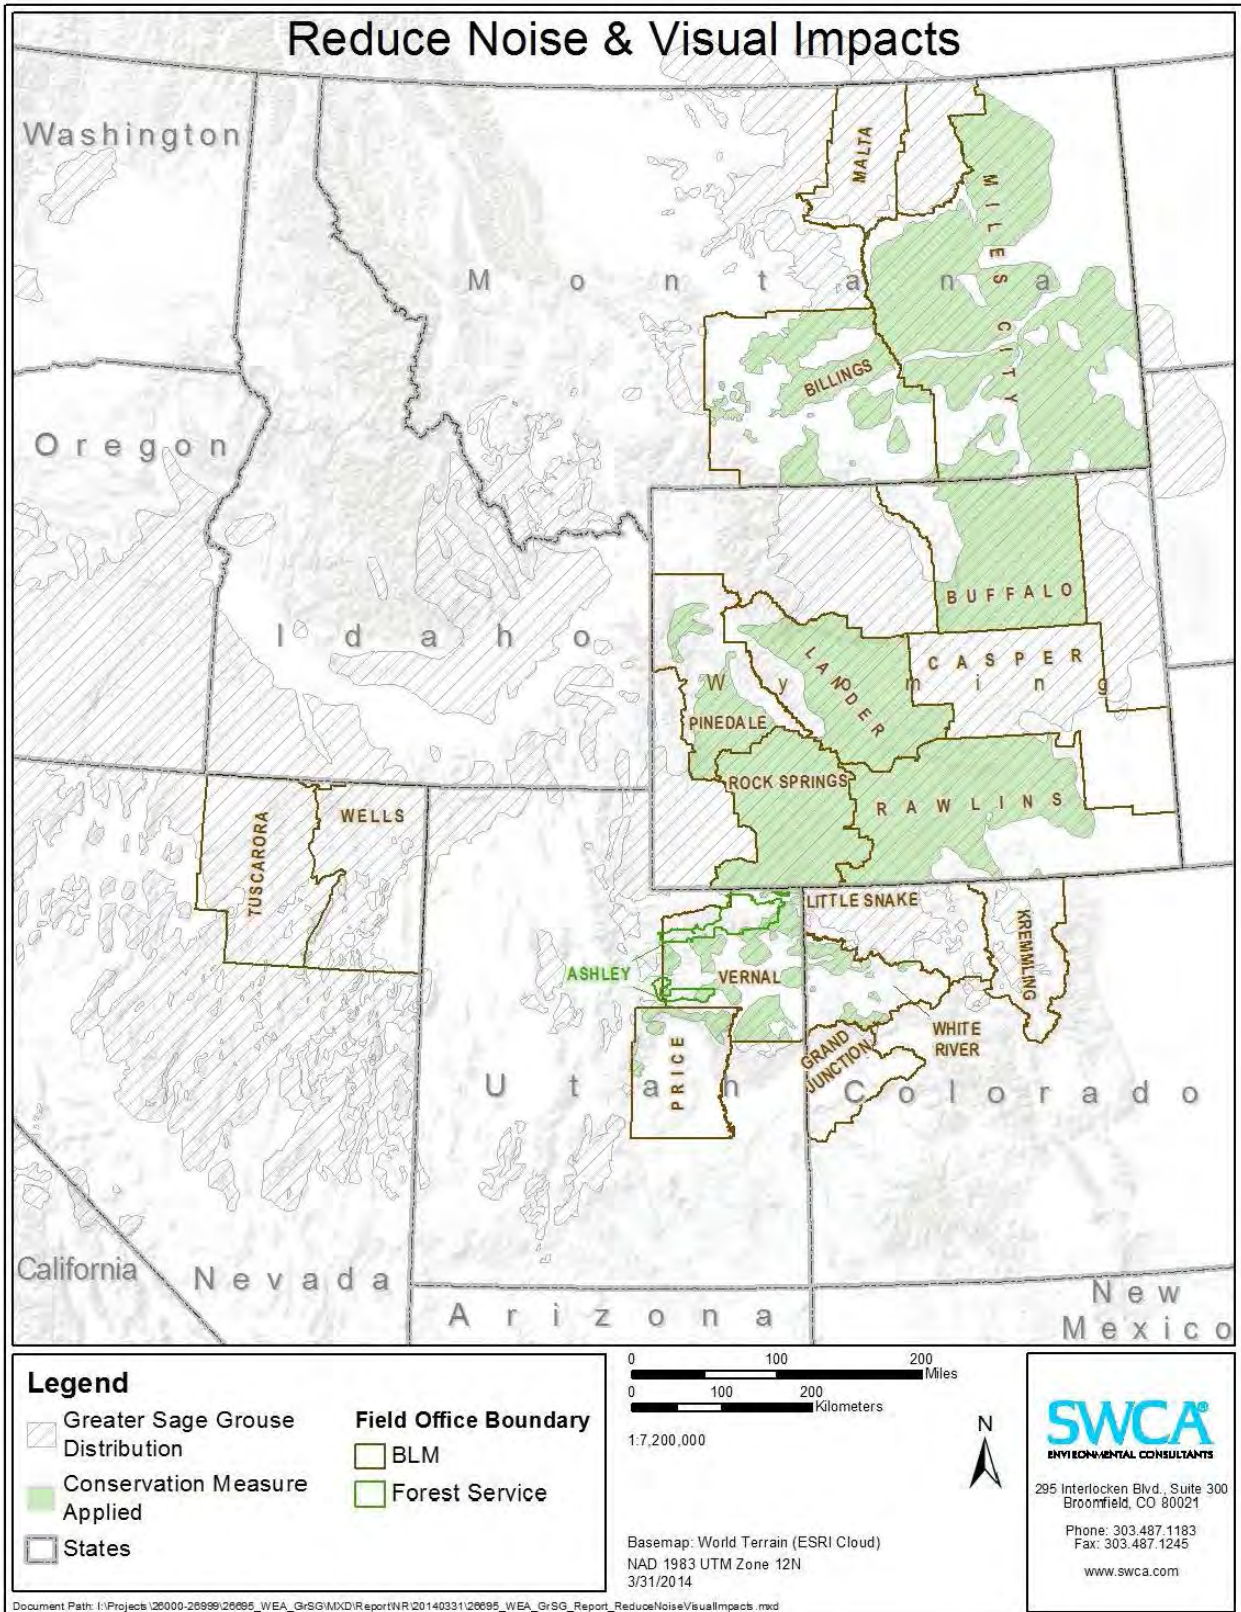

Figure I-1. Map of FOs where Reduce Noise and Visual Impacts COAs are applied.

**Table I-2. Reduce Noise and Visual Impacts COAs and Conservation Measures**

Citation	Field Office	Description
Anadarko Petroleum Corporation, Double Tank Phase II POD EA, WY-070-07 015, Buffalo Field Office Buffalo, Wyoming, 2009.	Buffalo Field Office, BLM	Noise mufflers will be installed on the exhaust of compressor engines to reduce the exhaust noise. Where noise impacts to existing sensitive receptors are an issue, noise levels will be required to be no greater than 55 decibels measured at a distance of one-quarter mile from the appropriate booster (field) compressor. When background noise exceeds 55dBA, noise levels will be no greater than 5dBA above background. This may require the installation of electrical compressor motors at these locations.
Anadarko Petroleum Corporation, Dry Willow III POD EA, WY-070-08-036, Buffalo Field Office Buffalo, Wyoming, 2009.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Anadarko/Lance Oil & Gas. Rose Draw Unit Beta Environmental Assessment WY-070-EA08-186, 2008.	Buffalo Field Office, BLM	Noise mufflers will be installed on the exhaust of compressor engines to reduce the exhaust noise. Where noise impacts to existing sensitive receptors are an issue, noise levels will be required to be no greater than 55 decibels measured at a distance of one-quarter mile from the appropriate booster (field) compressor. When background noise exceeds 55dBA, noise levels will be no greater than 5dBA above background. This may require the installation of electrical compressor motors at these locations.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	In order to minimize noise disturbances to strutting or dancing grouse, compressor stations and generators will be muffled with hospital-style mufflers.
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	Pump jack engines will be equipped with high-grade mufflers to reduce noise during the operational LOP.
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	To reduce noise levels down to an acceptable level so as not to disturb strutting birds or cause lek abandonment, all wells within 3.1 miles of a lek will be muffled with the latest technology to reduce noise levels from wells down to no more than 45dB at a lek. All wells within 3.1 miles of a lek will have mufflers oriented away from leks.
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	All applicable production equipment, including compressor engines, will have hospital grade mufflers.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	Different management actions affecting location, size, and muffler requirements would be applied to compressors.
Devon Energy Production Company, L.P., Golden Eagle- Juniper Draw CBNG Field POD EA, WY-070-EA07-111, Buffalo Field Office Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Devon Energy Production Company. West Pine Tree Unit – Brook Trout POD Environmental Assessment WY-070-EA08-129, 2008.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage-grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	To minimize the possible impacts of project related noise on wildlife, muffle and maintain all motorized equipment according to manufacturers' specifications.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	Site disturbance would use topographic features whenever possible to shield leks from new disturbance.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	The applicant will make efforts to muffle and redirect noise emanating from on- site compression facilities (if used) in a manner that would substantially reduce noise-reception from occupied sage-grouse habitats on adjacent ridgelines (for example, using heavy side-slope vegetation and distance to attenuate noise and considering prevailing winds to align residual transmission down-canyon for F22, downwards NNE into canyon for E34/L27).
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	The applicant will use the lowest intensity lights that safety requirements will allow and make efforts to shield fixtures to reduce the intensity of light visible from adjacent ridgeline habitats.

Citation	Field Office	Description
EnCana Oil and Gas. Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project Environmental Assessment. WY-050-EA08-88. Approved 9/5/08 by the Lander BLM Field Office.	Lander Field Office, BLM	In addition to other restrictions for activities within a 2-mile distance from active sage-grouse leks, noise levels would be required to be no more than 10 decibels on the A-weighted scale (dBA) above background levels.
EnCana Oil and Gas. Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project Environmental Assessment. WY-050-EA08-88. Approved 9/5/08 by the Lander BLM Field Office.	Lander Field Office, BLM	To help prevent reproductive failure for any potential sage grouse in the vicinity of the generator or compressor, noise would be regulated and limited to 49 decibels (BLM 2003a).
Exxon. Piceance Development Project EA, Finding of No Significant Impact and Decision Record, CO-110-2005-219-EA, 2007.	White River Field Office, BLM	Limit noise at the fence line of the CTF so as not to exceed 65 decibels.
Gasco Energy Inc. Uinta Basin Natural Gas Development Project, Environmental Impact Statement FES 12-5, Record of Decision, Bureau of Land Management Vernal Field Office, June 2012.	Vernal Field Office, BLM	Within 0.5 mile of known active leks, the best available technology will be used to reduce noise, e.g., installation of multi-cylinder pumps, hospital sound-reducing mufflers, and placement of exhaust systems.
Jonah Infill Drilling Project Environmental Impact Statement and Record of Decision, Sublette County, Wyoming. 2006.	Pinedale Field Office, BLM Rock Springs Field Office, BLM	All engines and compressor exhaust stacks would be muffled and maintained according to manufacturers' specifications.
Kerr-McGee Oil & Gas Onshore LP (KMG), Greater Natural Buttes EIS UT-080-07-807, BLM Vernal Field Office, Record of Decision, May 2012.	Vernal Field Office, BLM	Within 2 miles of an active greater sage-grouse lek, the best available technology (e.g., installation of multi-cylinder pumps, hospital sound reducing mufflers or other sound reducing devices, and placement of exhaust systems) will be installed as appropriate to reduce noise levels at, or direct noise away from, active greater sage-grouse leks. The reduction of noise levels will be reduced to decibels on the A-weighted scale levels established in ongoing and future studies regarding noise impacts to greater sage-grouse.
Lance Oil & Gas Company Inc. Camp John Unit Epsilon POD WY-070-EA10-239, Bureau of Land Management, Buffalo Field Office, 2011.	Buffalo Field Office, BLM	The operator will locate compressor stations so that noise from the stations at any nearby mapped sage-grouse or sharp-tailed grouse display grounds does not exceed 49 dB (10 dBA above background noise) at the display ground.
Lance Oil & Gas Company, Inc. Bear Draw Gamma. WY-070-11-172. Bureau of Land Management, Buffalo Field Office. 2011.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Lance Oil & Gas Company, Inc. Quarter Circle 9 Beta Environmental Assessment, 2008.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Lance Oil & Gas Company. Powder Valley Unit Epsilon Environmental Assessment WY-070-EA10-232, 2010.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Lance Oil & Gas, Powder Valley Unit Delta Environmental Assessment WY-070-EA08-143, 2008.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Lance Oil and Gas Company, Inc. Camp John Unit SMA Phase 1, Year 1; WY-070-EA11-214 Buffalo Field Office, 2011.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Lance Oil and Gas Company, Inc. Camp John Unit SMA Phase 1, Year 2; WY-070-EA12-084, Buffalo Field Office, 2013.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Powder River Basin Oil and Gas Project, Record of Decision and Resource Management Plan Amendments. EIS WY-070-02-065. April 2003.	Buffalo Field Office, BLM	The Companies will locate compressor stations so that noise from the stations at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Powder River Basin Oil and Gas Project, Record of Decision and Resource Management Plan Amendments. EIS WY-070-02-065. April 2003.	Buffalo Field Office, BLM	The Companies will locate compressor stations so that noise from the stations at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
QEP. APD and COAs for QEP Stewart Point 14-32 pad. 2013.	Pinedale Field Office, BLM	QEP shall submit a sundry notice to the BLM detailing a noise mitigation plan to be in effect for sage grouse prior to the onsite of big game winter range closures January 1 and shall detail how QEP will mitigate operations resulting in noise no greater than 10 decibels (dba) above local background data.
QEP. EA to re-enter the existing WRB 16-17-10-17 EA, DOI-BLM-UT_G010-2012-0151, BLM Vernal Field Office. 2012.	Vernal Field Office, BLM	Within 2 miles of active lek; use best available technology such as multi-cylinder pumps, hospital sound reducing muffler and placement of exhaust systems to reduce noise.

Citation	Field Office	Description
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	In selecting a site for a compressor facility, a well pad or other permanent facility, the distance from the edge of a an occupied greater sage-grouse lek will be sufficient to result in a noise level increase from operating facilities no greater than 10 decibels (dBA) above background (i.e., 39 dBA background + 10 dBA = 49 dBA). Further restrictions may be required if the species is determined by the USFWS to be eligible for listing as either threatened or endangered pursuant to the Endangered Species Act. Monitoring will be required by BLM to determine which leks in the PAPA are occupied and which have been abandoned.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Operators may be required to apply noise mitigation at well locations, as determined necessary by the BLM AO, on a case-by-case basis.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Table B.1 Standard 5: Decibel levels at the lek more than 10 dBA above background measured from the edge of the lek (2000 ROD, p.27), and a concurrent average of 30% decline in peak numbers of male birds over 2 years vs. reference area, additional mitigation responses are applied.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	To avoid potentially significant noise impacts, compressor engines will be located 2,500 feet or more from a dwelling or residence and from sage-grouse leks.
Williams Production RMT Company, Cedar Draw Unit 2 POD, EA WY-070-07-137, Buffalo Field Office Buffalo, Wyoming, 2010.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Yates Petroleum Company. NEO Coal Bed Natural Gas Environmental Assessment WY-070-10-331, 2010.	Buffalo Field Office, BLM	Noise from infrastructure within the POD is not to exceed 49 decibels (10 dBA above background noise) at any nearby sage grouse or sharp-tailed grouse display grounds. The Companies will locate compressor stations so that noise from the stations at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Yates Petroleum Corporation, Congaree POD EA, WY-070-10-195, Buffalo Field Office, 2010.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Yates Petroleum Corporation, Gauge POD EA, WY-070-EA09-75, Buffalo Field Office, 2009.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Yates Petroleum Corporation. All Day POD. EA # WY-070-08-026 and COAs. Buffalo Field Office Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.
Yates Petroleum Corporation. Napier Road POD Environmental Assessment WY-070-EA10-280, 2010.	Buffalo Field Office, BLM	The Companies will locate facilities so that noise from the facilities at any nearby sage grouse or sharp-tailed grouse display grounds does not exceed 49 decibels (10 dBA above background noise) at the display ground.

**APPENDIX J**  
**Reduce Perching Predators**

**Table J-1. PECE Policy Evaluation – Reduce Perching Predators**

Conservation Measure	Reduce Perching Predators
<b>Certainty of Implementation</b>	
The conservation effort, the party(ies) to the agreement or plan that will implement the effort, and the staffing, funding level, funding source, and other resources necessary to implement the effort are identified.	The BLM/USFS decision records require implementation as a condition of the agency authorization. Funding and implementation is generally identified as the responsibility of the operator(s).
The legal authority of the party(ies) to the agreement or plan to implement the formalized conservation effort, and the commitment to proceed with the conservation effort are described.	NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed this evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.

<b>Conservation Measure</b>	<b>Reduce Perching Predators</b>
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	COAs and conservation measures that reduce perching predators address threats associated with Energy Development and Infrastructure under Listing Factor A; and Predation under Factor C.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	NEPA processes generally identify dates and times for implementation of all measures and COAs.
The steps necessary to implement the conservation effort are identified in detail.	COAs and conservation measures to reduce predation potential are generally known and include anti-perching devices and other methods or technologies. Steps to implement these measures are well documented and presented in publications and other industry information including materials prepared by the Avian Power Line Interaction Committee.
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	Measures lend themselves to before-after comparisons to evaluate success of the measure as measured by decreased perching or use by potential predators.
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

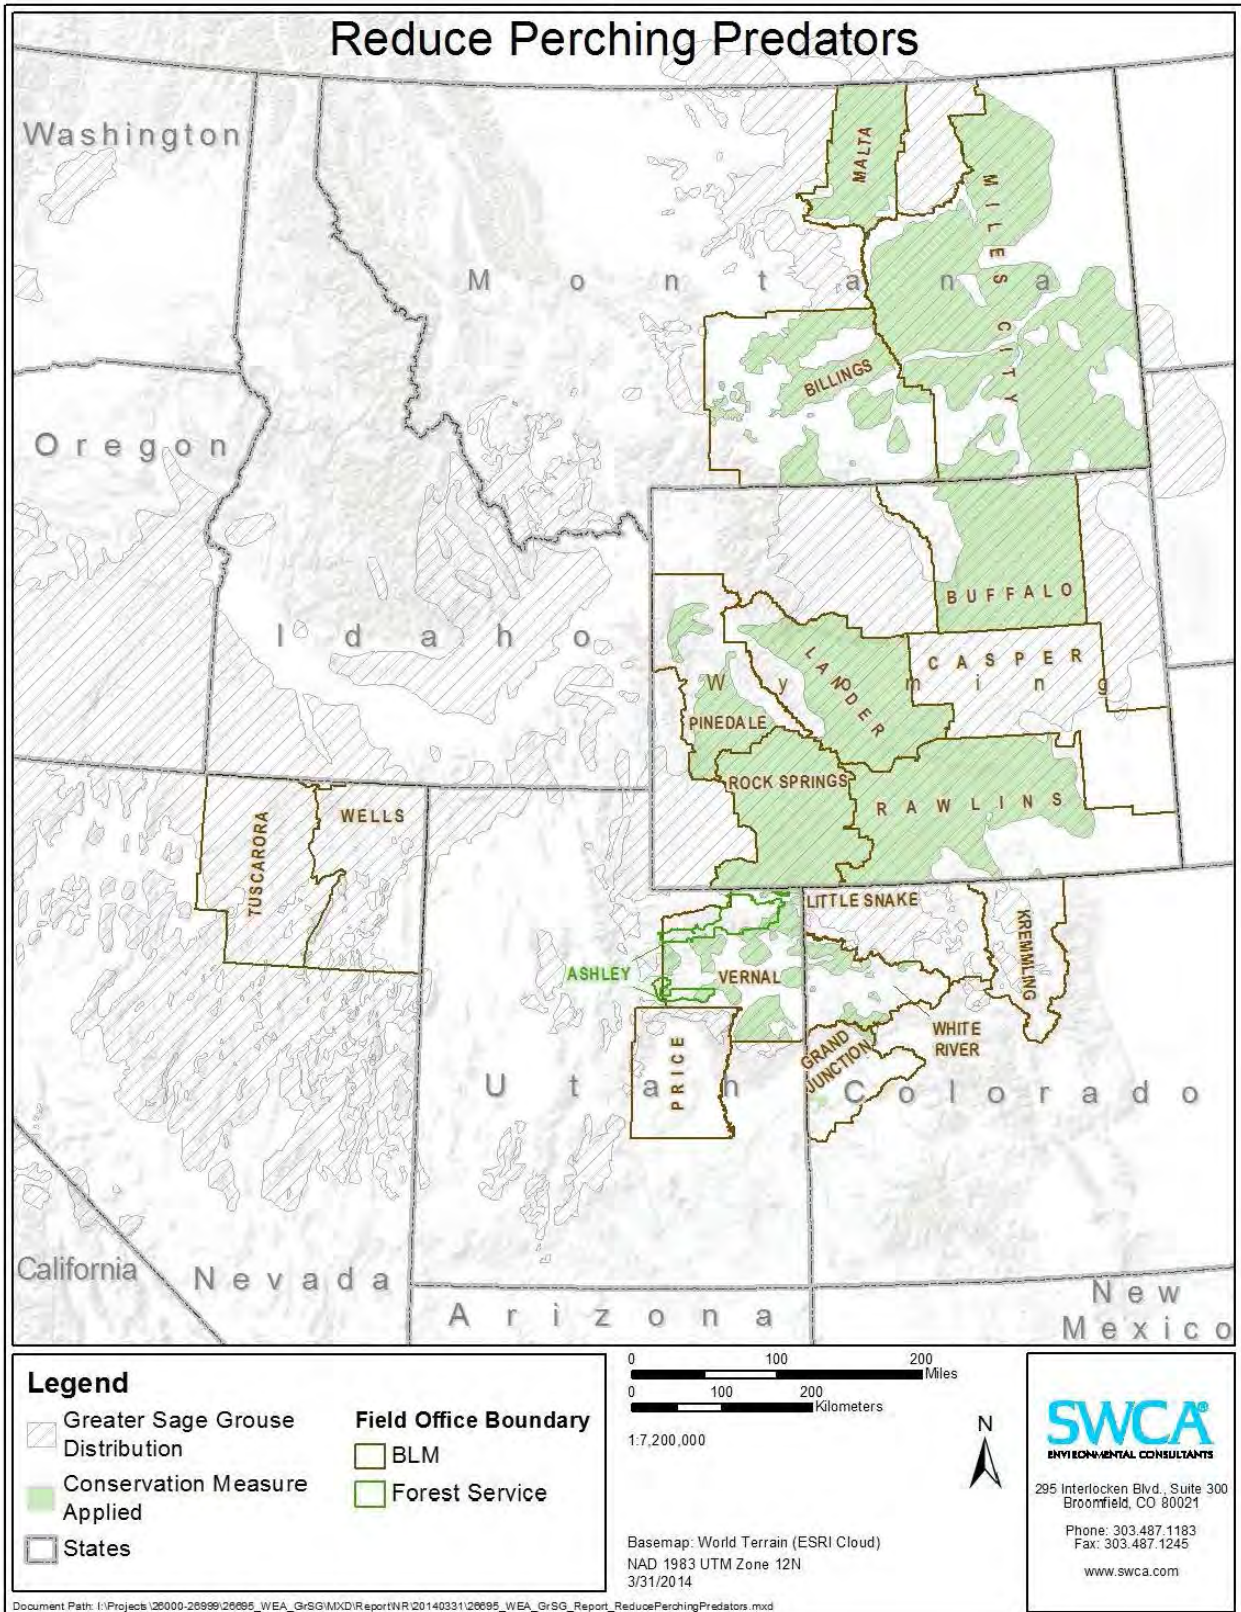

Figure J-1. Map of FOs where Reduce Perching Predators COAs are applied.

Citation	Field Office	Description
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	Surface disturbance and other actions that create permanent and high-profile structures, such as buildings, storage tanks, and overhead power lines, will not be constructed within 0.25 to 1.0 mile of the perimeter of leks, as determined on a case-by-case basis.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	These Best Management Practices (BMPs) will be applied under all alternatives as Conditions of Approval where proposals conflict with identified resources. 6) Burying of power lines to avoid use of poles and other tall structures...
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	Raptor perch avoidance devices will be installed on existing and proposed power poles and tank batteries to reduce potential predation where sage-grouse concerns exist.
Berry Petroleum Company. Record of Decision South Unit Oil and Gas Development Final Environmental Impact Statement Duchesne Ranger District, Ashley National Forest Duchesne County, Utah. 2012.	Ashley National Forest , USFS	To reduce the vantage point that raptors might have by perching on new structures, low-profile tanks will be required for all well pads within sage-grouse habitat.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	Lines should avoid high avian use areas such as wetlands, prairie dog towns, and grouse leks. If not avoidable, use anti-perching devices to discourage perching in sensitive habitats such as grouse leks, prairie dog towns and wetlands to decrease predation and decrease loss of avian predators to electrocution.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	Minimize the number of new power lines in sage grouse or mountain plover habitat. Bury lines near sage grouse leks and mountain plover nesting habitat when feasible.
Chevron. Table Rock Unit Oil and Gas Development EA and DR. WY-040-EA11-175. January 2012.	Rawlins Field Office, BLM Rock Springs Field Office, BLM	To minimize raptor perching and nesting, BLM approved raptor deterring devices would be installed on horizontal cross bars.
Chevron. Table Rock Unit Oil and Gas Development EA and DR. WY-040-EA11-175. January 2012.	Rawlins Field Office, BLM Rock Springs Field Office, BLM	WAR-1 New power lines within 2 miles of an occupied greater sage-grouse lek will either be buried or outfitted with raptor anti-perching devices based on guidance from the BLM wildlife biologist during the APD process. If burying new power lines is not feasible, new power line segments would be designed and constructed in accordance with applicable guidelines to minimize raptor perching, nesting, electrocution, and collision potential.
Cimarex. Rands Butte Gas Development Project Final Environmental Assessment, Decision Record and Finding of No Significant Impact, WY-100-EA09-43. 2010.	Pinedale Field Office, BLM	Power poles within the ½ -mile visual buffer around the lek near the center of the southwest quarter of Section 13, T29N, R114W, shall not extend higher than 80 feet above natural ground level.
Cimarex. Rands Butte Gas Development Project Final Environmental Assessment, Decision Record and Finding of No Significant Impact, WY-100-EA09-43. 2010.	Pinedale Field Office, BLM	The power line shall be relocated from the ridgeline in the north half of Section 14, T29N, R114W south approximately 900 feet to the north side of the of the road/two-track traverse the Spring Creek drainage.
Devon Energy Production Company, L.P., Golden Eagle- Juniper Draw CBNG Field POD EA, WY-070-EA07-111, Buffalo Field Office Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	Creation of raptor hunting perches will be avoided within 0.5-mile of documented sage-grouse lek sites. Perch inhibitors will be installed to deter avian predators from preying on sage grouse.
Devon Energy Production Company. West Pine Tree Unit – Brook Trout POD Environmental Assessment WY-070-EA08-129, 2008.	Buffalo Field Office, BLM	Raptor perch inhibitors will be installed along powerlines that are adjacent to areas with documented sage-grouse use.
Devon Energy Production Company. West Pine Tree Unit – Brook Trout POD Environmental Assessment WY-070-EA08-129, 2008.	Buffalo Field Office, BLM	The Companies will locate aboveground power lines, where practical, at least 0.5 mile from any sage-grouse breeding or nesting grounds to prevent raptor predation and sage-grouse collision with the conductors. Power poles within 0.5 mile of any sage-grouse breeding ground will be raptor-proofed to prevent raptors from perching on the poles.
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	Anti-perching devices will be required on all above ground power structures, including the 230 kV power line, associated with the proposed action.
Elk Petroleum. Environmental Assessment for the Grieve Unit CO2 Enhanced Recovery Project. Natrona County, Wyoming. WY-050-EA11-108. Approved 7/26/12 by BLM Lander Field Office.	Lander Field Office, BLM	The 25 kV electric distribution line to the Meter Station, and any enlargement of service in the field, will be installed underground to minimize disruptions to sage-grouse Core habitat areas.

Citation	Field Office	Description
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	Monitor all structures exceeding six feet in height for the presence of perching raptors or ravens.
EnCana Oil and Gas. Master Development Plan (MDP) for the SG E34 496, SG L27 796 and SG F22 496. DOI-BLM-CO-110-2013-0035-EA. Approved 6/7/13 by the White River Field Office.	White River Field Office, BLM	Raptor perch deterrents would be installed on cross arms of power poles and other documented raptor perches, such as radio towers where birds are noted to perch.
EnCana Oil and Gas. Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project Environmental Assessment. WY-050-EA08-88. Approved 9/5/08 by the Lander BLM Field Office.	Lander Field Office, BLM	Raptor deterrent perches would be used on powerlines structures within 0.5 miles of active sage-grouse leks to minimize raptors perching in the immediate area of the lek and reduce the potential for increased raptor predation during the sage-grouse breeding season.
EnCana Oil and Gas. Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project Environmental Assessment. WY-050-EA08-88. Approved 9/5/08 by the Lander BLM Field Office.	Lander Field Office, BLM	The buried power alternative and the hybrid power alternative were created to address concerns raised during 2007/2008 scoping about new overhead powerline construction in areas with sage-grouse habitat. The concern was that new overhead lines could provide perch locations for raptors that prey on sage grouse and thus decrease the sage-grouse population. The approved alternative reduces the amount of overhead powerlines and thus, the amount of potential perches for avian predators. The amount of surface disturbance is approximately 2% greater than the proposed project, which consists of all overhead powerlines.
EnCana. Environmental Assessment of the Orchard Master Development Plan for Oil and Gas Development. GJFO # DOI-BLM-CO-130-2009-0001-EA and GSFO # DOI-BLM-CO-140-2008-0032-EA. Grand Junction Field Office and Glenwood Springs Energy Office, October 2008.	Grand Junction Field Office, BLM	Dry hole marker shall be sub-surface, to prevent raptor predation upon small game, including sage-grouse.
Fidelity Exploration & Production Company. Bowdoin Natural Gas Development Project Phillips and Valley Counties, Montana. Environmental Assessment MT-92234-07-59. December, 2008. Buffalo Field Office, BLM	The Companies will construct power lines to minimize the potential for raptor collisions with the lines. Potential modifications include burying the lines, avoiding areas of high avian use (for example, wetlands, prairie dog towns, and grouse leks), and increasing the visibility of the individual conductors.
Yates Petroleum Corporation. Lazurite POD Environmental Assessment WY-070-EA09-095, 2009.	Buffalo Field Office, BLM	All proposed power will be buried in the approved corridor.

**APPENDIX K**  
**Produced Water Management**

**Table K-1. PECE Policy Evaluation – Produced Water Management**

Conservation Measure	Produced Water Management
<b>Certainty of Implementation</b>	
The conservation effort, the party(ies) to the agreement or plan that will implement the effort, and the staffing, funding level, funding source, and other resources necessary to implement the effort are identified.	The BLM/USFS decision records require implementation as a condition of the agency authorization. Funding and implementation is generally identified as the responsibility of the operator(s).
The legal authority of the party(ies) to the agreement or plan to implement the formalized conservation effort, and the commitment to proceed with the conservation effort are described.	NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed this evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.

<b>Conservation Measure</b>	<b>Produced Water Management</b>
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	Produced water management COAs and conservation measures address threats associated with Energy Development under Listing Factor A; Disease under Factor C; and Contamination under Factor E.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	Many documents prohibit or discourage disposal or storage on the surface.
The steps necessary to implement the conservation effort are identified in detail.	Steps are identified and include installing closed-loop drilling systems, screening water pits and using mosquito control methods.
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	The spread and distribution of West Nile Virus including around oil and gas fields can be measured. Decreases in water storage or disposal to the surface are tracked under many of the NEPA documents or by each state's water management agencies.
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Annual lek counts are tracked by state game and fish agencies and federal land management agencies for purposes of evaluating grouse populations and health. State game and fish agencies commonly track the spread and distribution of West Nile Virus including around oil and gas fields. Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

Exxon. Piceance Development Project EA, Finding of No Significant Impact and Decision Record, CO-110-2005-219-EA, 2007.	White River Field Office, BLM	It will be the responsibility of the operator to effectively preclude migratory bird access to, or contact with, reserve pit contents that possess detrimental properties (i.e., through ingestion or exposure) or have potential to compromise the water-repellent properties of birds' plumage. Exclusion methods may include netting, the use of "bird-balls," or other alternative methods that effectively eliminate migratory bird contact with pit contents and meet BLM's approval.
Fidelity Exploration & Production Company. Bowdoin Natural Gas Development Project Phillips and Valley Counties, Montana. Environmental Assessment MT-92234-07-59. December, 2008.	Malta Field Office, BLM	Manage produced water to reduce the spread of West Nile virus within sage-grouse habitat areas. Implement the following impoundment construction techniques and measures to eliminate water sources that support breeding mosquitoes: Overbuild the size of ponds to accommodate a greater volume of water than is discharged. This will result in non-vegetated and muddy shorelines that breeding mosquitoes avoid. Build steep shorelines to reduce shallow water and aquatic vegetation around the perimeter of impoundments. Construction of steep shorelines also will increase wave action that deters mosquito production. Maintain the water level below rooted vegetation for a muddy shoreline that is unfavorable habitat for mosquito larvae. Rooted vegetation includes both aquatic and upland vegetative types. Always avoid flooding terrestrial vegetation in flat terrain or low-lying areas. Use a horizontal pipe to discharge inflow directly into existing open water, thus precluding shallow surface inflow and accumulation of sediment that promotes aquatic vegetation. Fence pond site to restrict access by livestock and other wild ungulates that trample and disturb shorelines, enrich sediments with manure, and create hoof-print pockets of water that are attractive to breeding mosquitoes. Use adulticides to target adult mosquito populations and larvicides to control the hatching of mosquito larvae, using approved pesticides and utilizing licensed applicators with a Pesticide Use Plan.
Gasco Energy Inc. Uinta Basin Natural Gas Development Project, Environmental Impact Statement FES 12-5, Record of Decision, Bureau of Land Management Vernal Field Office, June 2012.	Vernal Field Office, BLM	The proper installation of netting or other deterrents as directed by AO will be required to exclude wildlife (including raptors, birds, and bats) from evaporative basins (or reserve pits as needed).
Jonah Infill Drilling Project Environmental Impact Statement and Record of Decision, Sublette County, Wyoming. 2006. **APPENDIX L**  
**Timing Limitations**

**Table L-1. PECE Policy Evaluation – Timing Limitations**

Conservation Measure	Timing Limitations
<b>Certainty of Implementation</b>	
The conservation effort, the party(ies) to the agreement or plan that will implement the effort, and the staffing, funding level, funding source, and other resources necessary to implement the effort are identified.	The BLM/USFS decision records require implementation as a condition of the agency authorization. Funding and implementation is generally identified as the responsibility of the operator(s).
The legal authority of the party(ies) to the agreement or plan to implement the formalized conservation effort, and the commitment to proceed with the conservation effort are described.	NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed this evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.

<b>Conservation Measure</b>	<b>Timing Limitations</b>
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	Timing limitation COAs and conservation measures address threats associated with Energy Development under Listing Factor A.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	Timing for implementation of restrictions is explicitly stated in each NEPA document. These are implemented annually for the life of the project.
The steps necessary to implement the conservation effort are identified in detail.	Steps are identified and include avoidance of activities surrounding leks within given distance buffers during certain times of the day.
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	Lek attendance monitoring, monitoring of nesting and brood-rearing hens, etc. provide quantifiable parameters to measure success of the measure. Multiple sources identify that avoidance of activities surrounding leks during lekking, nesting, and early brood-rearing periods provide conservation benefit and protective measures for sage-grouse.
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Annual lek counts are tracked by state game and fish agencies and federal land management agencies for purposes of evaluating grouse populations. Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

Conservation Measure	Vegetation Treatments
<b>Certainty of Implementation</b>	
The conservation effort, the party(ies) to the agreement or plan that will implement the effort, and the staffing, funding level, funding source, and other resources necessary to implement the effort are identified.	The BLM/USFS decision records require implementation as a condition of the agency authorization. Funding and implementation is generally identified as the responsibility of the operator(s).
The legal authority of the party(ies) to the agreement or plan to implement the formalized conservation effort, and the commitment to proceed with the conservation effort are described.	NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed this evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

<b>Conservation Measure</b>	<b>Vegetation Treatments</b>
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	Vegetation treatment and fire management COAs and conservation measures address threats associated with pinyon-juniper encroachment, invasive plants, and fire under Listing Factor A.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	The objectives and timing are explicitly stated in each NEPA document and associated habitat improvement plans.
The steps necessary to implement the conservation effort are identified in detail.	Steps are identified and include removal of encroaching pinyon and juniper and steps to enhance sage-grouse habitats. Fire Prevention and Management Plans detail the steps necessary for implementation.
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	Success is quantified by the number of acres pinyon juniper is reduced, and the number of acres sagebrush and other habitats are enhanced. Decreased or stable fire frequency can be easily measured.
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Project monitoring includes lek attendance monitoring, monitoring for use in treated areas, and monitoring for re-encroachment of undesirable vegetation. State and Federal agencies track fire frequency.
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

**Monitoring and Adaptive Management**

**Table N-1. PECE Policy Evaluation – Monitoring and Adaptive Management**

Conservation Measure	Monitoring and Adaptive Management
<b>Certainty of Implementation</b>	
The conservation effort, the party(ies) to the agreement or plan that will implement the effort, and the staffing, funding level, funding source, and other resources necessary to implement the effort are identified.	The BLM/USFS decision records require implementation as a condition of the agency authorization. Funding and implementation is generally identified as the responsibility of the operator(s).
The legal authority of the party(ies) to the agreement or plan to implement the formalized conservation effort, and the commitment to proceed with the conservation effort are described.	NEPA provides the legal and statutory authority to implement the conservation measures and COAs included in the agency decision records.
The legal procedural requirements (e.g. environmental review) necessary to implement the effort are described, and information is provided indicating that fulfillment of these requirements does not preclude commitment to the effort.	NEPA is the legal procedural requirement necessary to implement COAs and conservation measures included in the agency decision records.
Authorizations (e.g., permits, landowner permission) necessary to implement the conservation effort are identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the effort will obtain these authorizations.	The NEPA decision record provides the necessary authorization to implement the COAs and conservation measures. As the measures are conditions of the agency approval and are required for project completion, there is a high level of certainty that they will be implemented and authorized.
The type and level of voluntary participation (e.g., number of landowners allowing entry to their land, or number of participants agreeing to change timber management practices and acreage involved) necessary to implement the conservation effort is identified, and a high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain that level of voluntary participation (e.g., an explanation of how incentives to be provided will result in the necessary level of voluntary participation).	Participation in the implementation of the COAs and conservation measures is mandatory as a condition of the agency approval under NEPA. NEPA authorizations exceed this evaluation criteria by making the measures mandatory.
Regulatory mechanisms (e.g., laws, regulations, ordinances) necessary to implement the conservation effort are in place.	NEPA provides the regulatory mechanism for implementation. Where necessary, other federal or state authorizations or permits might be required prior to implementation (i.e., Clean Water Act permits). There is reasonable certainty that these permits will be obtained for each measure or COA.

<b>Conservation Measure</b>	<b>Monitoring and Adaptive Management</b>
A high level of certainty is provided that the party(ies) to the agreement or plan that will implement the conservation effort will obtain the necessary funding.	The agency decision requires that funding for the COAs and conservation measures be provided as a condition of the project approval. There is certainty that each measure will be funded.
An implementation schedule (including incremental completion dates) for the conservation effort is provided.	Each NEPA document and associated decision record analyzes and describes the schedule for project implementation. As conditions of agency approvals, COAs and conservation measures must be completed during or prior to project completion.
The conservation agreement or plan that includes the conservation effort is approved by all parties to the agreement or plan.	As a condition of the agency approval of each project, there is agreement between the operators and the agency that each COA or conservation measure will be implemented as part of project activities.
<b>Certainty of Effectiveness</b>	
The nature and extent of threats being addressed by the conservation effort are described, and how the conservation effort reduces the threats is described.	Monitoring and Adaptive Management COAs and conservation measures address threats associated with Energy Development and Infrastructure under Listing Factor A; Disease and Predation under Factor C; and Contaminants under Factor E.
Explicit incremental objectives for the conservation effort and dates for achieving them are stated.	Implementation of Monitoring and Adaptive management typically occurs annually for the life of the project. Objectives are to document the success of mitigation measure and to adjust the approach if mitigation is not successful.
The steps necessary to implement the conservation effort are identified in detail.	Adaptive management plans generally outline steps to be taken including regular meetings of Technical Advisory Committees or other similar stakeholder groups to review progress and identify additional actions
Quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured, are identified.	Monitoring quantifies various parameters in order to determine if the objectives of mitigation measures have been achieved based on standards described in a monitoring plan (number of grouse on leks, % cover of vegetation, etc.)
Provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.
Principles of adaptive management are incorporated.	Monitoring and adaptive management practices discussed in detail in the report provide examples of additional monitoring and reporting provisions.

Buffalo Field Office, BLM	For any surface-disturbing activities proposed in sagebrush shrublands, the Companies will conduct clearance surveys for sage grouse breeding activity during the sage grouse's breeding season before initiating the activities. The surveys must encompass all sagebrush shrublands within 0.5 mile of the proposed activities.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	WILDLIFE MONITORING AND PROTECTION PLAN. The goal of the plan is to avoid and/or minimize adverse impacts to wildlife present on project-affected areas by monitoring wildlife population trends on the ARNG during the course of project development and operations and by developing appropriate mitigation actions.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	Greater sage-grouse/Columbian sharp-tailed grouse lek inventories will be conducted by the BLM and Wyoming Game and Fish Department (WGFD) or by a BLM-approved operator-financed biologist on the project area and a two mile/one mile buffer to determine lek locations every 5 years, or as deemed appropriate by the BLM.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	Operators will complete draft annual reports for submittal to the Review Team by November 15 of each year. Annual reports will summarize annual wildlife inventory and monitoring results, note any trends across years, identify and assess protection measures implemented during past years, specify monitoring and protection measures proposed for the upcoming year, recommend modifications to the existing wildlife monitoring/protection plan based on the successes and/or failures of past years, and identify additional species/categories to be monitored.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	The BLM will use a performance-based management approach as part of the adaptive management process. The BLM will attempt to achieve the following Performance Goals in collaboration with other state and other federal agencies: provide well-dispersed sage-grouse breeding, nesting, brood rearing, and winter habitat. As part of the annual planning process, a monitoring and mitigation process will be required, and its development will begin within 30 days of the effective date of the ROD. This information should be reviewed at least annually with development plans modified based on trends.
Atlantic Rim Natural Gas Field Development Project Record of Decision and Environmental Impact Statement, Carbon County, Wyoming. March 2007.	Rawlins Field Office, BLM	The planning, review, and approval process for project implementation is described below. This process will typically be initiated by the Operators through an annual planning meeting with the Rawlins Field Office Manager, where they will outline detailed development plans for the upcoming year and a conceptual multi-year plan. The BLM (including interdisciplinary team members), cooperating and interested agencies, and the Operators will make up a Review Team to evaluate annual and site-specific development proposals and monitoring reports. The review and approval process will include a site-specific visit by the Review Team, applicable environmental review and establishing required BMPs, conditions of approval, or other protective measures to mitigate potential environmental impacts.

Bill Barrett Corporation, Beaver Creek Add II, Beaver Creek Add II SGP PODs, Beaver Creek Little Buffalo 32-24 APD & Beaver Creek Little Buffalo 34-24 APD, EA # WY-070-09-065, Buffalo Field Office Buffalo, Wyoming, 2010.	Buffalo Field Office, BLM	A sage-grouse lek survey of the area within four miles of the project will be conducted by a biologist following the most current WGFD protocol to determine status of known leks and locations of new leks. All survey results shall be submitted in writing to a BLM biologist.

Citation	Field Office	Description
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	BLM will apply wildlife mitigation measures consistent with adaptive management practices as necessary to achieve its resource objectives. Annual report on sage-grouse winter use monitoring to determine the effectiveness of sage-grouse mitigation and to provide useful information for potentially modifying the winter drilling exceptions through the adaptive management process.
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	The agency mitigation plan will also establish a mitigation oversight committee (MOC) to be led by the BLM, in coordination with UDWR, SITLA, other agencies, and the operators. The WTP MOC will include, or at least invite to participate, a representative from a local sage-grouse working group, any potential affected private landowners, and representatives from Carbon and Duchesne Counties. The WTP MOC will complete evaluations and make determinations on on-going and planned mitigation activities on an annual basis, in advance of considerations for winter activities (as is outlined in the ROD), and prepare a report on its findings.
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	As part of this plan, BBC and other operators will be required to mitigate impacts to wildlife on a 4:1 acre ratio based on total potential long-term surface disturbance. Under the plan, 30 percent of the total potential long-term surface disturbance (estimated to be approximately 685 acres) will be mitigated during the first 3 years of the development phase.
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	In order to mitigate the impacts of winter drilling, BBC has included a detailed Wildlife Mitigation Plan as part of their Proposed Action. The goal of BBC's Wildlife Mitigation Plan is to improve habitats for sage-grouse, mule deer, elk, and raptors in an effort to offset the effects of winter drilling and other potential impacts of the project. The BLM and UDWR have also included an Agency Wildlife Mitigation Plan. The agencies' alternative mitigation plan emphasizes the importance of offsetting, to the extent reasonable, the effects of the full field development in its entirety. The agencies' plan gives priority to compensating for potential impacts to greater sage grouse, deer, elk, and raptors.
Bill Barrett Corporation. Environmental Impact Statement (UT-070-05-055) for West Tavaputs Plateau Natural Gas Full Field Development Plan and ROD. 2010.	Price Field Office, BLM	The operators will contribute to UDWR for monitoring greater sage-grouse, whether the continued telemetry study or other, more aggressive means of monitoring, if necessary, including experimental designs.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	Aerial surveys will be used for determining lek locations. BLM, MFWP or BLM-approved Operator-financed biologist will monitor sage grouse lek attendance within 2 miles of areas having < 4 locations per section such that all leks on these areas are surveyed at least once every 3 years. Data collected during these surveys will be recorded on BLM and MFWP approved data sheets and entered into the BLM GIS database. An effort should also be made to compare trends of the number of males/lek to reference leks.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	BLM and MFWP will conduct sage grouse lek inventories over the BLM planning area every 5 years to determine lek locations. Surveys of different areas may occur during different years with the intent that the entire area will be covered at least once every 5 years. If BLM notes a downward trend, mitigation, such as extension of timing restrictions, could occur.
BLM Montana. Record of Decision for the Final Statewide Oil and Gas Environmental Impact Statement and Proposed Amendment of the Powder River and Billings Resource Management Plans. 2003.	Billings Field Office, BLM Miles City Field Office, BLM	BLM and MFWP will conduct sage grouse lek inventories over the entire CBM project area every 5 years to determine lek locations. Surveys of different areas may occur during different years with the intent that the entire CBM project area will be covered at least once every 5 years.

Citation	Field Office	Description
EnCana Oil and Gas. 28 APDs on new well pad D36 496. DOI-BLM-CO-110-2011-0169-EA. Approved 9/23/11 by the White River Field Office.	White River Field Office, BLM	In an effort to accommodate existing lease rights and maintain viable populations of sage-grouse in development areas, a cooperatively developed pilot strategy is being employed that attempts to exploit the strong fidelity of adult sage-grouse to previously used reproductive habitats, tempered by considerations for the average 4-5 year life-span of sage-grouse and the propensity of yearling grouse to abandon areas disturbed by natural gas development. By allowing concentrated development pressure in pre-defined subunits of a subpopulation for a period not to exceed three consecutive breeding seasons, and then vacating that subunit of all possible activity for no less than two consecutive breeding seasons, it is hoped that one or two years' recruitment associated with resident adult birds would allow those broods to develop sufficient site fidelity to perpetuate occupation and reproductive use of that subunit. The proposed location is thought to carry few birds and represents relatively low risk in testing the efficacy of this development strategy. This strategy, as applied to the applicant's leases in the PPR population area, is addressed in an existing agreement between EnCana and CPAW. The agreement also incorporates a number of applicant-committed grouse management measures that constrains construction and maintenance/operation activities to less critical timeframes and, where possible, uses extraordinary means to avoid grouse habitat altogether.
EnCana Oil and Gas. Story Gulch Well Pads (2). DOI-BLM-CO-110-2009-0229-EA. Approved 2/3/10 by White River Field Office.	White River Field Office, BLM	In an effort to accommodate existing lease rights and maintain viable populations of sage-grouse in development areas, a cooperatively developed pilot strategy is being employed that attempts to exploit the strong fidelity of adult sage-grouse to previously used reproductive habitats, tempered by considerations for the average 4-5 year life-span of sage-grouse and the propensity of yearling grouse to abandon areas disturbed by natural gas development. By allowing concentrated development pressure in pre-defined subunits of a subpopulation for a period not to exceed 3 consecutive breeding seasons, and then vacating that subunit of all possible activity for no less than 2 consecutive breeding seasons, it is hoped that 1 or 2 years' recruitment associated with resident adult birds would allow those broods to develop sufficient site fidelity to perpetuate occupation and reproductive use of that subunit. The subunit now being considered (Story 2) consists of approximately 4,000 acres in the upper watershed of West and Middle Forks of Story Gulch extending south from the Garfield County line. As alluded to above, this subunit is thought to carry few birds and represents relatively low risk in testing the efficacy of this development strategy. This strategy, as applied to the applicant's leases in the PPR population area, is addressed in an existing agreement between EnCana and the CDOW. During on-site inspections and a subsequent meeting with the applicant, certain recommendations offered by BLM and CDOW biologists were incorporated as amendments to this agreement (i.e., activity timing and feature design and location).
EnCana Oil and Gas. APDs- N22-496 (16)& P28-496 (16). DOI-BLM-CO-110-2011-0006-EA. White River Field Office. Approved 5/24/11 by White River Field Office.	White River Field Office, BLM	An EnCana initiative, and one endorsed by CDOW and WRFO, the development designs for multi-well pads and centralized production facilities in the valley bottoms were undertaken specifically as a means to avoid habitat and behavioral impacts to sage-grouse. Although not avoiding the potential for adverse grouse response altogether, under these circumstances, these development patterns and timeframes effectively balance a number of desirable sage-grouse oriented objectives, including avoiding short and long term modification and occupation of suitable sage-grouse habitat, reduced disruption of sage-grouse reproductive activities, reduced surface density of development features, and reduced frequency of vehicle traffic during the decades-long production phase. This development strategy is consistent with wildlife management agreements arranged between EnCana and the CDOW.
EnCana Oil and Gas. L24 496 New Well Pad - 28 APDs. DOI-BLM-CO-110-2012-0021-DNA. Approved 3/20/12 by White River Field Office.	White River Field Office, BLM	Consistent with EnCana-Colorado Parks and Wildlife (CPW) wildlife mitigation plan and in coordination with the WRFO the applicant has confined operations to this range fringe for the last several years and has incorporated design features and BMPs that minimize short and long-term declines in habitat availability and reduces the frequency and intensity of behavioral impacts on birds that continue to use this ridgeline.
EnCana Oil and Gas. Pappy Draw Exploratory Coal-bed Natural Gas Pilot Project Environmental Assessment. WY-050-EA08-88. Approved 9/5/08 by the Lander BLM Field Office.	Lander Field Office, BLM	Appropriate clearance surveys would be conducted for special status species before construction activities begin. If threatened, endangered, candidate, or proposed species are discovered at any time during construction, all construction activities would be stopped and the BLM would be immediately notified. Work would not resume until a Notice to Proceed is issued by the BLM.
Exxon. North Hatch Gulch Project Environmental Assessment, DOI-BLM-CO-110-2010-0200-EA, 2012.	White River Field Office, BLM	Wildlife Research Cooperative Agreement: Effective May 1, 2010, a cooperative agreement among CPW, Colorado State University, and XTO was executed to jointly research: 1. The potential effects of hydrocarbon development and extraction on wildlife and their supporting habitat, and 2. The most efficient mitigation measures to reduce identified impacts on wildlife and associated habitat. XTO's sponsorship of ongoing and future studies under this cooperative agreement will produce a better understanding of oil and gas production potential effects on wildlife, particularly big game, and the development of effective mitigation measures that can minimize the effects of oil and gas activity on wildlife and their habitats in Piceance Basin.

Citation	Field Office	Description
Exxon. North Hatch Gulch Project Environmental Assessment, DOI-BLM-CO-110-2010-0200-EA, 2012.	White River Field Office, BLM	Wildlife Mitigation Plan: In May 2008, XTO, BLM, and the Colorado Parks and Wildlife (CPW) initiated in discussions regarding future development plans in the Piceance Basin, potential mitigations to reduce environmental impacts to wildlife, and strategies to obtain approval of year-round and continuous activities. The objective of the discussions was to develop a Wildlife Mitigation Plan (WMP) for XTO's leases. A WMP is one method approved by the Colorado Oil and Gas Conservation Commission (COGCC), under recent rule changes, to facilitate APD approvals by avoiding the need for individual well or well pad consultations with CPW for development in sensitive wildlife areas. The proposed WMP was intended to apply to CPW's administration of wildlife on approximately 150,000 acres of XTO leases, largely on federal surface, within the Piceance Basin. A final WMP was approved and signed by representatives of XTO and CPW in August 2010, but is effective as of July 1, 2010. A copy of the Plan has been included as Appendix A to this EA. The Plan indicates specific mitigations and Best Management Practices (BMPs) which XTO will use in its development activities within the covered leasehold. An important feature of the Plan is CPW's present support of XTO's year-round and continuous activities within XTO's 150,000-acre leasehold. XTO will meet with CPW on at least an annual basis to review the effectiveness of applied mitigation measures, revise these measures as necessary to ensure their efficiency, consistent with the principles of adaptive management, and provide an updated three-year development plan to CPW.
Exxon. Piceance Creek 3D Seismic Survey Project Environmental Assessment, CO-110-2008-036-EA, 2008.	White River Field Office, BLM	BLM biologists will be notified prior to beginning use of vibe trucks in the Magnolia area. BLM biologists will monitor initial use of vibe trucks and determine whether there is less impact to suitable habitat if the vibes travel in a single file line rather than staggered. A final decision on whether to stagger the vehicles in this area or to have them travel single file will be made after the initial demonstration.
Exxon. Piceance Development Project EA, Finding of No Significant Impact and Decision Record, CO-110-2005-219-EA, 2007.	White River Field Office, BLM	ExxonMobil will consider assisting BLM with sage-grouse presence surveys and habitat assessment in the sagebrush community adjacent to and surrounding the proposed locations of the CTF.
Exxon. Piceance Development Project EA, Finding of No Significant Impact and Decision Record, CO-110-2005-219-EA, 2007.	White River Field Office, BLM	Sage-grouse presence surveys and habitat assessment will be completed each spring prior to construction in areas of known sage-grouse activity or suitable habitat. BLM-approved biologists will be required to meet with BLM biologists prior to initiating surveys, and will conduct the surveys using BLM survey protocols.

Citation	Field Office	Description
Powder River Basin Oil and Gas Project, Record of Decision and Resource Management Plan Amendments. EIS WY-070-02-065. April 2003.	Buffalo Field Office, BLM	The BLM Buffalo Field Manager will implement the Mitigation Monitoring and Reporting Plan by establishing the Powder River Basin Working Group (PRBWG). The PRBWG will function as a resource working group consisting of BLM, cooperating agencies and other agencies who have expertise and regulatory authority in the area. The primary function of the PRBWG will be to: Review the development and implementation of monitoring plans for the PRB oil and gas development; Meet at a minimum once a year or more often as needed; Keep written record of meetings and disseminate to members and interested public; Conduct field inspections as needed to review the implementation of construction and rehabilitation operations; Review status quo and any new information since last meeting (e.g., monitoring results of impact mitigation effectiveness); Synthesize monitoring plan activities/expectations for the coming year, based upon operator input and new information; Review recommendations from the Task Groups and submit a recommendation to BLM (e.g., management practices and monitoring needs for upcoming field season); Oversee implementation of monitoring.
Powder River Basin Oil and Gas Project, Record of Decision and Resource Management Plan Amendments. EIS WY-070-02-065. April 2003.	Buffalo Field Office, BLM	The Companies will conduct clearance surveys for threatened, endangered or other special-concern species at the optimum time. Inventory for special concern species is contingent upon landowner concurrence. This will require coordination with the BLM before November 1 annually to review the potential for disturbance and to agree on inventory parameters.
Powder River Basin Oil and Gas Project, Record of Decision and Resource Management Plan Amendments. EIS WY-070-02-065. April 2003.	Buffalo Field Office, BLM	The Companies will conduct clearance surveys for threatened, endangered or other special-concern species at the optimum time. Inventory for special concern species, other than federally listed species below, is contingent upon landowner concurrence. This will require coordination with the BLM before November 1 annually to review the potential for disturbance and to agree on inventory parameters.
Powder River Basin Oil and Gas Project, Record of Decision and Resource Management Plan Amendments. EIS WY-070-02-065. April 2003.	Buffalo Field Office, BLM	The semi-annual report will include field survey reports for endangered, threatened, proposed and candidate species for all actions covered under the Environmental Impact Statement (EIS) for the Powder River Basin Oil and Gas Project and ROD. The semi-annual reports will include all actions completed up to 30 days prior to the reporting dates. The first report will be due 6 months after the signing of the ROD and on the anniversary date of the signing of the ROD. Reporting will continue for the life of the project.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	This ROD includes a Wildlife Monitoring and Mitigation Matrix (Appendix B) that will trigger mitigation responses based upon monitoring information (e.g. Average of 30% decline in sage grouse male lek attendance over 2 years compared to reference area would trigger mitigation)
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Adaptive management - The Operators will provide information on existing development and results of relevant monitoring studies at the annual meeting of the Review Team...When monitoring indicates a change requiring mitigation, serious mitigation efforts will be developed...
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Decibel monitoring from March 1-May 15 at lek sites.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Establish a Pinedale Anticline Project Office to obtain, collect, store, and distribute monitoring information to support adaptive management and analyze mitigation projects.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	If existing information is not current, field evaluations for greater sage-grouse leks and/or nests will be conducted by a qualified biologist prior to the start of activities in potential greater sage grouse habitat. These field evaluations for leks and/or nests will be conducted if project activities are planned in potential greater sage-grouse habitat between March 15 and July 15. BLM wildlife biologists will ensure that such surveys are conducted using proper survey methods.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Monitor winter concentration area use.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Nesting success and habitat selection study.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Operators pay into a Fund used for additional air quality monitoring, additional wildlife, livestock, vegetation and reclamation research, analysis, monitoring, and mitigation.

Citation	Field Office	Description
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Should a change requiring mitigation occur for any of the performance standards, mitigation responses will first evaluate on-site measures then off-site measures and operational measures as outlined in the following sequence: On-site: Protection of flank areas from disturbance (e.g., voluntary lease suspensions, lease buyouts, voluntary limits on area of delineation/development drilling) to assure continued habitat function of flank areas, and to provide areas for enhancement of habitat function. AND/OR Habitat enhancements of SEIS area (both core/crest and flanks) at an appropriate (initially 3:1) enhancement-to-disturbance acreage ratio. On-site/Off-site: Conservation Easements or property rights acquisitions to assure their continued habitat function, or provide an area for enhanced habitat function (e.g., maintenance of corridor and bottleneck passages, protection from development, establishment of forage reserves, habitat enhancements at an appropriate (initially 3:1) enhancement-to-disturbance acreage ratio). Modification of Operations: Recommend, for consideration by Operators and BLM, adjustments of spatial arrangement and/or pace of ongoing development.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Table B.1 Standard 2: If there is an average of 30% decline in attendance numbers over 2 years as measured by the total average 2-year change in numbers of males attending development area lek complexes (the Mesa, Duke's Triangle, or Yellow Point lek complex), compared to the East Fork, Speedway, or Ryegrass reference lek complexes, additional mitigation responses are applied.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Table B.1 Standard 4: If there is an average of 15% per year decline in amount of winter habitat used over 2 years compared to reference areas, and a concurrent average of 30% decline in numbers over 2 years compared to reference area, additional mitigation responses are applied.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	Table B.1 Wildlife Monitoring and Mitigation Matrix provides standards based metrics that, if not met, trigger additional mitigation responses to ensure standards are met. Standard 1: Active use on 70% of total current leks; Active use on 70% of leks in each complex (the development area complexes include the Mesa, Duke's Triangle, and Yellow Point complexes) compared to 2007 data. If a 30% decline in total number of active leks, or 30% decline in the number of leks in a single complex is observed, additional mitigation responses are applied.
Record of Decision, Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project, Sublette County, Wyoming. 2008.	Pinedale Field Office, BLM	The total contribution to the Fund by Ultra, Shell, and Questar will be \$36 million. Ultra, Shell, and Questar will each annually contribute \$7,500 for each well spudded on their respective leaseholds the previous calendar year. Ultra, Shell and Questar may make advanced contributions to the Fund to implement projects. Such contributions will be credited toward the end of development contributions. Annual contributions are anticipated to be \$1.8 million per year with an initial contribution of at least \$4.2 million. The Fund will be used for both on-site and off-site mitigation and project-related activities in the PAPA vicinity including additional air quality monitoring, additional wildlife, livestock, vegetation and reclamation research, analysis, monitoring, and mitigation. The Fund could be used to support wildlife mitigation such as basic habitat enhancements for improvement of habitat function both on-site and off-site and to identify and protect key migration routes and wildlife habitat. The Fund may also be used for monitoring impacts resulting from development and the effectiveness of the mitigation. Mitigation and monitoring may occur on federal, state, or private lands. It may also be used to provide funds to governmental agencies to pay personnel to complete, oversee, mitigate, and monitor PAPA activities. The Fund is not intended to fund projects or proposals to mitigate potential impacts beyond those identified in the Final SEIS (BLM, 2008).
Summit Gas Resources, Inc. Cabin Creek VII Federal POD WY-070-EA12-183, Buffalo Field Office, 2012.	Buffalo Field Office, BLM	For any surface-disturbing activities proposed in sagebrush shrublands, the operator will conduct clearance surveys for sage-grouse breeding activity during the sage-grouse's breeding season before initiating the activities. The surveys must encompass all sagebrush shrublands within 0.5 miles of the proposed activities. This will apply to all approved wells and infrastructure. All survey results shall be submitted in writing to a Buffalo BLM biologist no later than July 31 of the current year. This condition will be implemented on an annual basis for the duration of surface disturbing activities. If a previously unknown lek is identified during surveys (April 1-May 7), a Buffalo BLM biologist shall be notified.

All survey results shall be submitted in writing to a Buffalo BLM biologist and approved prior to surface disturbing activities.
Yates Petroleum Corporation, Gauge POD EA, WY-070-EA09-75, Buffalo Field Office, 2009.	Buffalo Field Office, BLM	A sage-grouse survey will be conducted for all known leks within 2 miles of the POD by a biologist following the most current WGFD protocol. All survey results shall be submitted in writing to a Buffalo BLM biologist no later than July 31 of the current year. Currently, this applies to the Gilkie Ranch lek, Innes lek, and North Beaver Creek leks.
Yates Petroleum Corporation, Gauge POD EA, WY-070-EA09-75, Buffalo Field Office, 2009.	Buffalo Field Office, BLM	For any surface-disturbing activities proposed in sagebrush shrublands, the Companies will conduct clearance surveys for sage grouse breeding activity during the sage grouse's breeding season before initiating the activities. The surveys must encompass all sagebrush shrublands within 0.5 mile of the proposed activities.
Yates Petroleum Corporation. All Day POD. EA # WY-070-08-026 and COAs. Buffalo Field Office Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	A sage-grouse lek survey will be conducted for all known leks within 2 miles of the POD by a biologist following the most current WGFD protocol. All survey results shall be submitted in writing to a Buffalo BLM biologist and approved prior to surface disturbing activities.
Yates Petroleum Corporation. All Day POD. EA # WY-070-08-026 and COAs. Buffalo Field Office Buffalo, Wyoming, 2008.	Buffalo Field Office, BLM	For any surface-disturbing activities proposed in sagebrush shrublands, the Companies will conduct clearance surveys for sage grouse breeding activity during the sage grouse's breeding season before initiating the activities. The surveys must encompass all sagebrush shrublands within 0.5 mile of the proposed activities.
Yates Petroleum Corporation. Lazurite POD Environmental Assessment WY-070-EA09-095, 2009.	Buffalo Field Office, BLM	For any surface-disturbing activities proposed in sagebrush shrublands, the Companies will conduct clearance surveys for sage grouse breeding activity during the sage grouse's breeding season before initiating the activities. The surveys must encompass all sagebrush shrublands within 0.5 mile of the proposed activities.
Yates Petroleum Corporation. Napier Road POD Environmental Assessment WY-070-EA10-280, 2010.	Buffalo Field Office, BLM	For any surface-disturbing activities proposed in sagebrush shrublands, the Companies will conduct clearance surveys for sage grouse breeding activity during the sage grouse's breeding season before initiating the activities. The surveys must encompass all sagebrush shrublands within 0.5 mile of the proposed activities.

**APPENDIX O**  
**Implemented Projects**

**Table O-1. Description of Implemented Sage-grouse Mitigation Projects.**

<b>Project Name</b>	<b>Project Description</b>
BLM. Piceance Basin Greater Sage-Grouse Habitat Inventory, 2006	<p>ExxonMobil, and EnCana allowed BLM to use their land to access public land and/or to conduct the habitat inventory on their land. EnCana provided \$17,000 to help fund this project. Developed a computer model of potential sage-grouse habitat within the Parachute Creek – Piceance Basin – Roan Plateau area (PPR). The next step was to ground-truth the vegetation types within the computer model.</p> <p>We are using this information to improve our estimate of the acreage of sage-grouse habitat. We have also used this information to identify several potential areas for habitat restoration work based on dense shrub cover, low understory cover, tall serviceberry shrubs, or the encroachment of pinyon/juniper. EnCana has provided \$10,000 towards sage-grouse habitat restoration and we plan to begin work next summer.</p>
BLM. PPR Greater Sage-Grouse Habitat Mapping, 2008	<p>Vegetation mapping of 29,205 acres 2007 field season. We are using this information to improve our estimate of the acreage of sage-grouse habitat. We have also used this information to identify several potential areas for habitat restoration work based on dense shrub cover, low understory cover, tall serviceberry shrubs, or the encroachment of pinyon/juniper. ConocoPhillips, EnCana, ExxonMobil, Orion Energy Partners, Shell, and landowners provided access to their land. EnCana provided \$34,000 to help fund this project in 2006 and 2007.</p>
Mesa Sagebrush Fertilization Project Prepared by Bureau of Land Management Pinedale Field Office. WY-100-EA11-186.	<p>Decision approves fertilization of 30,958 acres of BLM administered lands to improve sagebrush habitat conditions. In 2010, the mule deer monitoring data indicated the mule deer numbers on the Mesa decreased more than 15% triggering a mitigation response as outlined in the ROD. This project was developed as a mitigation response to exceeding the threshold in change of mule deer abundance as outlined in the WMMM. Habitat enhancement is one of the first options available in the Mitigation Responses to population decline. The project is designed to enhance available winter forage for mule deer by increasing sagebrush production, and potentially increasing palatability and nutrient quality on identified mule deer crucial winter range. The proposed project has been reviewed and is in conformance with BLM IM. No. WY-2010-012 and is consistent with guidelines provided in the Governor’s Sage-grouse Implementation Team’s Core Population Area strategy and the Governor’s Executive Order 2011-5. The project would maintain and/or potentially increase the current sagebrush canopy cover and should therefore maintain the functionality and quality of the habitat for sage-grouse in winter. The shift in plant community dynamics that would be expected to occur with the fertilizer treatments could increase the amount of cover and forage available for sage-grouse on the Mesa year round. To date approximately 1,600 acres have been fertilized (2 separate projects) and efforts are underway to determine whether actions have resulted in increased vegetation productivity and/or nutrient content.</p>

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

<b>Project Name</b>	<b>Project Description</b>
Arambel Reservoir Habitat Improvement	Treatment of 5-acre test plots using Lawson Aerator. Snow fence construction to add moisture for increased reclamation success, test of weed control methods, and repair of dam on Arambel Reservoir. Develop 2 water wells and build an enclosure around Sublette Springs to improve the riparian area. Project funded \$499,000. 1830 acres. Status (2011): in progress, monitoring on-going.
Cottonwood Ranches Bench Corral Conservation Project	This project has three parts including: 1) Conservation easement and conservation plan to preserve and enhance pristine wildlife habitat on 1,110 acres; 2) Water efficiency project that will allow improved irrigation and grazing management on 25,000 acres, and 3) Funding for intensive grazing management on a large scale (25,000 acres) that will address BMPs for sagebrush obligates. Project meets JIO wildlife mitigation goals for preserving and enhancing wildlife habitats. Project funded \$559,900.00. 27,000 acres. Status (2011): Conservation easement complete.
Cottonwood Ranches II Conservation Easement	This is the second Cottonwood Ranches project. This project includes a conservation easement with a conservation plan on approximately 1,600 acres of private land; implementation of improved grazing management on adjacent BLM allotments, state leases and private lands; and implementation of a water efficiency project designed to enhance grazing management implementation, increase forage production (for wildlife and livestock), and improve stream and riparian health over a two-mile stretch of Cottonwood Creek. Project meets JIO wildlife mitigation goals for preserving and enhancing valuable wildlife habitats. Acres: 5,172; Status (2011): Conservation easement complete; Project funded \$910,417.00.
Cottonwood Ranches III Easement	Conservation easement acquisition coupled with long-term land management planning and habitat improvement projects. Project funded \$988,350.00. 2,571 acres. Status (2011): Conservation easement complete.
Cottonwood Ranches Conservation Plan	Plan for Cottonwood I, II, and III projects. The general location of the Cottonwood site was selected by the Jonah Interagency Office staff in 2007 for its outstanding wildlife values that mimic those found in the Jonah Field. The overall goal of the Cottonwood Ranches Initiative is to conserve and enhance the contiguous 90,000 acres of deeded and public lands controlled by the Cottonwood Ranches. Three progressive management plans are incorporated into a comprehensive plan that adds an additional contiguous 5,034 acres to the management planning area, and connects the Cottonwood Ranches site to the McNeel Trust JIO project site, providing a contiguous block of 50,000 acres being managed for benefits to sage-grouse and other affected species. This project includes the implementation of various practices to improve wildlife habitat including sagebrush treatments, watering facilities, irrigation practices, and monitoring. Project funded \$625,000.00. Status (2011): In progress

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

<b>Project Name</b>	<b>Project Description</b>
Carney Ranch Conservation Easement	Conservation easement, with a conservation plan on 2,571 acres of extremely valuable wildlife habitat in the Upper Green River Valley that is at high risk for development. This property includes portions of the pronghorn antelope migratory bottleneck (the Funnel Bottleneck) at the head of the Upper Green River, sage-grouse nesting and brood rearing habitat, approximately one mile of Green River frontage, elk winter range, moose crucial winter range, and other wildlife habitat values. This project meets the JIO wildlife mitigation goals by permanently protecting the "Funnel Bottleneck" portion of the pronghorn antelope migratory corridor. The conservation plan demonstrates how this property will be managed in a way that improves/maintains/protects these valuable habitats. Project funded \$2,093,800.00. Acres: 51,156; Status (2011): In progress.
Cross Lazy Two Ranch Project	Project involves (1) purchasing a conservation easement on the ±4,410-acre Cross Lazy Two Ranch and (2) implementing a mutually-agreeable conservation/habitat management plan includes annual monitoring and a communication plan to ensure regular review and adaptation as necessary. Project meets JIO wildlife mitigation goals for preserving and enhancing wildlife habitats. Project funded \$2,000,000.00; Acres: 4,598; Status (2011): Conservation easement complete; conservation plan implementation in progress
Diamond H Ranch Conservation Project	Conservation easement and conservation plan on approximately 3,000 acres of high quality wildlife habitat around small-tract home-site developments. Habitat fragmentation resulting from development activities are considered to be among the State's greatest threats to wildlife habitat and to traditional agricultural operations. Project meets JIO wildlife mitigation goals for preserving and enhancing wildlife habitats. Project funded \$479,430.00. Status (2011): Complete.
Elk Mountain/Red Canyon Prescribed Burn	Project includes the improvement of upland plant communities for various wildlife species, including sage-grouse, with prescribed burning of 20,000 acres in a mosaic pattern in the Elk Mountain area. This action is the most environmentally acceptable method of stimulating regeneration of desired plant communities (aspen, mountain shrubs and grasses). Project meets JIO wildlife mitigation goals for preserving and enhancing wildlife habitats. Project funded \$72,000.00. Status (2011): complete
Espenscheid Ranches Conservation Easement	Project is designed to meet JIO wildlife and livestock mitigation goals through acquisition of a conservation easement on 10,000 acres of private land and a grazing management plan for 10,700 acres of associated BLM allotments. Conservation easement and plan must be completed by May 31, 2011. Project funded for \$575,000. 10,000 acres. Status (2011): funded
McNeel Conservation Plan	Project involves: 1) purchasing a conservation easement on the 620 acres of McNeel Ranch and 2) implementing and monitoring a conservation/habitat management plan on 2,500 acres. Project meets JIO wildlife mitigation goals for preserving and enhancing wildlife habitats. Project funded \$320,000.00. 2,052 acres. Status (2011): Conservation easement complete; conservation plan implementation in progress.

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

<b>Project Name</b>	<b>Project Description</b>
MJ Ranch Conservation Project	Conservation easement and conservation plan on 2,052 acres to preserve valuable wildlife habitat. Project meets JIO wildlife mitigation goals for preserving and enhancing wildlife habitats. Project funded \$536,821.00. Status (2011): Conservation easement complete; conservation plan implementation in progress.
Noble Cora Peak Wildlife Project	Project includes 3 separate components: 1) Upgrade an existing spring and install a diversion to divert sediments away from the spring. Spring will provide essential vegetation for sage-grouse brood rearing, and drinking water for wildlife. 2) Drill and install a new water well with facilities for wildlife and livestock. This well will allow water to run-off down into the draw and into an old reservoir potentially creating vegetation essential for sage-grouse brood rearing. This watering facility will also create clean drinking water for pronghorn, as this is in the migratory area. Potential exists to install a wildlife friendly fence around the spring and reservoir for wildlife use. 3) Drill and install 2nd water well in northeast area of allotment. This well will provide drinking water for pronghorn and mule deer, especially during migrations, as well as livestock. Potential exists to develop plans for vegetation improvements if warranted. Project proponent will use the watering systems to implement a rotational grazing pattern throughout the allotment. Project funded \$64,640.00. Status (2011): in progress
Ryegrass Allotment Mowing Project	Project consists of mowing sagebrush on the Ryegrass Individual and James Ryegrass allotments. Project meets JIO wildlife mitigation goals by enhancing wildlife habitats through creating a mosaic landscape improving diversity and age classes of vegetation. Project funded \$13,000.00. Project status (2011): Completed
Water Trough Bird Ramps	Install wildlife escape ramps in all BLM range improvement water tanks. Project meets JIO wildlife mitigation goals by reducing sage-grouse and other animal drowning in livestock watering facilities. These escape ramps will allow for easy access out of the tank should animals fall in. Eighty ramps installed in 2009. Project funded \$36,500.00. Status (2011): in progress.

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

Project Name	Project Description
Fence monitoring for sage grouse strikes, 2012 Monitoring Report, Aster Canyon Consulting.	11.9 miles of fence were monitored 8 times during greater sage-grouse lekking season (March, April, and May). 4 simple strikes and 4 mortality strikes of greater sage-grouse were recorded during lekking season monitoring. 78.2 miles of fence were monitored twice outside of greater sage-grouse lekking season (July and August). 3 simple strikes (2 greater sage-grouse, 1 common nighthawk) and 6 mortality strikes (3 greater sage-grouse, 3 horned lark) were recorded during summer monitoring. In the spring of 2011, fence markers were placed along the northern border of the JIDPA in places where sage-grouse strikes had been recorded in 2010. The same was done in the spring of 2012 for all sage-grouse strikes recorded in 2011. The objectives of 2012 fence monitoring were to: (1) provide locations of fence strikes on 11.9 miles of fence monitored during sage-grouse lekking season and 78.2 miles of fence monitored during the summer; and (2) provide information on the effectiveness of previously-placed fence markers. In 2013, monitoring surveys to document fence strikes will be conducted on 9.3 miles of designated fence line in the northern portion of the JIDPA. If sage-grouse fence strike areas are identified, those problem areas of fence will be subsequently equipped with strike deterrents in accordance with the methods developed by Sutton Avian Research Center in Oklahoma.
Greater sage-grouse lek surveys, 2012 Monitoring Report, Aster Canyon Consulting	In 2012, the BLM and WGFD conducted annual sage-grouse lek surveys and inventories in the JIDPA and 3-mile buffer. In 2013, Annual lek counts and inventories will be conducted by WGFD and BLM personnel on existing known lek locations within the JIDPA and a 3-mile buffer.
Atlantic Rim Sage Grouse Winter Concentration Habitat Mapping Study	1. Generate winter probability-of-occurrence maps across the Atlantic Rim based on data collected in winter 2007–2010. 2. Identify source winter habitats through seasonal risk-assessment modeling (i.e., determine which habitats identified as having a high probability-of-occurrence also have high probabilities of adult female survival during winter. 3. Generate maps depicting areas of winter conservation concern across the Atlantic Rim based on winter occurrence of grouse and risk of adult female survival
Avian Predator Densities associated with Sage Grouse Nests in SW Wyoming. Jonathon Dinkins, et al.	Study of predation risk, compared avian predator densities at sage-grouse nest and brood locations to random locations.
Identifying habitats for Greater Sage-grouse Population Persistence in a Developing Coalbed Methane Field in South-Central Wyoming	1. Generate probability-of-occurrence maps specific to the reproductive period of female sage-grouse; 2. Quantify habitat value as related to reproduction and survival through risk-assessment modeling; 3. Combine these models to identify critical and/or limiting reproductive habitats across the project area (i.e., sink and source habitats)

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

Project Name	Project Description
Sage-grouse Inventory and Monitoring in the Atlantic Rim 2007-2009 (BLM / WyG&F / APC)	2007 -Collaring Study –track and monitor sage grouse locations –aerial 2008 -Collaring Study –identify important nesting and brood rearing habitat –air and ground 2009 -Collaring Study –identify important nesting and brood rearing habitat –air and ground
Peters Point Road Re-route Reclamation Monitoring.	On July 30, 2013 EIS personnel conducted an ocular estimate of vegetation growth on the reclaimed road west of the Peters Point airstrip. This project is part of the Reclamation and Wildlife Enhancement Plan.
Prickly Pear SE 12 Pad and Road Reroute	This project is part of the Reclamation and Wildlife Enhancement Plan. The 2011 report was a preconstruction evaluation of the pad and new road and gives suggested reclamation and monitoring information. The 2011 report does not discuss the reclaimed roads.
Cottonwood Ridge Pinyon-Juniper Treatment Project	To further the required mitigation needs for the WTNG project, the BLM and DWR are proposing to mechanically/hand treat approx. 2,070 acres. The proposed action is to use a hand crew as well as a bull hog to cut and limb/shred and grind pinyon pine and juniper (P/J) within the areas shown in the attached map. The project would be mostly on BLM-administered lands with the rest on State of Utah lands. The project would be funded by the Bill Barrett Corporation. The current proposal would include a small portion that is located within the Jack Canyon WSA and lands with wilderness characteristics. The proposed action would benefit sage grouse by removing P/J that is encroaching into existing sagebrush parks, which has reduced the grouses’ natural habitat of only sagebrush and grass, and in addition provided perching trees for raptors that prey upon sage grouse. It
QEP WRB 16-17-10-17 well COA implementation	All of the EA COAs were implemented. Documentation would include invoices showing when the location was built, invoices for the equipment that was used, weed spray invoices, reclamation invoices, water truck invoices and telemetry invoices.
UDWR Sage grouse study (3 year project)	QEP contribution of \$27,450 (voluntary, not required by NEPA)
South Unit Habitat Improvement Project	The project will improve wildlife habitat by deterring the encroachment of pinyon, juniper, and Douglas-fir trees into shrub communities, which are critical for wildlife. Approximately 7,820 acres will be mechanically treated under this proposal. Treatments will occur from mid-summer to fall over a 7-year period. Existing roads will be used to access the project area. A portion of the project was completed in 2006, with additional treatments scheduled during the next few years. Document shows the 2006 and 2007 work was funded. The National Forest Foundation requested that Berry Petroleum, as a participant in the IPAMS “Conservation in Action” program, consider a tax-deductible contribution of \$15,000 in cash and in-kind support (possible labor and equipment use donation). This was prior to the South Unit EIS.

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

<b>Project Name</b>	<b>Project Description</b>
Anthro Mountain Habitat Improvement Project	<p>This project will include prescribed burning of up to approximately 1000 acres on Anthro Mountain. This project is one component of several similar projects and part of the conservation action known as the Roosevelt/Duchesne District Prescribed Burns being implemented over several years. The project is designed to improve wildlife habitat and address concerns of conifer encroachment and stressed aspen stands. Utah Division of Wildlife Resources (UDWR) has identified the treatment area as critical big game winter range and it is also habitat for sage grouse and other sagebrush obligate species. This treatment will enhance habitat for both of these types of wildlife. In addition, the project will promote aspen regeneration and reduce density of conifer and sagebrush stands. If matching funding is available, the project will be conducted and completed in the Fall of 2007.</p> <p>Through the assistance of Utah State University, ten study sites containing 4 transects each were established in 2006 to monitor sage grouse use (pellet count transects) prior to and after the prescribed burns. Five of these study sites will be treated (burned) and five will be untreated as controls. Each of these study sites have baseline data collected in 2006, and will be read four times a year. It is anticipated that this monitoring will continue for at least the next five years.</p> <p>The National Forest Foundation requested that Berry Petroleum, as a participant in the IPAMS “Conservation in Action” program, consider a tax-deductible contribution of \$11,500 to match the funding available from other sources as explained in the estimated cost section, above.</p>
Anadarko Sage Grouse Lek Monitoring in the Atlantic Rim Project Area 2009	<p>Greater Sage-grouse lek monitoring is done to determine if a known lek is active or inactive in any given year. Consistent yearly monitoring allows managers the opportunity to look at trends in activity at specific leks and across the landscape. Grasslands Consulting, Inc. was requested to survey seven leks within the ARPA in 2009</p>

<b>Project Name</b>	<b>Project Description</b>
<p>Pinedale Anticline Project Area Sage Grouse Monitoring: Noise Monitoring Report. Prepared by KC Harvey for Pinedale Area Project Office. August 14, 2009.</p>	<p>The changes in background noise that the ROD specifies will be monitored are: “Noise levels demonstrated to impact peak lek use by male sage grouse and a concurrent change in the total average 2-year numbers of males attending development area lek complexes (the Mesa, Duke’s Triangle, or Yellow Point lek complex), compared to the East Fork, Speedway, or Ryegrass reference lek complexes.” Appendix B of the ROD indicates that the specific change in noise monitoring that will require mitigation is as follows: “Decibel levels at the lek more than 10 dBA above background measured from the edge of the lek (2000 ROD, p.27), and a concurrent average of 30% decline in peak numbers of male birds over 2 years vs. reference area.” The purpose of this noise monitoring project was to determine the noise levels at leks during the male attendance period from late March to mid-May. Meeting the noise monitoring criteria of the ROD required equipment capable of measuring noise levels over an extended period. The RFP for sage grouse monitoring for this project specified using four noise monitors for two 10-day intervals during the strutting period. Summary data analysis indicates that average measured noise levels are all below the 10 dBA above background threshold level of 49 dBA. Noise monitoring in 2010 should attempt to answer some of the unknowns in the noise conditions of the project area. This will determine if adjustment for the threshold noise levels defined in the ROD is warranted as part of adaptive management.</p>
<p>Pinedale Anticline Project Area Sage Grouse Monitoring Progress Report. Prepared by KC Harvey for Pinedale Area Project Office. June 16, 2009.</p>	<p>The purpose of this project is to monitor sage grouse activity in the Pinedale Anticline Project Area (PAPA). This will satisfy sage grouse monitoring requirements as described in Appendix B of the Record of Decision (ROD), Final Supplemental Environmental Impact Statement for the Pinedale Anticline Oil and Gas Exploration and Development Project. The project area includes six sage grouse lek complexes and covers approximately 550,000 acres in Sublette County, Wyoming. The project consists of two tasks; determination of sage grouse nesting success and habitat selection, and noise level monitoring. Due to a late start for the project, a third task; winter concentration area use, was not included in the work scope.</p> <p>KC Harvey field crews captured and affixed radio collars to 89 sage grouse hens. KC Harvey field crews began tracking collared hens toward the end of the capture effort to monitor nest success. As of June 13, 2009, 11 of 89 collared hens were still sitting on nests. KC Harvey field personnel will monitor bird locations monthly in order to determine habitat selection beginning July 2009. Noise meters were deployed at 13 active leks in the Mesa, Duke’s Triangle, and Yellowpoint lek complexes. Summary data analysis indicates that background noise levels are all below the 10 db above background threshold level (49 db).</p>

<b>Project Name</b>	<b>Project Description</b>
<p>Sommers-Grindstone Ranch Rapid Assessment of Mitigation Value. Holly E. Copeland and Joe Kiesecker. February 3, 2011.</p>	<p>In 2009, the PAPO provided project funds for three conservation easements on 19,546 acres of the Sommers-Grindstone Ranch in Sublette County. Our objective here is to provide a rapid quantitative assessment of the contribution of the Sommers-Grindstone Ranch to the mitigation goals determined by the 2010 assessment. Overall, one-third (6412 acres) of the Sommers-Grindstone easement lies within a Priority Mitigation Area as defined by TNC analysis. There are 752,435 acres of Priority Mitigation Areas overall within the study area, but only 12% (91,634 acres) are privately owned and available for conservation easements. The Sommers-Grindstone easement contributes significantly to many conservation goals with the PAPO (Table 1). The easement exceeds the minimum 2010 analysis goal for four conservation targets: mule deer migration corridor, bald eagle nesting habitat, wetlands, and montane sagebrush steppe. The easement also contributes significantly towards meeting goals of many other conservation targets (Table 1). Project areas will be monitored for easement compliance at least once each year. Habitat and wildlife conditions will be monitored or studied as time and funding allow.</p>
<p>Ten Year Sublette Mule Deer Mitigation Plan. Pinedale Anticline. October 12, 2012.</p>	<p>The focus areas for this 10-year Plan includes lands associated with the Mesa, Soapholes, and Ryegrass (Refer to Maps, Appendices B and G and Figure 1), and other adjacent areas identified by mule deer collaring information as important for either deer transitional ranges or winter ranges. Generally, winter ranges are located at relatively lower elevations associated with the Mesa, Soapholes, and eastern portions of the Ryegrass. Transitional ranges, including migration corridors and stopover habitat areas, have been identified by Sawyer and Nielson (2011) through the collaring and tracking of mule deer that winter on the Mesa. The importance of the Ryegrass, Soapholes, and Mesa areas to mule deer, sage-grouse (<i>Centrocercus urophasianus</i>) and other sagebrush-related wildlife species cannot be overstated, in particular in the face of development and the loss of some of the traditional areas/ranges of importance. Most of these areas are not only important crucial winter range, but also have great importance from a mule deer transitional/migration standpoint. In addition, the majority of the areas evaluated in 2011 lay within the designated Sage-Grouse Core Habitat Area (State of Wyoming Executive Order 2011).</p>

<b>Project Name</b>	<b>Project Description</b>
2012-13 Greater Sage-grouse Annual Report Pinedale Anticline Project Area. Prepared by The Pinedale Anticline Project Office. September 4, 2013.	The 2008 Final Supplemental Environmental Impact Statement Record of Decision for the Pinedale Anticline Oil and Gas Exploration and Development Project (BLM 2008) includes a Wildlife Monitoring and Mitigation Matrix (WMMM) that identifies key wildlife species to be monitored and specific changes that require mitigation (Appendix A, Table 1). For greater sage-grouse, the WMMM is designed to quantitatively identify changes in greater sage-grouse populations within the Pinedale Anticline Project Area (PAPA). The WMMM defines criteria for monitoring greater sage-grouse and outlines mitigation responses if specified thresholds or triggers are met. Six lek complexes are monitored annually for changes specified in the WMMM (Appendix A, Figure 1). Lek attendance by male greater sage-grouse, number of active leks, winter concentration area use and noise are all monitored. Monitoring results indicate a threshold was met in 2012 and 2013. In 2012 and 2013, the Duke’s Triangle complex saw a 50% decline in active leks, exceeding the threshold of a 30% decline in number of active leks in a single development area complex compared to 2007 baseline data.
Greater Sage-grouse Lek Counts (2000-2007) in and Around Fidelity Exploration & Production Company’s Coalbed Natural Gas Development Areas in Big Horn County, Montana and Sheridan County, Wyoming	<p>Since 2002, Hayden-Wing Associates (HWA) has been contracted to conduct wildlife surveys, including greater sage-grouse lek counts, in and around Fidelity’s proposed drilling areas in Big Horn County and Sheridan County (HWA 2002, 2003a, 2003b, 2004a, 2004b, 2005a, 2005b, 2006a, 2006b, 2007a, 2007b). HWA biologists have conducted annual lek counts from 2003 through 2007. In addition, HWA has compiled relevant count data from other sources for leks in and around Fidelity’s Plan of Development (POD) areas. From 2003 to 2007, aerial and ground surveys for greater sage-grouse leks were conducted by HWA in and within two miles of Fidelity’s PODs during the strutting season (i.e., April through early May) to search for new or undocumented leks and to check the activity status of known leks.</p> <p>In addition, HWA has compiled sage-grouse lek data collected before and during drilling operations (i.e., 2000-2007) from the BLM-Miles City Field Office (FO) and BLM-Buffalo FO, Wyoming Game and Fish Department (WGFD), Decker Coal Company (DCC), Spring Creek Coal Company (SCC), and the University of Montana (UMT). BLM biologists have conducted sage-grouse lek counts in the area on an irregular basis and have gathered data from a number of other sources.</p> <p>Thirty-seven greater sage-grouse leks have been documented in and around Fidelity’s drilling areas in Big Horn County, Montana and Sheridan County, Wyoming (Table 1, Figure 1). Although lek counts were conducted differently between leks and years, the total number of grouse counted at each lek provides a general, albeit unreliable, estimate of lek attendance. Survey effort varied from leks having been checked only four of eight years to leks having been checked all eight years. To date, lek activity status in and around Fidelity’s drilling areas does not seem to have been affected by drilling activities from 1999 through 2007.</p>

Project Name	Project Description
<p>Greater Sage-grouse Nesting Habitat within Fidelity Exploration &amp; Production Company’s Badger Hills, Coal Creek, Corral Creek, Decker Mine East, and Deer Creek North Plans of Development in Big Horn County, Montana - 2006.</p>	<p>Fidelity Exploration and Production Company (Fidelity) is developing coalbed natural gas wells within the Badger Hills, Coal Creek, Corral Creek, Decker Mine East, and Deer Creek North Plans of Development (PODs), located in Big Horn County, Montana (Map 1). In order to proactively identify habitats important for greater sage-grouse (<i>Centrocercus urophasianus</i>) conservation, and to plan development in a manner that minimizes impact to sage-grouse populations in the region, Fidelity requested that Hayden-Wing Associates (HWA) provide an inventory of the potential nesting habitat within these PODs that is located within three miles of occupied sage-grouse leks.</p> <p>Approximately 6,218 acres of potential nesting habitat were identified and delineated within the PODs, comprising 24.8% of the survey area. Based on the average stand characteristics, approximately 5,729 acres of the potential nesting habitat were designated suitable quality and 489 acres were designated marginal quality.</p>
<p>Market-based Approach for Restoring Rangelands and Critical Wildlife Habitat in the Sagebrush Biome. Cooperative Sagebrush Initiative. 2011.</p>	<p>CSI members were interested in such a credit trading system, but required a reproducible and defensible tracking system based on appropriate ecosystem service metrics in order for it to be potentially implemented. This project was initiated to develop and evaluate a metric system for mitigation in sagebrush ecosystems and to further evaluate the potential for development of a mitigation credit trading system based on the metrics. The proposed metric system relied on the use of ecological sites as classified and described by the Natural Resource Conservation Service as a basis for assuring equivalency of sagebrush ecosystems and ecosystem services. The system also used an assessment of wildlife habitats to evaluate equivalency of benefits and impacts at landscape scales. Seven project areas were studied, including the Seven Brothers East Ranch is a 3105 acre property owned by Fidelity Exploration &amp; Production Company (Fidelity) in Sheridan County, Wyoming. For the Fidelity Project there were six wildlife species modeled for the landscape analysis: pronghorn antelope, sagebrush lizard, sage sparrow, sage thrasher, sagebrush vole, and sage grouse.</p>
<p>Management Plan and Conservation Strategies of Sage Grouse in Montana, revised 2-1-2005</p>	<p>Fidelity participated in several meetings in Miles City, Montana during the drafting of the Management Plan and Conservation Strategies of Sage Grouse in Montana, revised 2-1-2005 (“Management Plan”). Fidelity provided input during these meetings, and therefore, became aware of the conservation actions for Mining and Energy Development as discussed on pages 59 - 62 in the Management Plan. Prior to the final adoption of the Management Plan, Fidelity started implementing several of the conservation actions in its Coal Bed Natural Gas (“CBNG”) operations in Big Horn County, Montana and Sheridan County, Wyoming.</p>

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

---

<b>Project Name</b>	<b>Project Description</b>
Fidelity Exploration & Production Company Comprehensive Sage-Grouse Strategy. November 2008.	Due to the multitude of sensitivities associated with exploring, drilling and operating of oil and gas properties in sage-grouse habitat, Fidelity has been very proactive in its application of sage-grouse stipulations, collection of data, and interaction with various agencies and nongovernmental organizations since 2002. This pro activity has been recognized by the Wyoming Game and Fish Department, the Bureau of Land Management as well as internally by MDU Resources Group, Inc. The current sage-grouse research being conducted in Sheridan County, Wyoming was initiated in 2006 and was originally designed to identify tools that we could use to operate in sensitive sage-grouse habitat. This research has also identified a significant opportunity to leverage off-site mitigation on Fidelity's 7 Brothers East Ranch to offset potential impacts in the future development of Fidelity's Deer Creek South Plan of Development.
Greater Sage-Grouse Nesting Habitat within Fidelity Exploration & Production Company's Joint Venture North Pilot Project Area in Sheridan County, Wyoming. 2007.	Fidelity is developing CBNG wells within the Joint Venture North Pilot project area, Sheridan County, Wyoming. In March 2007, HWA evaluated potential sage-grouse nesting habitat at and around proposed well locations and proposed compressor station within the project boundary. Sage grouse nesting habitat was described using the characteristics given in the Wyoming Greater Sage Grouse Conservation Plan (2003) and the Management Plan and Conservation Strategies for Sage Grouse in Montana (2005). The purpose of the evaluation was to minimize impacts to sage-grouse suitable nesting habitat during the planning stage.
Occurrence and Success of Greater Sage Grouse Broods in Relation to Insect-Vegetation Community Gradients in Northeastern Wyoming. HWA 2011.	In 2008, we conducted research aimed at identifying important brood habitat (specifically, insect-vegetation communities) in northeastern Wyoming, USA. Specifically, we used statistical approaches to combine insect and vegetation components and to link these components with brood occurrence and survival. Managing for a particular species of insect or plant is generally impracticable. However, the information we provide on how the larger plant/insect community is related to brood success more effectively lends itself to application because such information is better aligned with the tools that are available to managers (e.g., fire management, rotational grazing, vegetation manipulation, etc.). Funding for this study was provided by Fidelity Exploration & Production Company.

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

<b>Project Name</b>	<b>Project Description</b>
Noble Energy's Greater Sage-grouse Mitigation Plan for Mary's River Exploration Project, Elko County, Nevada. 2014.	<p>It is the intention of this document to illustrate compliance with WO IM No. 2012-043 and reduce the level of impacts by the proposed action on sage-grouse to an insignificant level through the implementation of Design Features, BMP's, and Mitigation Measures. This mitigation plan will lead to an MOU with the BLM. The NTT has suggested BMP's to be used for fluid mineral extraction. Many of these BMP's are addressed in Noble's proposed BMP's and would be adhered to. In addition to the BMP's and Design Features these Mitigation Measures have been developed and are agreed to by Noble, NDOW, and the BLM to reduce impacts on sage-grouse and sage-grouse habitat to a level that is below significance as defined in the NEPA Handbook H-1790-1 Section 7.3.</p> <p>In addition, compensation for impacts would be sought for temporary, long term and permanent impacts. The Proponents would agree to a maximum of \$600 per disturbed acre at 3:1 ratio for PPH/ Category 1 &amp; 2 and 2:1 ratio for PGH/Category 3 for mitigation off-sets to be put in an Impact Compensation Fund (escrow or similar account) for later use on offsite sage grouse habitat mitigation projects. Further details like how disturbed acres will be calculated and specifics about escrow accounts will be spelled out in the MOU.</p> <p>Types of projects that would be considered include but are not limited to: Habitat enhancement projects; Invasive species treatments (as offsite mitigation only, onsite treatments would remain the responsibility of the proponent); Sagebrush plantings; Conservation easements; Restoring or preserving habitat connectivity; Sage Grouse Research (maximum of 10% total funds)</p>
Wildlife Monitoring for Exploration Activity in the Noble Marys River Project Area, Elko County, Nevada 2012	The Marys River Project Area includes approximately <b>39,366 acres</b> that includes 52% federal (BLM) and 48% private lands. Four known greater sage-grouse leks and one historic lek are known to occur in or within three miles of the Marys River Exploration Project Area. Aerial surveys were conducted on March 27-28 and April 4-5, 2012 to search for new or undocumented leks. One new or previously undocumented sage-grouse lek was discovered approximately two miles outside of the Project Area. Three ground count surveys were conducted at each lek location within three miles of the Marys River Exploration Project Area to determine grouse occupancy and the maximum number of birds attending the lek.
Greater Sage-grouse Winter Concentration Surveys in the Noble Marys River Project Area, Elko County, Nevada, 2013.	The Project Area includes approximately <b>39,366 acres</b> that includes 52% federal (BLM) and 48% private lands. Four greater sage-grouse leks and one historic lek are known to occur in or within three miles of the Marys River Exploration Project Area. Three aerial surveys were conducted during February 2013 to locate wintering sage-grouse and identify winter concentration areas in and within three miles of the Marys River Exploration Project Area. On two of the three surveys, a group of birds was found near the possible new sage-grouse lek that was found in 2012.

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

Project Name	Project Description
Greater Sage-grouse Lek Surveys in the Noble Marys River Exploration Project Area, Elko County, Nevada during 2013.	Greater sage-grouse lek count surveys conducted by HWA for the Marys River Exploration Project Area in Elko County, Nevada during spring 2013. See 2012 survey description.
Greater Sage-grouse Noise Monitoring in the Noble Marys River Project Area, Elko County, Nevada, 2013.	Noble Energy, Inc. will be implementing an exploration project within the Marys River Exploration Project Area in Elko County, Nevada. Because three active greater sage-grouse leks are known to occur in or within three miles of the Marys River Exploration Project Area, baseline noise monitoring was conducted at these three leks prior to construction activities. Noise monitoring surveys were conducted for seven consecutive days (24 hours per day) to collect full spectrum of natural and human-caused noise.
Noble, Mary's River Drill Rig Noise Levels/Noise Contours, Elko County, Nevada, October 8, 2013.	j.c. brennan & associates, Inc. conducted an analysis of noise levels associated with the Noble Energy drilling at the Mary's River project site within Elko County. To establish the noise levels associated with the proposed well drilling operations, Noise measurements were conducted for the well drilling rig to be used at the Mary's River site. An additional analysis was conducted to determine the effects of snow on sound propagation.
Greater Sage-Grouse Monitoring for Exploration Activity in the Noble Jiggs Project Area, Elko County, Nevada 2012	The Jiggs Project Area includes approximately <b>33,785 acres</b> that includes approximately 60% federal (BLM Elko District Field Office) and 40% private lands. HWA surveyed known sage-grouse leks and searched for new or undocumented leks in and within three miles of the Jiggs Exploration Project Area. Surveys for new leks consisted of two flights, weather permitting, over suitable habitat. No new or previously undocumented leks were found in or within three miles of the Project Area. Three ground count surveys were conducted at each known, and possible lek locations within three miles of the Jiggs Exploration Project Area to determine grouse occupancy and the maximum number of birds attending the lek.
Wildlife Surveys in the Huntington Valley Exploration Project Area, Noble Energy, Inc., Elko County, Nevada 2013.	The Huntington Valley Project Area is approximately <b>63,548 acres</b> . Approximately 55% (34,882 acres) of the Project Area is within lands managed by the Bureau of Land Management (BLM) – Tuscarora Field Office; Elko District Field Office. HWA surveyed all BLM and private lands with landowner permission within the Project Area. HWA surveyed the known sage-grouse leks and searched for new or undocumented leks in and within three miles of the Huntington Valley Exploration Project Area. Aerial surveys were conducted on March 27-29 and May 1-3, 2013 to search for new or undocumented leks. Three ground count surveys were conducted at each lek location in and within three miles of the Huntington Valley Exploration Project Area to determine grouse occupancy and the maximum number of birds attending the lek.

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

<b>Project Name</b>	<b>Project Description</b>
Summary of Noise Measurements Conducted for the Flex Drill in the Lamoille Valley, prepared for Noble Energy, September 2013.	j. c. brennan& associates conducted noise measurements and frequency analysis of a drill rig located in the Lamoille Valley are of Elko County. The intent of the noise measurements is to supplement the nose section of the [Huntington Valley] EA and to provide input data for future noise modeling of drill rig noise impacts.
Noble, Huntington Valley Drill Rig Noise Levels/Noise Contours, Elko County, Nevada, October 22, 2013.	j.c. brennan & associates, Inc. conducted an analysis of noise levels associated with the Noble Energy drilling at the Huntington Valley project site. This analysis supplements the EA noise section, and develops noise contours down to 25 dBA for each of the forty-one well sites. An additional analysis was conducted to determine the effects of snow on sound propagation.
Petro-Canada Resources, Red Draw POD, Wildlife and Plant Surveys 2008. Hayden Wing Associates, 2008.	The Red Draw POD is located in the BLM Buffalo Field Office. Aerial surveys for grouse leks were conducted in and within 2 miles of the project area to search for new or undocumented leks and to check the activity status of known leks.
Petro-Canada Resources, Mooney Draw POD Wildlife and Plant Surveys - Hayden Wing 2009	Petro-Canada Resources, Inc. is developing coalbed methane (CBM) resources within the Mooney Draw Plan of Development (POD) located in Campbell County, Wyoming. Hayden- Wing Associates, LLC (HWA) conducted surveys for wildlife and plant species of management concern to the Bureau of Land Management (BLM) - Buffalo Field Office in and around the Mooney Draw POD in 2003, 2004, 2005, 2006, 2007, and 2008 (HWA 2003, 2004a,b, 2005, 2006, 2007, 2008). HWA conducted aerial and ground surveys for greater sage-grouse leks in and within two miles of the POD..
Petro Canada Resources, Twentymile Creek POD Wildlife Surveys, Hayden Wing, 2008.	HWA conducted surveys in and around the Twentymile Creek POD from 2005-2007. In 2008, surveys included aerial and ground surveys to search for new or preciously undocumented sage grouse leks in and within 3 miles of the POD.
Noble Energy, Inc. Mooney Draw POD Wildlife Surveys - Hayden Wing, 2010.	Petro-Canada Resources, Inc. (now Noble Energy, Inc.) is developing coalbed methane (CBM) resources within the Mooney Draw Plan of Development (POD) located in Campbell County, Wyoming. Hayden-Wing Associates, LLC (HWA) conducted surveys for wildlife and plant species of management concern to the Bureau of Land Management (BLM) - Buffalo Field in and around the Mooney Draw POD, including aerial surveys for greater sage-grouse leks in and within two miles of the POD.
Noble Energy, Inc. Mooney Draw POD Wildlife Surveys - Hayden Wing 2011.	Noble Energy, Inc. is developing coalbed methane (CBM) resources within the Mooney Draw Plan of Development (POD) located in Campbell County, Wyoming. Hayden-Wing Associates, LLC (HWA) conducted surveys for wildlife and plant species of management concern to the Bureau of Land Management (BLM) - Buffalo Field in and around the Mooney Draw POD, including aerial surveys for greater sage-grouse leks in and within two miles of the POD.

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

<b>Project Name</b>	<b>Project Description</b>
Noble Energy, Inc. Mitchell Draw Amended Phase III POD Wildlife Surveys - Hayden Wing, 2005-2011.	Noble Energy, Inc. is developing coalbed methane resources within the Mitchell Draw Amended Phase III Plan of Development (POD) located in Johnson County, Wyoming. Hayden-Wing Associates, LLC (HWA) conducted preliminary surveys for wildlife and plant species of management concern to the Bureau of Land Management (BLM) - Buffalo Field Office in and around the original Mitchell Draw Phase III POD during 2004 and full surveys during 2005, 2006, 2007, 2008, 2009, and 2010. Surveys included aerial surveys for new or previously undocumented greater sage-grouse leks in and within two miles of the POD.
Noble Energy, Inc. Gator POD Wildlife Surveys - Hayden Wing 2010.	Noble Energy, Inc. proposes to develop coalbed methane resources within the Gator Plan of Development located in Campbell County, Wyoming. The POD covers approximately 2,687 acres and is located in upland habitats west of Wild Horse Creek. HWA conducted surveys for wildlife and plant species of management concern to BLM - Buffalo Field Office in and around the Gator POD. During 2010, surveys for wildlife species conducted by HWA in and around the Gator POD included aerial and ground surveys of known greater sage-grouse leks and aerial surveys to search for new or previously undocumented greater sage-grouse leks in and within two miles of the southern 1/3 of the POD.
Petro Canada Resources, Montgomery Draw POD. Raptor and Greater Sage-grouse Surveys, Hayden Wing 2008.	HWA conducted sage grouse surveys in and around the Montgomery Draw POD 2003-2007. In 2008, sage-grouse lek ground count surveys were conducted to determine the actual number of male and female sage grouse using the Montgomery Lek. Behavior of the birds and the time birds left the lek were recorded.
Petro Canada Resources SS Draw POD, Wildlife Surveys, Hayden Wing, 2008.	HWA conducted surveys in and around the SS Draw POD from 2004-2007. In 2008, surveys included aerial surveys of known sage grouse leks and aerial surveys to search for new or previously undocumented sage grouse leks in and within 2 miles of the POD.
Temporal and hierarchical spatial components of animal occurrence: conserving seasonal habitat for greater sage-grouse. M.R. Dzialak, C.V. Olson, S.M. Harju, S.L. Webb, and J.B., Winstead, Hayden-Wing Associates LLC. Ecosphere Volume 3(4).	Developing strategies for sustainable management of landscapes requires research that bridges regionally important ecological and socioeconomic issues, and that aims to provide solutions to sustainability problems. We integrated Global Positioning Systems (GPS) telemetry and statistical modeling to quantify hierarchical spatial and temporal components of occurrence among greater sage-grouse ( <i>Centrocercus urophasianus</i> ; n=87), a species of conservation concern, with the larger goal of developing spatially-explicit guidance for conservation of important winter habitat in a Wyoming, USA landscape undergoing development for energy resources. This study was funded by ConocoPhillips Company, EnCana Corporation, and Noble Energy in the Gun Barrel, Iron Horse, and Madden Deep units in central Wyoming.

*Evaluation of the NEPA Process as an Adequate Regulatory Mechanism to Eliminate or Minimize Threats to Greater Sage-Grouse Associated with Oil and Natural Gas Development Activities*

<b>Project Name</b>	<b>Project Description</b>
<p>Identifying and Prioritizing Greater Sage-Grouse Nesting and Brood-Rearing Habitat for Conservation in Human-Modified Landscapes, M.R. Dzialak, C.V. Olson, S.M. Harju, S.L. Webb, J.P. Mudd, J.B. Winstead, L.D. Hayden-Wing. PlosOne Volume 6(10) 2011.</p>	<p>We investigated reproductive success in female greater sage-grouse (<i>Centrocercus urophasianus</i>) relative to seasonal patterns of resource selection, with the larger goal of developing a spatially-explicit framework for managing human activity and sage-grouse conservation at the landscape level. The 5,625 km<sup>2</sup> study area included portions of the Wind River Basin in central Wyoming, USA. This study was funded by ConocoPhillips Company, Encana Corporation and Noble Energy.</p>
<p>Landscape features and weather influence nest survival of a ground-nesting bird of conservation concern, the greater sage-grouse, in human altered environments. S. L. Webb, C. V. Olson, M. R. Dzialak, S.M Harju, J.B. Winstead, D. Lockman. 2012.</p>	<p>We studied daily survival rate [DSR] of greater sage-grouse (<i>Centrocercus urophasianus</i>) from 2008 to 2010 in an area in Wyoming experiencing large-scale alterations to the landscape. We used generalized linear mixed models to model fixed and random effects, and a correlation within nesting attempts, individual birds, and years. The study area included 5,625 km<sup>2</sup> of the Wind River Basin in central Wyoming. Funding was provided by ConocoPhillips, EnCana Oil and Gas, and Noble Energy.</p>

**Subject:** BLM NEWS: National Forests Added to Sage-Grouse Conservation Planning

## **BLM NEWS RELEASE**

U.S. Department of the Interior • Bureau of Land Management • Washington, D.C., Office • 1849 C Street N.W. • Washington, D.C.

### ***National Forests Added and Comment Period Formally Extended on Planning for Sage-Grouse Conservation Measures***

#### **For Immediate Release**

Date: February 9, 2012

**Contact:** Erin O'Connor (801) 625-5347

Mitch Snow (202) 912-7368

In cooperation with the U.S. Forest Service, the Bureau of Land Management (BLM) will issue a corrected Notice of Intent to address sage-grouse in 10 additional National Forest System Lands and Resource Management Plans and formally extended the comment period through March 23, 2012. The notice will appear in the February 10, 2012, *Federal Register*.

The BLM and the Forest Service are seeking public comment on issues that should be addressed in Environmental Impact Statements (EIS) and Supplemental Environmental Impact Statements (SEIS) that will evaluate and provide greater sage-grouse conservation measures in land use plans in 10 Western states. This notice extends the time period for public comment on the scoping process for the EIS/SEIS through March 23, 2012.

The EIS/SEIS will be coordinated under two regions: The Rocky Mountain Region, previously designated as the Eastern Region, which includes land use plans in the states of Colorado, Wyoming, North Dakota, South Dakota and portions of Utah and Montana; and the Great Basin Region, previously designated as the Western Region, which includes land use plans in northeastern California, Oregon, Idaho, Nevada, and portions of Utah and Montana.

Within the Rocky Mountain Region, the potentially affected National Forest System Land Management Plans include:

- Colorado's Routt National Forest
- Wyoming's Thunder Basin National Grassland, Medicine Bow National Forest and the Bridger-Tetons National Forest.

Within the Great Basin Region, the affected Land Management Plans include:

- Idaho's Boise National Forest, Salmon National Forest, Challis National Forest, Targhee National Forest, Caribou National Forest and the Curlew National Grassland;
- Montana's Beaverhead-Deerlodge National Forest;
- Nevada's Humboldt and Toiyabe National Forests;
- Utah's Ashley National Forest, Manti-LaSal National Forest, Wasatch Cache National Forest, Uinta National Forest, Dixie National Forest and the Fishlake National Forest.

The BLM and the Forest Service aim to incorporate conservation measures into all affected Land Management Plans by September 2014 in order to make the U.S. Fish and Wildlife Service's (FWS) timeline for making a listing decision on this species. As a result, the accompanying EIS's/SEIS's will be conducted under expedited timeframes.

All comments and submissions to be considered for the environmental analysis process must be received by the BLM by close of business on March 23, 2012.

The BLM manages more land - over 245 million acres - than any other Federal agency. This land, known as the National System of Public Lands, is primarily located in 12 Western states, including Alaska. The Bureau, with a budget of about \$1 billion, also administers 700 million acres of sub-surface mineral estate throughout the nation. The BLM's multiple-use mission is to sustain the health and productivity of the public lands for the use and enjoyment of present and future generations. The Bureau accomplishes this by managing such activities as outdoor recreation, livestock grazing, mineral development, and energy production, and by conserving natural, historical, cultural, and other resources on public lands.

**Subject:** FW: From E&ENews PM -- ENDANGERED SPECIES: Height of grass coverage key to successful sage grouse nests -- study

FYI.....

x

AN E&E PUBLISHING SERVICE

***ENDANGERED SPECIES:***  
***Height of grass coverage key to successful sage grouse nests -- study***

*Scott Streater, E&E reporter*  
*Published: Tuesday, December 16, 2014*

*A new study has found that the success of greater sage grouse nesting is strongly related to the height of the grass around the nests, a conclusion that some environmental activists say points to the need to better control grazing activities in grouse habitat.*

*The study led by researchers with the Fish and Wildlife Service and the University of Montana studied sage grouse nests in northeast Wyoming and southeast Montana for five years and found that the taller the grass near the nests, the more successful the nest and resulting increase in population.*

*Published this month in the journal Wildlife Biology, the **study** concluded that the size of grass that provides cover from predators has "high predictive power" for nest success and should be utilized "as a management tool to benefit sage-grouse populations."*

*This is particularly true when it comes to managing livestock and sheep grazing, says the study, which also included researchers from Colorado State University and the University of Wyoming.*

*"Findings emphasize the importance of an indirect effect of grazing on sage-grouse nest success. Results have broad implications because livestock grazing is the most widespread land use in the world, affecting 70 percent of land area in the western U.S.," the study says.*

*"However, adjustments to duration and timing of grazing also may increase residual cover with the added benefit of increasing long-term rangeland health on which birds depend," it says.*

*The study comes as federal and state regulators are working to preserve the grouse and its habitat*

bird for possible federal protection.

The \$1 trillion federal spending omnibus bill approved by Congress contained a controversial rider that says FWS shall not use money to "write or issue" listing rules for four types of sage grouse: proposed rules for the greater sage grouse and the Columbia Basin population of greater sage grouse, and final rules for the bi-state population of greater sage grouse and the Gunnison sage grouse ([Greenwire](#), Dec. 12).

But the Bureau of Land Management and Forest Service, which manage the majority of remaining sage grouse habitat, are revising roughly 100 land-use plans covering 67 million acres in an effort to protect and restore its sage grouse habitat. And Western states have completed or continue to work to complete grouse management plans.

While they do that, the study says, "Viability of ranching as a predominant land use may in part determine the future of sage-grouse conservation in the West."

Environmental activists today said the study should be used to better manage grazing on federal allotments and elsewhere in grouse habitat.

"The more grass cows eat, the fewer sage grouse survive on public lands," said Randi Spivak, director of the Center for Biological Diversity's public lands program. "The livestock industry no longer has any defense that cows on public lands do not hurt sage grouse."

A spokesman for the National Cattlemen's Beef Association, the nation's leading cattle industry group, did not respond to a request for comment in time for publication.

"In some parts of the West, ranchers blame predators for sage grouse declines, but when livestock grazing strips away the cover that sage grouse need to hide, the birds and their nests become easy pickings," said Erik Molvar, a wildlife biologist with WildEarth Guardians. "This new study demonstrates the importance of strict regulation of livestock grazing to protect sage grouse habitat.

"This study is proof that irresponsible livestock grazing practices make it difficult for sage grouse populations to survive," he added.

**Subject:** Re: Mt Governors Task Force and Preferred Alt.

Hi Rob,

The following is a quick response to your questions and a little extra information to provide context.

The Dillon RMP RMP identified sagebrush habitats that provide sage grouse breeding, early brood rearing, or winter habitat as one of several priority wildlife habitats. The MT Fish, Wildlife, and Parks worked with BLM and others and later identified core GRSG areas which BLM has identified as priority areas in the action alternatives for the Billings, HiLine, Miles City, and Lewistown RMP revisions/amendments.

The Montana Governors GRSG Conservation Advisory Council is an on-going effort and plans to issue a draft management plan October 8-9 for public comment. Final recommendations are scheduled for January 7-8, 2014. We anticipate the Governor will issue an executive order early next calendar year. We do not anticipate any official modifications to the areas identified as GRSG core areas prior to the report being released, although BLM has identified some minor modifications based on our studies that support our on-going RMP efforts. You can go to the MT FWP website and find much more information.

The Dillon Field Office (DFO) is trying to schedule a briefing for the Montana State Director and management team that will compare current GRSG management with each alternative. The DFO will recommend a Preferred Alternative to the MT State Director, and identify elements that will be notable deviations from current management as well as any element of that alternative that would cause concern. Cornie Hudson and Pat Fosse are trying to coordinate with the Beaverhead/Deerlodge NF. The date for this briefing has not be set due to other scheduling conflicts; but it will likely occur early the week of August 12.

Brent and I have discussed whether it would be appropriate for the ID State Director and the MT State Director to discuss a Preferred Alternative before this goes to WO review on 8/12. This may not be necessary if ID and MT identify the same alternatives as a Preferred. Obviously, if the MT management team is not briefed until the week of August 12, that discussion, if necessary, would be delayed.

While the FS would not identify a Preferred Alternative in the DEIS, We would be very interested in your perspective. Obviously, it would be good to coordinate with the B/D. I think we would be especially interested in seeing how the various alternatives compare with the existing B/D Forest Plan. I have encouraged Kelly Bockting (DFO) to use the BLM Greater Sage-Grouse Planning Proposed Alternatives Summary Table (from the Regional ID Team power point) as a template to compare the current Dillon RMP decisions with each of the other alternatives. A similar comparison between the B/D Forest Plan and the alternatives would be equally useful. Also, we should address whether each of the alternatives is consistent with other federal, state, local plans.

Finally, Brent indicated that ID BLM would prefer to notify WO reviewers verbally of the Preferred Alternative. ID and other states in the Great Basin do not want this leaked prematurely. Cooperating agencies would be notified of the Preferred Alternative later. The NV State Director committed to presenting options to

the other SDs on how and when this could be done. I have not heard or seen anything on this yet. We intend to comply with their decision.

Let me know if you have more questions. Also, any assistance in coordinating with the B/D would be appreciated.

Hey John,

Has Montana submitted anything to BLM regarding habitat delineation or management in SW Montana?

Also, has the State Director discussed the Preferred Alternative selection for Montana, I need to make sure that the B-D NF folks are involved in that conversation.

Thanks..

Robbert Mickelsen

The Honorable Tom Vilsack  
Secretary of the Department of Agriculture  
U.S. Department of Agriculture  
1400 Independence Ave., S.W.  
Washington, DC 20250

Dear Secretaries Jewell and Vilsack,

On behalf of the undersigned organizations, we are submitting a *Scorecard for Conserving the Greater Sage Grouse* for your use and consideration in issuing revised resource management plans (RMPs) for the greater sage grouse. The *Scorecard* is primarily based on the USDO I and USDA's own expert recommendations made in the National Technical Team report of 2011, "to ensure that BLM management actions are effective and based on the best available science" for conserving and restoring greater sage grouse populations and habitat.

As you know, the National Technical Team was comprised of 23 federal and state agency biologists and land managers—including 16 USDO I and two USDA experts — and drew from the extensive scientific literature on sage grouse to produce "A Report on National Greater Sage-grouse Conservation Measures" (NTT Report). The NTT was charged with, among others, to:

- "Identify science based management considerations for the greater sage grouse (e.g., conservation measures) that are *necessary* to promote sustainable sage grouse populations, and which focus on the threats in each of the management zones" [emphasis added].
- "Provide assurance that relevant science is considered, are reasonably interpreted, and accurately presented; and that uncertainties and risks are acknowledged and documented."
- "Understand current scientific knowledge related to the greater sage grouse."
- "Articulate conservation objectives for the greater sage grouse in measurable terms to guide overall planning."

The conservation measures in the NTT Report were derived from "the best available scientific studies" using "best professional judgment." This was confirmed by more than 100 scientists who described the report in a letter to then-Secretary of the Interior Ken Salazar as a "comprehensive compilation of the scientific knowledge needed for conserving Sage-Grouse" that "offers the best scientifically supportable approach to reduce the need to list Sage-Grouse as a Threatened or Endangered species."

It is essential to the conservation and protection of greater sage grouse that USDO I and USDA

follow the conservation measures in the NTT Report in the final RMPs. In fact, the National Technical Team stated that their recommendations should be used “against which management actions and policies of BLM should be weighed.” We agree, and believe that this *Scorecard* is an effective tool for evaluating the RMPs.

In contrast, the “Greater Sage-grouse Conservation Objectives: Final Report” (COT Report) identifies key threats to sage grouse and general conservation objectives for management, but does not provide measurable standards for assessing the adequacy of conservation prescriptions for the species to ensure that conservation measures are effective or will be implemented consistently to stem and reverse the steep population declines that greater sage grouse is experiencing.

We have used the *Scorecard* to evaluate the recently issued Lander Resource Management Plan — the first BLM RMP revision and record of decision completed under the National Greater Sage Grouse Strategy. As the attached graded *Scorecard* demonstrates, the Lander plan fails to adopt adequate conservation measures – including those recommended in the NTT report – and, thus, the Lander RMP will be ineffective in conserving greater sage grouse throughout Lander.

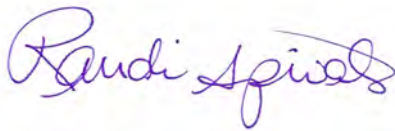

Key flaws in the Lander RMP include:

- ***Allowing new oil and gas leasing within core sage grouse habitat.*** The NTT recommends excluding development in unleased core habitat given the known negative effects of disturbance from fluid mineral development on sage grouse.
- ***Failing to protect sage grouse leks and associated nesting and brood-rearing habitat.*** The Lander RMP fails to protect unleased land, and adopts scientifically untenable lek buffers of 0.6 miles around leks in core habitat. These inadequate buffers stand in stark contrast to empirical scientific information and the NTT Report, both of which recommend much larger buffers to protect sage grouse leks and adjacent habitat – i.e., 4 mile no-surface-occupancy lek buffers for only when there are valid existing rights.
- ***Allowing a disturbance cap in core habitat almost twice as high as recommended by the best available science.*** The NTT says that “where 3% [per an average of 640 acres (one square mile)] disturbance threshold is already exceeded from any source, no further anthropogenic disturbances will be permitted by BLM until enough habitat has been restored to maintain the area under this threshold (subject to valid existing rights).” Yet, the Lander RMP adopts a 5% disturbance threshold, without any supporting scientific evidence that this inflated cap will adequately protect sage grouse habitat.
- ***Failing to protect sage-grouse winter habitat.*** The Lander RMP eschews any real protections for sage grouse winter habitat, instead favoring a seasonal restriction on development within winter habitat. But, permitting the degradation and fragmentation of winter habitat during the non-winter seasons will only slow— not eliminate—the adverse effects of any development on winter habitat. As such, seasonal restrictions on development are tantamount to no restrictions. Further, given that several different breeding populations often use the same winter habitat, the result will be disproportionately large.

We will be evaluating each of the forthcoming plans against the *Scorecard* to ensure USDO and USDA are adopting adequate conservation measures based on the best available science on sage-grouse, and we encourage USDO and USDA to do the same. We support these efforts to revise resource management plans to conserve the greater sage grouse, but the plans must be effective to conserve the species, not half measures to avoid difficult decisions and buy a bit more time while the grouse continues to decline.

We would be happy to discuss the *Scorecard* and any other questions you may have.

Sincerely,

Randi, Spivak, Center for Biological Diversity

Steve and Kurt:

I read that Steve and Secretary Jewell will be visiting China Mountain on Tuesday October 14  
( <http://www.jrn.com/kivity/news/Interior-Secretary-coming-to-Idaho-to-tour-sagebrush-conservation-efforts--278828141.html> ).

Coincidentally, just yesterday the Sagebrush Habitat Conservation Fund Board of Directors, of which I am a member, toured China Mountain and the Antelope Springs allotment with Marc Brackett, the co-owner of the Antelope Springs Ranch which is the primary grazing permittee on the Antelope Springs allotment where China Mountain is located. (Guerry Ranches holds a small sheep grazing permit for 81 AUMs on the allotment as well).

We discussed with Marc the possible purchase of the ranch and waiver and retirement of the Antelope Springs allotment, which, as you know, is exceptionally important wildlife habitat for a number of species but especially for Greater Sage-grouse.

I would suggest to you that Secretary Jewell's Office invite Marc Brackett on your tour and take the opportunity to discuss with him privately his thoughts about the conservation values of the allotment and the interest of the Sagebrush Fund in buying the ranch and retiring that grazing permit.

Marc's email address and cell telephone number are: [antelopesprings@msn.com](mailto:antelopesprings@msn.com) ; 208-358-6609.

To work with Marc and accomplish that purchase and retirement, the Sagebrush Fund needs language added to the Jarbidge RMP either through the current review of Protests of that plan or through the SEIS process for RMP plan amendments for Greater Sage-grouse for BLM Field Offices located in Greater Sage-grouse like the Jarbidge Field Office.

Here is recommended language to accomplish that goal:

***Grazing privileges that are lost, retired, relinquished, canceled, or have base property sold without transfer would have attached AUMs held for watershed protection and wildlife habitat.***

Thanks for taking a moment to talk with Marc.

Jon

## RESOURCE MANAGEMENT PLANNING

## POTENTIAL TRIBAL CONSULTATION EFFICIENCIES

## MILES CITY RMP AND SOUTH DAKOTA RMP (POTENTIALLY THE BUFFALO RMP IN WYOMING)

- RMP progress is similar
- All Field Offices routinely consult with the same tribes which have collective interests in both the Powder River Basin Country and the Black Hills
- All three Field Offices have previously held joint intertribal RMP workshops with interested tribes (October 17 and 18, 2012 – Regional Intertribal Workshop on RMP Planning in Spearfish, SD)
- **Could provide joint government to government meetings for those tribes that request them**
- **BLM lands contiguous with the Northern Cheyenne, Ft. Peck - critical that Miles City have govt. to govt. with Ft. Peck and Northern Cheyenne**
- **Miles City April 2014 update** - No formal consultation efforts – the FO has discussed the RMP with THPO's for Crow, N. Cheyenne, and Ft. Peck. FO has also discussed with the cultural committee on N. Cheyenne. Current guidance from the THPOs is not at this time.
- **South Dakota April 2014 update:**
  - May 14, 2013 - BLM, SDFO held a field trip with area tribes to look at and discuss potential cultural sites at Fort Meade ACEC. Representatives from the Standing Rock, Yankton, and Oglala Sioux were present.
  - May 15, 2013 - BLM, SDFO held a field trip with area tribes to discuss oil and gas leasing in Harding County. Representatives from the Standing Rock, Yankton, Oglala Sioux and Crow Tribe of Montana were present.
  - May 30 2013 - BLM, SDFO and MCFO provided a presentation and discussion about the SD RMP and MCFO RMP at the Lower Brule Reservation. Elders from the Standing Rock, Cheyenne River, Crow Creek, and Lower Brule Sioux Tribes were present.
  - June 5-6, 2013 - The SD Field Manager called the Crow Creek, Lower Brule, Oglala, Rosebud, Santee, Standing Rock, Yankton and Sisseton-Wahpeton Oyate, Flandreau, and Fort Peck Sioux Tribes, the Three Affiliated Tribes, Crow Tribe of Montana, and the Northern Cheyenne tribes. The purpose of the call was to inform the tribes of the June 14th release of the Draft SD RMP/EIS and to see if any tribes wanted to meet about the Draft RMP/EIS. None of the tribes expressed interest in a meeting at this time.
  - June 18-19, 2013 - The SD Field Office Cultural Resource Specialist called the Crow Creek, Lower Brule, Oglala, Rosebud, Santee, Standing Rock, Yankton and Sisseton-Wahpeton Oyate, Flandreau Sioux Tribes, the Three Affiliated Tribes, Crow Tribe of Montana, the Fort Peck Sioux and the Northern Cheyenne tribes. She asked the tribes if they would like a meeting or needed additional information about the draft RMP/EIS. The Rosebud Sioux later called back and requested that BLM come to a tribal council meeting and discuss the RMP.
  - August 14, 2013 - BLM, SDFO provided a RMP presentation and discussed the SD RMP at the Rosebud Sioux Tribal Council Meeting.

## BILLINGS RMP

- BiFO unable to participate in intertribal RMP workshop will set up separate meetings
- Emphasis appears to be limited to Crow and Northern Cheyenne
- BLM lands contiguous with Crow Reservation, critical have government to government meeting with Crow
- Due to Nez Perce Trail, critical to have ongoing consultations with Nez Perce Tribe, and other tribes with connections to the trail
- Would be appropriate to also engage the Eastern Shoshone to see if there is an interest
- April 2014 update -

#### HILINE RMP

- Different schedule than Lewistown or Missoula
- BLM lands contiguous with Ft. Belknap, Blackfeet and Ft. Peck Govt. to Govt. critical
- Tribes with traditional interests in Sweet Grass Hills Sacred Landscape include: Ft. Belknap, Rocky Boy, Blackfeet, Salish-Kootenai
- Could participate in Ft. Peck government to government with Miles City and South Dakota
- April 2014 update:
  - April 23, 2013 - Met with the Confederated Salish and Kootenai Tribes of the Flathead Nation Tribal Historic Preservation Officer at the tribal headquarters in Pablo and made a PowerPoint presentation on the HiLine RMP/EIS. The Tribal Council was briefed on the Proposed RMP and the Preferred Alternative (as well as provided a Draft RMP), and the BLM explained the comment period and had a productive discussion with the Tribal Chairman and two councilmen regarding issues where they voiced their support for the proposed plan and its conservation measures pertaining to cultural heritage and preservation. Items discussed included: RMP discussion, OHV usage and closures, grazing leases, and sage-grouse conservation.
  - April 23, 2013 - Met with the Blackfeet Tribal Council and Tribal Historic Preservation Officer at the Tribal Headquarters in Browning, Montana. The Tribal Council was briefed on the Proposed RMP and the Preferred Alternative (as well as provided a Draft RMP), and the BLM explained the comment period and had a productive discussion with the Tribal Chairman and two councilmen regarding issues where they voiced their support for the proposed plan and its conservation measures pertaining to cultural heritage and preservation. The majority of the conversation centered on oil and gas as well as wind energy development. The BLM explained that the RMP only applied to off-reservation public lands managed by the BLM. Items discussed included: RMP discussion, OHV usage and closures, NSO stipulations for oil and gas, interaction of threatened and endangered species, travel management, grazing leases, sage-grouse conservation, and wind energy potential.
  - April 25, 2013 - Met with the Chippewa-Cree Tribal Council and Tribal Historic Preservation Officer (THPO) on the Rocky Boy's Indian Reservation. The Tribal Council and THPO were briefed on the Proposed RMP and the Preferred Alternative (as well as provided a Draft RMP), and the BLM explained the comment period. Items of interest included: carbon sequestration, oil and gas rights-of-way and the Keystone XL pipeline. Items discussed

included: RMP discussion, air resources, NHPA, mineral extraction, federal archaeological reports, carbon sequestration, whitebark pine, Sweet Grass Hills, Keystone XL pipeline, medicinal plants, and tribal government challenges.

- May 3, 2013 - Met with the Fort Peck Tribal Council in Poplar, Montana. The Tribal Council was briefed on the Proposed RMP and the Preferred Alternative (as well as provided a Draft RMP), and the BLM explained the comment period and had a productive discussion with the Tribal Chairman and two councilmen regarding issues where they voiced their support for the proposed plan and its conservation measures pertaining to cultural heritage and preservation. The majority of the briefing was dominated by discussion of oil and gas development. Items discussed included: RMP discussion, tribal sovereignty, oil and gas drilling, fracking, and predator control.
- May 10, 2013 - Met with the Fort Belknap Tribal Council on the Fort Belknap Indian Reservation. The Tribal Council was briefed on the Proposed RMP and the Preferred Alternative (as well as provided a Draft RMP), and the BLM explained the comment period and had a productive discussion with three councilmen regarding issues where they voiced their support for the proposed plan and its conservation measures pertaining to cultural heritage and preservation. They also thanked the BLM for its expertise and mentioned ongoing efforts between the BLM and the Tribal College. Items discussed included: RMP discussion, hard rock mining, mine reclamation, sage-grouse, wind energy, oil and gas, and carbon sequestration.

#### GRSG AMENDMENTS

- **LFO and NDFO April 2014 update** - The FOs sent three sets of letters offering Government to Government consultation. The FOs sent letters for scoping when the process started, a letter was sent offering consultation when the tribes were invited to be cooperating agencies, and letters were sent when the DEISs were released for public comment. To date, neither office has received requests for formal consultation.
- **ID/SW MT April 2014 update** – The BLM has met with both the Sho-Pai (multiple times) and Sho-Ban (once) tribes. Fostering ongoing conversations at the staff level and managers have engaged both tribes during the process. There will be some additional consultation conducted by BLM/FS managers/ authorized officers as we prepare the Administrative Final EIS.

#### LEWISTOWN AND MISSOULA RMP

- Appear to be on similar schedules/time lines
- Consult with some of the same tribes: Blackfeet, Rocky Boy, Salish-Kootenai
- **Would recommend a regional intertribal workshop with Lewistown and Missoula to explain the RMP process would include: MT/WY Tribal Leadership Council: specific invited tribes, Blackfeet, Salish-Kootenai, Chippewa-Cree of Rocky Boy, Shoshone-Bannock, Crow**
- **Can double up on government to government with most tribes.**
- **April 2014 update** – Missoula has not begun their revision yet – doing some inventory work this year – scoping next FY. Lewistown has begun scoping and invited tribes to be cooperating agencies.

**Idaho State Office**  
**September 18, 2014**

**Project Name:** Idaho and Southwestern Montana Greater Sage-Grouse Plan Amendments

**Status:** Review Comments and Coordination

**Requested Action:** Share Comments on Idaho and Southwestern Montana Administrative Draft Proposed Plan & Discuss Coordination

**Project Description:** BLM and Forest Service initiated the National Greater Sage-Grouse Planning Strategy in 2011. The Strategy is responding to the US Fish and Wildlife Service ‘Warranted but Precluded from Listing’ finding in March 2010. As part of the Strategy BLM and Forest Service announced the development of plan amendments to incorporate adequate regulatory mechanisms into existing land use plans to ameliorate threats to the Greater Sage-Grouse identified in the US Fish and Wildlife Service finding.

**Location:** The Strategy addresses all BLM and Forest Service Greater Sage-Grouse habitat in the western United States (North Dakota, South Dakota, Montana, Wyoming, Colorado, Idaho, Utah, Nevada, Oregon and California). The Idaho and Southwestern Montana sub regional environmental impact statement addresses the Greater Sage-Grouse habitat in Idaho, Southwestern Montana and the portion of the Sawtooth National Forest in Utah.

**Resource Issues:** The primary threats to Greater Sage-Grouse in the Idaho and Southwestern Montana sub region include: wildfire, invasive species and human disturbance and development.

**Time Lines:** A Draft Environmental Impact Statement was published and released to the public in November of 2013. BLM and Forest Service are currently working on developing the Proposed Plan and Final Environmental Impact Statement which is expected to be published and released to the public in fall of 2014. An Administrative Draft of the Proposed Plan has been developed and released internally, to Tribal entities and to Cooperating Agencies for review.

BLM has provided an opportunity to review these materials with comments to be provided to BLM the Wings and Roots meeting on September 18, 2014.

Ted

Doug McConahey

Anne-Marie Starker

Tribes see things in plan they can embrace

Wild fire is an issue but fire is a part of the natural process

more human caused fires, and spread of invasive species is also human caused

we are experiencing dry conditions across the west

the strategy of stopping fire has added to fuels on the ground

verbal fact approval of plan

grandmother thought that thunder would kill chicks in the egg

**Department of Interior-BLM Boise District  
Last regular session of the Boise District Wings and Roots: 08.20.14**

**Agenda:**

1. Welcome – Shoshone-Paiute Tribal Chairman Lindsey Manning or designee  
Welcome – BLM District Manager Jim Fincher  
Process expectations – facilitator Doug McConnaughey
2. Prayer break in the native tongue of this land – Ted Howard
3. Four Rivers Field Office – Tate Fischer, Manager
  - Hoffman/Duffy Dam Safety Modification Project Update
4. Bruneau Field Office – Tanya Thrift, Manager
  - Hole in the Rock (Update)
  - Hutch Springs Demonstration Project Tribal Comment Opportunity
  - Ruff and Ross Lake fencing project Update
5. Boise District Office – Jim Fincher, Manager

- Free Use Fire Wood Projects
- Tribal Inquiry involving official photography in Wilderness in Camas Creek/Pole Creek area

## 6. Idaho State Office

- Sage Grouse plan presented in July, 2014 – Brent Ralston/Kurt Weidenmann  
Tribal Comment Opportunity

## 7. Adjournment. Next regularly-scheduled Boise District Wings and Roots Native American Campfire: **Thursday, October 16, 2014**

### Agenda(ad hocfrom 08.28.14):

1. Welcome and ad hoc process expectations – Doug McConnaughey
2. Owyhee Juniper fuel/fire project – Lance Okeson
3. Adjournment.
- 4.

### Agenda(from 08.21.14):

1. Welcome – BLM Boise District Manager Jim Fincher  
Welcome – Shoshone-Paiute Tribal Chairman Lindsey Manning  
Process Expectations – facilitator Douglas McConnaughey
2. Prayer break in the native tongue of this land – Ted Howard
3. Four Rivers Field Office – Tate Fischer, Manager
  - Hoffman/Duffy Dam Safety Modification Project (Introduction)
4. Bruneau Field Office – Tanya Thrift, Manager
  - Hole in the Rock Field Review Session  
(Follow-up item)
5. Owyhee Field Office – Michele McDaniel, Acting Manager
  - ARS Research Sites in Reynolds Creek (as reported by the tribes at the 7.23.14 Wings & Roots NAC)
6. Boise District Office – Jim Fincher, Manager
  - SW Idaho Juniper Utilization Working Group Update – Justin Boeck
7. Adjournment. Next regularly-scheduled Boise District Wings and Roots government-to-government hearing: **Thursday, September 18, 2014.**

### Agenda (from 07.23.14):

1. Welcome – Shoshone-Paiute Tribal Chairman Lindsey Manning or designee  
Welcome – BLM Boise District Manager Jim Fincher  
Process Expectations by facilitator Douglas McConnaughey
2. Prayer break in the native tongue of this land – Ted Howard
3. Bruneau Field Office – Tanya Thrift, Manager
  - Boundary Fence at Ross and Ruff Lakes (Update)
  - Hole-in-the-Rock (followup)
4. Owyhee Field Office - - Michele McDaniel, Acting Manager

- South Mountain ARS Project (Introduction) - Lance Okeson and Courtney Wyatt
- Johnson Draw ARS Project (Introduction) – Lance Okeson and Karen Kumiega
- 5. Law Enforcement Update – Stan Buchanan, Chief District Law Enforcement Ranger (Executive Session)
- 6. CRUP for Bionomics Environmental Inc. for ITD Highway 93 Rehab project from Deep Creek to Hollister – Kurt Wiedenmann
- 7. Sage Grouse EIS Draft Proposed Plan Discussion/Update – Brent Ralson
- 8. Adjournment. Next regularly-scheduled Boise District Wings and Roots Native American Campfire: **Thursday, August 21, 2014.**

**Agenda (from 06.19.14):**

1. Welcome – BLM Boise District Manager Jim Fincher
2. Welcome – Shoshone-Paiute Tribal Chairman Lindsey Manning or designee
3. Process Expectations by facilitator Douglas McConnaughey
4. Prayer break in the native tongue of this land – Ted
5. Four Rivers Field Office - Tate Fisher,, Manager
  - Nelson Mining Plan of Operation (POO) (Introduction) with BDO Geologist Valerie Lenhartzen
  - Big Willow Natural Gas Field Protective Leasing (Introduction) with Jon Beck
6. Bruneau Field Office – Tanya Thrift, Manager
  - Boundary Fence at Ross and Ruff Lakes
  - Re-cap discussion of June 11, 2014 Field Review Session
  - Hole in the Rock (follow-up)
  - Renewal Owyhee County Road and Bridge Sand and Gravel Free Use Permit
7. Owyhee Field Office – Michelle McDaniel, Acting Manager
  - Renewal of South Board of Control Sand and Gravel Free Use Permit
  - Renewal of Gem County Highway District Sand and Gravel Free Use Permit (Introduction)
  - Rat’s Nest Wild Horse Gather (Introduction) – Michelle McDaniel
8. Boise District Office – Jim Fincher, Manager
  - Bruneau Owyhee Sage Grouse Habitat Restoration (BOSH) Project (New item – Early Alert) – Jim Fincher and Mike McGee
  - TriState Fire and Fuels Management Project (New item-Early Alert) – Jim Fincher and Justin Boeck
  - Landscape Scale Inventory Assessment of Western Juniper (Introduction) Jim Fincher and Justin Boeck
9. Idaho State Office
  - CRUP Application Review – Bionomics Environmental Inc. for ITD Highway 93 Rehabilitation project from Deep Creek to Hollister  
Kurt Wiedenmann
- 10, Adjournment. Next regularly-scheduled Boise District Wings and Roots Native American Campfire: **Thursday, July 17, 2014 Postponed to July 23, 2014**

**Agenda (from 05.15.14):**

1. Welcome - Shoshone-Paiute Tribal Chairman Dennis Smith  
Welcome - BLM Boise District Manager Jim Fincher  
Process Expectations - Facilitator Douglas McConnaughey
2. Prayer break in the native tongue of this land - Ted Howard
3. Four Rivers Field Office
  - Mineral Material Permit Renewals (Introduction) - Tate Fisher
4. Bruneau Field Office - Tanya Thrift, Manager
  - Riverstone International School Backpacking Special  
Recreation Permit Update
5. Owyhee Field Office - Loretta Chandler, Manager
  - Rabbit Creek Road Repairs and Expansion - Post

- Activity Archaeological Inventory (Update) - Michelle McDaniel
  - SIDRA - Dirt Inc. Hare and Hound National Event - (Update) - Michelle McDaniel
  - Owyhee SRP - Annual Event List (New Information) - Michelle McDaniel
6. Issues from the Idaho State Office
    - CRUP - ID-I3707 Craig S. Smith - Williams
    - Northwest Pipeline (Introduction) - Kurt Weidenmann
    - Sage Grouse EIS (Update) - Brent Ralston
  7. Adjournment. Next regularly-scheduled Boise District Office Wings and Roots Native American Campfire: **Thursday, May 15, 2014**

**Agenda (from 02.20.14):**

1. Welcome - BLM Boise District Manager Jim Fincher  
Welcome - Shoshone-Paiute Tribal Chairman Dennis Smith

  - Tribal Comment: Cove Rec. Site Interpretive Sign Artwork (headdress question)
  - Wees Bar recording project (09.26.07 – 09.30.07): Number of people? Number of trips? Dates?
  - Hornet Creek Fuels Management Project Update (80 acres, 5 miles NW of Council, ID)
  - Bruce Way right-of-way Update: Clearance Report ready (project previously introduced in W&R in June, 2006)
  - Wees Bar Recording Project Confidentiality Agreement
4. Bruneau Field Office – John Biar, Acting Manager
  - Upper Castle Creek Juniper Hand Cut Final EA
5. Owyhee Field Office – Mark Lane, Manager
  - Hardtrigger/Black Mountain Wild Horse Gather – post gather report

- Mack's Creek Ponds (Introduction)

6. Adjournment. Next regularly-scheduled meeting: **Thursday, October 18, 2007**

**Agenda (from 07.19.07):**

1. Welcome – BLM State Director Tom Dyer or Special Assistant Howard Hedrick  
Welcome – Shoshone-Paiute Tribal Chairman Kyle Prior  
Facilitator's Notes – Doug McConnaughey
2. Prayer break in the native tongue of this land – Ted Howard
3. Boise District Office
  - Overview of fire season to date by Fire Management staff
  - Tribal inquiry requesting information and details involving demolition and changes to historic structures at the Mud Flat Guard Station. Tribal request for District lead Archaeologist to be in attendance.
4. Owyhee Field Office – Mark Lane, Field Manager
  - Tribal Comment: Hardtrigger/Black Mtn. wild horse gather EA
  - Tribal inquiry and request for information into Wildlife Conservation Projects in the vicinity of Mac's Creek
5. Four Rivers Field Office – Rosey Thomas, Field Manager
  - Cultural Survey results – King Road to Boise Basin Pathway, Idaho City (Bionomics)
  - Cascade Land Sales proposal – Draft EA for tribal review and eventual comment
  - Wees Bar Petroglyph recording project trip follow-up
  - Hornet Creek Fuels Management Project (80 acres located 5 miles NW of Council, Idaho) Introduction

6. Adjournment. Next regularly-scheduled meeting: **Thursday, August 16, 2007**

**Agenda (from 06.21.07):**

1. Welcome – Shoshone-Paiute Tribal Chairman Kyle Prior  
Welcome – BLM State Director Tom Dyer (or Special Assistant Howard Hedrick)  
Facilitator's Notes – Doug McConnaughey
2. Prayer break in the native tongue of this land – Ted Howard
3. Four Rivers Field Office – Rosey Thomas, Field Manager
  - CJ Strike Road Improvement Tribal Comment
  - Cascade Land Sale Package Tribal Comment
  - Thorn Springs Development – additional information
  - West Fork Fence – additional information
  - Wees Bar Petroglyph Recording Project:
    - boat transportation for Elders
    - Draft Confidentiality Statement
    - camping and boat arrangements made with Celebration County Park for September, 2007
  - Unknown location CRUP application by ENTRIX, Inc.
  - Unknown location CRUP application by Dr. Mark Plew
4. Bruneau Field Office – John Biar, acting Field Manager
  - Bruneau RMP Preliminary Draft Special Designations Tribal Comment
  - Upper Castle Creek Juniper Cut Pre-decisional EA presented May 17, 2007 Tribal Comment
  - Update: East Castle Creek Allotment Conversion of Type of Livestock to Domestic Sheep in Pasture 17, Finding of Significant Impact and Proposed Decision Denying Application to Change Kind of Livestock from Cattle to Sheep
5. Owyhee Field Office – Mark Lane, Field Manager
  - Wild Horse Gather Tribal Comment
  - Palmer Juniper Cut – Introduction
6. Adjournment. Next regularly-scheduled meeting: **Thursday, July 19, 2007**

**Agenda (from 05.17.07):**

1. Welcome – BLM State Director (or Special Assistant Howard Hedrick)  
Welcome – Shoshone-Paiute Tribal Chairman Kyle Prior

- Facilitator's Notes – Doug McConaughy
2. Prayer break in the native tongue of this land – Ted Howard

**To:** Jeffery Foss; Paul Makela  
**Cc:** Timothy Murphy; Ethan Ellsworth; Scott Hoefer; Jonathan Beck  
**Subject:** RE: Question on sagegrouse

Jeff,

Yes, I have talked with the Tribe at the Wings and Roots venue about two issues: 1) the noise concern and the sonic booms which are suspected by the Tribe as causing mortality of chicks while developing within the egg; and 2) concern over the use of chaff and flares. The first occasion was in July 2012 where they raised the concern over military overflights. After that meeting I chatted with Paul regarding any know literature regarding this activities effects of mortality to sage-grouse and at that point there wasn't any that we found. I also spoke with Carl Rudeen at the Mountain Home Air Force Base and he shared the EA that the Base had done. The use of chaff and flares is a use authorized by FAA & FCC (as described in IB 2001-030) and evaluated in NEPA conducted by the Mountain Home Air Force Base (March 29, 2010 Environmental Assessment).

The bottom line is that BLM does not have any authority or say in military overflights which is authorized by the FAA or the use of chaff and flares which are also authorized by the FAA & FCC.

At the September 2012 Wings and Roots meeting I communicated that the GRSG EIS was not the appropriate venue to address this concern and that BLM did not have the authority – that the Tribes should coordinate/consult with the Air Force over these issues. That caused a small reaction that quickly blew entirely out of sorts with Doug (the facilitator) indicating that I had single-handedly destroyed the working relationship that previously existed and that he would be contacting Mike Poole and Tom Dyer to express this concern.

At this meeting I had also shared out preliminary alternatives, including the Governor's Alternative. After the initial reaction, Gary, who had been leafing through the material, brought up that we were indeed addressing noise, in that we had a management action specific to noise levels around leks. We talked about those management actions and that they would be applied to BLM authorized activities. That seemed to mollify the concern and the reaction seemed to blow over as I left with everything back on good terms. In addition we acknowledged the lack of any specific scientific studies relating to chick mortality and sonic booms and that this may be something for the Tribe with assistance from university researchers to develop a study to investigate.

In my subsequent meetings with Wings and Roots the concern over noise; i.e. sonic booms and mortality of chicks in the eggs; has come up at least two other time as more of an FYI for BLM without recognition that we have previously vetted this issue at the meeting previously and without any overt need for further BLM follow-up.

At my most recent meeting this came up again in the form of Ted 'telling a story' about his grandmother experience that jets flying above and the associated sonic boom would kill chicken chicks in the eggs. This seems to be the root of the concern without any scientific studies that would support this.

We will identify the sound concern in the EIS acknowledging the concern and the discussions and the need for further investigation but there will not be any discussion in effects analysis since that is and effect that cannot be verified and described for effects. For the chaff concern we will identify that concern as well in the cumulative effects description and reference the effects as described in the Air Force EA.

From IB 2001-030:

N. The BLM will work cooperatively with the military to minimize any effects from the use of chaff and flares. The BLM has no legal authority to regulate the use of chaff and flares; the military use of chaff and flares above public lands is regulated by the FAA and FCC. In the environmental hazards management sense, the use of chaff and flares over public lands is considered the valid use of a product(s) for its intended purpose. [Note: See "Definitions and Acronyms" attachment for explanation of the terms "chaff" and "flares."]

*Discussion: Chaff and flares, properly dispensed in accordance with military policy and procedures over public land have minimal to no impact. Improperly dispensed chaff or chaff canisters which malfunction can leave clumps of chaff on the ground and all chaff releases leave plastic end caps that degrade at a relatively slow rate. Chaff consists of aluminum coated fiber similar in size to human hair. To be effective, chaff is normally dropped at altitudes above 12,000 feet above mean sea level (MSL) and chaff is most often carried aloft in upper level winds for great distances (hundreds of miles). Properly dispensed chaff disperses so that it is non-detectable on the ground. The most recent study on the effects of chaff concluded that, although additional study is recommended, there are no known negative environmental or health effect from the use of chaff.*

*Properly dispersed flares travel less distance in the upper winds than chaff and burn out prior to hitting the ground, but may leave small amounts of debris. Wildfires have been known to start from unauthorized low level use of flares.*

*The use of chaff and flares near Congressionally designated areas or special management areas where the lands are managed so "the earth and its community of life are untrammelled by man and where man himself is a visitor who does not remain", e.g., wilderness areas, wilderness study areas, and wild segments of wild and scenic rivers, is an area of concern. In these areas, the release of chaff and flares below the authorized altitudes could potentially cause impacts that may not be in keeping with the congressional designation of these areas.*

*Where chaff and flares are being dispensed in the proximity of special management areas, the impacts of improperly dispensed chaff and flares need to be considered. BLM and military cooperation is paramount in meeting the intent of Congress relative to the management of special management areas.*

Tim,  
Regarding military over flights and GRSG, there is not a lot of info, but some. The attached Word document contains a section I copy/pasted from the June 2012 Mountain Home Air Force Base" Integrated Natural Resource Management Plan" that acknowledged a temporary response by GRSG could occur, and low level flights could cause stress. However in the mitigation

bullets they state that "Flight activities are dispersed across MOA airspace to reduce associated noise."

I am unable to locate other recent literature on the subject at this time, however the 2010 FWS 2010 Finding references timing limitations to military flights, at the Yakima Training Center in Washington, and says: "Leks have a 1-km (0.6-mi) buffer where all training is excluded, and aircraft below 91.4 m (300 ft) are restricted from midnight to 9 am from March 1 to May 15 (Stinson et al. 2004, p. 32)."

I am following up with a few colleagues. I will let you know if I find more.

Paul

**Subject: Question on sagegrouse**

Tim, another thought I have besides cultural resources monitoring post fire is has anyone studied the effects of the air force on sage grouse nesting/egg hatching I have heard stories from elders saying it has effected egg hatching in their chickens. As the air force operates over the entire strong hold for sage grouse northern Nevada, southern Idaho, and eastern Oregon. Just another thought

Thanks

## Excerpt from Final (June 2012) “Mountain Home Air Force Base Integrated Natural Resource Management Plan” Pages 4-16 and 4-17.

### MILITARY TRAINING- AIRCRAFT OVERFLIGHT, ORDNANCE DROPPING, COMBAT LASER USE

Aircraft overflight might affect sage-grouse. Noise is the predominant disturbance from aircraft overflight. Noise effects from aircraft overflight are infrequent nature and short duration in most of the MOAs (MHAFB, 2008B). During nighttime hours and during most daylight hours, hourly noise levels on days with military flight activity do not differ significantly from hourly noise levels on days without military flight activity. However, differences in hourly noise levels on the order of 10 dB occurred in a few late morning and early afternoon hours. Note that even during hours in which aircraft noise elevated ambient noise levels, average hourly equivalent levels remained lower than 40 dB (40 dB is the amount of noise produced by a refrigerator). Individual military aircraft sorties are occasionally noticeable and typically lasting tens of seconds. High level aircraft noise intrusions are rare events in MOAs. Hourly equivalent sound levels at most sites are generally lower than 40 dB. Although certain aircraft types often operated at high subsonic speeds in the MOAs, flight operations at supersonic speeds capable of producing sonic booms audible on the ground are rare events (Fidell Associates, Inc, 2003). Low-level flights are common near SCR [Saylor Creek Range] and JBR [Juniper Butte Range]. Low-level flights generate short duration, high intensity noise events as high as 140 dB (Table 4-2). Lowlevel flights are uncommon in the rest of the MOAs and are restricted by the parameters of the MOAs, JBRWA, ROD, SROD, SA and FAA regulations (See Appendix 11).

Upland game birds have not been found to vacate areas or experience reproductive losses in response to short-term exposure to aircraft noise or sonic booms (Manci et al. 1988). Manci et al. 1988 further summarized results from Lynch and Speake (1978) and Lamp (1989) indicating that gallinaceous birds are not known to be highly sensitive to aircraft noise. Sage-grouse may show a temporary response to overflights, but are expected to develop a tolerance to noise levels. Combat laser use won't affect sage-grouse. Laser targeting-equipped aircraft operate on SCR and JBR. Use of “combat” mode of operation is limited to specific targets. While the potential for an animal's exposure to the high intensity main beam of the laser cannot be totally discounted, it is considered to be highly improbable due to the specific series of events that would have to occur to result in such exposure. This series of events include being immediately adjacent to the target being lazed, directly looking at the approaching aircraft, and continuing to look at the aircraft during the targeting process (USAF, 1998). Ordnance dropping won't affect sage-grouse. The potential for an animal to be hit by ordnance is lower than for a combat laser. An effect from ordnance dropping is highly improbable.

**1. Direct Effects:** Noise from overflights in the MOAs is unlikely to affect sage-grouse. Noise from low-level flights may increase stress in sage-grouse. Fire caused by ordnance sparking rocks or targets within the target area on SCR and JBR may degrade sage-grouse habitat.

**2. Indirect Effects:** Invasive or nonnative species proliferation where disturbance has occurred from ordnance, increased fire potential from increase in invasive or nonnative species, and a decrease in sagebrush and native plants.

**3. Interrelated or Interdependent Actions:** Military Training- Aircraft Flare and Chaff Use; Military Training- Ground Operations; Range Clearance; Fire Suppression; Maintenance Activities.

**4. Cumulative Effects:** None. There are no related State or private activities reasonably foreseeable on MHRC.

#### **Mitigation Measures**

1. Use cold spot or no spot ordnance to reduce risk of fires on JBR and during fire season on SCR.
2. Use simulated ordnance dropping during high fire risk times.
3. Use fire ratings and restrictions to reduce the risk of fires.
4. Provide ordnance cleanup to reduce the likelihood of ordnance striking ordnance and creating sparks.
5. Employ firefighters on range during declared fire season to provide immediate initial response for fires.
6. Flight activities are dispersed across MOA airspace to reduce associated noise.

Hi Brent,

Yes, we can include this explanation. We don't have a tribal rights section in Chapter 4, but perhaps we could include it in the Native American Tribal Consultation section of Chapter 5?

Also, I received your AR CDs, so thank you for sending them!

Meredith

On Dec 1, 2014, at 8:35 PM, Brent Ralston <[bralston@blm.gov](mailto:bralston@blm.gov)> wrote:

Cheryle,

That's a good question and things keep morphing to a certain extent. Our latest approach for land tenure is the elimination of outright disposal through sales – all GRSG habitat would be retained unless an exchange would result in a greater benefit to GRSG or their habitat. This approach would fit with a retention of land areas which in many cases is of critical importance to the Tribes. When it comes to

exchange site specific NEPA would be required which would include additional Tribal consultation to address their concerns and desires regarding specific parcels.

The no net loss standard applies to effects to GRSG from new development and does not specifically apply to land tenure – i.e. no net loss of acreage during exchange. The plan allows for differences in acreages for exchange based on GRSG values. For infrastructure the intent is to eliminate long term effects to GRSG to maintain populations.

I've spent some time in the Wings and Roots meetings answering their questions regarding the plan which has included the allocations for land tenure and mitigation. In my last visit we were given tacit approval of our plan with an associated offer for support and assistance during implementation.

We have shared the plan with the Sho-Ban as well but have not heard any additional concerns beyond their comments on the draft EIS which we have incorporated into the Final EIS.

Brent/Kurt, I am thinking that the tribes may not understand how their rights/interests will be affected as laid out here. I'm having a hard time telling. Help me out. For example, I see land tenure discussed under these different development scenarios but what does it mean relative to tribal rights/concerns - no net loss. It appears to me that we haven't laid that out for them. or am I missing something?

Cheryle,

That's a good question and things keep morphing to a certain extent. Our latest approach for land tenure is the elimination of outright disposal through sales – all GRSG habitat would be retained unless an exchange would result in a greater benefit to GRSG or their habitat. This approach would fit with a retention of land areas which in many cases is of critical importance to the Tribes. When it comes to exchange site specific NEPA would be required which would include additional Tribal consultation to address their concerns and desires regarding specific parcels.

The no net loss standard applies to effects to GRSG from new development and does not specifically apply to land tenure – i.e. no net loss of acreage during exchange. The plan allows for differences in acreages for exchange based on GRSG values. For infrastructure the intent is to eliminate long term effects to GRSG to maintain populations.

I've spent some time in the Wings and Roots meetings answering their questions regarding the plan which has included the allocations for land tenure and mitigation. In my last visit we were given tacit approval of our plan with an associated offer for support and assistance during implementation.

We have shared the plan with the Sho-Ban as well but have not heard any additional concerns beyond their comments on the draft EIS which we have incorporated into the Final EIS.

Subject: Fwd: IB No. ID-2015-001, Idaho Southwestern Montana Greater Sage-Grouse Administrative Draft Proposed Plan, DD: 10/24/2014

Brent/Kurt, I am thinking that the tribes may not understand how their rights/interests will be affected as laid out here. I'm having a hard time telling. Help me out. For example, I see land tenure discussed under these different development scenarios but what does it mean relative to tribal rights/concerns - no net loss. It appears to me that we haven't laid that out for them. or am I missing something?

Yes, we can. Our relationship with the tribe is more inclusive due to the government to government aspect and does not require a CA agreement.

We have not had any additional formal G to G, but a Tribal member on the RAC has been kept informed at every RAC meeting (3 per year) on what the current status and timelines are. There is no plans to do another formal G to G unless they request one, after we give them advance notice of the FEIS release, before the release to the general public.

**Subject:** Request for Greater Sage-grouse Conservation Effort Database Entries!  
**To:** Jonathan Beck <[jmbeck@blm.gov](mailto:jmbeck@blm.gov)>

Hi Jon

In an effort to make sure everyone has entered conservation efforts into the database please distribute the below email to any staff/partners to notify them there is still time to respond. Thanks-----Kathleen

Dear Sage-grouse Conservation Partner,

We are writing to you to remind and encourage you to submit data about your conservation efforts that benefit greater sage-grouse to our online Conservation Efforts Database (CED), and to contact us if you are having any difficulty in doing so.

Last week, Congress passed a spending bill that includes specific provisions for greater sage-grouse. These provisions do not change the Service's obligation to determine, whether the species still warrants protection under the ESA by September 30, 2015. The spending bill does not affect our ability to develop, implement, and analyze conservation efforts to support the species. **Meaning we must continue to transition from the process of data collection to data analysis.**

We recognize that an unprecedented number of conservation efforts are occurring throughout the 11-state range of greater sage-grouse and that many of you have completed or will soon complete projects and plans that benefit greater sage-grouse. We need your continued help in capturing this information so that we can understand how your efforts have addressed threats to the species. Under the ESA, we are required to accept all information submitted prior to our decision, but the practical reality is that the earlier we receive it, the more fully we will be able to integrate it into our decision-

making process. Therefore, we are urging you to provide relevant information into the CED by year's end, and **no later than January 15<sup>th</sup>, 2015**. To register and provide data, as well as locate additional information about the CED, please visit: <https://conservationefforts.org>.

We also recognize that not all of our partners will be able to fulfill this request by January 15, 2015. Under the ESA, the Service is required to - and in fact will - consider all the information received up to the point of our decision. However, the nature of how we consider information and how it is incorporated in our analysis may be affected by when the service receives that information. If you are unable to complete data entry in the Conservation Efforts Database by **January 15<sup>th</sup>**, please contact us immediately so that we may try to assist you. Please contact:

- Kathy Hollar at [Kathy.Hollar@fws.gov](mailto:Kathy.Hollar@fws.gov), 503-231-6156; or
- Lief Wiechman at [Lief.Wiechman@fws.gov](mailto:Lief.Wiechman@fws.gov), 307-772-2374, x236

In addition, we would like to ask for your assistance in passing this email and attachment onto other conservation partners in your state/area that have also accomplished conservation efforts for greater sage-grouse. The Bureau of Land Management, US Forest Service, Natural Resource Conservation Service, Farm Service Agency, and State Fish and Wildlife Agencies have provided, or are in the process of providing, information to the CED for projects that they have funded. However, other partners such as county commissioners, sage-grouse local working groups, soil and water conservation district offices, cattlemen's associations, private landowners and others who may have also completed greater sage-grouse conservation projects independent of those efforts, and we want to ensure that they also have the opportunity to enter their projects in the CED.

On behalf of the Service's greater sage-grouse team, Thank you for your assistance in providing the Service with the best scientific and commercial data available to help us complete our status review, and thank you for your efforts to conserve greater sage-grouse.

Good morning:

The BLM manages more Greater Sage-Grouse habitat than any other government agency. Our work to ensure the overall health and vitality of sagebrush ecosystems is critical to Greater Sage-Grouse and other species that depend on sagebrush for survival. Also, sagebrush grasslands are a cornerstone of the West's ranching industry and many rural western communities rely on the economic boost provided by healthy sagebrush landscapes. We recognize the importance of our efforts to improve conservation for sage-grouse habitat and we are doing our part to make a difference for the Greater Sage-Grouse.

The BLM has developed a strategy to sustainably manage sagebrush ecosystems through our planning system. The strategy establishes science-based conservation measures that limit disturbance to critical habitat, restore and enhance sagebrush landscapes and work together to reduce the impacts of fire. And this summer, the BLM will finalize 15 Environmental Impact Statement, including six Resource Management Plan revisions and 68 land use plan amendments that incorporate appropriate measures to conserve and restore sage-grouse habitat.

All of you are invited to learn more about the BLM's Greater Sage-Grouse Planning effort. Please join Stephanie Carman, the BLM Greater Sage-Grouse Project Lead, for a Webex on Tuesday, April 21 from 1:00 - 2:00 p.m. EST. This interesting Webex presentation is a great way to learn more about the unprecedented planning effort the BLM has undertaken to protect sage-grouse and its habitat.

Look for more information and features on the BLM Daily that will highlight the hard work BLMers across the country are putting into the Greater Sage-Grouse planning effort. Thank you.

## 5 Things About BLM's Greater Sage-Grouse Planning Strategy

- 1 Greater Sage-Grouse depend on sagebrush for survival:** Greater Sage-Grouse live in sagebrush-steppe or sagebrush shrublands, which are ideally large, intact and mostly treeless landscapes with sagebrush, native bunchgrasses, wildflowers and wet meadows. The habitat also supports more than 350 wildlife species. Threats to Greater Sage-Grouse habitat, including habitat fragmentation, fire and invasive species make it one of the most imperiled of all ecosystems in the United States.
- 2 Healthy landscapes support diverse uses:** Sagebrush grasslands are a cornerstone of the West's ranching industry and many rural western communities rely on the economic boost provided by healthy sagebrush landscapes. We are working to protect both an iconic landscape and a way of life in the West.
- 3 The BLM can make a difference for sage-grouse:** The BLM is responsible for more than half of the nation's remaining sage-grouse habitat across 11 western states. The BLM is working to restore the health and resilience of sage-grouse habitat. We're building on the work of our partners and incorporating the best available science to inform resource management decisions.
- 4 BLM's Greater Sage-Grouse Planning Strategy is the start of something big:** The BLM has established a planning strategy to improve and restore vital sage-grouse habitat. The strategy establishes science-based conservation measures that limit disturbance to critical habitat, restore and enhance landscapes and work together to reduce the impacts of fire. This summer, the BLM will finalize six Resource Management Plans, 14 Environmental Impact Statements and 68 land use plan amendments.
- 5 You're the key to the success of the strategy:** BLM's mission is to manage and conserve public lands for the use and enjoyment of present and future generations under our mandate of multiple-use and sustained yield. We are committed to doing the right thing to protect both the Greater Sage-Grouse and sagebrush habitat.

## **IDL Greater Sage-grouse Conservation Plan**

### **Background and Key Elements of the Plan**

*Updated April 2015*

There are approximately 10.5 million acres of Core and Important (C/I) Sage-grouse habitat in Idaho. Approximately 620,000 acres of endowment rangeland are in identified C/I habitat, which makes up only about six percent of the total surface ownership within C/I habitat zones but accounts for 44 percent of all endowment rangeland ownership. Approximately 69,000 acres of IDL mineral ownership makes up 0.66 percent of the total mineral ownership within C/I habitat zones.

**The IDL plan focuses on the three primary threats to Sage-grouse for Idaho, as determined by the U.S. Fish & Wildlife Service.**

- Wildfire
- Infrastructure
- Invasive Species

**The IDL Plan outlines enforceable stipulations in leases, permits, and easements on endowment lands.**

**The conservation measures also will be used as best management practices for activities pertaining to IDL's role in supporting fire prevention, suppression, and rehabilitation, and regulating oil and gas development, some mining activities, and abandoned mine reclamation.**

**The IDL plan complements Governor Otter's sage grouse plan for federal land management in Idaho.**

- The Governor's plan was submitted to the U.S. Department of Interior Bureau of Land Management (BLM) in September 2012. The Governor's Plan was incorporated in the November 2013 BLM Draft Idaho and Southwest Montana Sub-Regional Sage-grouse Land Use Management Plan Amendment and Environmental Impact Statement, where it was presented as a "co-preferred alternative."
- The USFWS will consider the Idaho plan, including the IDL plan nested within the broader state effort, and conservation measures outlined by ten other western states and regulatory mechanisms for federal lands in the states, before it makes a decision whether to list sage-grouse under the Endangered Species Act (ESA).

**Governor Otter backed up Idaho's commitment with a budget recommendation of \$750,000 for Sage-grouse conservation activities.**

- \$250,000 for IDL to implement cooperative fuel breaks on endowment rangelands and money to refurbish firefighting equipment for use by Idaho's rangeland fire protection associations

\$500,000 to Office of Species Conservation for spring lek surveys; funding for establishment of more rangeland fire protection associations; and private lands coordination efforts

FINAL IDL Greater Sage-Grouse Conservation Plan and other materials available at:  
<http://www.idl.idaho.gov/sage-grouse/index.html>

## Key Elements of the IDL Plan

---

**Fuels Management** – IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to:

- Strategically **establish fuel breaks** to protect C/I habitat zones
- Use **targeted grazing** as a treatment to reduce vegetative fire fuels, reduce annual grass densities, and to protect and enhance C/I habitat zones
- Strategically **remove juniper** near habitat
- Utilize the BLM/U.S. Forest Service Fire and Invasives Assessment Team (FIAT) plans for identification and prioritization

### **Fire prevention**

- IDL will continue to support the formation and ongoing operations of **rangeland fire protection associations**
- Authorized lessees and permittees will be required to develop and be prepared to implement a **fire prevention and emergency response plan** that covers all aspects of operations

### **Wildfire Restoration and Rehabilitation**

IDL will form partnerships, agreements, and cooperate with lessees, working groups, and other federal, state, county, and private partners in **post-fire restoration treatments** of C/I habitat zones on lands damaged by fire.

### **Buffers**

**No surface occupancy** is allowed within 0.62 mile of lek in C/I habitat zones.

### **Marked fencing**

New and existing wire fence segments located in high risk areas will be **marked with collision-diverter markers**.

### **Operational restrictions**

- **Noise levels** from operational activities within C/I habitat zones will be limited during breeding season
- **Seasonal restrictions** apply to project activities within 0.62 mile of occupied leks

### **Land Exchanges**

IDL may recommend the Land Board consider a three-year deferral on leasing of endowment minerals if the Department of Interior adopts a streamlined exchange process that enables the State to enter into an expedited exchange process with the BLM to reduce endowment ownership of Key habitat within Core habitat zones and provide the greatest levels of certainty for conservation of Sage-grouse habitat.

Dear Interested Party:

Thank you for your comments on the Idaho Department of Lands (IDL) draft Greater Sage-Grouse Conservation Plan (Plan). IDL values your contributions.

Since February 2013, IDL has engaged you and other stakeholders for comments on the draft Plan. The comments IDL received informed revisions to the Plan, and the revised Plan is now posted at <http://www.idl.idaho.gov/sage-grouse/index.html>.

The revised Plan will be presented for approval to the State Board of Land Commissioners on April 21, 2015, and the Idaho Oil and Gas Conservation Commission on April 23, 2015.

-----

*Greater Sage-grouse (GRSG) is a candidate species currently being reviewed by the US Fish and Wildlife Service to determine listing status under the Endangered Species Act (ESA). As a direct outcome of the proposed ESA listing review, the US Bureau of Land Management (BLM) initiated a draft Land Use Plan Amendment and Environmental Impact Statement (EIS) pertaining to the GRSG throughout their management zones within sage-grouse habitat. The State of Idaho engaged in similar efforts and Governor Otter submitted an Idaho Plan for sage-grouse conservation on federal land to be considered by the BLM in the EIS alternative analysis. IDL's Sage-grouse Management Plan is meant to complement the Governor's Idaho Alternative, but it addresses endowment trust lands and IDL regulatory programs on private land.*

## Executive Summary

Sage-grouse is a candidate species being reviewed by the U.S. Fish and Wildlife Service (USFWS) to determine listing status under the Endangered Species Act (ESA).

As part of Idaho's commitment to conserving sage-grouse, the Idaho Department of Lands (IDL) developed conservation measures (CMs) for endowment trust land (endowment lands) management programs and for programs that fall under some IDL regulatory and assistance functions. The CMs for IDL programs that involve sage-grouse habitat are included in the Proposed Greater Sage-Grouse Conservation Plan (Plan) outlined in this document.

For proposed activities by third parties on endowment lands, IDL will implement sage-grouse CMs as enforceable stipulations in authorizing documents such as leases, permits, and easements. For activities that take place on privately owned lands in sage-grouse habitat but involve some IDL regulatory and assistance functions, CMs are presented as voluntary best management practices.

Endowment lands are managed under a mandate in the Idaho Constitution (Article IX Section 8) to maximize long-term financial returns to public schools and other State of Idaho institutions. Approximately 1.4 million acres of the total 2.4 million acres of endowment land in Idaho are rangelands, and nearly half of these endowment rangelands are in Core and Important sage-grouse habitat zones identified by the Idaho Alternative, and as concurred by the USFWS.

The IDL also carries out a number of regulatory and assistance duties. The IDL regulatory and assistance responsibilities that affect sage-grouse habitat include regulating certain oil and gas development activities; dredge and placer mine permitting; mine reclamation plan approvals; and abandoned mine land reclamation. The IDL also supports enhanced fire preparedness and suppression in sage-grouse habitat.

Page intentionally blank

## 1. Brief History

In 2010, the USFWS determined Greater Sage-grouse (sage-grouse) warranted protection under the ESA, but it was precluded from listing due to higher priority species. In the USFWS decision, the primary threats listed for Idaho were: wildfire, invasive species, and infrastructure development.

The timeline for USFWS analysis was further accelerated when in 2011 a multidistrict litigation in the U.S. District Court of the District of Columbia resulted in a settlement agreement between the litigants and the USFWS. The settlement agreement required the USFWS to implement a six-year work plan to enable the agency to systematically review and address the needs of more than 250 species listed on the 2010 *Candidate Notice of Review* to determine if they should be added to the Federal Lists of Endangered and Threatened Wildlife and Plants. The USFWS agreed to determine the listing status of sage-grouse in 2015. Later in 2012, the U.S. District Court for the District of Idaho ruled that pursuant to the D.C. District Court settlement, the USFWS must reevaluate the status of sage-grouse under the ESA by September 30, 2015. In response to these deadlines, then-Secretary of the Interior Ken Salazar invited the 11 western states impacted by a potential listing of the species, including Idaho, to develop state-specific regulatory mechanisms to address the cited deficiencies in an effort to preclude a listing under the ESA.

As a direct outcome of the proposed ESA listing review, the U.S. Bureau of Land Management (BLM) initiated a draft Land Use Plan Amendment and Environmental Impact Statement (EIS) pertaining to the sage-grouse throughout BLM' management zones within sage-grouse habitat.

In March 2012, Governor C.L. "Butch" Otter issued Executive Order No. 2012-02 establishing the Governor's Sage-grouse Task Force. The task force's goal was ultimately to develop state-specific regulatory mechanisms for the BLM to incorporate the state's plan as an alternative in the BLM environmental analysis pursuant to the National Environmental Policy Act (NEPA) EIS. The *Idaho Alternative* was submitted to the BLM in September 2012. The *Idaho Alternative* was incorporated as Alternative E in the November 2013 BLM Draft Idaho and Southwest Montana Sub-Regional Sage-grouse Land Use Plan Amendment and EIS, where it was presented as a "co-preferred Alternative" along with the BLM Alternative D.

The IDL Plan complements the Governor's *Idaho Alternative* Sage-grouse Plan for federal land management in Idaho.

The Plan utilizes the *State of Idaho Habitat Zone* classifications defined in 2012 by the Governor's task force. Consistent with the *Idaho Alternative*, IDL focuses conservation efforts on the Core and Important habitat zones, which include the great majority of the sage-grouse populations in Idaho. There are more than 10,500,000 acres in Core and Important sage-grouse habitat zones in Idaho, with the vast majority of these acres under federal management (Table 1.1). IDL has surface or mineral ownership of almost 690,000 acres of Core and Important habitat, with about 619,000 acres of surface ownership in these habitat zones. While the IDL ownership is a relatively small proportion of the 10.5 million acres of habitat (less than 6 percent), almost half of endowment rangelands are found within the Core and Important habitat zones.

## 2. Purpose of the Plan

The Plan has a threefold purpose. (1) It summarizes CMs for endowment land programs and IDL regulatory and assistance programs that are complementary to the *Idaho Alternative* for sage-grouse conservation actions on federal land. (2) It communicates to the USFWS that, along with the *Idaho Alternative*, there are adequate existing regulatory mechanisms to alleviate the primary threats to sage-grouse and sage-grouse habitat in Idaho (such certainty will be necessary to prevent the sage-grouse from being listed under the ESA). (3) It preserves the statutory responsibility of IDL to manage endowment lands under a constitutional mandate to maximize long-term financial returns to state institutions, mainly public schools.

For proposed activities by third parties on endowment lands, IDL will implement sage-grouse CMs as enforceable stipulations in authorizing documents such as leases, permits and easements. The authorized activities include: alternative energy development (solar, wind, and geothermal); oil and gas exploration and development; mining; grazing; miscellaneous commercial activities; and the granting of access through rights-of-way, including easements. In addition, IDL as the land manager will implement and support fire prevention and mitigation measures and wildfire suppression efforts to minimize the impact to sage-grouse and their habitat.

For regulatory and assistance activities on private land, CMs will be voluntary BMPs because IDL does not have the statutory authority within its regulatory programs or assistance activities to require adoption by authorized parties. Regulatory and assistance activities include: abandoned mine lands projects; dredge and placer mine permitting; mine reclamation plan approvals; and oil and gas permits (e.g. seismic imaging surveys, well drilling). Where appropriate, IDL will include recommended BMPs within its authorizing documents to encourage compliance.

IDL also will implement actions through its roles and responsibilities that support enhanced fire preparedness and suppression in sage-grouse habitats.

## 3. Coordination

Utilizing available funding, IDL will collaborate, coordinate, and utilize cooperative planning efforts to implement and monitor proposed CMs to protect and potentially improve sage-grouse habitat. Coordination efforts could include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups, lease/permit holders, and nongovernmental organizations.

Current sage-grouse coordination efforts in which IDL is involved include:

- a. *Bruneau-Owyhee Sage-Grouse Habitat Project (Federal Register- NOI, 01/20/2015),*
- b. *Burley Interagency Landscape Sage-Grouse Habitat Restoration Project,*
- c. *Tri-State Interagency Fuel Break Project (Federal Register-NOI, 2015),*
- d. *Paradigm Fuel Break Project (BLM Draft EA, 01/24/2014),*
- e. *Jarbidge Fuel Breaks Project (DOI-BLM-ID-T010-2011-0006-EA),*
- f. *BLM/IDFG/IDL Rangeland Rehabilitation MOU (Final MOU 02/2015), and*
- g. *Owyhee Land exchange (Agreement to Initiate signed December, 2008).*

In addition, IDL's FY 2016 budget includes a one-time appropriation of \$55,000 from the General Fund to cover IDL personnel costs within the Forest and Range Protection program for two heavy equipment mechanic positions to refurbish water tender equipment. This equipment will be utilized by the Rangeland Fire Protection Associations (RFPAs) in suppressing rangeland fire in the sage-grouse landscape. The FY 2016 budget also includes a one-time appropriation of \$195,000 in Dedicated Funds (Earnings Reserve) for operating expenses within the Lands and Waterways program for fire prevention fuel breaks, conifer encroachment treatments, post-fire seeding, fire prevention brush management, wildlife fencing, flagging, and water development wildlife escape ramps.

#### **4. Greater Sage-Grouse Management Areas**

The Plan utilizes the *State of Idaho Habitat Zone* classifications as described in the *Idaho Alternative, September 2012* and as proposed by the Governor's Sage-grouse Task Force. The *Idaho Alternative* designated a Sage-Grouse Management Area ("SGMA") with three distinct management zones: Core Habitat ("CHZ"), Important Habitat ("IHZ") and General Habitat ("GHZ"). At this time, IDL is not proposing any CMs for endowment lands or regulatory and assistance activities within the GHZ.

IDL concurs with and repeats the following statements from the *Idaho Alternative*:

*The State recognizes that any attempt to map sage-grouse habitat must, by necessity, be at a broad, programmatic scale. The mapping of boundaries presented above is not intended to equate to verified boundary locations or on-the-ground habitat types from which the public can determine with certainty whether any particular location is inside or outside of a particular management zone.*

*Rather, the mapping exercise is intended to give governmental entities, land managers, project proponents and the public a general idea of where certain types of habitat and conservation priorities are spatially located as of the date of the map. The State also recognizes that this mapping exercising depicting current habitat for the species is not static, and any map must be verified through site-specific environmental analysis.*

As described in the *Idaho Alternative*, additional lands beyond the identification thresholds have "been included in the CHZ to consolidate key breeding areas, to include wilderness areas and lands within national monuments, and to foster population connectivity with neighboring states." The IHZ similarly includes "areas of value for migration corridors, connectivity among breeding areas, and long-term persistence of each of the two key meta-populations of sage-grouse in Idaho." By default of the broad scale mapping exercise, both the CHZ and IHZ also include some areas that are neither sage-grouse habitat nor connectivity corridors.

The *Idaho Alternative* lists specific vegetation criteria to be considered for livestock grazing management on federal lands.

*Grazing within the CHZ and IHZ will be managed according to the process outlined in the text below. The first step, and perhaps the most important, is to inform and educate affected permittees regarding sage-grouse habitat needs and conservation measures. These habitat needs or characteristics outlined in Tables 3-5 will be incorporated into relevant resource management plans as the desired conditions with the understanding that these desired conditions may not be*

*achievable: (a) due to the existing ecological condition, ecological potential or the existing vegetation; or (b) due to casual events unrelated to existing livestock grazing.*

The IDL Range Management/Livestock Grazing measures do not include the vegetative criteria recommended for grazing on federal lands. The IDL livestock grazing component is from the previously vetted and approved 2006 Conservation Plan for the Greater Sage-grouse in Idaho (“2006 Idaho Plan”), and as detailed in Section 16 below.

The *Idaho Alternative* uses a *Core, Important, and General* habitat zone classification that is somewhat different from the BLM subregional alternative habitat classification of *Priority, Important, and General Habitat Management Areas* for Idaho. In addition to differences in habitat classifications there exist variations between on-the-ground habitat mapping in the Idaho Alternative and the BLM subregional Alternative. However, both Alternatives recognize the value of a three-tiered habitat approach which is essential to the functionality of the adaptive management process outlined in the Idaho Alternative. In 2014, the State of Idaho and the Idaho BLM came to final agreement of the sage-grouse habitat map for purposes of completion of the Final EIS for management actions on federal lands. The State and IDL both recognize the value of having a consistent classification across the sage-grouse landscape in Idaho, and IDL fully adopts the habitat map agreed upon by the State of Idaho and the Idaho BLM.

IDL will recognize any habitat management updates resulting from the five-year formal map review.

## **5. Adaptive Management**

### **5.a. Adaptive Management for Federal Lands**

The *Idaho Alternative* (September, 2012) Adaptive Management Triggers have been further refined and presented to the USFWS (Brian Kelly) in a letter from Governor Otter dated March 14, 2013. The trigger discussion has been copied from that letter, in part for reference:

*The adaptive triggers provide a regulatory backstop to prevent further loss and stabilize habitats and populations in the CHZ, and to a lesser extent in the IHZ, where a demonstrated significant loss has either occurred over time or unexpectedly (i.e., Murphy Complex Fire). These adaptive triggers are employed when dramatic shifts in population or habitat occurs based on an average over a three year period compared to 2011 values. Additionally, these adaptive triggers place the primary and secondary threats to the species in proper context to appropriately evaluate the cause(s) of the decline.*

*In addition to the below description, Idaho’s Alternative utilizes two types of triggers to help determine whether changes in management are necessary. The triggers are broken down into a “soft” trigger and a “hard” trigger. The “soft” trigger becomes operative when one of the following occurs:*

- *10% decline in maximum number of males counted and a finite rate of change below 1.0 but not significantly on CHZ over a period of three years; or*
- *10% loss of nesting and wintering habitat in the CHZ of a Conservation Area over a period of three years.*

*When the monitoring information indicates that the “soft trigger” may be tripped, an Implementation Team – aided by the technical expertise of IDF&G – will assess the factor(s) leading to the decline and identify potential management actions. See Idaho Alternative at 7. The Implementation Team<sup>1</sup> may consider possible changes in management to the CHZ. As to the IHZ, the Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state’s ability to meet the overall management objective. It is anticipated IDF&G will collect data annually and will make recommendations to the Implementation Team by August 31<sup>st</sup> for population triggers and January 15<sup>th</sup> for habitat triggers. (Per D. Kemner, IDFG, IDFG will collect population data and the BLM will collect habitat data)<sup>2</sup>.*

*The “hard” trigger becomes operative when one of the following occurs:*

- *20% loss in CHZ nesting and/or<sup>2</sup> wintering habitat over a period of three years; or*
- *20% decline in maximum number of males counted and a finite rate of change significantly below 1 within a CHZ of a<sup>2</sup> Conservation Area over a period of three years.*

*If the hard trigger becomes operative according to the monitoring information, management changes are no longer discretionary and will be implemented in the following manner:*

*First, the IHZ will be managed according to the CHZ provisions primarily impacting the ability to consider infrastructure projects. Like the “soft trigger,” the Implementation Team will analyze the actual cause(s) of the decline. The flow chart (Appendix II of letter is titled Adaptive Trigger Strategy- Determine What Caused a Hard Trigger to Become Operative and What Management Actions are Necessary) illustrates the process used to determine which threat(s) caused the habitat or population loss.*

*As the illustration denotes, the Service identified wildfire, invasive species, and infrastructure as the primary threats and West Nile Virus, improperly managed grazing, and recreation as secondary threats. This adaptive trigger strategy focuses the analysis on mitigating the primary threats to the*

---

<sup>1</sup> Excerpted from the clarification letter sent to Steve Ellis, Idaho State Director, BLM from Dustin Miller, Administrator, Governor’s Office of Species Conservation dated July 1, 2013 :

*As part of the state’s responsibility under the MOU, Governor Otter would issue an Executive Order (under state law, an EO has the force and effect of law) establishing an Implementation Task Force to meet the state’s role and responsibilities under the MOU. This task force would be similar in composition to Governor Otter’s Sage-Grouse Task Force pursuant to Executive Order 2012-02.*

*The Implementation Task Force would be tasked with providing Governor Otter advice and counsel on at least the following issues: (1) analyzing the annual sage-grouse monitoring data to determine whether an adaptive response is appropriate and necessary given the population and habitat objectives provided in the Governor’s Alternative; (2) providing input during the National Environmental Policy Act (NEPA) process for on-the-ground infrastructure projects; and (3) prioritizing habitat restoration opportunities. The Implementation Task Force would submit these recommendations to the Governor, and based on his review and concurrence, will transmit these recommendation to the appropriate agency as part of the underlying NEPA analysis. The ultimate decision involving public land management would fall to the appropriate agency.*

*The Implementation Task Force will make recommendations based on the data and recommendations provided by a science subcommittee led by the Idaho Department of Fish and Game (IDFG). The Implementation Task Force may solicit outside experts if necessary.*

<sup>2</sup> Personal communication with Don Kemner, Idaho Fish and Game, April 11, 2015 correcting and clarifying items in letter that were refined for the DEIS.

species in the CHZ. Only where the monitoring information indicates the cause(s) of the decline is not a primary threat will the Implementation Team analyze the secondary threats to the species and determine whether further management actions are needed.

Population and habitat objectives are measured against baselines are illustrated in the tables below. The baseline for habitat within each CA is the 2011 nesting and wintering habitat for the CHZ and IHZ. (See Tables 1 and 2, *Idaho Alternative*, 2012.) The population baseline is the maximum number of males counted on lek routes in 2011 within the CHZ and the average finite rate of change of population for 2009-2011 within the CHZ. It is measured the same way in IHZ. CHZ and IHZ triggers are analyzed separately. The habitat triggers are also analyzed separately from the population triggers.

## **5.b. Adaptive Management for State Endowment Lands**

While IDL recognizes that the soft and hard triggers would become operative across the landscape in a conservation area, regardless of land ownership, the appropriate response to address a soft or hard trigger tripping will only take place on federal land according to the *Idaho Alternative*. However, if the Implementation Team determines the causal factors are applicable to IDL managed land, IDL commits to implementing CMs tailored to meet the identified causal factor. These would likely be implemented immediately under an emergency action clause pending IDL Director approval. However, any CM to be implemented long-term that is a major deviation from the IDL Sage-grouse Plan would need to be approved by the State Board of Land Commissioners (Land Board) as an amendment to the Plan.

IDL will also utilize monitoring results to make any recommendations to the Land Board for their consideration as amendments to the Plan.

## **6. Anthropogenic Disturbance**

Impacts caused by anthropogenic disturbances on sage-grouse can vary depending on the type of activity and local habitat conditions. In addition, cumulative impacts of multiple activities can have significant, negative impacts on sage-grouse populations. In the *Administrative Draft Proposed Plan*, the BLM utilizes a 3 percent disturbance limit across all landowners within eight Biologically Significant Unit areas. Because endowment lands make up such a small percentage of Core and Important habitat zones, IDL will not place a disturbance limit within any defined areas on endowment lands since these limits would result in a violation of the fiduciary trust responsibilities bestowed on the Land Board and IDL in managing endowment lands in accordance with the Constitutional mandate.

## **7. Mitigation**

At this time, the State of Idaho has not finalized a mitigation plan, nor have there been funding sources identified or allocated to implement such a mitigation plan. Idaho's proposed mitigation plan is described in the "Framework for Mitigation of Impacts from Infrastructure Projects on Sage-grouse and Their Habitats" (Sage-Grouse Mitigation Subcommittee of the Idaho Sage-Grouse Advisory Committee, December 2010).

IDL will commit to following Idaho’s mitigation plan once fully developed to the extent adequate funding exists.

## Plan Format

The Plan format uses two PARTS. PART I presents the CMs IDL will implement in its authorizing documents (e.g. leases) for third party activities on endowment lands. In addition, PART I identifies activities to be undertaken by IDL as the land manager related to fire prevention, wildfire suppression, and land transactions (e.g. land exchanges).

PART II presents the CMs IDL will recommend as voluntary best management practices for mining operators and oil and gas operators on non-state lands. In addition, PART II identifies activities to be undertaken by IDL under its statutory roles regarding fire prevention, wildfire suppression, and abandoned mine land reclamation.

Each Part then follows the numbered headings used in the BLM *Administrative Draft Proposed Plan* as an organizational outline and reader courtesy.

**TABLE 1.1 IDL Ownership within Sage-grouse Habitat by Conservation Area and Habitat Zones**

Conservation Area	Habitat Zone	Total Acres All Owners	Total IDL Ownership		IDL Surface Ownership		IDL Minerals Ownership Only	
		Acres	Acres	%	Acres	%	Acres	%
Idaho Desert	Core	1,017,180	31,702	3.12	29,853	2.93	1,849	0.18
	Important	1,064,653	43,510	4.09	38,710	3.64	4,800	0.45
	Total	2,081,833	75,212	3.61	68,563	3.29	6,649	0.32
Idaho Mountain Valleys	Core	2,110,685	177,006	8.39	164,286	7.78	12,720	0.60
	Important	1,602,894	135,004	8.42	120,881	7.54	14,124	0.88
	Total	3,713,578	312,010	8.40	285,166	7.68	26,844	0.72
Idaho Southern	Core	856,442	47,207	5.51	38,352	4.48	8,855	1.03
	Important	1,225,756	70,727	5.77	51,073	4.17	19,654	1.60
	Total	2,082,198	117,934	5.66	89,425	4.29	28,509	1.37
Idaho West Owyhee	Core	2,034,057	133,498	6.56	130,801	6.43	2,697	0.13
	Important	609,354	50,345	8.26	45,616	7.49	4,729	0.78
	Total	2,643,412	183,843	6.95	176,417	6.67	7,425	0.28
All Conservation Areas	CHZ and IHZ	10,521,022	688,999	6.55	619,571	5.89	69,428	0.66

## **PART I. CONSERVATION MEASURES FOR ACTIVITIES ON STATE ENDOWMENT TRUST LANDS**

For proposed activities by third parties on endowment lands in Core and Important habitat zones, IDL will implement CMs as enforceable stipulations in authorizing documents such as leases, permits and easements. The authorized activities include: alternative energy development (solar, wind, and geothermal); oil and gas exploration and development; mining; grazing; miscellaneous commercial activities; and the granting of access through rights-of-way, including easements.

Also, IDL as the land manager will implement and support fire prevention and mitigation measures and wildfire suppression efforts to conserve sage-grouse habitat. In addition, IDL will include an analysis of sage-grouse habitat impacts when considering land transactions that are located in Core or Important habitat zones.

Because of the diversity of terrain and vegetation types within the sage-grouse region of Idaho, it is difficult to design a “one-size fits all” set of CMs. Science and technology also changes over time, and new options or alternatives may be proposed as part of a site-specific management plan. Site-specific management plans submitted by applicants or lessees must provide equal or better results than the CMs described below. Site-specific management plans will be reviewed and approved by the appropriate IDL staff. When anticipated results are uncertain, IDL will confer with the Idaho Department of Fish and Game (IDFG) prior to approving any site-specific management plan.

### **8. Fire Prevention on Endowment Land**

IDL is committed to conserving habitat for the sage-grouse in Idaho, which is under threat from the invasion of annual grasses and the loss of habitat from fire. IDL has developed wildfire preparedness and prevention measures that are complementary with the January 5, 2015 U.S. Department of Interior, Secretary of Interior Order Number 3336. The Order from Secretary Jewell sets forth enhanced policies and strategies for preventing and suppressing rangeland fire and for restoring sagebrush landscapes impacted by fire across the West.

In Idaho, there are 619,571 acres of endowment lands located within Core (363,211 acres) and Important (256,280 acres) habitat zones. These lands contain about 82,000 Animal Unit Months (AUMs) of leased forage. As a primary threat wildland fire has the potential to significantly impact endowment rangelands located in Core and Important habitat zones. Between 2009 and 2014, more than 19,000 acres of Core and Important sage-grouse habitat burned on endowment rangelands due to wildland fire. Based on historical averages, approximately 3,200 acres of endowment rangelands are expected to burn each year within Core and Important habitat zones with significant impacts to grazing lessees and endowment beneficiaries.

During the 2014 fire season, 2,957 acres of Core Habitat Zone burned on endowment rangelands making 470 AUMs of livestock forage unavailable for one to two years. In 2014, Core habitat restoration costs on 2,088 acres of those endowment lands totaled nearly \$45,000. Left unaddressed, the primary threat of wildland fire within Core and Important habitat zones on endowment rangelands is expected to continue at the same rate.

The following CMs will be incorporated as stipulations for any authorizing documents, (except livestock grazing which is addressed separately under item 16 ), issued within Core and Important sage-grouse habitat:

**8.1.** Authorized parties will be required to develop and be prepared to implement a fire prevention and an emergency response plan that covers all aspects of operations, which will include: coordination with local jurisdictions, such as the cities, counties, landowners, IDL, rangeland fire protection associations, and federal land agencies; emergency contact numbers and information, including 911 and local fire dispatch centers; and fire prevention and safety procedures that will include evacuation routes and procedures, the designated safety meeting place, and emergency shutdown procedures.

**8.2.** Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.

**8.3.** Authorized parties will ensure that field personnel are aware of:

- a. fire prevention and emergency response plan,
- b. evacuation routes and procedures,
- c. designated safety meeting places, and
- d. emergency shutdown procedures.

**8.4.** Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

## **9. Wildfire Suppression on Endowment Land**

Appendix C outlines how wildfire protection responsibilities are organized in Idaho, and how Idaho funds its fire program, particularly suppression costs for fires that burn on lands protected by the State of Idaho (IDL and two timber protective associations). Exhibit 2 displays the IDL, federal, and active and proposed rangeland fire protection association boundaries within the sage-grouse landscape.

Blank Page inserted for  
Exhibit 2  
Sage Grouse Habitat Zone and Fire Protection

Page intentionally blank

IDL is committed to conserving habitat for sage-grouse in Idaho, which is under threat from the invasion of annual grasses and the loss of habitat from fire. IDL has developed wildfire suppression guidance that is complementary with the January 5, 2015 U.S. Department of Interior, Secretary of Interior Order Number 3336. The Order from Secretary Jewell sets forth enhanced policies and strategies for suppressing rangeland fire and for restoring sagebrush landscapes impacted by fire across the West.

None of the IDL forest protective districts have suppression responsibilities within any currently identified Core or Important habitat zones. Likewise, as of December 2014, none of the IDL forest protective districts have suppression responsibilities within any currently identified General habitat zone.

When IDL fire suppression resources are dispatched as a cooperating agency to another agency's incident within sage-grouse habitat, the resources will utilize that agency's BMPs as applicable for sage-grouse habitat and as instructed in the dispatched resource's briefing. Interagency cooperation suppression activities are assumed to follow the prioritization associated with the BLM/U.S. Forest Service Fire and Invasives Assessment Team (BLM/FS FIAT) plans. For extended attack fires involving endowment rangelands, in or near Core or Important habitat zones:

**9.1.** IDL may assign a Resource Advisor (primarily a Resource Specialist-Range) to provide local information regarding sage-grouse habitat during the in-brief and continually throughout the incident. The Resource Advisor will also be engaged with the incident to assess sage-grouse habitat that may be affected by the fire or suppression activities.

## **10. Fuels Management on Endowment Land**

Wildfires in a rangeland ecosystem can grow quickly and affect hundreds of thousands of acres of sage-grouse habitat in a matter of days or within a single burning period. Due to rapid fire spread, the potentially long response times due to remoteness, and limited sites for firefighters to establish safe anchor points to engage wildfires in some of these areas, these fires can be difficult to manage. Additionally, only one of the three legs of the fire triangle (fuel, oxygen, and heat) can be modified, which is fuel. This is why fuels management is key in wildfire control in sage-grouse habitat.

**10.1.** Unless otherwise specified as part of a land use plan, IDL will consider the full array of fuels management treatment types (prescribed fire, mechanical, chemical, and biological) when implementing CMs and BMPs on endowment rangelands.

**10.2.** Where applicable IDL will design fuels treatment objectives on endowment rangelands to protect existing Core and Important habitat zones, modify fire behavior, restore native plants, and create landscape patterns to benefit sage-grouse habitat, as resources permit and consistent with the BLM/FS FIAT plans .

**10.3.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to use proper livestock management and targeted grazing as a

treatment to reduce vegetative fire fuels, reduce annual grass densities, and to enhance and protect Core and Important habitat zones.

**10.4.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically remove standing and encroaching conifer near sage-grouse leks, nesting, wintering and brood-rearing habitat, as resources permit. Examples of IDL cooperative efforts include:

- a. *Bruneau-Owyhee Sage-Grouse Habitat Project (Federal Register- NOI, 01/20/2015)*
- b. *Burley Interagency Landscape Sage-Grouse Habitat Restoration Project*

**10.5.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically implement brush management treatments and rehabilitate annual grasslands to reduce vegetative fire fuels within and to protect Core and Important habitat zones, as resources permit.

**10.6.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically establish green and brown strip fuel breaks along existing roads and other disturbances; identify and target higher-risk roads for fuel break construction and maintenance based on fire history maps; and use properly managed and targeted livestock grazing to create fuel break patterns that protect Core and Important habitat zones. Fuel breaks to include annual monitoring and maintenance. Examples of IDL cooperative efforts include:

- a. *Tri-State Interagency Fuel Break Project (Federal Register-NOI, 2015)*
- b. *Paradigm Fuel Break Project (BLM Draft EA, 01/24/2014)*
- c. *Jarbridge Fuel Breaks Project (DOI-BLM-ID-T010-2011-0006-EA)*

**10.7.** IDL will authorize private, state and federal contractor fuel break construction across IDL managed land.

**10.8.** IDL will prioritize fuel management treatments within Key Areas (large contiguous blocks of endowment land within Core and Important habitat that USFWS has identified as a priority for conservation efforts). Fuel management treatments within Key Areas will incorporate sage-grouse seasonal habitat guidelines as presented in Tables 3-5 *Idaho Alternative* (developed from Connelly et al. 2000). When habitat parameters are uncertain or in doubt, IDL will confer with IDFG prior to conducting any fuel management treatments within the Key Areas.

## **11. Wildfire Restoration and Rehabilitation on Endowment Land**

Wildfire restoration/rehabilitation is essential for conserving sage-grouse habitat. The increasing frequency and intensity of rangeland fire poses a significant threat to habitat as well as increasing opportunity for the accelerated invasion of non-native annual grasses, in particular cheatgrass and medusahead rye, and the spread of pinyon-juniper across the sagebrush-steppe ecosystem. By quickly taking action to restore/rehabilitate following wildfire, this opportunity is decreased as we increase the likelihood of desired vegetation reestablishing.

**11.1.** IDL will form partnerships, agreements, and cooperate with lessees, working groups, and other federal, state, county and private partners in post-fire restoration treatments of Core and Important habitat zones on state endowment trust rangelands damaged by fire. Restoration and rehabilitation efforts will be consistent with the BLM/FS FIAT plans.

- a. *BLM/IDFG/IDL Rangeland Rehabilitation MOU (Final MOU 02/2015)*

**11.2** IDL will prioritize fire restoration/rehabilitation treatments within Key. Fire restoration/rehabilitation treatments within Key Areas will incorporate sage-grouse seasonal habitat guidelines as presented in Tables 3-5 *Idaho Alternative* (developed from Connelly et al. 2000). When habitat parameters are uncertain or in doubt, IDL will confer with IDFG prior to conducting any fire restoration/rehabilitation treatments within the Key Areas.

## **12. Habitat Restoration and Vegetation Management on Endowment Land**

**12.1.** As resources permit, IDL will give high priority to vegetation restoration, rehabilitation or manipulation projects in Core and Important habitat within the Key Areas first, followed by those areas not within the Key Areas, consistent with the BLM/FS FIAT plans that include:

- a. Cooperative efforts that may improve Core and Important habitat zones over multiple ownerships.
- b. Projects that may provide connectivity between suitable habitats or expand existing good quality habitat within Core and Important habitat zones on endowment rangelands.
- c. Sites where environmental variables contribute to improved chances for project success.
- d. Projects that address conifer encroachment within Core and Important habitat zones. Priority for treatment as Phase 1 (<10 percent conifer cover), Phase 2 (10-30 percent), and Phase 3 (>30 percent).
- e. Where desirable perennial bunchgrasses and/or forbs are deficient in existing sagebrush stands, use appropriate mechanical, aerial, or other techniques to re-establish desired species.
- f. Re-establish sagebrush cover on recently burned native areas within suitable Core and Important habitat zones, with consideration to endowment rangeland forage productivity, local needs and conditions.

**12.2.** Assess existing on-site vegetation to ascertain if enough desirable perennial vegetation exists to consider techniques to increase on-site seed production to facilitate an increase in density of desired species.

**12.3.** Use available plant species based on their adaptation to the site when developing seed mixes.

**12.4.** Use post-treatment control to reduce annual grass densities, invasive and noxious weed competition through targeted livestock grazing and herbicide applications.

**12.5.** IDL will cooperate with lessees, working groups, and other federal, state, county and private partners to strategically remove standing and encroaching conifer near sage-grouse leks, nesting, wintering and brood-rearing habitat, as resources permit.

- a. *Bruneau-Owyhee Sage-Grouse Habitat Project (Federal Register- NOI, 01/20/2015)*
- b. *Burley Interagency Landscape Sage-Grouse Habitat Restoration Project*

**12.6** IDL will prioritize habitat restoration treatments within Key Areas. Habitat restoration treatments within Key Areas will incorporate sage-grouse seasonal habitat guidelines as presented in Tables 3-5 *Idaho Alternative* (developed from Connelly et al. 2000). When habitat parameters are uncertain or in doubt, IDL will confer with IDFG prior to conducting any habitat restoration treatments within the Key Areas.

### **13. Invasive Plant Species on Endowment Land**

Exotic annual grasses and other invasive plants alter habitat suitability for sage-grouse by reducing or eliminating native forbs and grasses essential for food and cover. Exotic annual grasses, in particular cheatgrass and medusahead rye, also facilitate an increase in mean fire frequency. For endowment lands, the following four CMs for invasive plant species will be applied through lease stipulations or other recordable instrument stipulations.

**13.1.** Vehicles and equipment operated by IDL or lessees that will travel off approved /designated transportation routes will be inspected and cleaned of seeds and propagules to prevent the spread of invasive and noxious plant species.

**13.2.** Through a cooperative effort, invasive and noxious plant species will be inventoried and monitored pre-disturbance and throughout the life of the project by the lessee and the lessor or a designated agent.

**13.3.** Reclamation activities will include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) will be certified weed free by the appropriate federal or State of Idaho agency.

**13.4.** Authorized parties will use BMPs and appropriate treatments including chemical, mechanical and biological to treat invasive and state listed noxious plant species. When regulated chemicals are determined to be the best treatment, authorized parties will use Idaho licensed professional applicators to treat noxious plant species with the approved and properly documented herbicide. Weeds will be treated promptly when located on a project site.

## 14. Infrastructure Development/ Lands and Realty on Endowment Land

The *Idaho Alternative* defines “infrastructure”:

*... as discrete, large-scale anthropogenic features, including highways, high voltage transmission lines, commercial wind projects, energy development (e.g., oil and gas development, geothermal wells, airports, mines, cell phone towers, landfills, residential and commercial subdivisions, etc.*

*Infrastructure related to small –scale ranch, home and farm businesses (e.g., stock ponds, fences, range improvements) do not fall within this definition. These issues are not included within this definition, and are addressed in other sections of the Alternative or through local resource management plans.*

Infrastructure development on endowment lands can vary from minor road or fencing construction to utility-scale renewable energy facilities including wind farms, geothermal power plants, and solar power plants. These developments regardless of their size can have a measurable and substantial impact on sage-grouse and their habitat. All infrastructure developments require some form of road construction to deliver materials for construction and perform regular maintenance to facilities. These roads are often graded gravel roads and are maintained periodically for easy access to sites. Other smaller roads are developed for access to geothermal well pads, wind turbines, or pipelines. Roads may also be necessary for third-party access to private or federal lands.

Transmission lines must be built in order to harness power from wind turbines, geothermal sites, or solar sites and to provide for grid reliability. Additionally, fences are often erected to protect facilities such as turbines or substations from vandalism. These features all have the potential to directly, or indirectly, affect sage-grouse at multiple scales and over time.

IDL’s assessment of the potential for renewable energy development to occur on endowment lands located in Core and Important sage-grouse habitat zones is very low. However, any proposed development will be required to comply with the CMs identified in the following sections. These same CMs will also be included as stipulations in rights-of-way, when IDL authorizes parties to access other lands by using endowment lands.

### 14.1. Surface Use and Timing

**14.1.1.** Controlled surface use and timing limitations as described below will be applied within Core and Important habitat zones, unless species occupancy and distribution determined by the IDFG recommends otherwise.

**14.1.2.** No surface occupancy is allowed within 1 km (0.62 mi.) of an occupied lek in the designated Core and Important habitat zones. Livestock grazing is not considered surface occupancy.

**14.1.3.** During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6 p.m. and

9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000-foot elevation may be used as a general distinction.

**14.1.4.** Major construction and maintenance activity shall be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

## **14.2. Noise**

Limit noise levels from discretionary activities within Core and Important habitat zones to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from two hours before sunset to two hours after sunrise during breeding season. Ambient noise levels will be determined by measurements taken at the perimeter of an occupied lek at sunrise.

## **14.3. Fencing**

Findings from Stevens et al. 2012 show that sage-grouse collisions are highly variable spatially, and targeting efforts for fence marking is more strategic and cost-effective. Analysis revealed that terrain ruggedness and distance from the lek were primary factors associated with fence collision risk across the landscape. Use Natural Resource Conservation Service (NRCS) fence collision data and local knowledge to determine low, medium or high risk level around occupied leks. Fence segments within Key Areas will be the first priority.

**14.3.1.** New and existing wire fence segments constructed by authorized parties that are located in high risk areas will be marked according to the NRCS Fence Collision Risk Tool which is based on (Stevens et al. 2012) using collision diverter fence markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.

**14.3.2.** As necessary and feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important habitat zones.

## **14.4. Water Supply Structures**

**14.4.1.** New or modified spring developments (including pipelines) shall be designed by authorized parties to maintain or enhance the free-flowing characteristics of springs and wet meadows, which will help maintain continuity of the pre-developed riparian areas.

**14.4.2.** As an exception to 14.4.4.1., on projects requiring water to be pumped such as solar, hydro or fossil fuel operation, floated tanks will be allowed to conserve water resources and efforts will be made by the lessee to treat these tanks for mosquito species that carry West Nile Virus.

**14.4.3** The construction of new ponds or reservoirs by authorized parties will be minimized, except as needed to meet important resource management or restoration objectives, to reduce the potential impact from West Nile Virus on sage-grouse.

**14.4.4.** Wildlife escape ramps in new and existing water troughs and open-water storage tanks shall be developed to facilitate the use of and escape by wildlife.

## **14.5. Constructed Improvements**

**14.5.1.** Construction methods will be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.

**14.5.2.** Infrastructure will be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed for access to facilities. Requirements from public utilities will be followed for all installations

**14.5.3.** Surface disturbances will be clustered in order to limit surface occupancy.

**14.5.4.** New utility developments and transportation routes will be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.

**14.5.5.** Use best available science in concurrence with IDFG to address concerns of transmission towers as perches for predatory or corvid birds.

**14.5.6.** New structures with a height over five feet will not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built, or presently exist, the lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.

**14.5.7.** Construction plans developed by authorized parties will include options that deter raptor perching and raven nesting on elevated structures.

**14.5.8.** Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

## **14.6. Site Reclamation** (non-fire related rehabilitation/reclamation)

**14.6.1.** Site reclamation will be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.

**14.6.2.** Reclamation activities and plans will consider the ecological site potential. The goal of the reclamation will be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.

**14.6.3.** Sites will be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

## **Transition Lands/Land Tenure**

IDL considers opportunities to sell, purchase, develop, or exchange endowment lands to meet its constitutional mandate to maximize long term returns to the owning beneficiaries by diversifying land holdings, maximizing the rate of return to the trusts, improving public access to endowment lands, and consolidating endowment lands for more efficient management. In order to accomplish these objectives, IDL must be able to maintain the flexibility to move lands into and out of the identified habitat zones. Lands identified for potential ownership changes are termed “transition lands.”

The ultimate decision authority for determining to auction or exchange endowment lands lies with the Land Board. IDL commits to providing the Land Board relevant data and analysis to inform them on potential impacts to sage-grouse habitat of land transitions within Core or Important sage-grouse habitat zones through the following CMs.

**14.7.** Any tract proposed for sale or exchange within Core or Important habitat zones will include an analysis on the impact to sage-grouse habitat resulting from the transition. This analysis will include, but not limited to:

- Acres in and percentages of Core and Important habitat zones.
- Quality/type of habitat (number of leks, breeding, nesting, early brood rearing, summer/late brood rearing, fall, winter).
- Any knowledge of new owner’s implementation/commitment for sage-grouse conservation measures to estimate overall impact to sage-grouse habitat conservation.
- IDFG data and review comments.

## **14.8 BLM Land Exchanges**

IDL adopts a general strategy aimed at reducing endowment ownership of Key Habitat within Core Habitat Zones through completion of land exchanges with the BLM. This strategy would provide the greatest levels of certainty for conservation of core sage-grouse habitat.

Once endowment lands have been proposed to be included in a formal land exchange with the submission and acceptance of an Agreement to Initiate (ATI) with the BLM, the IDL, with Land Board concurrence, would commit to up to a three-year deferral on leasing of those lands for mineral development in order to accomplish the exchange.

Key habitat areas within Core Habitat Zones within the endowment trust estate ~~are~~would be prioritized for exchange. In exchange for those endowment lands, IDL would prioritize BLM lands and/or minerals with the following characteristics for acquisition consistent with its duty to maximize revenue over the long term in accordance with Article IX, Section 8 of the Idaho Constitution: 1) lands and minerals located outside of Core and Important habitat zones, 2) lands with oil and gas resource development potential, 3) lands with non-native vegetation (previously seeded crested wheatgrass), and 4) lands that block up existing IDL ownership, not necessarily limited to the current disposal lists in the respective Resource Management Plans.

Given the long timeframes that can be associated with federal land exchanges, the IDL proposes that the Department of Interior consider adopting a streamlined exchange process, similar to authorities contained in the 2014 Farm Bill for the U.S. Department of Agriculture. Land exchanges that provide a net benefit to conservation of core sage grouse habitat, should be considered for a categorical exclusion under NEPA.

#### **14.9. Owyhee Land Exchange**

In December, 2008 the BLM and IDL entered into an Agreement to Initiate Land Exchange. IDL's objectives for parcel acquisition selection include: improved range (crested wheatgrass seedings), parcels outside core or important Greater Sage-Grouse habitat or Bighorn Sheep habitat, parcels that block up current IDL ownership and/or provide legal access to existing ownership, and parcels that may have Higher and Better Use (HBU) potential. Objectives for disposition of IDL lands include: wholly within or adjacent to designated wilderness, scattered parcels with no legal access and no management control, other scattered IDL parcels within large blocks of BLM ownership. Acreage in the current version of the of the exchange includes approximately 28,000 acres of IDL ownership and 32,000 acres of BLM ownership. Parcels in the exchange are displayed in Appendix D.

**14.10** New acquisitions of endowment lands within the Core and Important habitat zones would be discouraged; however, if minor amounts of lands were acquired, they would be managed according to the IDL sage-grouse CMs.

### **15. Mineral Leasing on Endowment Land**

For all mineral leasing activities on endowment lands, CMs for the sage-grouse will be applied through lease stipulations or other recordable instrument stipulations that are enforceable. Mineral leasing can be slightly more complex due to the potential for split estate scenarios, where the surface owner is different than the mineral estate owner. In these cases, IDL would still

include CMs as lease stipulations when leasing involves only the mineral estate (where the endowed beneficiary is not the surface owner).

### **15.1. Fluid Mineral Leasing on Endowment Land**

Fluid minerals are resources of oil, natural gas (gas), and natural gas condensate. The first commercially-viable resources of gas were discovered in Payette County in 2010. Exploration activity is also located in adjacent counties to Payette County. Recent leasing in south central and southeast Idaho suggests exploration interests in these areas. Additional resource discoveries are possible in all of these areas. Presently, IDL has no exploration activities to regulate for fluid minerals located in Core or Important sage-grouse habitat zones.

The resources in Payette County were discovered with conventional drilling operations, which utilized vertical well bores that penetrated permeable gas accumulations within site-specific gas traps. These types of deposits are termed conventional gas (or oil) resources. In contrast, unconventional resources are continuously-distributed oil or gas accumulations in fine-grained rocks, which generally cannot be exploited through conventional methods and techniques. Unconventional resources have not been identified in Idaho, but the potential for their discovery does exist. For endowment lands, the following oil and gas lease stipulations will be included in the lease document and advertised prior to lease auction on tracts within Core and Important habitat zones.

#### **15.1.1. Surface Use and Timing**

- a. Controlled surface use and timing limitations as described below will be applied within Core and Important habitat zones, unless species occupancy and distribution determined by IDFG recommends otherwise.
- b. No surface occupancy is allowed within 1 km (0.62 mi.) of an occupied lek in the designated Core and Important habitat zones.
- c. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000-foot elevation may be used as a general distinction.
- d. Major construction and maintenance activity will be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

#### **15.1.2. Noise**

Limit noise levels from discretionary activities within Core and Important habitat zones to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from two hours before sunset to two hours after sunrise during breeding season.

Ambient noise levels will be determined by measurements taken at the perimeter of an occupied lek at sunrise.

### **15.1.3. Fencing**

New and existing wire fence segments constructed by authorized parties that are located in high risk areas will be marked according to the NRCS Fence Collision Risk Tool which is based on (Stevens et al. 2012) using collision diverter fence markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.

### **15.1.4. Water Supply Structures**

Wildlife escape ramps in new and existing open-water storage tanks will be developed to facilitate the use of and escape by wildlife.

### **15.1.5. Constructed Improvements**

- a. Construction methods will be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- b. Infrastructure will be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, will be located along roads already in existence or required to be newly constructed for access to facilities.
- c. Surface disturbances will be clustered in order to limit surface occupancy.
- d. New utility developments and transportation routes will be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- e. Use best available science in concurrence with IDFG to address concerns of transmission towers as perches for predatory or corvid birds.
- f. New structures with a height over five feet will not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built, or presently exist, the lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- g. Construction plans developed by authorized parties should include options that deter raptor perching and raven nesting on elevated structures.
- h. Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

### 15.1.6. Site Reclamation for Leases

- a. Site reclamation will be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- b. Reclamation activities and plans will consider the ecological site potential. The goal of the reclamation will be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- c. Sites will be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

## 15.2. Mining Activities on Endowment Lands

Mineral leasing and any subsequent mining activities on state endowment trust lands require authorization and oversight by IDL. IDL uses written procedures, including mineral lease pre-auction inspections, quarterly or yearly mineral lease inspections, and mineral lease enforcement to ensure compliance by authorized parties. The following conservation measures will be incorporated into the IDL mineral leases that are in Core and Important sage-grouse habitat zones.

### 15.2.1. Surface Use and Timing

- a. Controlled surface use and timing limitations as described below will be applied within Core and Important habitat zones, unless species occupancy and distribution determined by the Idaho Department of Fish and Game (IDFG) recommends otherwise.
- b. No surface occupancy is allowed within 1 km (0.62 mi.) of an occupied lek in the designated Core and Important habitat zones.
- c. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations, project activities will be avoided within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000 foot elevation may be used as a general distinction.
- d. Major construction and maintenance activity will be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

### 15.2.2. Noise

Limit noise levels from discretionary activities within Core and Important habitat zones to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before sunset to 2 hours after sunrise during breeding season. Ambient

noise levels will be determined by measurements taken at the perimeter of an occupied lek at sunrise.

### **15.2.3. Fencing**

New and existing wire fence segments constructed by authorized parties that are located in high risk areas will be marked according to the NRCS Fence Collision Risk Tool which is based on (Stevens et al. 2012) using collision diverter fence markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.

### **15.2.4. Water Supply Structures**

Wildlife escape ramps in new and existing open-water storage tanks will be developed to facilitate the use of and escape by wildlife.

### **15.2.5. Constructed Improvements**

- a. Construction methods will be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- b. Infrastructure will be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, will be located along roads already in existence or required to be newly constructed for access to facilities.
- c. Surface disturbances may be clustered in order to limit surface occupancy.
- d. New utility developments and transportation routes will be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- e. Use best available science in concurrence with IDFG to address concerns of transmission towers as perches for predatory or corvid birds.
- f. New structures with a height over five feet will not be constructed by authorized parties within 1km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within 3 km of breeding period habitats. If these structures must be built, or presently exist, the lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- g. Construction plans developed by authorized parties should include options that deter raptor perching and raven nesting on elevated structures.
- h. Permanent structures that create movement will be minimized within Core and Important Habitat Zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

**15.2.6. Site Reclamation for Leases**

- a. Site reclamation will be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- b. Reclamation activities and plans will consider the ecological site potential. The goal of the reclamation will be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- c. Sites will be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

**16. Range Management/Livestock Grazing on Endowment Land**

IDL recognizes that healthy rangelands provide a basic foundation for productive sage-grouse habitat. Conservation and improvement of sage-grouse habitat is consistent with long-term grazing management systems that support conditions or trends toward healthy rangelands. Within the 2006 Conservation Plan for the Greater Sage-grouse in Idaho (“2006 Idaho Plan”), IDL agreed to take measures that protect or improve important and critical wildlife habitat, subject to the fundamental mission of IDL to support endowment beneficiaries. Though the impact of livestock grazing to rangelands is recognized as a secondary threat to sage-grouse habitat in Idaho, roughly 619,571 surface acres or 44 percent of endowment rangelands are within Core and Important habitat zones. IDL identifies proper livestock grazing as a tool that could benefit sage-grouse habitats by taking into consideration flexibility and site-specific management opportunities.

Identified within the 2006 Idaho Plan, livestock management practices are not stand-alone actions. Management activities should be considered in combinations best characterized by a complete and effective grazing program and that also considers key sage-grouse conservation needs. IDL further recognizes that opportunities exist for state and federal agencies, grazing lessees and university researchers to collaborate on efforts to modify current conditions and needed management actions in terms of livestock grazing in sage-grouse habitats throughout southern Idaho. IDL will administer endowment rangelands and livestock grazing leases in core and important habitat zones with lease stipulations that are drawn from, in part, the CMs specified within the 2006 Idaho Plan as well as more recent IDFG recommendations.

Issue Addressed	Conservation Measure(s)
Livestock management and leks.	1. Use lek route or other relevant information to identify leks where the placement of sheep camps, bed grounds, herding or related activities is repeatedly disturbing displaying birds on active leks. Dates of concern are from March 15 through May 1 in lower elevation with habitats and March 25 through May 15 in higher elevation habitats. Once such leks are identified, IDL will work closely with sheep ranchers, Local Working Groups and/or IDFG to identify mutually agreed upon alternative sites or herding routes that eliminate or reduce disturbance. In selecting such

Issue Addressed	Conservation Measure(s)
	<p>alternative sites/routes, focus on areas away from leks and that do not provide breeding habitat characteristics, where feasible. If such lek-specific CMs cannot be developed (due to time or logistical constraints), domestic sheep grazing activities described above will be avoided within the lesser of 1 km (0.62 mi) or direct line of sight of any such lek during the lekking periods.</p> <ol style="list-style-type: none"> <li>2. IDL will provide maps to lessees to ensure that sheep operators and herders are aware of the location of possible or occupied leks.</li> </ol>
Livestock management and late brood rearing habitat.	<ol style="list-style-type: none"> <li>1. Due to the preference of forbs by domestic sheep, manage sheep allotments using grazing management techniques that promote and maintain a diversity of desirable annual and perennial forbs. Suggestions include: <ol style="list-style-type: none"> <li>A. Alternate or rotate areas for spring turnout.</li> <li>B. Promote light, once-over use of vegetation, as opposed to repeated use during the same season by the same band or successive bands of sheep.</li> <li>C. Ensure that permittees, foremen, herders and sheep camp tenders are informed of management and movement requirements, such as related to the avoidance of recent burns, burned area rehabilitation seedings or other restoration sites.</li> <li>D. Employ open (loose) herding of sheep as opposed to tightly bunched sheep.</li> </ol> </li> <li>2. Manage grazing of riparian areas, meadows, springs, and seeps in a manner that promotes vegetation structure and composition appropriate to the site. In some cases enclosure fencing may be a viable option. However, in some cases, (e.g., enclosed meadows) the availability and quality of herbaceous species may be improved by periodic grazing use of enclosure and should be considered in the grazing management program.</li> <li>3. In agricultural fields where sage-grouse use has been documented or is likely, willing lessees may wish to avoid or limit use of alfalfa by livestock after the last cutting, to provide residual alfalfa for use by sage-grouse broods.</li> </ol>
Livestock management during periods of drought.	<ol style="list-style-type: none"> <li>1. In sage-grouse nesting and brood-rearing habitats, adjust livestock use (season, utilization, stocking, intensity, and/or duration) during drought to minimize the additional stress placed on herbaceous species. This is anticipated to reduce impacts on perennial herbaceous cover, plant species diversity and plant vigor. IDL will cooperate with lessees and federal partners as needed.</li> <li>2. IDL will continue to foster the coordination of drought management activities and outreach through the Idaho</li> </ol>

Issue Addressed	Conservation Measure(s)
Placement of salt and mineral supplements.	<p>Rangeland Drought Task Force committee.</p> <ol style="list-style-type: none"> <li>1. When using salt or mineral supplements: a) place them in existing disturbed sites, areas with reduced sagebrush cover, seedings, or cheatgrass sites (for example) to reduce impacts to sage-grouse breeding habitat, b) where feasible, use salts or mineral supplements to improve management of livestock for the benefit of sage-grouse habitat.</li> </ol>
Placement of fences and other structures.	<ol style="list-style-type: none"> <li>1. Findings from Stevens et al. 2012 show that sage-grouse collisions are highly variable spatially, and targeting efforts for fence marking is more strategic and cost-effective. Analysis revealed that terrain ruggedness and distance from the lek were primary factors associated with fence collision risk across the landscape. Use Natural Resource Conservation Service (NRCS) fence collision data and local knowledge to determine low, medium or high risk level around occupied leks. Fence segments within Key Areas will be the first priority.</li> <li>2. New and existing wire fence segments constructed by authorized parties that are located in high risk areas will be marked according to the NRCS Fence Collision Risk Tool which is based on (Stevens et al. 2012) using collision diverter fence markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.</li> <li>3. Where feasible, IDL will recommend placement of new fences and structures with consideration of their impact on sage-grouse. In general, avoid constructing new fences within 1 km (0.62 mi) of occupied leks (adopted from Connelly et al. 2000b). Where feasible, place new, taller structures such as corrals, loading facilities, water storage tanks, windmills etc., as far as possible from occupied leks to reduce opportunities for perching raptors. Careful consideration, based on local conditions, will also be given to the placement of new fences or structures near other important seasonal habitats (winter-use areas, movement corridors etc.). In order to reduce potential impacts, fence markers will be used to mitigate mortality within areas identified by IDL, lessees or cooperative partners.</li> </ol>
Design and placement of water developments.	<ol style="list-style-type: none"> <li>1. IDL and lessees will cooperate on site-specific new spring developments in sage-grouse habitat. Spring developments will be designed to maintain or enhance the free-flowing characteristics of springs and wet meadows by the use of float valves on troughs or other features where feasible. Retrofit existing water developments during normal maintenance activities to maintain or enhance lentic, riparian properties and</li> </ol>

Issue Addressed	Conservation Measure(s)
	<p>minimize annual maintenance.</p> <p>2. IDL and lessees will cooperate to ensure that new and existing livestock troughs and open water storage tanks are fitted with wildlife escape ramps/ladders to facilitate the use of and escape from troughs by sage-grouse and other wildlife. Floating boards or similar objects will not be used as these are too unstable and are ineffective. IDL and lessees will cooperate to ensure that USDA-NRCS design requirements for wildlife escape ramps are followed when installed.</p>

## 17. Wild Horses and Burros

No direct measures, this item included to maintain sequential numbering system utilized for the BLM *Administrative Draft Proposed Plan*.

## 18. Travel Management

18.1. On site traffic should be reduced by use of telemetry and other remote sensing tools.

18.2. During operations, existing roads or trails should be employed and activities should be contained as close to existing roads and trails as feasible.

18.3. Roads should be designed by authorized parties to an appropriate minimum standard necessary to accommodate their intended purpose.

18.4. Road crossings should be constructed by authorized parties at right angles to ephemeral drainages and stream crossings.

## 19. Recreation

Recreation has been determined to not be a primary threat to sage-grouse in Idaho, but the measures listed above in 13. and 14. will also apply to recreation leases.

## 20. Implementation and Monitoring

Implementation of the CMs through lease/permit/easement stipulation will be incorporated into existing lease/permit/easement issuance procedures. A copy of the applicable CMs will be provided to all interested applicants for a lease, permit or easement on endowment lands located in Core or Important habitat zones, so the applicant is informed of the expected requirements when entering the application process. The CMs will be incorporated into the authorizing

document either directly or by separate addendum. See Appendix B for IDL's DRAFT Implementation Plan.

Monitoring of CMs required through lease/permit/easement stipulation will be incorporated into existing lease/permit inspection procedures. Inspection forms will be amended to include a section for documenting that CMs were implemented and an assessment of their effectiveness. See Appendix E for IDL's DRAFT Monitoring Plan (not yet completed).

Procedures for land transactions will be amended to include an analysis of the impacts on sage-grouse when the transaction includes transition lands within Core or Important habitat zones. The results of this analysis will be included in the information provided to the Land Board for their review of the proposed transaction.

## **PART II. CONSERVATION MEASURES FOR IDL ACTIVITIES IN THE FIRE PROGRAM AND FOR REGULATED ACTIVITIES IN THE OIL & GAS AND MINERALS PROGRAMS**

For regulatory and assistance activities on private land, CMs will be voluntary BMPs because IDL does not have the statutory authority within its regulatory programs or assistance activities to require adoption by authorized parties. Regulatory and assistance activities include: abandoned mine lands projects; dredge and placer mine permitting; mine reclamation plan approvals; and oil and gas permits (e.g. seismic imaging surveys, well drilling). Where appropriate, IDL will include recommended BMPs within its authorizing documents to encourage compliance.

In addition, IDL has roles and responsibilities in its fire program where CMs will be implemented to address conservation of sage-grouse habitat in Core and Important habitat zones.

### **8. Wildfire Preparedness/Prevention**

IDL is committed to conserving habitat for the greater sage-grouse in Idaho, which is under threat from the invasion of annual grasses and the loss of habitat from fire. IDL has developed the following wildfire preparedness and prevention conservation measures that are complementary with the January 5, 2015 U.S. Department of Interior, Secretary of Interior Order Number 3336. The Order from Secretary Jewell sets forth enhanced policies and strategies for preventing and suppressing rangeland fire and for restoring sagebrush landscapes impacted by fire across the West.

**8.1.** IDL will continue to support the ongoing operations of taxing and non-taxing fire districts in Idaho, when requested and as available, through equipment acquired through the Federal Excess Personal Property (FEPP) program and Firefighter Property (FFP) program, and through Volunteer Fire Assistance (VFA) grant fund allocations.

**8.2.** IDL will continue to support the formation and ongoing operations of Rangeland Fire Protection Associations (RFPAs) through the South Idaho Fire Liaison Program. This position is the point of contact for any needs or issues raised by RFPAs and their cooperators. The position coordinates information needs on an annual cycle as well as facilitating an annual meeting for all RFPA Board of Directors and their cooperators, held following fire season.

**8.3.** IDL will continue to support, as funding is available, the formation and operation of RFPAs through start-up funding that provides personal protective equipment, radios, firefighting equipment, and training materials.

**8.4.** IDL will continue to utilize burning permits (per Idaho Code 38-115, Rule IDAPA 20.04.01.060) during the designated closed fire season as a fire prevention and control tool. Burning permits acquaint the permit holder with the laws and requirements for safe burning. During times of critical fire hazard, all burning may be stopped by the suspension

of burning permits. Closed fire season provides for public safety and the protection of land resources by ensuring that all burning operations which may occur during periods of high fire danger are conducted under safe conditions and in such manner that the danger of uncontrolled fire spread is minimized.

**8.5.** IDL will continue to participate in the Idaho Fire Restrictions Plan (per Idaho Code 38-115, Rule IDAPA 20.04.01.060; IDAPA 20.04.01.070; IDAPA 20.04.01.090; and IDAPA 20.04.01.120), which is an interagency document that outlines coordination efforts regarding fire restrictions and closures. The purpose of fire restrictions is to reduce the risk of human-caused fires during unusually high fire danger and/or burning conditions. An interagency approach for initiating restrictions or closures helps provide consistency among the land management partners, while defining the restriction boundaries so they are easily distinguishable to the public.

## **9. Wildfire Suppression**

Appendix C outlines how wildfire protection responsibilities are organized in Idaho, and how Idaho funds its fire program, particularly suppression costs for fires that burn on lands protected by the State of Idaho (IDL and two timber protective associations).

None of the IDL forest protective districts have suppression responsibilities within any currently identified Core or Important habitat zones. Likewise, as of December 2014, none of the IDL forest protective districts have suppression responsibilities within any currently identified General habitat zone.

When IDL fire suppression resources are dispatched as a cooperating agency to another agency's incident within sage-grouse habitat, the resources will utilize that agency's BMPs as applicable for sage-grouse habitat and as instructed in the dispatched resource's briefing. Interagency cooperation suppression activities are assumed to follow the prioritization associated with the BLM/U.S. Forest Service Fire and Invasives Assessment Team (BLM/FS FIAT) plans.

## **10. Fuels Management**

IDL does not have general regulatory authority over fuels management on non-state rangelands.

## **11. Wildfire Restoration and Rehabilitation**

IDL does not have general regulatory authority over wildfire restoration and rehabilitation on non-state rangelands.

## **12. Habitat Restoration and Vegetation Management**

IDL has limited authority to regulate habitat restoration and vegetation management, but will address vegetation management through voluntary BMPs and permit stipulations. See section 15.

## **13. Invasive Plant Species**

IDL has limited authority to regulate invasive species, but will address invasive species management through voluntary BMPs and permit stipulations. See Section 15.

## **14. Infrastructure Development**

The *Idaho Alternative* defines “infrastructure”:

*... as discrete, large-scale anthropogenic features, including highways, high voltage transmission lines, commercial wind projects, energy development (e.g., oil and gas development, geothermal wells, airports, mines, cell phone towers, landfills, residential and commercial subdivisions, etc.*

*Infrastructure related to small –scale ranch, home and farm businesses (e.g., stock ponds, fences, range improvements) do not fall within this definition. These issues are not included within this definition, and are addressed in other sections of the Alternative or through local resource management plans.*

Because of the diversity of terrain and vegetation types within the sage-grouse region of Idaho, it is difficult to design a “one-size fits all” set of CMs. Science and technology also change over time, and new options or alternatives may be proposed as part of a site-specific management plan. Site-specific management plans submitted by authorized parties should provide equal or better results than the CMs described below. Site specific management plans will be reviewed by appropriate IDL staff and the IDFG prior to a final recommendation from IDL.

IDL has limited authority to regulate infrastructure development, but will address infrastructure development through voluntary BMPs and permit stipulations. See Section 15.

## **15. Minerals**

### **15.1. Fluid Minerals**

Fluid minerals are resources of oil, natural gas (gas), and natural gas condensate. The first commercially-viable resources of gas were discovered in Payette County in 2010. Exploration activity is also located in adjacent counties to Payette County. Recent leasing in south central and southeast Idaho suggests exploration interests in these areas.

Additional resource discoveries are possible in all of these areas. Presently, IDL has no exploration activities to regulate for fluid minerals located in Core or Important sage-grouse habitat zones.

The resources in Payette County were discovered with conventional drilling operations, which utilized vertical well bores that penetrated permeable gas accumulations within site-specific gas traps. These types of deposits are termed conventional gas (or oil) resources. In contrast, unconventional resources are continuously-distributed oil or gas accumulations in fine-grained rocks, which generally cannot be exploited through conventional methods and techniques. Unconventional resources have not been identified in Idaho, but the potential for their discovery does exist.

### **15.1.2. Oil and Gas Activities – Regulatory Compliance**

The IDL is the administrative arm of the Idaho Oil and Gas Conservation Commission (Commission) pursuant to § 47-319(2) which states that the commission is authorized to; "...regulate the exploration for and production of oil and gas, prevent waste of oil and gas and to protect correlative rights, and otherwise to administer and enforce this act. It has jurisdiction over all persons and property necessary for such purposes. In the event of a conflict, the duty to prevent waste is paramount." Under this authority, § 47-321 provides for the commission to establish spacing units which are legally described boundaries overlaying the resource and set a fixed acreage per well, with the well located in the center of the boundary. § 47-321(b) states that these spacing units are established by the Commission in order to; "...result in the efficient and economical development of the pool as a whole..."

At this time for conventional drilling techniques, the default spacing, set by the Commission, is 640 acres for gas and 40 acres for oil. As surface use restrictions grow, the Commission could see requests to modify the default spacing unit in order to limit surface disturbance. As the Commission receives these requests, IDL will provide sage-grouse habitat data so that the Commission, if it chooses, can incorporate such information into its decision establishing a new spacing unit.

The BMPs listed below will be provided to all applicants seeking permit issuance for operations in Core or Important sage-grouse habitat zones. If they agree to voluntarily comply with some or all of the practices, those practices will be incorporated as a stipulation in the permit.

#### **15.1.2.1. Oil and Gas Activities**

The following BMPs will be provided to all operators making application to drill a well, treat a well, or conduct seismic explorations in Core or Important habitat zones.

##### **a. Wildfire Prevention**

- i. Authorized parties will be required to develop and be prepared to implement a fire prevention and an emergency response plan that covers all aspects of operations, which will include: coordination with

local jurisdictions, such as the cities, counties, landowners, IDL, rangeland fire protection associations, and federal land agencies; emergency contact numbers and information, including 911 and local fire dispatch centers; and fire prevention and safety procedures that will include evacuation routes and procedures, the designated safety meeting place, and emergency shutdown procedures.

- ii. Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.
- iii. Authorized parties will ensure that field personnel are aware of:
  - a. fire prevention and emergency response plan,
  - b. evacuation routes and procedures,
  - c. designated safety meeting places, and
  - d. emergency shutdown procedures.
- iv. Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

#### **b. Invasive Species**

- i. All vehicles and equipment that should travel off approved/designated transportation routes or will be utilized during operations will be cleaned before entry to prevent the spread of seeds and propagules. The equipment will also be cleaned at the conclusion of all field activities.
- ii. Through a cooperative effort, invasive and noxious plant species will be inventoried and monitored pre-disturbance and throughout the life of the project by IDL and the authorized party.
- iii. Reclamation activities should include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) should be certified weed free by the appropriate Federal or State of Idaho agency.
- iv. Authorized parties will use BMPs and appropriate treatments including chemical, mechanical and biological to treat invasive and state listed noxious plant species. When regulated chemicals are determined to be the best treatment, authorized parties will use Idaho licensed professional applicators to treat noxious plant

species with the approved and properly documented herbicide. Weeds will be treated promptly when located on a project site.

**c. Surface Use and Timing**

- i. Conventional well activity and exploration will not be conducted within 0.62 miles of an occupied lek.
- ii. All pipelines and collector lines will be emplaced utilizing horizontal boring methods with a minimum setback of 0.62 miles of an occupied lek.
- iii. Construction of pipelines will be in accordance with seasonal stipulations regarding no operations or construction from March to July.
- iv. Planned pipeline maintenance will not be conducted between 6 p.m. to 8 a.m., except in an emergency situation, within 0.62 miles of an occupied lek during the breeding season.
- v. Compressor stations and other vital operations shall be placed a minimum of 0.62 miles from an occupied lek, unless screening or other mitigation is determined to be as protective.

**d. Noise**

- i. Noise from permitted well sites will not exceed a 65db daily average threshold during the lekking season, within 0.62 miles of an occupied lek.
- ii. Noise levels may be exceeded for emergency situations including well control, threats to freshwater resources, and other environmental safety concerns.

**e. Fencing**

- i. New and existing wire fence segments constructed by authorized parties that are located in high risk areas will be marked according to the NRCS Fence Collision Risk Tool which is based on (Stevens et al. 2012) using collision diverter fence markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.
- ii. As necessary and feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland

areas facilitates management objectives for Core and Important habitat zones.

**f. Constructed Improvements**

- i. Construction methods should be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- ii. Infrastructure should be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed for access to facilities.
- iii. Surface disturbances should be clustered in order to limit surface occupancy.
- iv. New utility developments and transportation routes should be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- v. Transmission towers should be outfitted by authorized parties with anti-perch devices in occupied sage-grouse habitat.
- vi. New structures with a height over five feet will not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built, or presently exist, the power lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- vii. Construction plans developed by authorized parties should include options that deter raptor perching and raven nesting on elevated structures.
- viii. Permanent structures that create movement will be minimized within Core and Important habitat zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

**g. Site Reclamation**

- i. Site reclamation should be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.

- ii. Reclamation activities and plans should consider the ecological site potential. The goal of the reclamation should be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- iii. Sites should be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

## **15.2. Abandoned Mine Lands Program**

The Abandoned Mine Lands Program operates on private, federal, and state lands. IDL works with landowners to address safety closures of dangerous mine openings and reclaim areas to protect human health. Reclamation is also performed to improve water quality and wildlife habitat, but public safety projects take precedence. IDL develops and controls these projects, and can incorporate sage-grouse CMs into the projects. Abandoned mine land projects will implement the following BMPs within Core and Important sage-grouse habitat zones.

### **a. Wildfire Prevention**

- i. Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.
- ii. Authorized parties will ensure that field personnel are aware of:
  - a. fire prevention and emergency response plan,
  - b. evacuation routes and procedures,
  - c. designated safety meeting places, and
  - d. emergency shutdown procedures.
- iii. Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

### **b. Invasive Species**

- i. Vehicles and equipment operated by IDL or authorized parties that will travel off approved /designated transportation routes will be inspected and cleaned of seeds and propagules to prevent the spread of invasive and noxious plant species.

- ii. Weeds should be inventoried and monitored pre-disturbance by IDL, and throughout the life of the project.
- iii. Reclamation activities should include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) should be certified weed free by the appropriate federal or State of Idaho agency.
- iv. Authorized parties will use BMPs and appropriate treatments including chemical, mechanical and biological to treat invasive and state listed noxious plant species. When regulated chemicals are determined to be the best treatment, authorized parties will use Idaho licensed professional applicators to treat noxious plant species with the approved and properly documented herbicide. Weeds will be treated promptly when located on a project site.

#### **c. Surface Use and Timing**

- i. Controlled surface use and timing limitations should be applied within Core and Important habitat zones, unless species occupancy and distribution determined by IDFG recommends otherwise.
- ii. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000foot elevation may be used as a general distinction.
- iii. Major construction and maintenance activity should be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

#### **d. Noise**

Limit noise levels from discretionary activities within Core and Important habitat zones to no more than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from two hours before sunset to two hours after sunrise during breeding season. Ambient noise levels should be determined by measurements taken at the perimeter of an occupied lek at sunrise.

#### **e. Fencing**

- i. New and existing wire fence segments constructed by authorized parties that are located in high risk areas will be marked according to the NRCS Fence Collision Risk Tool which is based on (Stevens et al. 2012) using collision diverter fence markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.
- ii. As necessary and feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important habitat zones.

#### **f. Water Supply Structures**

- i. New or modified spring developments (including pipelines) should be designed by authorized parties to maintain or enhance the free-flowing characteristics of springs and wet meadows, which will help maintain continuity of the pre-developed riparian areas.
- ii. The construction of new ponds or reservoirs by authorized parties should be minimized, except as needed to meet important resource management or restoration objectives, to reduce the potential impact from West Nile Virus on sage-grouse. On projects requiring water to be pumped such as solar, hydro or fossil fuel operation, floated tanks will be allowed to conserve water resources and efforts will be made by the authorized parties to treat these tanks for mosquito species that carry West Nile Virus.
- iii. Wildlife escape ramps in new and existing water troughs and open-water storage tanks should be developed to facilitate the use of and escape by wildlife.

#### **g. Constructed Improvements**

- i. Construction methods should be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- ii. Infrastructure should be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, should be located

along roads already in existence or required to be newly constructed for access to facilities. Requirements from public utilities will be followed for all installations.

- iii. Surface disturbances should be clustered in order to limit surface occupancy.
- iv. New utility developments and transportation routes should be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- v. Transmission towers should be outfitted by authorized parties with anti-perch devices in occupied sage-grouse habitat.
- vi. New structures with a height over five feet will not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built the power lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- vii. Construction plans developed by authorized parties should include options that deter raptor perching and raven nesting on elevated structures.
- viii. Permanent structures that create movement will be minimized within Core and Important habitat zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

#### **h. Site Reclamation**

- i. Site reclamation should be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- ii. Reclamation activities and plans should consider the ecological site potential. The goal of the reclamation should be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- iii. Sites should be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

### 15.3. Mining Regulatory Program

The Mining Regulatory program operates on private, federal, and state lands and covers all dredge and placer mining and surface mining operations. Activities classified as exploration, such as drilling or trenching, only require a notification to IDL. Dredge and placer mining operations over ½ acre require a permit and bond. Surface mining operations that produce materials for immediate or ultimate sale require a reclamation plan and bond. Coordinated reviews with Idaho Department of Environmental Quality, Idaho Department of Water Resources, and IDFG are required for operations that may impact water quality.

The BMPs listed below will be provided to all applicants seeking reclamation plan approval or permit issuance for mining operations in Core or Important sage-grouse habitat zones. If they agree to voluntarily comply with some or all of the practices, those practices will be incorporated as a condition of reclamation plan or permit approval.

To further contribute to conservation of sage-grouse habitat, IDL will also coordinate with IDFG to evaluate existing mines and their potential impact on sage-grouse habitat. The following best management practices will be suggested to these mine operators. IDL will also work with IDFG to develop an informational brochure for new mine operators so they may consider adopting these BMPs into their proposed operations.

#### a. Wildfire Prevention

- i. Authorized parties will be required to develop and be prepared to implement a fire prevention and an emergency response plan that covers all aspects of operations, which will include: coordination with local jurisdictions, such as the cities, counties, landowners, IDL, rangeland fire protection associations, and federal land agencies; emergency contact numbers and information, including 911 and local fire dispatch centers; and fire prevention and safety procedures that will include evacuation routes and procedures, the designated safety meeting place, and emergency shutdown procedures.
- ii. Field personnel for authorized parties will carry an emergency response plan; a shovel; a fire extinguisher; and an adequate radio, cell phone, or special communications equipment within their vehicles and construction equipment (or, if on extended foot-based exploration activities, on their person). All fires will be reported immediately.
- iii. Authorized parties will ensure that field personnel are aware of:
  - a. fire prevention and emergency response plan,
  - b. evacuation routes and procedures,
  - c. designated safety meeting places, and
  - d. emergency shutdown procedures.

- iv. Authorized parties will park vehicles on bare ground that has been cleared of all vegetation. Vehicles will be inspected immediately after parking to verify vegetation is not touching catalytic converter, manifold, muffler, or exhaust.

#### **b. Invasive Species**

- i. Vehicles and equipment operated by IDL or authorized parties that will travel off approved /designated transportation routes will be inspected and cleaned of seeds and propagules to prevent the spread of invasive and noxious plant species.
- ii. Through a cooperative effort, invasive and noxious plant species will be inventoried and monitored pre-disturbance and throughout the life of the project by IDL and the authorized party.
- iii. Reclamation activities should include certified weed-free seed mixes, approved by the IDL or surface owner. All materials used for reclamation (mulch, straw, etc.) should be certified weed free by the appropriate federal or State of Idaho agency.
- iv. Authorized parties will use BMPs and appropriate treatments including chemical, mechanical and biological to treat invasive and state listed noxious plant species. When regulated chemicals are determined to be the best treatment, authorized parties will use Idaho licensed professional applicators to treat noxious plant species with the approved and properly documented herbicide. Weeds will be treated promptly when located on a project site.

#### **c. Surface Use and Timing**

- i. Controlled surface use and timing limitations should be applied within Core and Important habitat zones, unless species occupancy and distribution determined by IDFG recommends otherwise.
- ii. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6 p.m. and 9 a.m. to avoid disturbance to lekking and roosting sage-grouse. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000-foot elevation may be used as a general distinction.
- iii. Major construction and maintenance activity should be avoided by authorized parties in sage-grouse winter range (winter concentration areas) from December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology.

#### **d. Noise**

- i. Limit noise levels from discretionary activities within Core and Important habitat zones to no more than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from two hours before sunset to two hours after sunrise during breeding season. Ambient noise levels should be determined by measurements taken at the perimeter of an occupied lek at sunrise.
- ii. Authorized party will keep noise levels on existing infrastructure within the 0.62 mile buffer to 65 decibels or less.

#### **e. Fencing**

- i. New and existing wire fence segments constructed by authorized parties that are located in high risk areas will be marked according to the NRCS Fence Collision Risk Tool which is based on (Stevens et al. 2012) using collision diverter fence markers as defined by NRCS design practices (Stevens, 2011). Examples of high risk areas include fencing with characteristics such as evidence of grouse fence strikes, gentle topography near a lek, or fences that bisect winter concentration area.
- ii. As necessary and feasible, fence springs, seeps, and riparian areas in order to maintain, restore, and foster progress toward Proper Functioning Condition (PFC) of riparian wetland areas. PFC assessment is a qualitative method for considering the attributes and processes of hydrology, vegetation, and erosion/deposition of soils (TR1737-16, 2003 USDA-NRCS). PFC of riparian wetland areas facilitates management objectives for Core and Important habitat zones.

#### **f. Water Supply Structures**

- i. New or modified spring developments (including pipelines) should be designed by authorized parties to maintain or enhance the free-flowing characteristics of springs and wet meadows, which will help maintain continuity of the pre-developed riparian areas.
- ii. The construction of new ponds or reservoirs by authorized parties should be minimized, except as needed to meet important resource management or restoration objectives, to reduce the potential impact from West Nile Virus on sage-grouse. On projects requiring water to be pumped such as solar, hydro or fossil fuel operation, floated tanks should be allowed to conserve water resources and efforts should be made by the authorized parties to treat these tanks for mosquito species that carry West Nile Virus.

- iii. Wildlife escape ramps in new and existing water troughs and open-water storage tanks should be developed to facilitate the use of and escape by wildlife.

**g. Constructed Improvements**

- i. Construction methods should be implemented by authorized parties that minimize surface disturbance. This could include utility placement through borings instead of trenches.
- ii. Infrastructure should be placed by authorized parties in already-disturbed locations, as feasible, where the habitat has not been established. Infrastructure, such as pipelines, should be located along roads already in existence or required to be newly constructed for access to facilities. Requirements from public utilities will be followed for all installations.
- iii. Surface disturbances should be clustered in order to limit surface occupancy.
- iv. New utility developments and transportation routes should be located by authorized parties in existing utility or transportation corridors, as allowable by any existing right-of-way restrictions.
- v. Transmission towers should be outfitted by authorized parties with anti-perch devices in occupied sage-grouse habitat.
- vi. New structures with a height over five feet should not be constructed by authorized parties within one km of occupied leks. To the extent practicable, power lines, towers, and other tall structures that provide perch sites for raptors will not be constructed within three km of breeding period habitats. If these structures must be built the power lines should be buried or the structures modified to prevent their use as raptor perch sites. Screening or other mitigation may also be used.
- vii. Construction plans developed by authorized parties should include options that deter raptor perching and raven nesting on elevated structures.
- viii. Permanent structures that create movement will be minimized within Core and Important habitat zones. Painting, shielding, or other measures can be implemented to mitigate potential impact from these structures.

#### **h. Site Reclamation**

- i. Site reclamation should be completed by authorized parties as soon as phases of operations or construction are completed. Site accessibility and timing conditions for successful germination will be taken into consideration.
- ii. Reclamation activities and plans should consider the ecological site potential. The goal of the reclamation should be: (a) to stabilize the site with plant species that are suitable to the site and include sage brush and native forb species; (b) provide the opportunity for sage-grouse habitat to develop over time; and (c) prevent non-native invasive species from occupying the site.
- iii. Sites should be irrigated or mulched appropriately by authorized parties if necessary for establishing seedlings more quickly.

#### **16. Range Management/Livestock Grazing**

IDL does not have general regulatory authority over livestock grazing on non-state lands.

#### **17. Wild Horses and Burros**

IDL does not have regulatory authority over wild horses and burros.

#### **18. Travel Management**

IDL does not have general regulatory authority over travel management on non-state lands.

#### **19. Recreation**

IDL does not have general regulatory authority over recreation on non-state lands.

#### **20. Implementation and Monitoring**

Implementation of the CMs through voluntary agreement will be incorporated into existing permit procedures. A copy of the applicable CMs will be provided to all applicants for a permit on lands located in Core or Important habitat zones. As part of the application, applicants will acknowledge which, if any, CMs they are willing to voluntarily comply with. Those CMs will then be incorporated into the permit as an enforceable stipulation of the permit. See Appendix B for IDL's DRAFT Implementation Plan.

Monitoring of CMs stipulated in the permit will be incorporated into existing permit inspection procedures. Inspection forms will be amended to include a section for documenting that CMs were implemented and an assessment of their effectiveness. See Appendix E for IDL's DRAFT Monitoring Plan (not yet completed).

Procedures for Abandoned Mine Lands projects will be amended to include an assessment of the impact on sage-grouse when the project includes lands within Core or Important habitat zones. The results of this assessment will be used to determine the appropriate CMs to be implemented as part of the project.

### Glossary

Page intentionally blank

## Habitat Classifications

**Core Sage-Grouse habitat:** State of Idaho delineation of strongholds for Sage-Grouse populations in Idaho. This habitat is the highest priority for conservation efforts and for policies to address primary threats. It includes approximately 65 percent of known active leks and occupied by approximately 73 percent of male Sage-Grouse counted at leks throughout the Idaho Sage-Grouse management area.

**Important Sage-Grouse habitat:** State of Idaho delineation defined as the 75 percent breeding bird density areas. This habitat includes areas of value for migration corridors, connectivity among breeding areas, and long term persistence of each of the two key metapopulations of Sage-Grouse in Idaho. It includes approximately 25 percent of the known active leks. This habitat is occupied by an estimated 22 percent of Sage-Grouse males. Captures high quality habitat and populations necessary for providing a management buffer for the core habitat.

**Key Habitat:** State of Idaho delineation of areas of generally intact sagebrush that provide sage-grouse habitat during some portion of the year including winter, spring, summer, late brood-rearing, fall, transition sites from winter to spring, spring to summer, and summer/fall to winter. Key habitat may or may not provide adequate nesting, early brood-rearing, and winter cover due to elevation, snow depth, lack of early season forbs, limited herbaceous cover, or small sagebrush patch size.

**Priority Sage-Grouse habitat:** Areas that have been identified as having the highest conservation value to maintaining sustainable Sage-Grouse populations. These areas would include breeding, late brood-rearing, and winter concentration areas. The BLM has identified these areas in coordination with respective state wildlife agencies.

**General Sage-Grouse habitat:** Occupied (seasonal or year-round) habitat outside of priority habitat. It includes a few active leks and fragmented or marginal habitat, such as two isolated populations of Sage-Grouse in the East Idaho Uplands and West Central Idaho. These areas have been identified by the BLM in coordination with respective state wildlife agencies.

## Lek Classification

**Lek:** A traditional courtship display area attended by male Sage-Grouse in or next to sagebrush-dominated habitat. A lek is designated based on observations of two or more male Sage-Grouse engaged in courtship displays. Subdominant males may display on itinerant courtship display areas during population peaks. Such areas usually fail to become established leks. Therefore, a site where less than five males are observed strutting should be confirmed active for two years before meeting the definition of a lek (Connelly et al. 2000; Connelly et al. 2003, 2004). Each state may have a slightly different definition of lek, active lek, inactive lek, occupied lek, and unoccupied leks. Regional planning will use the appropriate definition provided by the state of interest.

**Lek buffer:** Buffers are calculated from the center (IDFG GPS coordinate) of the lek. Exact lek edges are difficult to define because leks shift and birds move on any given day.

**Lek complex:** A lek or group of leks within 2.5 kilometers (1.5 miles) of each other between which male Sage-Grouse may interchange from one day to the next. Fidelity to

leks has been well documented. Visits to multiple leks are most common among yearlings and less frequent for adult males, suggesting an age-related period of establishment (Connelly et al. 2004).

**Lek, abandoned:** A lek in otherwise suitable habitat that has not been active for 10 consecutive years. To be designated abandoned, a lek must be inactive (see above criteria) in at least four nonconsecutive courtship display seasons spanning the 10 years. The site of an abandoned lek should be surveyed at least once every 10 years to determine whether it has been reoccupied by Sage-Grouse.

**Lek, active:** Any lek that has been attended by male Sage-Grouse during the courtship display season.

**Lek, destroyed:** A formerly active lek site and surrounding sagebrush habitat that has been destroyed and is no longer suitable for Sage-Grouse breeding.

**Lek, inactive:** Any lek where sufficient data suggests that there was no courtship display activity throughout a lekking season. Absence of strutting grouse during a single visit is insufficient documentation to establish that a lek is inactive. This designation requires documentation of one of the following scenarios:

- An absence of Sage-Grouse on the lek during at least two ground surveys separated by at least seven days. These surveys must be conducted under ideal conditions (April 1-May 7 or other appropriate date based on local conditions), no precipitation, light or no wind, half-hour before sunrise to one hour after sunrise).
- A ground check of the exact known lek site late in the courtship display season (after April 15) that fails to find any sign (tracks, droppings, feathers) of strutting activity. Data collected by aerial surveys should not be used to designate inactive status as the aerial survey may actually disrupt activities.

**Lek, occupied:** A lek that has been active during at least one strutting season within the prior 10 years. This is the status IDFG recommends for long term decision making.

**Lek, undetermined:** A lek that has not been surveyed to determine status.

**Lek, unoccupied:** A lek that has either been destroyed or abandoned.

## **Habitat Use and Periods**

**Breeding period:** Includes lekking, nesting and early brood-rearing periods, generally March 1 through June 30 (Connelly et al. 2000b).

- *Early brood rearing habitat:* Generally upland sagebrush habitats relatively close to sage-grouse nest sites. These areas are important to broods during the first few weeks after hatching. Forb and insect abundance and diversity are important factors. (See Connelly et al. 2000b)

**Late brood rearing:** This occurs in a variety of habitats used by sage-grouse from late June to early November.

- *Late Brood-rearing habitat:* Includes mesic sagebrush and mixed shrub communities, wet meadows, and riparian habitats, as well as some agricultural lands (e.g., alfalfa fields).

**Lekking period:** This should be determined locally, but approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations. The terms *low* and *high* elevation are used generally. IDFG biologists with knowledge of the timeline for local lek routes usually advise when a lek should be checked. For planning purposes a 5,000 foot elevation may be used as a general distinction.

**Nesting period:** Generally April 1 through June 15.

**Winter concentration periods:** For the purpose of this plan, generally December 1 to February 15. Specific dates may be earlier or later, depending on local breeding chronology. IDL shall confer with IDFG biologists for local variations.

- *Sage-Grouse winter habitats:* Occupied annually by Sage-Grouse and provide sufficient sagebrush cover and food to support birds throughout the entire winter (especially periods with above average snow cover).

# IDL Sage-Grouse Conservation Plan- Implementation

## Part I. Implementation Plan for Endowment Land Activities

The following Implementation Plan (IP) will apply to activities on state endowment trust lands within Core and Important sage-grouse habitat zones in response to the IDL Greater Sage-Grouse Conservation Plan. The following IP addresses authorizations previously granted by IDL and authorizations that may be granted by IDL in the future. These activities include:

- alternative energy development (solar, wind, and geothermal leases and land use permits);
- oil and gas exploration and development (leases and land use permits);
- mining (minerals leases, land use permits and construction permits);
- grazing (grazing leases, land use permits and construction permits);
- miscellaneous commercial activities (commercial leases, land use permits and construction permits); and
- granting of access through rights-of-way, including easements.

This document also addresses the implementation of fire prevention and mitigation measures and wildfire suppression efforts to minimize the impact to sage-grouse and their habitat.

### I. Previous Authorizations Granted by IDL

IDL recognizes that written authorization through leases, permits and easements has been granted to third parties for activities on state endowment trust lands within Core and Important habitat zones prior to the approval of the IDL Greater Sage-Grouse Conservation Plan. These authorizing documents logically do not contain the conservations measures identified in the IDL Greater Sage-Grouse Conservation Plan that would be included with authorizations granted today or in the future by IDL. To resolve this matter IDL will accomplish the following:

- Within 60 days of the date of the Record of Decision (ROD) for the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS, IDL will complete a comprehensive GIS analysis to determine the type, number and location of all IDL authorizing documents within Core and Important habitat zones.
- Within 6 months of the date of the ROD, IDL will develop instrument modifications for each authorizing document identified in the GIS analysis within **Core habitat zones**. The instrument modifications will identify the appropriate stipulations for the activity and allow the instrument holder the opportunity to agree to these instrument terms.

- Within 18 months of the date of the ROD, IDL will develop instrument modifications for each authorizing document identified in the GIS analysis within **Important habitat zones**. The instrument modifications will identify the appropriate stipulations for the activity and allow the instrument holder the opportunity to agree to these instrument terms.
- Once developed, IDL will mail the instrument modifications to the instrument holders with a cover letter explaining the purpose of the instrument modification and encourage their execution of the document due to the benefits to the Greater Sage-grouse and their habitat. The letter will identify a 30-day timeframe for their response.
- IDL will follow-up in writing with those instrument holders that do not respond within 30 days, offering them a second opportunity to accept the instrument modification.
- If an instrument holder does not agree to the instrument modification, IDL will attempt to make direct contract with the party to discuss the conservation measures and provide educational and supporting documents that would encourage their participation. In addition, IDL will identify which conservation measures are sticking points and give consideration, on a case-by-case basis, to negotiating conservation measure stipulations and come to an agreement on those measures that are acceptable to the instrument holder. As a fallback measure, IDL would include conservation measures as stipulations in any new authorization following the expiration of the existing authorization.

## II. **Future Authorizations to be Granted by IDL**

For new activities proposed by third parties on state endowment trust lands in Core and Important habitat zones and for new instruments generated following the expiration of an instrument that expires after the date of the ROD, IDL will implement conservation measures as enforceable stipulations in authorizing documents such as leases, land use permits, construction permits and rights-of-way.

IDL will develop and implement specific instrument templates that include the appropriate conservation measures as mandatory and enforceable stipulations. As a result, all new authorizations granted by IDL within Core and Important habitat zones will contain conservations measures in alignment with the IDL Greater Sage-Grouse Conservation Plan. IDL will provide these instrument templates to third parties inquiring about or making application for a proposed activity within a Core and Important habitat zone and explain the significance of these stipulations.

## III. **Fire Prevention and Mitigation Measures and Wildfire Suppression Efforts**

IDL does not have direct wildfire suppression responsibilities within any Greater Sage-Grouse core or important habitats in Idaho. However, IDL does have jurisdictional authority for state lands within Greater Sage-Grouse habitat.

Wildland fire protection for federal, state and private lands within Greater Sage-Grouse habitat in southern Idaho is provided by federal agencies through the **Cooperative Fire**

**Protection and Stafford Act Agreement** and by the cooperative efforts of volunteer Rangeland Fire Protection Associations (RFPA's) and fire service organizations (city, county and rural fire departments).

In the interest of promoting conservation efforts of the Greater Sage-Grouse and its habitat under this plan, IDL will:

1. Provide maps to all Rangeland Fire Protection Associations (RFPA's) that include the location of any designated core or important Greater Sage-Grouse habitat within their RFPA boundaries by May 10, 2015 (Beginning date of closed fire season in Idaho as designated in Idaho Code Title 38 Section 115.).
2. On any fire affecting or threatening important or core habitat on state or private lands requiring an Incident Management Team (IMT), IDL will assign an IDL line officer to jointly work with the federal protecting agency to develop Greater Sage-Grouse conservation objectives for fire suppression activities that will be incorporated into:
  - a. the Wildland Fire Decision Support System (WFDSS);
  - b. the Leader's Letter of Intent to the team;
  - c. the joint Delegation of Authority; and
  - d. ensure the objectives are fully implemented in daily Incident Action Plans.
3. Conservation objectives will include:
  - a. Incident priorities:
    - i. Firefighter safety
    - ii. Public Safety
    - iii. Improvements
    - iv. Resource Values
      - Sage Grouse core and important habitat
      - Other resource and property values (historical, archeological, recreational, aesthetics, livestock, etc.).
  - b. Utilize direct attack as the primary tactic to minimize burned acres in Greater Sage-Grouse core and important habitat.
  - c. Accept relatively small acreage, short-term ground disturbance due to heavy equipment use to meet higher objectives.
  - d. Rehabilitation for burned acres will promote reestablishment of Greater Sage-Grouse habitat within or adjacent to core and important habitat.
4. IDL will consider and promote fire prevention and mitigation measures including but not limited to:
  - a. Master fuelbreak systems across all ownerships.
  - b. Proposals to adjust fire restriction boundaries and associated use restrictions in the Idaho Fire Restrictions Plan based on protection of core and important Greater Sage-Grouse habitat.
  - c. Develop annual grazing plans or targeted grazing practices to reduce fuel loading in locations that would be advantageous as a wildfire control location.

## Part II. Implementation Plan for IDL's Regulatory and Assistance Activities

The following Implementation Plan (IP) will apply to regulatory and assistance activities administered by IDL within Core and Important sage-grouse habitat zones. The IP was developed in response to the IDL Greater Sage-Grouse Conservation Plan. Conservation measures will be voluntary best management practices on private land because IDL does not have the statutory authority within its regulatory or assistance programs to require adoption by authorized parties. The following IP addresses authorizations previously granted by IDL and authorizations that may be granted by IDL in the future. These activities include:

- Dredge and placer mining (exploration notices and permits);
- Surface mining (exploration notices and reclamation plans);
- Oil and gas exploration and development (seismic and drilling permits, spacing requests);
- Abandoned mine land reclamation.

### I. Previous Authorizations Granted by IDL

IDL recognizes that written authorizations through permit and plan approvals and contracts have been granted to third parties for activities within Core and Important habitat zones prior to the approval of the IDL Greater Sage-Grouse Conservation Plan. These authorizing documents do not contain the conservation measures identified in the IDL Greater Sage-Grouse Conservation Plan that would be included with authorizations granted today or in the future by IDL. To resolve this matter IDL will accomplish the following:

- Within 60 days of the date of the Record of Decision (ROD) for the Final Idaho and Southwest Montana Sub-regional Sage-grouse LUPA and EIS, IDL will complete a comprehensive GIS analysis to determine the type, number and location of all IDL authorizing documents within Core and Important habitat zones.
- No outstanding abandoned mine lands contracts are present in Core and Important sage grouse habitat zones.
- Within 6 months of the date of the ROD, IDL will develop appropriate conservation measures for each authorizing document identified in the GIS analysis within **Core habitat zones**. IDL will also notify each operator that their activity falls within this zone, and provide the conservation measures to the operators.
- Within 18 months of the date of the ROD, IDL will develop appropriate conservation measures for each authorizing document identified in the GIS analysis within **Important habitat zones**. IDL will also notify each operator that their activity falls within this zone, and provide the conservation measures to the operators.
- If impacts to GRSG habitat are irreversible, IDL will suggest working within the Idaho Mitigation Framework and utilizing the compensatory mitigation process the State Sage-grouse Advisory Committee develops.

- Ongoing inspections of these operations will include recommendations that give guidance on how the operators can follow the conservation measures

## **II. Future Authorizations to be Granted by IDL**

IDL will develop an information brochure for oil and gas and mining operators who want to explore or develop minerals in Core and Important habitats.

For new activities proposed in Core and Important habitat zones and for amendments to existing approved activities, IDL will forward the applications to IDFG for comments and recommendations.

During the review process, IDL will suggest GRSG conservation measures to those mine operators based on:

- Feedback from IDFG
- GRSG conservation measures in the IDL plan
- The specific details of the proposed mine

New abandoned mine land projects in Core and Important habitat will be implemented by IDL in conformance with the IDL Greater Sage-Grouse Conservation Plan. This includes inspections and work performed by IDL staff, as well as those performed by contractors and subcontractors.

As a result, all new authorizations granted by IDL within Core and Important habitat zones will include recommendations for conservation measures in alignment with the IDL Greater Sage-Grouse Conservation Plan. IDL will work with the operators as needed to implement the conservation measures or to implement voluntary mitigation measures, if needed.

Wildfire Protection in Idaho  
Responsibilities and Funding

Page intentionally blank

## **Wildfire Protection in Idaho Responsibilities and Funding Model**

### **How is fire response organized in Idaho?**

There are approximately 53.5 million acres of land in Idaho, which is divided into 16 forest protective districts. Two of these districts cover lands protected by the Forest Service and the Bureau of Land Management (BLM), and two are tribal districts. The State of Idaho – the Idaho Department of Lands (IDL) and two timber protective associations – provide direct wildfire protection on approximately 6.3 million acres of private, state and some federal forest lands.

The BLM provides primary wildfire protection on most of the lands that have sage-grouse habitat in Idaho.

Due to the scattered nature of ownership in Idaho, some state and private lands are located within federal protection areas, while some federal lands are located within state protection areas. These are known as “offset acres.” Fire managers assign a relative value to each acre to characterize how easily fires can be ignited and how difficult those fires likely will be to control. Through an “offset agreement” the federal agencies protect approximately 900,000 acres of private and state endowment land around Idaho in exchange for the State of Idaho protecting approximately 800,000 acres of federal land. Generally speaking, forested lands in Idaho are included in the offset agreement and rangelands in Idaho are not included the offset agreement.

More than 200 local and rural fire districts provide structure protection in generally non-urban parts of the state that would otherwise not have structural fire protection.

Five rangeland fire protection associations (RFPAs) assist the BLM in providing initial attack on rangelands in southern Idaho. IDL works closely with the BLM and ranchers to establish RFPAs to enable quick initial attack of range fires. Approximately 230 ranchers in southern Idaho are members of five different RFPAs, and there are six additional areas where ranchers have begun to have conversations about starting new associations. IDL expects at least one more RFPA to be formed before the start of the 2015 fire season. Continued support of RFPAs is a key part of the IDL Sage Grouse Conservation Plan. The RFPAs are volunteer initial attack organizations and are not intended to participate in extended attack situations.

Page 4 of Appendix C shows a 2014 map of forest protection district boundaries and current RFPA boundaries in Idaho.

### **Funding Fire Suppression in Idaho**

Fire protection funding is grouped into two categories – preparedness and suppression.

- ***Preparedness:*** The first is preparedness, providing resources to be ready in advance of an actual fire. This includes hiring firefighters, ensuring they have the necessary training, tools, and supplies, and purchasing or leasing equipment such as fire engines. In FY14 IDL spent approximately \$11 million in preparedness costs.

Preparedness on state-protected lands is funded by a combination of assessments levied on parties who own forested land, federal funds, and the State General Fund.

The forest land assessment is 60 cents per acre with a surcharge for forested parcels with structures. The IDL, in its role as the owner of endowment lands, contributes to preparedness expenses, just like private forest landowners. In FY14 IDL contributed 60 cents per acre on 974,312 endowment acres that receive protection from the fire management function of IDL, for a total of \$584,587.

In recognition that the value Idahoans place on forests is not limited to harvestable timber, Idaho Code spreads the costs of protection beyond timber. While still requiring forest landowners to provide protection, the law limits the potential liability accruing to the landowner by establishing maximum protection assessments and committing general fund tax revenue to cover expenses over that amount.

- **Suppression:** The second component of wildfire protection is suppression. There is a stable source of funding to pay wildfire suppression costs on lands protected by the State of Idaho. When personnel and equipment are dispatched to a fire managed by the State of Idaho, payment for resources assigned to the fire is made from the General Fund through deficiency warrant authority granted by the Idaho Legislature to the State Board of Land Commissioners. Contracts for aircraft also are charged to deficiency warrants. Deficiency warrant authority allows IDL to spend money to promptly suppress wildfires. Deficiency warrants have been used since at least the early 1970s. When the Idaho Legislature convenes in January it reviews the suppression bills incurred during the previous and current fiscal years, and appropriates funds to pay for the expenditures.

The 10-year average of suppression costs on lands protected by the State of Idaho, including the 2014 fire season, is approximately \$10.5 million. The 10-year average fire size on lands protected by the State of Idaho, including the 2014 fire season, is approximately 19,000 acres. In FY14, IDL employed 261 permanent employees and 202 seasonal employees. Fifty-five percent of IDL FY14 permanent employees worked in a forestry and fire capacity, and during fire season the total percentage of permanent employees contributing to IDL fire duties expands because many members of staff who are not categorized as “fire” help in fire efforts. These staff members are part of fiscal, GIS, operational leadership, administrative staff, and executive staff. Sixty percent of the IDL FY14 seasonal workforce worked in forestry and fire (38 percent in fire).

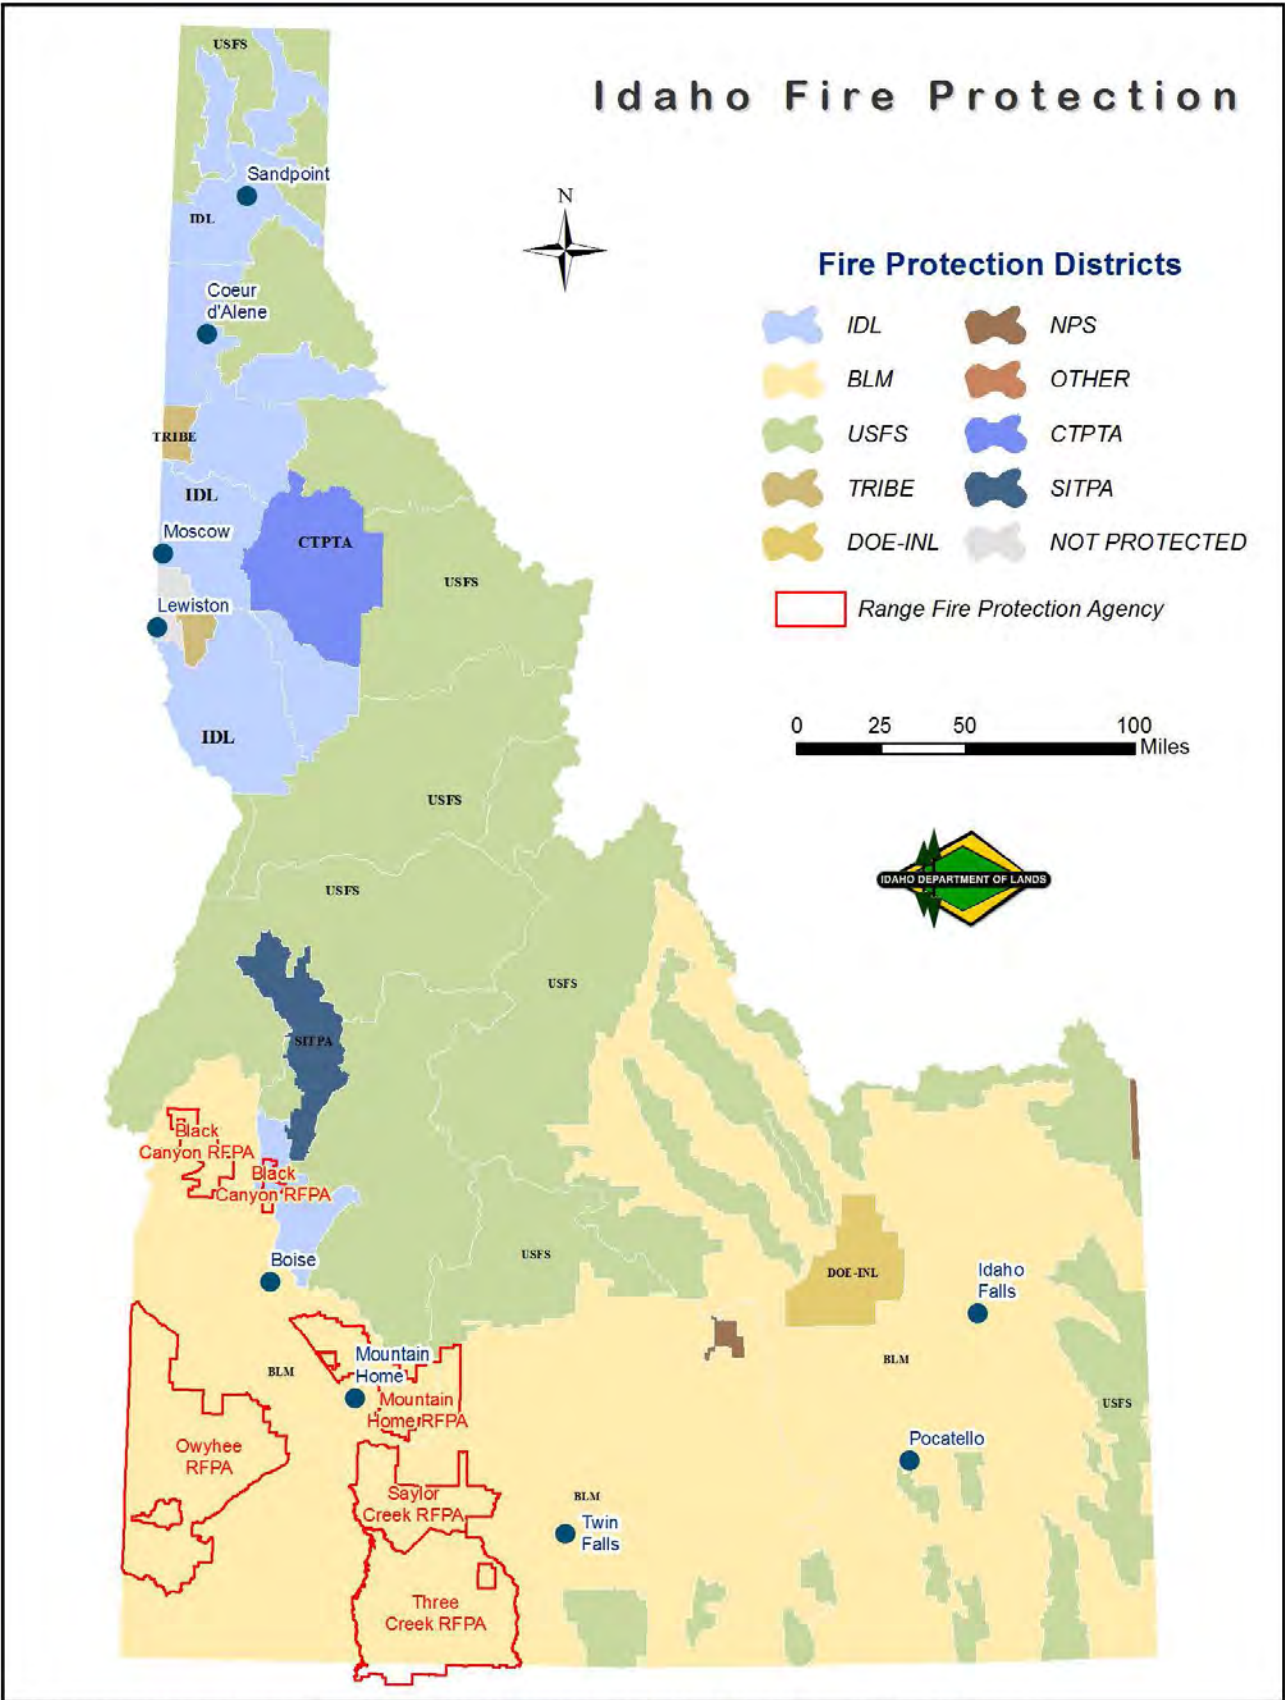

***If a fire starts on forest land in Idaho***, regardless of ownership (federal, state, or private), the protection agency (Forest Service, BLM or IDL) is responsible for paying the suppression bill, not the owner of the land where the fire starts or burns. However, if a fire investigator determines negligence is a factor in igniting a human-caused fire, the responsible party is responsible for paying the suppression costs.

***If a fire starts on privately owned rangeland***, then the responding agency (BLM, rangeland fire protection association, rural fire district, or sometimes the Forest Service) bears the cost of its own suppression action. In cases involving declared emergencies, the Federal Emergency Management Agency (FEMA) may cover a portion of the costs if communities or infrastructure are threatened. The State of Idaho does not have direct wildfire protection responsibility on rangelands.

**Currently by agreement, if a fire starts on rangeland owned by the State of Idaho,** does not spread to another ownership and is suppressed by the BLM, then the IDL will pay the suppression costs. If a fire starts on rangeland owned by the State of Idaho and spreads to another ownership, then IDL will pay a pro-rata share of the BLM's suppression costs. The IDL does not share in suppression costs when a fire starts on another ownership and spreads onto or across rangeland owned by the State of Idaho.

While IDL does incur fire suppression costs when the State of Idaho assists federal fire managers on fires they manage, the federal agencies reimburse IDL for use of State personnel and resources.

**Attachments:** GRSG BA ConcurLtrKT4-24.docx

Hello

As discussed, I have worked with FWS and FS to put together a template transmittal letter for you to use in submitting your final BA to the FWS.

Hopefully the format is self-explanatory, but here a few points of clarification.

Letter will be transmitted from BLM but will also be on behalf of FS as well. You can anticipate that the FWS will address both agencies in their single response.

Letter is in Memo format because it's being submitted from a DOI agency to a DOI agency.

My recommendation is that the BA's be submitted from the respective state office and if there are more than one BA (more than one LUP amendment) is being submitted within that state, they should fall under one cover letter. The one distinction I would make is to create a separate determination table for each LUP, but contain them in one letter.

Please populate the table with ALL species being addressed in the BA. Such a format offers a much more efficient review process for the FWS.

If you have a need to adjust the transmittal letter based on the nature of your particular request to the FWS, you have that latitude.

All final BA's are expected to be transmitted to the FWS within the first week of May (no later than May 8).

Please re-read your entries in the GRSG EIS BA Table (attached) to ensure that your process is moving forward as reported. If there are changes, then please update asap.

As indicated in the cc line. please ensure that copies are sent to the specified individuals (an email copy to me is sufficient).

Thanks for all your hard work.

Best,  
Kim

**GRSG EIS BA updates 3-31-2015**

To: Field Supervisor, Ecological Services Office

From: BLM XXXX State Director

Subject: The Bureau of Land Management (BLM) and U.S. Forest Service (USFS) request consultation on the effects to listed species and critical habitat from the proposed Greater Sage-grouse Land Use Plan Amendment REPLACE with NAME/S of PLAN AMENDMENT/S (Amendment/s).

Date: April 24, 2015

CC: USFS Regional Forester, Chris Colt, Glen Stein, Kim Tripp, Doug Laye

Through this memorandum the BLM and the USFS are requesting consultation under Section 7 of the Endangered Species Act of 1973, as amended. The BLM and USFS have coordinated informally with the U.S. Fish and Wildlife Service (USFWS) to develop this biological assessment (BA) which describes and analyzes the potential effects of the proposed Amendment/s on federally listed and proposed species and their respective designated and proposed critical habitat.

The purpose of the Amendment is to conserve areas that have been identified as having the highest value to maintaining the Greater Sage-grouse (GRSG) and its habitat. These Priority Habitat Management Areas will be protected by a suite of tools and mechanisms, such as excluded activities, disturbance limits, restrictions, mitigation measures, and applying required design features. These overlapping and reinforcing mechanisms will work in concert to conserve sage-grouse throughout its lifecycle. Taken together, the actions we are taking in priority habitat will limit potential development on these lands.

In general, the conservation measures applied on behalf of the GRSG will also provide conservation value to other species including federally listed plants and animals. In instances where there may be some possible conflicts with federally protected species, conservation measures specific to individual species are incorporated into the Amendment and/or BA as part of the federal action to avoid or greatly reduce any discernable effects. Within this context of conservation benefits, avoidance measures and effect reduction efforts, the BLM and USFS have made the following effects determinations for the federally listed and proposed species and critical habitat analyzed in the BA:

Species Name	Federal Status	Effects Determination
(e.g. Southwest Willow Flycatcher)	proposed, threatened, endangered	no effect, may affect not likely to adversely affect, may affect likely to adversely affect
(e.g. Southwest Willow Flycatcher Critical Habitat)	proposed, designated	no effect, may affect not likely to adversely affect, may affect likely to adversely affect

The BLM and USFS request the USFWS's concurrence on our may affect and not likely to adversely affect determinations for the listed species and designated critical habitat. We also request your concurrence on our jeopardy determinations for proposed species and proposed critical habitat.

Although this memorandum is transmitted under BLM letterhead and signature, our request is also on behalf of the USFS. Thank you for your agency's cooperation throughout this planning process. We look forward to your reply.

### ***ROW - Relevant Regulations***

For ROW grants issued under the authority of the Mineral Leasing Act (MLA), the regulations found at 43 CFR 2887.12 address renewals. Regulations found at 43 CFR 2887.12(a) state that “...BLM will renew your grant if the pipeline is being operated and maintained in accordance with the grant, these regulations, and the Act.” (underline added)

For ROW grants issued under the authority of Title V of the Federal Land Policy and Management Act (FLPMA), the regulations found at 43 CFR 2807.22 address renewals. Regulations found at 43 CFR 2807.22(a) state that “If your grant specifies that it is renewable,...BLM will renew the grant if you are complying with the terms, conditions, and stipulations of the grant and applicable laws and regulations.” (underline added)

Regulations found at 43 CFR 2807.22(b) state that, “if your grant does not address whether it is renewable, you may apply to the BLM to renew your grant...In your application you must show that you are complying with the terms, conditions, and stipulations of the grant and applicable laws and regulations. BLM has the discretion to renew the grant if doing so is in the public interest.” (underline added)

### ***Conclusions***

So, assuming that the ROW is being operated in accordance with the grant (including stipulations and terms and conditions), the regulations, and applicable laws:

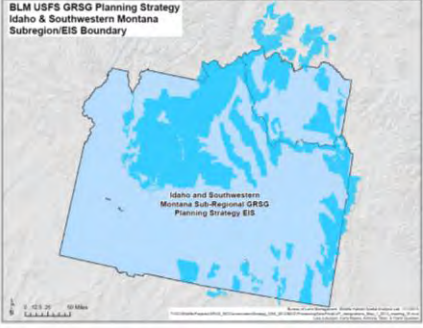

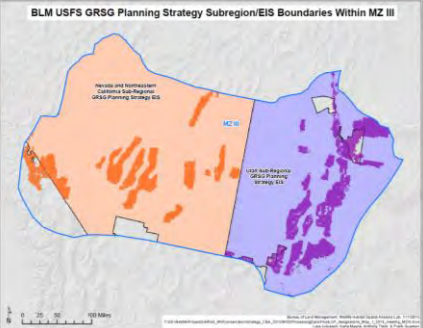

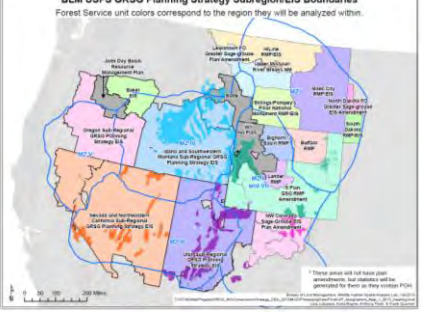

- BLM must renew ROW grants issued under the authority of MLA (always) and those issued under the authority of FLPMA (if the ROW grant indicates it is renewable), even if the planning designation has changed to a ROW exclusion or avoidance area.
- For ROW grants issued under the authority of the FLPMA that do not address whether they are renewable, the BLM has discretion to renew the authorization, if doing so is in the public interest.

I would recommend that the ROW exclusion/avoidance area may be a factor considered when weighing the public interest, but that it does not preclude the renewal since the ROW is a valid existing right. I recommend that when considering the public interest, the Authorized Officer should also consider the investment in the facility (the dollar value and how that investment was funded – public/private) and the population being served by the facility (public benefit), in addition to other relevant factors. It is often not in the public interest to deny the renewal and require removal of the associated infrastructure.

ROW grants issued under authorities other than MLA and FLPMA, should be renewed (which may involve issuing a new authorization under the authority of the FLPMA) as long as the ROW is being operated in accordance with the grant (including terms and conditions and stipulations), the regulations and applicable laws, and if doing so would not be inconsistent with the enabling authority. Since the specific authority that the ROW was granted under will affect the rights that were granted to the Holder, if an Authorized Officer is considering not renewing one of these grants they should consult the Solicitor’s Office for advice/assistance to ensure that the BLM is not diminishing the rights that were originally granted.

Note that in all cases, the BLM has the discretion to modify the terms, conditions, and/or stipulations of the ROW grant as a condition of the renewal (43 CFR 2807.22(c) & 2887.12(b)). So the Authorized Officer may determine that additional measures are needed to protect the resources that triggered the exclusion or avoidance designation and generally these measures will be related to minimizing impacts that result from the operation and maintenance of the authorized facility (ex. speed limits along ROWs, weed control within ROW, etc.).

5.1 **GREATER SAGE-GROUSE CUMULATIVE EFFECTS ANALYSIS: [BUFFALO FIELD OFFICE](#)  
[IDAHO SOUTHWEST MONTANA](#)**

Commented [JMM1]: Copy and paste error?

This cumulative effects analysis (CEA) discloses the long-term effects on Greater Sage-Grouse (GRSG) from implementing each RMP/EIS alternative, in conjunction with other past, present, and reasonably foreseeable future actions.

The cumulative effects analysis study area extends beyond the Idaho and southwestern Montana sub-region boundary and consists of Western Association of Fish and Wildlife Agencies (WAFWA) Management Zones (MZ) IV and II/VII. MZ II and VII are combined for the purpose of characterizing GRSG habitat conditions and impacts, as was done in the Summary of Science, Activities, Programs, and Policies That Influence the Range-Wide Conservation of Greater Sage-Grouse (Manier et al. 2013). However, the Idaho and southwestern Montana sub-region contains a portion of MZ II and does not overlap with MZ VII. The analysis of BLM and Forest Service actions in MZs IV and II/VII is primarily based on MZ-wide datasets developed by the BLM National Operations Center (NOC).

The analysis of nonfederal actions is more qualitative and includes a review and analysis of the following:

- State plans
- Coordination with states and agencies during consistency reviews
- Additional data from non-BLM-administered lands.

**Figure 5-1** shows the boundaries of the WAFWA Management Zones and the BLM and Forest Service planning areas. The Idaho and southwestern Montana sub-region contains a large proportion of MZ IV, with 11,827,900 acres of PHMA out of 22,105,600 total acres in MZ IV; and 5,635,700 acres of GHMA out of 10,128,500 total acres in MZ IV. In contrast, the Idaho and southwestern Montana sub-region has a relatively small influence in the context of MZ II/VII, because it contains relatively few priority habitat management areas (PHMA) or general habitat management areas (GHMA; 147,100 acres of PHMA out of 14,105,000 total acres in MZs II/VII; and 23,600 acres of GHMA out of 17,771,500 total acres in MZs II/VII). As a result, actions in the Idaho and southwestern Montana LUPA/EIS may have less impact on GRSG than those in larger planning areas in MZs II/VII.

In addition, the MZ IV contains 4,198,900 acres of the Southern Idaho/Northern Nevada Sagebrush Focal Area (SFAs), and MZs II/VII contain 563,300 acres of the Bear River Watershed Area SFA. SFAs are a subset of PHMA and represent recognized "strongholds" for the species that have been noted and referenced by the conservation community as having the highest densities of the species and other criteria important for the persistence of the species. Those portions of SFAs on BLM-administered and National Forest System lands would be petitioned for withdrawal from mineral entry; subject to an NSO stipulation

with no exceptions, modifications, or waivers; and are prioritized for management and conservation actions, including but not limited to, review of livestock grazing permits/leases. Management of SFAs would enhance protection of GRSG in these areas, providing a net conservation gain to the species in light of other past, present, and reasonably foreseeable future actions considered in this CEA.

**Section 5.1.1**, Methods, provides a description of the methodology used for this cumulative effects analysis. **Section 5.1.2** lists assumptions used in the analysis. **Section 5.1.3** describes existing conditions in WAFWA MZ IV and in the Idaho and southwestern Montana sub-region. **Section 5.1.4**, provides a broad-scale description regional efforts to manage GRSG in MZ IV. **Section 5.1.5** discusses the relevant cumulative actions in MZ IV that will be analyzed in this CEA. **Section 5.1.6** analyzes threats to GRSG in MZ IV and discusses the potential cumulative effects resulting from each threat for each alternative. **Section 5.1.7** describes existing conditions in WAFWA MZs II/VII. **Section 5.1.8**, provides a broad-scale description regional efforts to manage GRSG in MZs II/VII. **Section 5.1.9** discusses the relevant cumulative actions in MZs II/VII that will be analyzed in this CEA. **Section 5.1.10** analyzes threats to GRSG in MZs II/VII and discusses the potential cumulative effects resulting from each threat for each alternative. **Section 5.1.11**, Conclusions, determines the cumulative effects on GRSG as a result of implementing each alternative in combination with other private, local, regional, state, and federal past, present, and reasonably foreseeable future actions in MZs IV and II/VII.

#### **5.1.1 Methods**

The CEA uses the following methods:

- Data from the USGS publication Summary of Science, Activities, Programs, and Policies That Influence the Range-Wide Conservation of Greater Sage-Grouse (Manier et al. 2013) establishes the reference condition against which the alternatives and other past, present, and reasonably foreseeable future actions are compared.
- The USFWS's 12-Month Findings for Petitions to List the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered" (USFWS 2010) and the USFWS publication Conservation Objectives: Final Report (i.e., the COT report; USFWS 2013) were reviewed to identify the primary threats facing GRSG in each WAFWA MZ. Table 2 of the COT report lists threats to GRSG that are present and widespread in each population in the MZ.
- For MZ IV the list of present and widespread threats that are directly or indirectly affected by BLM and Forest Service actions are fire, spread of weeds, conifers, infrastructure, grazing/free-roaming equids, conversion to agriculture, energy development/mining, and recreation (USFWS 2013, pp. 22-24). For MZ II/VII, these threats include: energy

development/mining, infrastructure, grazing, conversion to agriculture, fire, spread of weeds, recreation, and conifers (USFWS 2013, pp. 17-19, 27-28). Two other threats listed in the COT report, sagebrush eradication and isolation/small population size, affect GRSG populations in MZs IV and II/VII. While they are not addressed separately in this analysis, they are discussed as elements of other threats.

- Predation was not included as a threat in the final COT report and was not identified by USFWS as a significant threat to GRSG populations (USFWS 2010). Predation is a natural occurrence that may be enhanced by human habitat modifications such as construction of infrastructure that may increase opportunities for nesting and perching or increase exposure of GRSG nests. In such altered habitats, predators may exert an undue influence on GRSG populations. Predation is discussed in this CEA in the context of these other threats.
- Sagebrush eradication is a component of many threats, while isolation/small population size is not analyzed separately because no management actions directly address this threat. These two threats are discussed as a component of other threats and in the conclusions. Not all the threats discussed in this section represent major threats to GRSG in each planning area in the MZs, but each poses a present and widespread threat to at least one population.
- Each threat is analyzed (quantitatively when possible), and a brief conclusion for each threat is provided.
  - The BLM NOC compiled MZ-wide datasets for quantifiable actions in all LUPA/EISs in MZs IV and II/VII. These datasets provide a means by which to quantify direct impacts of the threats identified in the COT report.
  - Data and information were gathered from other federal, state, and local agencies and tribal governments, where available, and were used to inform the analysis of cumulative impacts on GRSG from each of the threats in MZs IV and II/VII. Because of the lack of consistent non-BLM and non-Forest Service data across the MZ, this portion of the analysis is qualitative.
- A conclusion is provided for each alternative in **Section 5.1.11**. Each alternative considers the cumulative impacts on GRSG from each of the threats. It also considers whether those threats can be ameliorated by implementing that particular alternative in conjunction with non-BLM and non-Forest Service actions in MZs IV and II/VII.
- The list of relevant cumulative actions in **Sections 5.1.5** and **5.1.9** was derived from each LUPA in MZs IV and II/VII to provide an overview of the ongoing and proposed land uses there.

**Commented [jmbeck2]:** This is a confusing sentence. I think there are two thoughts that should be explained a little better.

- Baseline data that are consistent across planning areas and that analyze cumulative effects for each alternative, including the no action alternative and Proposed Plan, are used in this analysis.
- The Idaho and southwestern Montana sub-region is located within two MZs. In this instance, the CEA analyzes threats and impacts for each MZ separately.
- This analysis uses the most recent information available. It assumes that the Proposed Plan will be implemented in the other BLM and Forest Service sub-regions in MZs IV and II/VII.

### 5.1.2 Assumptions

This cumulative analysis uses the same assumptions and indicators as those established for the analysis of direct and indirect effects on GRSG in **Section 4.4.9**. In addition, the following assumptions have been made:

- The timeframe for this analysis is 10 years.
- The CEA area extends beyond the sub-region boundary and encompasses all of WAFWA MZ IV and II/VII; the quantitative impact analysis focuses on impacts across the MZs.
- The magnitude of each threat would vary geographically and may have more or less impact on GRSG in some parts of the MZs, depending on such factors as climate, land use patterns, and topography.
- A management action or alternative would contribute a net conservation gain to GRSG if there is an actual benefit or gain above baseline conditions. Baseline conditions are defined as the pre-existing condition of a defined area and/or resource that can be quantified by an appropriate metric(s). During environmental reviews, the baseline is considered the affected environment that exists at the time of the review's initiation, and is used to compare predictions of the effects of the proposed action or a reasonable range of alternatives.
- The CEA quantitatively analyzes GRSG habitat. Impacts on habitat are likely to correspond to impacts on populations within the MZs, since reductions or alterations in habitat could affect reproductive success through reductions in available forage or nest sites. Human activity could cause disturbance to the birds, preventing them from mating or successfully rearing offspring. Human activities also could increase opportunities for predation, disease, or other stressors (Connelly et al. 2004; USFWS 2010; Manier et al. 2013).
- The governor of Idaho is expected to issue an executive order providing direction for GRSG conservation in Idaho on state lands. This executive order is expected to be largely consistent with BLM and

Forest Service direction, though exact details are not known at the time this FEIS is published.

- Acres presented for GHMA also include acres within IHMA.

**Commented [JMM3]:** This is not previously defined. Is this a typo for GHMA or is the I for Idaho?

**5.1.3 Existing Conditions in WAFWA MZ IV and the Idaho and Southwestern Montana Sub-region**

This section summarizes existing conditions and past and present actions for the Idaho and southwestern Montana sub-region (provided in more detail in Chapter 3) and for MZ IV as a whole.

*GRSG Habitat and Populations*

MZ IV consists of nine GRSG populations: Baker, East-Central, Southwest Montana, Snake-Salmon-Beaverhead, Belt Mountains, Weiser, Northern Great Basin, Box Elder, and Sawtooth (Garton et al. 2011). The sub-region includes six of these populations: East-Central, Southwest Montana, Snake-Salmon-Beaverhead, Weiser, Northern Great Basin, and Sawtooth. This MZ represents one of the largest areas of connected GRSG habitat, as demonstrated by Knick et al. (2011), and supports the largest population of GRSG outside of the Wyoming Basin (Garton et al. 2011). MZ IV includes GRSG populations in Oregon, Idaho, Nevada, Utah and Montana.

In MZ IV, BLM-administered and other federal lands account for approximately 22,522,300 million acres of GRSG habitat (approximately 68 percent of habitat), with state and private lands accounting for over 10 million acres of GRSG habitat (approximately 31 percent of habitat) (Manier et al. 2013, p. 118). The BLM also has some management authority over split estate lands, with privately held surface and federal subsurface mineral rights. Approximately 21 percent of PHMA and 44 percent of GHMA within MZ IV are located on BLM-administered and National Forest System lands in the Idaho and southwest Montana sub-region.

Table 5-1 provides a breakdown of landownership and acres of GRSG habitat in MZ IV. As the table shows, approximately 52 percent of PPH-PHMA and 19 percent of PGHGHMA is on BLM-administered lands. Approximately 7 percent of PPHMAPPH and 5 percent of PGHMAPGH is on National Forest System lands.

**Table 5-1**  
**Management Jurisdiction in MZ IV by Acres of Priority and General Habitats**  
**(PPHMAPPH and PGHMAPGH)**

	Total Surface Area (Acres)	PPHMAPPH (Acres)	PGHMAPGH (Acres)	Non-habitat (Acres)
<b>MZ IV</b>	78,259,200 (100%)	21,930,600	10,958,500	45,370,100

**Table 5-1**

Source: Manier et al. 2013, p. 118

*Sub-region Habitat Conditions*

Sub-regional habitat conditions and trends are presented by population area in **Table 3-4**.

**Commented [jmbeck4]:** There is no Table 3-4 in this document. Is this referring to the EIS?

*Idaho and Southwestern Montana LUPA/EIS Alternatives*

The Idaho and Southwestern Montana LUPA and EIS evaluated the following seven alternatives:

- Alternative A, current management (the no action alternative)
- Alternative B, which was developed using GRSG conservation measures in A Report on National Greater Sage-Grouse Conservation Measures (Sage-Grouse National Technical Team 2011)
- Alternative C, which was developed based on recommendations from individuals and conservation groups for protecting and conserving GRSG and habitat rangewide
- Alternative D, which incorporates conservation measures to conserve, enhance, and restore GRSG habitat on BLM-administered and National Forest System lands, while balancing resources and resource use among competing human interests, land uses, and the conservation of natural and cultural resource values, and sustaining and enhancing ecological integrity across the landscape, including plant, wildlife, and fish habitat.
- Alternative E, which was developed from recommendations by the State of Idaho's GRSG Task Force
- Alternative F, which was derived from individual and conservation group comments. This alternative contains a mixture of management actions from A Report on National Greater Sage-Grouse Conservation Measures as well as additional restrictions on resource uses and increased resource protection; and
- Proposed Plan, which was developed through a coordinated partnership of BLM, Forest Service, the States of Idaho and Montana and the USFWS and is consistent with the objectives described in the COT report

*Population Trends in Management Zone IV*

Historic conversion of habitat to agriculture has resulted in a residual sagebrush landscape that is less productive than those prior to European colonization. As a result, more known GRSG populations in the region are relatively small and/or separated from adjacent populations. Notable exceptions are the Snake-Salmon-Beaverhead and Northern Great Basin populations (Manier et al. 2013, p. 132). Garton et al. (2011) predicted a 10.5 percent chance this MZ will fall below 200 males by 2037, and a 39.7 percent chance it would fall below 200 males by 2107 (USFWS 2013, p. 75).

While population estimates and trends for the sub-region are not available, GRSG populations are described in **Section 3.2**. The Snake-Salmon-Beaverhead and Northern Great Basin populations encompass the largest number of occupied leks in the sub-region. The Northern Great Basin population is especially important to long-term conservation of GRSG in MZ IV. This is because it comprises a substantial portion of the Great Basin core population (Connelly et al. 2004); shared with Nevada, Utah, and Oregon, this is one of the

**Commented [jmbeck5]:** Are we really talking about productivity or productivity and fragmentation. If we are including fragmentation, we should add in other factors such as fire, urbanization, weeds, invasive, etc.

**Commented [jmbeck6]:** 5.2?

two remaining major population strongholds in the range of the species. The Snake-Salmon-Beaverhead population provides additional and substantial population contributions within Idaho. It also provides known connectivity with the Southwest Montana population area.

In Montana, the GRSG population changes cyclically. The GRSG population declined sharply from 1991 to 1996, before increasing through 2000 (Montana Sage Grouse Work Group 2005). The population is thought to be down 33 percent from historic levels. Between 2004 and 2013, the average number of displaying males per lek in a given year in Montana ranged from 7 to 19 (Greater Sage-Grouse Habitat Conservation Strategy 2014).

#### 5.1.4 Regional Efforts to Manage Threats to GRSG in MZ IV

There are several regional efforts to manage threats to GRSG in MZ IV. Because state and private lands account for approximately 10 million acres (approximately 31 percent) of GRSG habitat in MZ IV (Manier et al. 2013, p. 118) these efforts play an important role in alleviating threats to GRSG.

##### Idaho Statewide Efforts

Similar to efforts in nearby states, the governor of Idaho is expected to issue an executive order providing direction for GRSG conservation in Idaho on state lands. This executive order is expected to be largely consistent with BLM and Forest Service direction, though exact details are not known at the time this FEIS is published.

##### Montana Statewide Efforts

The Montana Department of Fish, Wildlife and Parks (MFWP) is tasked with implementing the range-wide WAFWA Sage-Grouse Strategy (Stiver et al. 2006) in Montana. The WAFWA Sage-Grouse Strategy monitors, researches, provides outreach, and funds conservation projects for GRSG. A basic premise of the WAFWA Sage-Grouse Strategy is that additional conservation capacity must be developed at all local, state, federal, and range-wide levels for both the short term (3 to 5 years) and for the long term (10 years or more) to ensure GRSG conservation.

In addition, the MFWP's Montana Management Plan and Conservation Strategy for Sage-Grouse was initiated in 2005 to protect, maintain, and restore GRSG habitat. The plan ranks threats to the species across the state and provides an overall strategy for public and private cooperation in conservation actions. In 2013, the Greater Sage-Grouse Habitat Conservation Advisory Council provided a plan to the governor to update and advance the conservation agenda for GRSG in Montana. The governor issued an executive order on September 9, 2014 (State of Montana 2014), based on the council recommendations that provided the direction for GRSG conservation in Montana.

Montana Executive Order. The plan calls for the following:

**Commented [jimbeck7]:** Idaho is doing more than just an executive order. Idaho Department of Lands has just released a GRSG management plan. I'm not sure of the status. Paul Makela would know.

I also think IDFG has some management plans too.

What about the Idaho State Alternative? We discuss the NV alternative below but seem to be missing some Idaho efforts (IDL Plan, executive order, local working groups, IDFG plans, the gov.'s alternative). Makela could give you more.

**Commented [JMM8]:** Who is this group? Maybe there should be a clarifying sentence describing their mission / purpose?

- A 0.6-mile NSO buffer around active leks in Core Areas (0.25 mile in GHMA) for oil and gas development,
- A 0.6-mile avoidance zone around leks for power lines and towers, and
- A 5 percent limit on surface disturbance.

**Commented [JMM9]:** This should be PHMA as the parents includes GHMA

The approach of the Montana plan is similar to the Wyoming ~~Executive Order~~ ~~executive order~~. Montana's plan will apply a 5% disturbance cap in core habitat and will limit well density to one location per 640 acres and apply timing limitations to seasonal habitats. The 0.6-mile buffer around lekking grounds would protect males in the vicinity of leks during the breeding season; the density limits and disturbance cap would protect GRSG during nesting, brood-rearing, and winter concentration activities.

**Commented [JMM10]:** The Wyoming Executive Order has not yet been discussed in this document, therefore the reader has no context for comparison. Either include a brief description of the WY EO or delete this sentence.

#### *Oregon Statewide Efforts*

The Oregon Department of Fish and Wildlife (ODFW) has developed a strategy to promote conservation of GRSG and intact, functioning GRSG habitats in Oregon. The Greater Sage-Grouse Conservation Assessment and Strategy for Oregon: A Plan to Maintain and Enhance Populations and Habitat (Oregon State Plan, Hagen 2011) describes the ODFW's proposed management of GRSG. It also provides guidance to public land management agencies and land managers for GRSG conservation. GRSG conservation guidelines in the State Plan are designed to maintain (at a minimum) or enhance the quality (the optimum) of current habitats. They will also assist resource managers in achieving the population and habitat objectives of the State Plan.

The Oregon State Plan provides biological recommendations for long-term conservation of GRSG in Oregon based on the best available science; however implementing recommendations is the responsibility of the respective land manager. Thus, the intent of the Oregon State Plan is plan is to inform decision-maker regarding the biological consequences of various actions on GRSG, but not to dictate land management decisions. Similarly, GRSG conservation proposed in the plan is voluntary on private lands (Hagen 2011, p. viii).

The Oregon State Plan establishes "Core Areas" to help delineate landscape planning units by distinguishing areas of high biological value to GRSG. These areas are based on the locations of breeding areas and are intended to help balance GRSG habitat requirements with development, which would be subject to stipulations and regulations (Hagen 2011, p. 80). ODFW developed Core Areas necessary to conserve 90 percent of Oregon's GRSG population with emphasis on highest density and important use areas which provide for breeding, wintering and connectivity corridors.

While the plan is comprised of voluntary management guidelines, the guidelines may be utilized by state regulatory agencies including the Energy Facility Siting Council as conditions of approval on a case-by-case basis for certain energy projects. For example, the council has jurisdiction on wind energy projects

greater than 105 MW (Dave Budeau, phone conversation with author, March 26, 2015).

Further, The Oregon Governor's natural resources department is currently in the process of developing regulations for GRSG conservation. The forthcoming Sage Grouse Conservation Action Plan will supplement the state plan and provide land use regulations and mitigations for Oregon core habitat areas (Dave Budeau, phone conversation with author, March 26, 2015).

The Oregon Department of State Lands (DSL) is working with the FWS to develop a Candidate Conservation Agreement with Assurances (CCAA) for State Common School Fund Rangelands to implement conservation measures on over 633,000 acres of DSL lands, including approximately 380,700 acres of low-density habitat, and 153,100 acres of core area habitat (80 FR 9475). The required Environmental Assessment under NEPA was made available for public comment on February 23, 2015.

Under the CCAA and associated Enhancement of Survival permit under the ESA, the DSL would voluntarily undertake management activities on their properties to enhance, restore, or maintain habitat benefiting GRSG, in exchange for assurances that DSL would not be subject to increased land use restrictions should GRSG become listed under the ESA in the future. The term of the CCAA and associated permit would be 30 years.

Under the CCAA, the DSL would prepare a Sage Grouse Habitat Assessment (SGHA), which would serve as a site-specific plan, for each land parcel under DSL administration. The SGHA would include conservation measures from the draft CCAA that would address all threats occurring on that parcel of land. The Service would review submitted SGHAs and approve them through a letter of concurrence if the SGHAs are consistent with the CCAA and permit terms and conditions.

*Nevada/California State Efforts*

Nevada State Plan. The state of Nevada submitted a state alternative for inclusion in the Nevada and Northeast California Sub-Regional Greater Sage-Grouse Draft Land Use Plan Amendment and Environmental Impact Statement (EIS). The Nevada Greater Sage-Grouse Conservation Plan (Sagebrush Ecosystem Technical Team 2014) includes regulatory mechanisms to avoid, minimize (with the use of design features) and/or mitigate impacts through the Conservation Credit System (described in additional detail below) to protect and restore GRSG habitat. The plan defines Core Management Areas, and aims to reach a conservation objective of ~~no net unmitigated loss due to new anthropogenic disturbance~~.

**Commented [LLM11]:** The State of Nevada has now changed this to "Net Conservation Gain"

Under the plan, project proponents must seek to avoid GRSG habitat disturbance. If a project proponent wishes to demonstrate that avoidance cannot be reasonably accomplished, exemptions will be granted to this

restriction as part of the SETT Consultation. The project proponent must demonstrate that specific criteria are met; criteria are summarized in Table 3-1 of the plan. Criteria are more stringent in Core Management Areas, and become less so as habitat quality decreases. If a project cannot avoid adverse effects (direct or indirect) to GRSG habitat, the project proponent will be required to implement design features that minimize the project's adverse effects to GRSG habitat to the extent practicable. Mitigation will be required for all anthropogenic disturbances to GRSG habitat, including those that have minimized disturbances through the process above. Mitigation requirements will be determined by the Conservation Credit System, a market-based mechanism that quantifies conservation outcomes (credits) and impacts from new anthropogenic disturbances (debits), defines standards for market transactions, and tracks conservation action implementation progress in the state.

GRSG habitat is determined based on the Nevada Habitat Suitability Map (described below) for GRSG habitat prepared by the state and USGS. The habitat map incorporates GRSG telemetry data along with environmental data at multiple scales, such as land cover, vegetation communities, physiographic indices and anthropogenic attributes. The habitat suitability model will be used to inform management decisions on protecting the most critical habitat and to provide strategic decision tools to identify where conservation activities will have the greatest beneficial impact on the habitat.

The Nevada state plan only applies to the state; it does not apply to portions of the Nevada and Northeastern California Sub-region within California.

Nevada State Regulations/Programs. Nevada has several state regulations and programs pertaining to GRSG. Assembly Bill 461 formally created and gave regulatory authorization for the Sagebrush Ecosystem Program. Governor Sandoval signed the bill into law in July, 2013. Nevada also has a pesticide registration fee; portions of the revenue from the fee will provide funding to the state noxious weed program and GRSG habitat conservation (WGA 2014). The state also has a Nevada Cheatgrass Action Team (WGA 2014), a voluntary multi-disciplinary group of individuals to assist the SETT with planning and managing projects to address cheatgrass and other invasive or noxious weeds that impact GRSG habitat.

*Natural Resource Conservation Service Sage Grouse Initiative*

The Natural Resource Conservation Service's (NRCS) Sage Grouse Initiative (SGI) is working with private landowners in 11 western states to improve habitat for GRSG (Manier et al. 2013, p. 117). With approximately 31 percent of all sagebrush habitats across the range in private ownership (Stiver 2011, p. 39), and over 25 percent in MZ IV and nearly 38 percent in MZ II/VII (Manier et al. 2013, p. 118), a unique opportunity exists for the NRCS to benefit GRSG and ensure the persistence of large and intact rangelands by implementing the SGI (USFWS 2010, p.5).

**Commented [LLM12]:** Need to discuss California State Regulations/Program

Participation in the SGI program is voluntary, but willing participants enter into binding contracts or easements to ensure that conservation practices that enhance GRSG habitat are implemented. Participating landowners are bound by a contract (usually 3 to 5 years) to implement, in consultation with NRCS staff, conservation practices if they wish to receive the financial incentives offered by the SGI. These financial incentives generally take the form of payments to offset costs of implementing conservation practices and easements or rental payments for long-term conservation.

While potentially effective at conserving GRSG populations and habitat on private lands, incentive-based conservation programs that fund the SGI generally require reauthorization from Congress under subsequent farm bills. These funding streams are potentially variable as they are subject to the political process.

As of 2014, the most recent year for which data are available, SGI has secured conservation easements on 98,167 acres within MZ IV (NRCS 2015). On these and additional private lands, SGI has completed other GRSG conservation actions within MZ IV, including implementation of grazing systems, conifer removal, vegetation seeding, and fence marking. These conservation actions are targeted at the critical threats in each MZ, consistent with those outlined in the COT report. SGI clusters implementation to achieve landscape benefits.

#### *Other Regional Efforts*

Tribes, counties, and local working groups are playing a critical role in promoting GRSG conservation at the local level. Individual conservation plans have been prepared by most local working groups to develop and implement strategies to improve or maintain GRSG habitat and reduce or mitigate threats on the local level. The proposed conservation actions and recommendations in these plans are voluntary actions for private landowners.

Local working group projects have included monitoring, research, and mapping habitat areas, as well as public outreach efforts, such as landowner education and collaboration with federal, state, and other local entities.

Some local working group conservation plans recommend restricting resource uses as well. For example, the Big Desert Sage-Grouse Conservation Plan (Big Desert Sage-grouse Local Working Group 2010) limiting recreational OHV use to existing designated roads and trails. Local working group GRSG conservation plans in MZ IV include the following:

- North Magic Valley Conservation Plan (2011)
- West Central Conservation Plan (2010)
- East Idaho Uplands Conservation Plan (2011)
- Big Desert Conservation Plan (2010)
- Shoshone Basin Conservation Plan (2008)
- Jarbidge Conservation Plan (2007)

- Curlew Valley Conservation Plan (2004)
- Owyhee County Conservation Plan (2013)
- Upper Snake Conservation Plan (2009)
- Challis Conservation Plan (2010)

**Commented [LLM13]:** Need to discuss ongoing regional efforts in California as well

#### **5.1.5 Relevant Cumulative Actions**

This cumulative effects analysis considers past, present, and reasonably foreseeable future actions on other federal, state, tribal, local, and private lands in MZ IV. Where these actions interface with GRSG habitat, they would cumulatively add to the impacts of BLM- and Forest Service-authorized activities.

The following list includes past, present, and future actions in MZ IV that could cumulatively affect GRSG (more detail is included in the table in Appendix A):

- Gateway West 230/500 Transmission Line Project, Wyoming and Idaho
- Boardman to Hemingway Transmission Line Project, Oregon and Idaho
- Fuels and vegetation treatments throughout the MZ
- Grazing permit renewals and allotment management plan updates throughout the MZ
- China Mountain Wind Project, Nevada and Idaho
- Small mining projects throughout the MZ

Several Native American tribal members have expressed concern about military overflights causing mortality of GRSG chicks as they incubate within their eggs. Further investigation into these impacts is needed, as effects seem to be anecdotal.

#### **5.1.6 Threats to GRSG in Management Zone IV**

In its COT report, the USFWS identifies fire, spread of weeds, conifer encroachment, infrastructure, grazing/free-roaming equids, conversion to agriculture, energy development, and recreation as the present and widespread threats facing GRSG populations in MZ IV (USFWS 2013, pp. 22-24). These threats impact GRSG mainly by fragmenting and degrading their habitat. The loss of sagebrush steppe across the West approaches or exceeds 50 percent in some areas. It is a primary factor in long-term declines in GRSG abundance across its historical range (USFWS 2010).

Habitat fragmentation reduces connectivity of populations and increases the likelihood of extirpation from random events, such as drought or outbreak of West Nile virus. Furthermore, climate change is predicted to affect the distribution of species through changes in annual average precipitation, greater early season plant growth, and increased frequency and severity of wildfires (BLM 2013a). Sensitive species such as GRSG, which are already stressed by declining habitat, increased development, and other factors, could experience additional pressures as a result of climate change.

Each COT report threat considered present and widespread in at least one population in MZ IV is discussed below. The quantitative impact analysis focuses on impacts in the MZ (sub-region percentages are provided for context).

**Fire**

Nature and Type of Effects. Sagebrush killed by wildfire often requires many years to recover, especially after large fires. Contiguous old-growth sagebrush sites are at high fire risk, as are large blocks of contiguous dead sagebrush and sagebrush sites with a substantial cheatgrass understory. Before recovering, these sites are of limited use to GRSG, except along the edges and in unburned islands.

Because of its widespread impact on habitat, fire has been identified as a primary factor associated with GRSG population declines. Depending on the species of sagebrush and the size of a burn, a return to a full pre-burn community cover can take from 25 to 120 years (Baker 2011). In addition, fires can reduce invertebrate food sources and may facilitate the spread of invasive weeds.

While most sagebrush subspecies are killed by fire and slow to reestablish, cheatgrass recovers within one to two years of a fire from seed in the soil. This annual recovery leads to a reoccurring fire cycle that prevents sagebrush reestablishment (USFWS 2010, p. 13932).

BLM management to prevent or control wildfires can also affect GRSG and habitat. Increased human activity and noise associated with fire suppression, fuels treatments, and prescribed fire in areas occupied by GRSG could affect nesting, breeding, and foraging behavior. Important habitats could be altered because of the use of heavy equipment, hand tools, and noise.

In addition, suppression may initially result in higher rates of conifer encroachment in some areas. In the initial stages of encroachment, fuel loadings remain consistent with the sagebrush understory. As conifer encroachment advances, fire return intervals are altered by decreasing understory abundance. The depleted understory causes the stands to become resistant to low intensity wildfires; over years, the accumulating conifer loads contribute to larger-scale wildfires and confound control efforts due to extreme fire behavior.

Conditions in the Sub-region and in MZ IV. Wildfire has been a primary threat to GRSG habitats and populations occurring across MZ IV, with 81 percent of PPHMAPPH and PGHMAPGH having high risk for fire, including the Snake-Salmon-Beaverhead and Northern Great Basin population areas (Manier et al. 2013, p. 133). Since 2000, more than 4.9 million acres (14 percent of PPHMAPPH and 17 percent of PGHMAPGH) of GRSG habitats have burned in this MZ, with an average of more than 239,000 acres of priority habitats burned annually; more than 1 million acres burned in some years (Manier et al. 2013, p. 133). The Murphy Fire in Idaho and Nevada affected over 650,000 acres of habitat in this MZ in 2007 (USFWS 2013, p. 78). An additional factor in the

**Commented [jmbek14]:** There have been some large fires in SE Oregon in the last few years that could be mentioned here.

analysis of cumulative effects of fire on GRSG is the trend of increasing fire size and frequency and severity, due to factors including exotic annual grasses, and climate change.

The use of chaff and flares by the military may increase wildfire risk, but this risk is generally mitigated by release altitudes about 2,000 feet above ground level and only above 5,000 feet above ground level during fire risk categories 4 and 5 (Mountain Home Air Force Base 2012).

Impact Analysis. Management actions in the Idaho and southwestern Montana sub-region that emphasize wildfire suppression in GRSG habitat would benefit the species by limiting habitat loss in the event of wildfire. Under current management (Alternative A), prescribed burning may be used to achieve habitat objectives. Alternatives B through F and the Proposed Plan provide for similar protection and maintenance of sagebrush habitat in implementing prescribed burning. The action alternatives all prioritize sagebrush protection in fuels treatment programs and would provide superior protection for sagebrush in prescribed burning, fuels treatment and fire suppression. The Proposed Plan would further reduce impacts from wildland fire by conducting the wildland fire and invasive species assessments and subsequent prioritization of the landscape. This is in accordance with the COT report objective to retain and restore healthy native sagebrush plant communities within the range of GRSG.

Recognition of the importance of sagebrush habitat during interagency wildfire response would benefit GRSG in the event of an unplanned fire. The Montana ~~eExecutive eOrder~~ executive order emphasizes fire suppression in ~~eCore pPopulation eAreas~~ core population areas, while recognizing other suppression priorities may take precedent. This would benefit GRSG during wildfire planning and response, particularly on lands not administered by the BLM or Forest Service.

On the local level, the Owyhee County Sage-Grouse Conservation Plan (2013) recommends reseeding burned areas with sagebrush and implementing sagebrush restoration projects in historical GRSG habitat where historical fires have removed sagebrush cover. However, the conservation plan does not identify a funding source for this action.

The Interagency Standards for Fire and Fire Aviation Operations “Red Book” includes a BMP for GRSG habitat conservation for wildlife and fuels management (BLM 2013b). This document is a supplemental policy or guidance for the BLM, the Forest Service, and the USFWS. This BMP would benefit the GRSG during interagency wildland fire operations by using spatial habitat data and predictive services to prioritize and preposition firefighting resources in critical habitat areas. The coordination of federal, state, and local fire prevention past, present, and reasonably foreseeable future actions and changes in fire management under the Idaho and southwestern Montana LUPA as well as under the other BLM and

Forest Service LUPAs in MZ IV, would provide a net conservation gain to GRSG habitats and populations in MZ IV.

**Spread of Weeds**

Nature and Type of Effects. As discussed in **Section 3.3**, invasive weeds alter plant community structure and composition, productivity, nutrient cycling, and hydrology. Invasive weeds also may cause declines in native plant populations, including sagebrush habitat, through such factors as competitive exclusion and niche displacement. Invasive plants reduce and may eliminate vegetation that GRSG use for food and cover. Invasive weeds fragment existing GRSG habitat and reduce habitat quality by competitively excluding vegetation essential to GRSG. Invasive weeds can also create long-term changes in ecosystem processes, such as fire cycles and other disturbance regimes that persist even after an invasive plant is removed (Connelly et al. 2004).

Commented [jmbeck15]: 5.3?

Roads and recreation can promote the spread of invasive weeds through vehicular traffic. Weed infestations can further exacerbate the fragmentation effects of roadways. Irrigation water has also supported the conversion of native plant communities to hayfields, pasture, and cropland, thus fragmenting sagebrush habitats. Excessive grazing in these habitats can lead to the demise of the most common perennial grasses in this system and an abundance of invasive species, such as cheatgrass or Japanese brome (Reisner et al. 2013).

Conditions in the Sub-region and in MZ IV. Via seeds carried by wind, humans, machinery, and animals, invasive and noxious weeds have invaded and will continue to invade many locations in MZ IV, including the sub-region. Some species, including annual bromes and Canada thistle, have become so ubiquitous throughout the sub-region that it is considered economically unfeasible to attempt to control them. They are considered part of the vegetative landscape despite their adverse impacts on other vegetation. Canada thistle, although common throughout the sub-region, is not treated on a plant-by-plant basis; rather, it is treated when plant populations reach densities high enough to make it the majority species. Examples are when it is growing in the bottom of dry reservoirs, on recreation sites, and along established roads and undeveloped vehicle trails.

Commented [JMM16]: Typo?

Commented [jmbeck17]: Is this counter to FIAT and the recent secretary order? If so, we may want to reword here.

The BLM currently manages weed infestations through integrated weed management: biological, chemical, mechanical, manual, and educational methods. It is guided by the 1991 and 2007 RODs for Vegetation Treatment on BLM Lands in Thirteen Western States (BLM 1991) and by the 2007 Programmatic Environmental Report (BLM 2007). Weeds are managed in cooperation with county governments and represents a landscape-level approach across management jurisdictions.

Impact Analysis. Increased activity, such as surface disturbance, motorized transportation, and animal and human activity, would increase the chance for the establishment and spread of invasive plants.

Management under Alternative A would allow for the most acres of surface disturbance; therefore, the potential for invasive weed spread and establishment would be greatest under this alternative, and effects to GRSG (e.g. reduction in quality of habitat) would be more pronounced. All of the action alternatives would reduce surface disturbance and would include weed-prevention measures to some degree. Of all alternatives, the Proposed Plan would likely have the lowest potential for invasive weed spread and establishment, given the three percent anthropogenic disturbance threshold which would limit surface disturbance; extensive mitigation and monitoring plans; wildfire and invasive species assessments and subsequent prioritization; application of RDFs and BMPs; and requirement for no net loss of key GRSG habitat. The COT report objective for invasive species is to maintain and restore healthy native sagebrush plant communities.

Invasive species on BLM-administered and National Forest System lands would be controlled under all alternatives. This would provide a net conservation gain to GRSG by restoring degraded sagebrush habitat.

Relevant cumulative actions that result in surface-disturbing activities, such as ROWs and energy and mining projects, would increase the potential for the spread of invasive weeds on both federal and non-federal lands. Projects subject to the general stipulations outlined in the Montana ~~eExecutive eOrder~~ ~~eOrder~~ are required to control noxious and invasive weed species and to use native seed mixes during reclamation processes. These stipulations would benefit GRSG ~~eCore eCore habitat eAreas~~ ~~eAreas~~—by limiting the spread or establishment of invasive species, particularly on lands that lack BLM and Forest Service protective regulatory mechanisms. Further, the *Greater Sage-Grouse Habitat Conservation Strategy for NRCS in Idaho* has identified GRSG conservation measures related to invasive weeds, such as reducing the risk and rate of fire spread, restoration and rehabilitation, and weed control. A number of projects are ongoing or in the planning phase to treat nonnative, invasive species (Appendix A). These impacts would be the same under all alternatives.

These stipulations, in combination with other state and county noxious weed regulations, other past, present and reasonably foreseeable future actions, and management under the Proposed Plans for other BLM and Forest Service LUPAs in MZ IV, would provide a net conservation gain to GRSG habitats and populations in MZ IV under the Proposed Plan and the other project alternatives. The Proposed Plan may result in the greatest net conservation gain due to its three percent anthropogenic disturbance cap that should reduce potential for the spread of weeds during the 10-year analysis period.

#### ***Conifer Encroachment***

Nature and Type of Effects. Conifer woodlands, especially juniper (*Juniperus* spp.) and in some regions pinyon pine (*Pinus edulis*), may expand into sagebrush habitat and reduce availability of habitat for GRSG. Conifer expansion may be

encouraged by human activities, including fire suppression and grazing (Miller et al. 2011). If woodland development is sufficient to restrict shrub and herbaceous understory growth, habitat quality for GRSG will be reduced (Connelly et al. 2004). Mature trees offer perch sites for raptors; thus, woodland expansion may also increase the threat of predation, as with powerlines (Manier et al. 2013, p. 91). Locations within approximately 1,000 yards of current pinyon-juniper woodlands are at highest risk of expansion (Bradley 2010). Studies have shown that GRSG incur population-level impacts at very low levels of conifer encroachment (Baruch-Mordo et al. 2013). In MZ IV, conifer encroachment ~~is connected to reduced-reduces~~ habitat quality in important seasonal ranges when woodland development is sufficient to restrict shrub and herbaceous production (Connelly and others, 2004 in Manier et al. 2013, p. 91).

Commented [jimbeck18]: I think I kept the meaning of the sentence.

Conditions in the Sub-region and in MZ IV Approximately 55 percent of conifer encroachment risk in PPHMAPPH (and 34 percent in PGHMAPPH) occur on BLM-administered lands within MZ IV (Manier et al. 2013, p. 93). In comparison, 25 percent of conifer encroachment risk in PPHMAPPH (and 32 percent in PGHMAPPH) occur on private lands and 15 percent in PPHMAPPH occurs on National Forest System lands (25 percent in PGHMAPPH). Therefore, BLM actions are likely to have a greater potential to ameliorate the effects of conifer encroachment on GRSG, particularly in PPHMAPPH, than any other single land management entity.

Impact Analysis The COT objective is to remove pinyon-juniper from areas of sagebrush that are most likely to support GRSG (post-removal) at a rate that is at least equal to the rate of pinyon-juniper incursion (USFWS 2013, p. 47). Management under Alternatives D, E, and the Proposed Plan would target conifers in GRSG habitat for removal. Treatment acres under the Proposed Plan are presented in **Table 2-5**. The Proposed Plan would also incorporate GRSG habitat objectives to guide treatments. Alternatives A, B, C, and F are largely silent on conifer removal and thus would not serve to reduce this threat on BLM-administered and National Forest System lands in the planning area, though the cumulative impact of other past, present, and reasonably foreseeable future actions in the planning area and larger MZ would help reduce the threat across the MZ.

Relevant cumulative actions on federal, private, and state lands within the MZ include several large conifer removal projects (Appendix A). Further, the NRCS carries out conservation measures to remove encroaching conifers near leks and lek seasonal habitats while minimizing disturbance to GRSG (NRCS 2012, p. 13). SGI has helped reduce the threat of early succession conifer encroachment through mechanical removal on 206,099 acres of private lands within MZ IV. The majority of these efforts were located inside PACs (NRCS 2015), helping to preserve historic fire return intervals and important GRSG habitat.

In combination with past, present, and reasonably foreseeable future actions and Proposed Plans for other BLM and Forest Service LUPAs within MZ IV, the Idaho and southwestern Montana Proposed Plan would have the greatest reduction in the threat from conifer encroachment and provide a net conservation gain to GRSG. Alternatives D and E would also reduce the threat, though to a lesser degree than the Proposed Plan.

### **Infrastructure**

#### *Rights-of-Way*

Nature and Type of Effects. As discussed in **Section 4.2**, power lines can directly affect GRSG by posing a collision and electrocution hazard. They also can indirectly decrease lek attendance and recruitment by providing perches and nesting habitat for potential avian predators, such as golden eagles and ravens (Connelly et al. 2004). In addition, power lines and pipelines often extend for many miles. The ground disturbance associated with construction, as well as vehicle and human presence on maintenance roads, may introduce or spread invasive weeds over large areas, degrading habitat. Impacts from roads may include direct habitat loss from road construction and direct mortality from collisions with vehicles. Roads may also present barriers to migration corridors or seasonal habitats, facilitate predator movements, spread invasive plants, and increase human disturbance from noise and traffic (Forman and Alexander 1998).

Conditions in the Sub-region and in MZ IV. Infrastructure, such as ROWs and associated facilities and urbanization, is widespread throughout MZ IV. In some locations, infrastructure development has affected GRSG habitat. Development of roads, fences, and utility corridors has also contributed to habitat loss and fragmentation in portions of MZ IV. The best available estimates suggest about 25 percent of the MZ IV is within approximately 4 miles of urban development (Knick et al. 2011, p. 214). Impacts of infrastructure development in MZ IV are primarily related to highways, roads, power lines, and communication towers, with 90 percent of MZ I within 4 miles of a road, 30 percent within 4 miles of a power line, and 5 percent within 4 miles of a communication tower (Knick et al. 2011, pp. 215-216).

Although not representative of all infrastructure ROWs, transmission lines greater than 115 kilovolts indirectly influence 37 percent of PPHMAPPH and 38 percent of PGHMAPGH across MZ IV. Indirect effects are assumed to occur to a radius of 4 miles (Manier et al. 2013, p. 41). Approximately 62 percent of transmission lines in PPHMAPPH and 43 percent in PGHMAPGH are on BLM-administered lands across GRSG habitats in MZ IV (Manier et al. 2013, p. 41). In contrast, National Forest System lands contain 5 percent of transmission lines in PPHMAPPH and 7 percent in PGHMAPGH. Therefore, BLM actions are likely to have a greater potential to affect transmission line ROWs in GRSG habitat than any other land management entity. Designating ROW exclusion and avoidance areas in PHMA and GHMA on BLM-administered and National Forest System

lands could reduce the threat on these lands. However, in areas with scattered federal landownership, infrastructure may be routed around federal lands, often increasing its length and impact. ROW avoidance and exclusion areas on BLM-administered and National Forest System lands could increase this tendency.

Impact Analysis. **Table 5-2** lists the areas of ROW avoidance and exclusion in GRSG habitat by alternative. **Table 5-3** lists acres of PHMA and GHMA in existing or future utility corridors.

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA within existing and proposed utility corridors in MZ IV; it also displays the percentage of those acres that are found within the planning area.

Alternative A (current management) has the most acres open to ROWs in PHMA. Across MZ IV, Alternative B, C, D, and F reduce the number of open acres in PHMA, with even larger reductions under Alternative E and the Proposed Plan. For GHMA, most of the action alternatives have comparable open acreage except for Alternative D, which has over a two-fold reduction. However, impacts would likely also be reduced under the Proposed Plan, which would use anthropogenic disturbance criteria to screen projects in GHMA. Alternatives B, C, and F would increase ROW exclusion areas in PHMA in MZ IV, whereas Alternatives A, E, and the Proposed Plan would have fewer acres managed as ROW exclusion in PHMA. Alternative D would have the fewest acres managed as ROW exclusion in both PHMA and GHMA. The other action alternatives would have a similar acreage managed as ROW exclusion compared to Alternative A.

In PHMA, Alternatives B, C, and F would not contribute acres of ROW avoidance within MZ IV, as PHMA would be managed as ROW exclusion under these alternatives. In contrast, Alternatives D, E, and the Proposed Plan manage PHMA as ROW avoidance, thereby increasing the acreage compared to Alternative A. The Proposed Plan offers additional protections due to the anthropogenic disturbance criteria, buffers, 3 percent disturbance cap, and mitigation requirements. Acres of utility corridors would be largely similar across all alternatives in both PHMA and GHMA.

Because of the additional protections under the Proposed Plan, this alternative provides the greatest net conservation gain to GRSG in the Idaho and southwestern Montana sub-region and is most likely to meet the COT report objective, which is to avoid development of infrastructure in GRSG priority areas for conservation.

**Commented [JMM19]:** Should the USFWS matrix be cited for calls like this throughout these documents?

The numbers of ROW authorizations are anticipated to grow in the sub-region. Increasing populations, continued energy development, and new communication sites drive the need for new ROWs on both federal and non-federal lands. For instance, the Boardman to Hemingway and Gateway West projects would influence GRSG habitat in MZ IV. While these projects would be exempted from the conservation measures in this plan, conservation measures for GRSG will be incorporated via the site-specific NEPA process for these projects. Actual impacts and contribution to cumulative effects from these projects are unknown at this time. Impacts on GRSG habitat on state or private land could be greater due to less restrictive management on those lands.

New ROW authorizations that require state agency review or approval would be subject to the permitting process and stipulations for development in GRSG Core areas under the Montana ~~eExecutive eOrder~~ executive order. These stipulations would benefit the GRSG in Core ~~aAreas~~ areas by encouraging ROW development outside of ~~eCore~~ core habitat ~~aAreas~~ areas, restricting surface occupancy within 0.6 mile of occupied leks, prohibiting power lines greater than 115 kV outside of designated corridors, and locating new roads used to transport products or waste over 1.9 miles from occupied leks.

In combination with the past, present, and reasonably foreseeable future actions and other BLM and Forest Service proposed plans in MZ IV, the Idaho and southwestern Montana Proposed Plan would provide the greatest net conservation gain to GRSG habitats and populations in MZ IV by providing the flexibility to site ROWs with the least impact on GRSG habitat.

#### *Renewable Energy*

Nature and Type of Effects. Impacts on GRSG from renewable energy development, such as that for wind and solar power, are similar to those from nonrenewable energy development. Additional concerns associated with wind energy developments are rotor blade noise, structure avoidance, and mortality caused by collisions with turbines (Connelly et al. 2004).

Conditions in the Sub-region and in MZ IV. Wind energy development is an increasing threat in some populations. Over the last six years, the BLM has authorized and then relinquished a ROW for wind development and has two pending applications. Wind testing sites have been authorized on BLM lands in the sub-region, though no wind developments have been authorized and constructed.

Solar energy potential is low in MZ IV, and the BLM has not received any applications for utility-scale solar production in the sub-region, nor are there solar resources comparable to the areas where utility-scale solar production projects are being proposed or built.

Although not representative of all renewable energy development, wind turbines indirectly influence less than 1 of ~~PPHMAPPH~~ and ~~PGHMAPGH~~

**Commented [jmbeck20]:** Where, is this BLM Idaho or Montana?

combined across MZ IV. Private lands account for 82 percent of wind turbines affecting GRSG in PPHMAPPH (and 62 percent in PGHMAPGH) within MZ IV. Therefore, actions on private land are likely to have a greater potential to ameliorate the effects of wind energy development than any other single land management entity.

Impact Analysis **Table 5-4** lists areas of wind energy ROW by alternative.

<sup>1</sup> Includes IHMA

<sup>2</sup> Open with standard stipulations. This table displays the acres of PHMA and GHMA within wind energy management designations in MZ IV; it also displays the percentage of those acres that are found within the planning area.

In the Idaho and southwestern Montana sub-region, the alternatives do not contribute to the open acres in PHMA in MZ IV, whereas the alternatives contribute most of the open and ROW exclusion acres in GHMA. Alternatives D and E manage the greatest acreage of PHMA as ROW avoidance, while Alternatives B, C, D, F, and the Proposed Plan would have the most acres managed as ROW exclusion for wind energy. The Proposed Plan would offer additional protections for PHMA, including anthropogenic disturbance criteria, a 3 percent disturbance cap, buffers, and mitigation requirements. Across MZ IV, most other sub-regions' proposed plans maintain exclusion areas in PHMA for wind energy, with the exception of Oregon which allows for avoidance in Lake, Harney, and Malheur counties. The Proposed Plan in Idaho would allow wind energy development in GHMA, subject to a screening process, whereas Montana would manage GHMA as avoidance for wind.

Projects that require state agency review or approval would be subject to the Montana ~~eExecutive eOrder~~ ~~executive order~~ permitting process. This would encourage wind energy development outside of ~~eCore~~ ~~core habitat~~ ~~aAreas~~ ~~areas~~. Implementation of the wind energy restrictions in the Idaho and southwestern Montana Proposed Plan, in combination with the disturbance caps under the Montana state plan, ROW exclusion areas in other BLM and Forest Service LUPAs, and other past, present, and reasonably foreseeable future actions,

would provide a net conservation gain to GRSG habitats and populations in MZ IV.

***Grazing/Free-Roaming Equids***

Nature and Type of Effects. In general, livestock can influence habitat by modifying plant biomass, plant height and cover, and plant species composition. As a result, livestock grazing could cause changes in habitat that alter species abundances and composition in GRSG insect prey. Changes in plant composition could occur in varying degrees and could change vegetative structure, affecting cover for nesting birds. Grazing could also alter fire regimes (Davies et al. 2010).

If not managed properly, cattle and sheep grazing can compact soil, enrich soil with nutrients, trample vegetation and nests, directly disturb GRSG and negatively affect GRSG recruitment. Cattle and sheep also can reduce invertebrate prey for GRSG or increase their exposure to predators (Beck and Mitchell 2000, pp. 998-1,000; Knick 2011; Coates 2007, pp. 28-33). Grazing in riparian areas can destabilize streams and riverbanks, cause the loss of riparian shade, and increase sediment and nutrient loads in the aquatic ecosystem (George et al. 2011). Stock watering tanks can contribute to stream and aquifer dewatering and may concentrate livestock movement and congregation in sensitive areas (Vance and Stagliano 2007).

However, grazing can reduce the spread of invasive grasses, if applied annually before the grasses have dried. It also can be used to reduce fuel load (Connelly et al. 2004, p. 7, 28-30). Light to moderate grazing does not appear to affect perennial grasses, which are important to nest cover (Strand and Launchbaugh 2013).

Periodic overgrazing can damage range resources over the long term. It often exacerbates drought effects when stocking levels are not quickly reduced to match the limited forage production. The degree to which grazing affects habitat depends on several factors, such as the number of animals grazing in an area, the time of grazing, and the grazing system used.

A well-developed understory of grass, forbs, and deciduous shrubs is critical for GRSG and other wildlife. Impacts on habitat vary with livestock densities and distribution; the more evenly livestock is distributed, the lower their impact on any given area (Gillen et al. 1984). However, cattle show a strong preference for certain areas, leading to high use in some areas and little to no use in others. Livestock grazing is generally limited by slopes of greater than 30 percent, dense forests and vegetation, poor or little upland forage, and lack of water.

Since the passage of the 1934 Taylor Grazing Act, range conditions on BLM-administered lands have improved due to improved grazing management practices and decreased livestock numbers and annual duration of grazing.

In addition, the BLM has applied Standards for Rangeland Health since 1997. Similarly, the Forest Service has multiple regulations requiring application of rangeland health standards. The purpose of this practice is to enhance sustainable livestock grazing and wildlife habitat, while protecting watersheds and riparian ecosystems.

Although livestock grazing is the most widespread land use across the sagebrush biome, it exerts a more limited influence on soils and vegetation than land uses that remove or fragment habitat (e.g., mineral extraction or infrastructure development). Thus, reducing AUMs or acres open to grazing would not necessarily restore high quality GRSG habitat.

Reducing grass height caused by livestock grazing in GRSG nesting and brood-rearing areas has been shown to negatively impact nesting success. This was the case when residual herbaceous cover was reduced below the approximately 7 inches needed for predator avoidance (Gregg et al. 1994). Livestock grazing could reduce the suitability of breeding and brood-rearing habitat, which would impact GRSG populations (USFWS 2010).

For BLM-administered and National Forest System lands, Standards for Rangeland Health require the agencies to ensure that the environment contains all of the necessary components to support viable populations of sensitive, threatened, and endangered species in a given area relative to site potential. The BLM Washington Office IM 2009-018 requires that land health considerations, such as vegetation cover for GRSG, are primary considerations for prioritizing the processing of grazing authorizations.

Livestock grazing impacts wildlife habitats, including habitats for numerous special status species. Potential impacts from livestock grazing would be minimized by managing BLM-administered and National Forest System lands to meet Standards for Rangeland Health, closing areas that fail to meet these standards, or changing grazing seasons and livestock numbers if grazing were a cause of the area's failure to meet Standards for Rangeland Health.

Range improvements could result in livestock overusing important GRSG areas. For example, developing springs would generally change vegetative composition from a high diversity of grasses and forbs, important to broods, to one dominated by grasses; conversely, in areas where livestock use was not well managed, invasive forbs would rise in prevalence.

Concentrated livestock use would remove standing vegetation and subsequently reduce associated insects and forbs, both of which are important to GRSG broods. Allowing spring developments along ephemeral streams and wetlands and allowing livestock watering tanks would decrease GRSG habitat. Springs, seeps, and wetland areas are vitally important to GRSG broods; therefore, allowing spring developments under this alternative could benefit some resources but not GRSG.

**Commented [JMM21]:** Re-word because This isn't exactly true. Standard #4 of the "Standards for Healthy Rangeland and Guidelines for Livestock Grazing Management for Public Lands Administered by the Bureau of Land Management in the State of Wyoming" is:

Rangelands are capable of sustaining viable populations and a diversity of native plant and animal species appropriate to the habitat. Habitats that support or could support threatened species, endangered species, species of special concern, or sensitive species will be maintained or enhanced.

**Commented [JMM22]:** Also not true. The IM serves as an aid to the field offices in determining priorities for focusing resources when processing permits and leases. The focus is based upon the categorization of an allotment – I, M or C. The IM is based around rangeland health but does consider critical habitats conditions, conflicts with sage grouse, and whether projects have been proposed for implementing the Healthy Lands initiative.

**Commented [jmbeck23]:** Rangeland Health applies to BLM only. The FS has something else; however, I don't know what it is.

**Commented [JMM24]:** The authorized officer shall take appropriate action upon determining that existing management needs to be modified to ensure that standards are met or are making significant progress towards meeting standards. Modifying management could involve a variety of actions including, but not limited to, changing animal kind, changing season of use, adjusting AUMS, adjusting livestock numbers, implementing a grazing prescription or implementing range improvement projects. Recommend deleting this section.

Wild horse and burro grazing has similar impacts as livestock grazing in their effect on soils, vegetation health, species composition, water, and nutrient availability by consuming vegetation, redistributing nutrients and seeds, trampling soils and vegetation, and disrupting microbial systems (Connelly 2004).

Conditions in the Sub-region and in MZ IV. Livestock grazing is present and widespread on many land types, such as federal and private, across MZ IV. Rangeland health assessments have found that over 19 percent of BLM-administered grazing allotments in GRSG habitat in MZs II/VII are not meeting wildlife standards with grazing as a causal factor (Manier et al. 2013, p. 97). Additionally, nearly 2 million acres of GRSG habitat within MZ IV is federally managed wild horse and burro range (Manier et al. 2013, p. 102).

Commented [JMM25]: Later (pg 71) in the document, this is 4.

Perhaps the most pervasive change associated with grazing management in GRSG habitats throughout MZ IV is the construction of fencing and water developments (Knick et al. 2011, p. 224). Barbed wire fences contribute to direct mortality through fence collisions (Stevens et al. 2011); water developments may contribute to the increased occurrence of West Nile virus (Walker and Naugle 2011).

Additional habitat modifications associated with grazing management are mechanical and chemical treatments to increase grass production, often by removing sagebrush (Knick et al. 2011). Standards for Rangeland Health protect habitat from elements detrimental to GRSG, but not all rangelands in MZ IV are in compliance with these standards.

Wild horses also occur within MZ IV and the sub-region; within MZ IV, 5.7 percent of PPH is negatively influenced by free-roaming equids (Manier et al. 2013, p. 102). Six designated herd management areas (HMAs) and nine herd areas occur on BLM-administered lands in the sub-region; no active wild horse and burro territories occur on National Forest System lands in the sub-region (**Section 3.6**). The BLM establishes an appropriate management level (AML) for each HMA, which represents the population objective.

Impact Analysis. On all lands in the sub-region, the BLM manages livestock grazing on 12,129,800 acres, encompassing 2,654 grazing allotments, while the Forest Service manages 9,646,900 acres encompassing 319 grazing allotments. **Table 5-5** lists the acres of PHMA and GHMA available and unavailable for grazing, by alternative.

Source: BLM GIS 2015

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA available and unavailable to livestock grazing in MZ IV; it also displays the percentage of those acres that are found within the planning area.

Acres available to livestock grazing in PHMA and GHMA are similar across most alternatives. Acres unavailable to livestock grazing would be greatest under Alternative C, which closes all GRSG habitat to grazing, followed by Alternative F, which would reduce grazing by 25 percent in PHMA. Such reductions and closures would benefit GRSG by maintaining nesting cover for protection and

forage; however, the increased need for fencing to exclude grazing animals could also harm nesting GRSG by increasing the likelihood of predation and collision.

However, as discussed, moderate grazing is compatible with GRSG habitat; thus, closing acres to grazing may not itself benefit or harm GRSG. Possibly equally or more beneficial is restricting range improvements in GRSG habitat, limiting fencing, and effectively implementing range health standards on grazing allotments in GRSG habitat. Alternatives B through F and the Proposed Plan include grazing restrictions (to varying degrees) which would help protect GRSG from potential impacts such as habitat changes due to herbivory and collisions with fencing. In terms of impacts on BLM-administered and National Forest System lands, Alternative A would have no GRSG-specific protective grazing restrictions, and would therefore have the greatest impacts on the species. Alternative C would have no areas available for livestock within with designated habitat, and would therefore have the fewest impacts on the species. However, as a result of restricting grazing in GRSG habitat under Alternative C, increased fencing on private lands may occur. This could result in higher cumulative effects though mortality from fencing collisions. Reduced grazing under Alternative F would have similar, but fewer impacts, compared to Alternative C.

The COT report objectives for livestock grazing are to manage grazing in a manner consistent with local ecological conditions. This management would maintain or restore healthy sagebrush shrub and native perennial grass and forb communities and conserve essential habitat components for GRSG. Restoration to meet these standards and adequate monitoring would be required. The COT report also states that land managers should avoid or reduce the impact of range management structures on GRSG habitat.

If BLM-administered and National Forest System lands were made unavailable for livestock grazing, as under Alternative C, this could increase grazing pressure on adjacent private lands. Loss of federal grazing permits would pose a threat of indirect adverse effects, including potential conversion of private grazing lands to agriculture, if the loss of federal grazing rights made ranching less economically viable.

Since 2010, SGI has enhanced rangeland health through rotational grazing systems, re-vegetating former rangeland with sagebrush and perennial grasses and control of invasive weeds. On privately-owned lands, SGI has developed a prescribed grazing approach that balances forage availability with livestock demand. This system allows for adjustments to timing, frequency, and duration of grazing, ensuring rangelands are managed sustainably to provide continued ecological function of sagebrush-steppe. A primary focus of the prescribed grazing approach is maintenance of key plant species, such as deep-rooted perennial grasses that have been shown to be essential for ecological resistance to invasive annual grasses (Reisner et al. 2013, pp. 1047-1048). These actions

help to alleviate the adverse impacts associated with improper grazing practices outlined above under Nature and Type of Effects. Within MZ IV, SGI has implemented 314,930 acres of prescribed grazing systems. This program is likely the largest and most impactful program on private lands within MZ IV. Because of its focus on priority areas for conservation, which often overlap PHMA, the SGI's past, present, and reasonably foreseeable work has had and likely will continue to have a cumulative beneficial impact on GRSG when considered alongside protective BLM management actions in PHMA.

In combination with NRCS actions under the Sage-Grouse Initiative (e.g., fence marking and conservation easements), state efforts to maintain ranchland, other past, present, and reasonably foreseeable future actions, and other BLM and Forest Service Proposed Plan in MZ IV, BLM and Forest Service management actions in the Idaho and southwestern Montana sub-region would provide a net conservation gain to GRSG habitats and populations.

Under all alternatives the BLM has the ability to adjust appropriate management levels of wild horses if resource damage occurs; however, only Alternatives B through F and the Proposed Plan provide management guidelines specific to GRSG habitat (e.g. prioritizing gathers in GRSG habitat), which would benefit the species more than Alternative A. Other past, present, and reasonably foreseeable future actions are unlikely to affect the threat from wild horses and burros, as these animals are federally-managed. Evaluating AMLs with consideration of GRSG habitat objectives for BLM-administered lands within MZ IV would provide a net conservation gain for GRSG habitats and populations.

**Conversion to Agriculture**

Nature and Type of Effects. Converting sagebrush habitat to agricultural use, commonly referred to as sodbusting, causes direct loss of habitat available for GRSG. Habitat loss also decreases the connectivity between seasonal habitats, increasing population isolation and fragmentation. Fragmentation then increases the probability for decline of the population, reduced genetic diversity, and extirpation from stochastic events (Knick and Hanser 2011).

In addition to reducing the land area available to support GRSG, habitat loss and fragmentation also increase the likelihood of other disturbances, such as human traffic, wildfire, and invasive plant spread.

Converting cropland has eliminated or fragmented sagebrush on private lands in areas with deep fertile soils or irrigation potential. Sagebrush remaining in these areas has been limited to the agricultural edge or to relatively unproductive environments.

Conditions in the Sub-region and in MZ IV. Regional assessments estimate that while only 1 percent of [PHMA](#) and [GHMA](#) in MZ IV are directly

influenced by agricultural development, over 85 percent of these habitats are within approximately 4 miles of agricultural land (Manier et al. 2013, p. 27).

Impact Analysis. The BLM and Forest Service do not convert public lands to agriculture. As such, the only direct authority these agencies have over conversion to agriculture is by retaining or disposing of lands in the realty program. Lands retained under BLM and Forest Service management will not be converted to agriculture and disposing of lands could increase the likelihood they will be converted to agriculture, depending on their location and new management authority.

As shown below in **Table 5-6**, acres identified for retention are similar in the sub-region and in MZ IV among the alternatives. Under Alternatives B, C, D, F, and the Proposed Plan, the BLM and Forest Service would generally retain GRSG habitat, thereby eliminating the possibility that GRSG habitat would be converted to agriculture use. Alternatives A and E do not specify retention of GRSG habitat, and thus there is the possibility of these lands being disposed. Most acres within MZ IV that are identified for disposal under Alternatives A and E are within the Idaho and southwestern Montana sub-region. However, land tenure adjustments require site-specific NEPA analysis and land sales must meet the disposal criteria under applicable law. BLM land tenure adjustments are not anticipated to be a significant contributing element to the threat of agriculture conversion.

**Table 5-6**

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA identified for retention and disposal in MZ IV; it also displays the percentage of those acres that are found within the planning area.

Cumulative impacts vary relatively little across alternatives because BLM and Forest Service management have little impact on alleviating this threat. Restrictions on grazing on federal land could increase agriculture pressure on adjacent private lands. If the loss of federal grazing rights makes ranching economically unviable, the potential conversion of private grazing lands to agriculture would increase. However, the Proposed Plan does not substantially increase acreage unavailable to grazing.

The COT report objectives for converting land to agriculture are to avoid further loss of sagebrush habitat for agricultural activities (both plant and animal production) and to prioritize restoration. In areas where taking agricultural lands out of production has benefited GRSG, the programs supporting these actions should be targeted and continued (USFWS 2013, p. 48). In accordance

with this objective, the NRCS's SGI program focuses on maintaining rangeland that provides habitat for GRSG. This voluntary program provides private landowners with monetary incentives to protect GRSG habitat, often through conservation easements. As a result, private land containing GRSG habitat is protected from conversion to agriculture or other development for the life of the conservation agreement. The conservation easements and other conservation incentives, such as restoration of water features and fence marking, can enhance the ability of private ranchlands to support GRSG. As of 2014, SGI has secured conservation easements on 98,167 acres within MZ IV and marked or removed 95 miles of fence (NRCS 2015). This has preserved habitat and reduced the risk of direct mortality on these lands. As a result, these efforts, in conjunction with other past, present, and reasonably foreseeable future actions, and other BLM and Forest Service Proposed Plans in MZ IV, BLM and Forest Service management in the Idaho and southwestern Montana sub-region, would provide a net conservation gain to GRSG habitats and populations in MZ IV.

#### ***Energy Development and Mining***

The COT report states that energy development should be designed to ensure that it will not impinge on stable or increasing GRSG population trends. For mining, the objective is to maintain stable to increasing GRSG populations and no net loss of GRSG habitats in areas affected by mining (USFWS 2013, p. 49).

There are approximately 1,137,700 acres of GRSG habitat in MZ IV where energy and mineral development (including geothermal, mineral materials, wind energy, and non-energy leasable minerals) is presently occurring. There are 6,553,300 acres indirectly influenced by energy development (including oil and gas, mineral materials, and wind energy; indirect effects were not quantified for geothermal and nonenergy leasable mineral developments) (Manier et al. 2013, pp. 52-71). No coal or oil and gas development is presently occurring in MZ IV.

#### ***Oil and Gas***

Nature and Type of Effects. As discussed in **Section 4.2**, oil and gas development impacts GRSG and sagebrush habitats through direct disturbance and habitat loss from well pads, access construction, seismic surveys, roads, power lines, and pipeline corridors. Indirect disturbances result from noise, gaseous emissions, changes in water availability and quality, and human presence. These factors could cumulatively or individually lead to habitat fragmentation in the long term (Connelly et al. 2004; Holloran 2005).

Oil and gas development results in direct loss of habitat from well pad and road construction as well as indirect disturbance impacts from increased noise and vehicle traffic. Oil and gas development also directly impacts GRSG through the species' avoidance of infrastructure. This development can also impact GRSG survival or reproductive success. Indirect effects include habitat quality changes, predator communities, and disease dynamics (Naugle et al. 2011).

Conditions in the Sub-region and in MZ IV. There is currently no oil and gas development within MZ IV (Manier et al. 2013, p. 52) and approximately 346,000 acres (1 percent) of GRSG habitat are leased but undeveloped (Manier et al. 2013, p. 55). There are two leases in Bonneville County in the sub-region within MZ IV (**Section 3.12**).

Less than one percent of GRSG habitat in MZ IV is within 1.8 miles of oil and gas wells (Knick et al. 2011, p. 240). Oil and natural gas development-related wells on BLM-administered lands indirectly influence 55 percent of PPHMAPPH and 45 percent of PGHMAPGH across MZ IV, occurring to a distance of 12 miles from the development. Private surface lands account for 45 percent of indirect effects in PPHMAPPH and 55 percent in PGHMAPGH in MZ IV (Manier et al. 2013, p. 52). The Forest Service does not have any direct or indirect effects within this MZ. Thus, actions on BLM-administered and private land have essentially the same potential to ameliorate the effects of oil and gas development within MZ IV.

Although oil and gas activities have a disproportionately greater effect on private lands, regulatory mechanisms on both federal surface and split estate lands in MZ IV are influential. Split estate lands with federal subsurface minerals may provide mitigation for impacts on GRSG habitat on private surface lands that would not be required on lands with both privately held surface and subsurface.

According to the RFD scenario (Appendix X), permanent disturbance associated with oil and gas development is projected to occur on 156 acres within the sub-region over the next 10 years, representing less than one percent of GRSG habitat within either the sub-region or MZ IV. The potential for impacts would be reduced where areas are closed to fluid mineral leasing and where NSO and CSU/TL stipulations are applied. Given the small acreage and implementation of RDFs and BMPs (**Appendix B**), the likelihood for impacts on GRSG habitat on BLM-administered and National Forest System lands is anticipated to be small and localized under all alternatives.

Impact Analysis. **Tables 5-7** and **5-8** provide a quantitative summary of fluid mineral leasing conditions on BLM-administered and National Forest System lands across MZ IV, followed by an analysis of the Idaho and southwestern Montana sub-regional alternatives.

**Table 5-7**

Open <sup>2</sup> to Fluid Mineral Leasing			

**Commented [jimbeck26]:** I think we need to define oil and gas development because we say there is not in MZ 4 however less than 1% is within 1.8 miles of an oil and gas well. May confuse folks. If there is no development, why are there wells? Also, the Four Rivers FO has oil and gas activity that will probably be producing soon.

**Commented [RMS27]:** In the NV portion of MZ IV, specifically the Elko area, the NV RFD discloses the proposed plan projects 180 acres of disturbance associated with O/G in the Elko area. I have attached an excerpt from the document. Though 156 acres of disturbance is close to the 180, I did not know if additional acres are projected in ID

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA with NSO Stipulations and CSU/TL Stipulations in MZ IV; it also displays the percentage of those acres that are found within the planning area.

As shown in **Tables 5-2** and **5-3**, fluid mineral closures and stipulations within the Idaho and southwestern Montana sub-region exert a fairly large influence within the broader MZ. Alternatives B, C, and F would provide the greatest protection to GRSG in the MZ by closing PHMA to new leases. This would reduce well density and impacts associated with construction and operation. Acres open and closed in GHMA would be similar across the alternatives,

though the Proposed Plan would have approximately double the acreage closed in GHMA compared to the other alternatives. Acres managed as NSO would be similar across alternatives in PHMA and GHMA, with more acres managed as NSO under Alternative E and the Proposed Plan. The Proposed Plan would provide additional protections to GRSG from fluid mineral development by requiring anthropogenic disturbance criteria, a 3 percent disturbance cap, buffers, mitigation requirements, RDFs and BMPs, and by managing SFAs as NSO with no waivers, exceptions, and modifications.

Restoring disturbed habitats would require the reestablishment of native shrubs and forbs, including big sagebrush, which would benefit GRSG; however, restored habitats may not support GRSG for long periods following restoration (Arkle et al. 2014). For this reason, successful restoration may not be successful without a nearby source population.

Overall, under the Proposed Plan, the combination of past, present, and reasonably foreseeable future actions for oil and gas exploration and development, Montana state actions, planned restoration activities, and other BLM and Forest Service Proposed Plans will provide a net conservation gain to GRSG habitats and populations in MZ IV.

#### *Geothermal*

Nature and Type of Effects. Impacts to GRSG from geothermal development are not well documented since geothermal development has been too recent to identify any immediate or lag effects (Knick et al. 2011 in Manier et al. 2013, p. 70). However, geothermal development is similar to fossil-fuel development and direct impacts to habitats would occur from development of power plants, access roads, pipelines and transmission lines. As a result, impacts of geothermal developments to GRSG from direct habitat loss, habitat fragmentation via roads and transmission lines, noise, and increased human presence (Connelly et al. 2004) may be similar to those discussed for nonrenewable energy development. Comparable effects on local GRSG populations are also anticipated (Manier et al. 2013, p. 70). Other concerns related to geothermal energy development include air and water pollution, disposal of hazardous waste, land subsidence, and release of toxic gases into the environment (Manier et al. 2013, p. 70).

Conditions in the Sub-region and MZ IV. Geothermal energy development potential is particularly high throughout MZ IV and geothermal leases directly affect 75,900 acres (less than 1 percent) of GRSG habitats in the MZ (Manier et al. 2013, p. 71). Geothermal leases in the sub-region cover 60,000 acres (**Section 3.12**).

The RFD scenario for the Idaho and southwestern Montana sub-region (**Appendix X**) predicts up to 410 acres of permanent disturbance associated with geothermal development over the next 10 years. The potential for impacts would be reduced where areas are closed to fluid mineral leasing and where NSO and CSU/TL stipulations are applied. Given the small acreage and

implementation of RDFs and BMPs (**Appendix B**), the likelihood for impacts on GRSG habitat is anticipated to be small and localized under all alternatives.

Impact Analysis. The quantitative analysis of effects from geothermal leasing would be the same as described for oil and gas because allocations and past, present, and reasonably foreseeable future actions would be the same.

*Coal*

Coal potential is low throughout MZ IV (Manier et al. 2013, p. 133) and there are no direct or indirect effects from surface coal leases in the MZ (Manier et al. 2013, p. 74). There is no coal development in the sub-region and lands are determined to be unsuitable for leasing; thus this threat will not be described further in this document.

*Mineral Materials*

Nature and Type of Effects. Development of surface mines (for sand, gravel and other common mineral materials found in MZ IV) may negatively impact GRSG numbers and disrupt the habitat and life-cycle of the species, similar to other types of mining activities (Braun 1998; Manier et al. 2013, pp. 70-71).

Conditions in the Sub-region and in MZ IV. There are 652,000 acres of mining and mineral materials disposal sites (not including minerals mined as energy sources) on BLM-administered surface land on PHMAPPH and GHMAPGH in MZ IV. There are 1,049,600 acres across all landownership types, making BLM-administered land the largest contributor to direct effects from this threat. National Forest System lands contribute to direct effects on 170,200 acres of PHMAPPH and GHMAPGH. Indirect effects are estimated to 1.5 miles out from the direct effects area. (Manier et al. 2013, p. 77).

The mineral materials currently being developed for commercial purposes in the Idaho and southwestern Montana sub-region include stone, sand and gravel, limestone, soil, and pumice.

Across MZ IV, PHMA and GHMA are most affected by mining and mineral materials disposal sites on BLM-administered lands. GRSG may be directly impacted, being in the path of development; however, indirect impacts on habitat affect a much wider population of birds. In total, 61 percent of PHMAPPH and 48 percent of GHMAPGH influenced by the indirect impact of mining and mineral materials disposal sites are on BLM-administered land. This does not include minerals mined as energy sources. Mining and mineral materials disposal sites on private land, by comparison, indirectly affect 26 percent of PHMAPPH and 34 percent of GHMAPGH. National Forest System lands indirectly affect 10 percent of PHMAPPH and 13 percent of GHMAPGH (Manier et al. 2013, p. 77). As a result, management of mining and material disposal sites on BLM-administered land would have the greatest impact on GRSG habitat conditions.

Impact Analysis. **Table 5-9** provides a quantitative summary of acreages of BLM-administered and National Forest System lands open and closed to mineral material disposal across MZ IV.

**Table 5-9**  
**Acres Open and Closed to Mineral Material Disposal in GRSG Habitat in MZ IV**

	Priority Habitat Management Areas		General Habitat Management Areas <sup>1</sup>	
	MZ IV	Percent Within Planning Area	MZ IV	Percent Within Planning Area
Open to Mineral Material Disposal <sup>2</sup>

<sup>1</sup> Includes IHMA

<sup>2</sup> Open with standard stipulations. This table displays the acres of PHMA and GHMA open and closed to mineral material disposal in MZ IV; it also displays the percentage of those acres that are found within the planning area.

Under Alternatives B, C, F, and the Proposed Plan, all PHMA would be closed to mineral material disposal, which would constitute much of the closed acreage on BLM-administered and National Forest System lands in MZ IV. Restrictions on mineral material development in the sub-region would be applied under Alternative D, and for PHMA and GHMA under the Proposed Plan. Acres closed in GHMA would be similar across most alternatives, though Alternative E and the Proposed Plan would have the greatest acres of GHMA closed. The Proposed Plan would provide additional protections to GRSG from mineral material development by requiring anthropogenic disturbance criteria, a 3 percent disturbance cap, RDFs and BMPs, buffers, and mitigation. These closures and restrictions would reduce the effect on GRSG from mineral material development on BLM-administered and National Forest System lands in MZ IV for most action alternatives, particularly the Proposed Plan and Alternative C. However, these actions may shift development onto non-federal lands, with potentially greater impact on GRSG. This is because similar protective stipulations and permit requirements might not apply on those other lands.

**Commented [JMM28]:** Typo for PHMA or undefined Idaho HMA?

Under the Montana Executive Order, authorizations of new mineral material disposal sites that require state agency review or approval would be subject to the GRSG permitting process. They also would be subject to stipulations for development in GRSG Core Areas. These stipulations would be of particular benefit on privately owned surface and subsurface lands, where BLM and Forest Service protective regulatory mechanisms do not apply.

**Commented [JMM29]:** This is not a likely occurrence with this particular plan. The very large majority of surface ownership is federal. Additionally, the development has likely historically already occurred on the private land, therefore, this assessment seems unlikely as a future outcome.

Overall, under the Proposed Plan, the combination of past, present, and reasonably foreseeable future actions for mineral materials development, Montana state actions, planned restoration activities, and other BLM and Forest Service Proposed Plans will provide a net conservation gain to GRSG habitats and populations in MZ IV.

#### *Locatable Minerals*

Nature and Type of Effects. Locatable minerals include gold, silver, uranium, and bentonite. Activities associated with locatable mineral development, such as stockpiling topsoil and extracting and transporting material, would cause mortality and nest disruption. These actions also would reduce the functionality of the surrounding habitat with noise and light disturbance, resulting in lost and degraded GRSG PHMA and GHMA.

As with fluid mineral development, reclamation practices may help to reduce long-term impacts on GRSG and their habitat. Although disturbed areas have not been restored to near pre-disturbance conditions in the past, recent efforts have been directed toward restoring functional habitat. Future reclamation should be focused on restoring habitats capable of supporting viable GRSG populations. Even with effective restoration, restored areas may not support GRSG populations at the same level as prior to disturbance.

Conditions in the Sub-region and in MZ IV. The primary locatable minerals in commercially viable quantities in the Idaho and southwestern Montana sub-region are zeolite and bentonite. Other locatable minerals are known to exist in the sub-region, but they are currently uneconomical to produce.

Impact Analysis. **Table 5-10** provides a quantitative summary of acreages of BLM-administered and National Forest System lands open and recommended for withdrawal from mineral entry across MZ IV.

**Table 5-10**

Proposed Plan	5,974,000	49%	9,000	98%

Source: BLM GIS 2015

<sup>1</sup> Includes IHMA

<sup>2</sup> Open with standard stipulations. Open with standard stipulations. This table displays the acres of PHMA and GHMA open to mineral entry and recommended for withdrawal from locatable mineral entry in MZ IV; it also displays the percentage of those acres that are found within the planning area.

Alternatives A and E would have similar acres open in PHMA and would not incorporate special mitigation measures for locatable mineral development in GRSG habitat. Locatable mineral mining would continue to affect GRSG through habitat loss and degradation. As a result, Alternative E would not provide any net conservation gain to GRSG compared to Alternative A.

Under Alternatives B, C and F, PHMA would be recommended for withdrawal and applicable BMPs would be mandatory as COAs within PHMA. The most acreage of all the alternatives would be recommended for withdrawal in PHMA. These alternatives would restrict future locatable mineral operations on GRSG habitat more than other alternatives; thus they would provide more protections and conservation gains to GRSG habitat from locatable mineral development.

Under Alternatives D and the Proposed Plan, the BLM and Forest Service would apply reasonable and appropriate RDFs and BMPs as Conditions of Approval to prevent unnecessary or undue degradation of GRSG habitat. The Proposed Plan would also recommend SFAs for withdrawal. Thus, these alternatives would provide a net conservation gain to GRSG.

Under all alternatives, BMPs and RDFs outlined in **Appendix B** would help minimize impacts on GRSG from locatable mineral development on federal land. For example, locating new compressor stations outside of PHMA would reduce noise disturbance. Clustering operations and facilities as close as possible and placing new infrastructure in already disturbed locations would reduce impacts on sagebrush habitats.

The disturbance cap in the Proposed Plan would not block locatable mineral entry projects, but any locatable mineral entry would be considered as

disturbance under the cap. Overall, the measures in the Proposed Plan would help alleviate the threat, and combined with state plans, other BLM and Forest Service proposed plans in MZ IV, and other past, present, and reasonably foreseeable future actions, would provide a net conservation gain to GRSG habitats and populations throughout MZ IV.

*Nonenergy Leasable Minerals*

Nonenergy leasable minerals are materials such as [phosphate](#), sulfates, silicates, and trona (sodium carbonate). Impacts on GRSG are similar to those from other types of mining.

Conditions in the Sub-region and in MZ IV. Existing leases for nonenergy leasable minerals represent a relatively small threat spatially, as 12,000 acres (less than 1 percent) of GRSG habitats in MZ IV are directly affected by existing prospecting permits (Manier et al. 2013, p. 71). Phosphate development is prevalent in southeastern Idaho, though acres disturbed are not known (**Section 3.12**).

Impact Analysis. **Table 5-11** provides a quantitative summary of acreages of BLM-administered and National Forest System lands open and closed to nonenergy leasable mineral leasing across MZ IV.

**Table 5-11**

<sup>2</sup> Open with standard stipulations. This table displays the acres of PHMA and GHMA open and closed to nonenergy leasing in MZ IV; it also displays the percentage of those acres that are found within the planning area.

Alternatives B, C, D, F and the Proposed Plan would increase the acreage of PHMA closed to nonenergy leasing compared to current management (Alternative A) and Alternative E. The alternatives would provide fewer protections in GHMA, though the Proposed Plan would increase the acres closed to nonenergy leasing. The Proposed Plan would provide additional protections compared to the other action alternatives by requiring anthropogenic disturbance criteria, a 3 percent disturbance cap, buffers, RDFs and BMPs, and mitigation.

In combination with the disturbance cap applied under the Montana state plan, other BLM and Forest Service proposed plans in MZ IV, and other past, present, and reasonably foreseeable future actions, the Proposed Plan represents an increase in GRSG habitat protections in MZ IV and a net conservation gain to GRSG habitats and populations.

**Recreation**

Nature and Type of Effects. Recreation, such as camping, bicycling, wildlife viewing, horseback riding, fishing, and hunting, can be dispersed; concentrated, such OHV use and developed campsites; and permitted, such as via BLM Special

Recreation Permit and Forest Service Special Use Permit. The BLM also manages Special Recreation Management Areas (SRMAs) where recreation is a primary resource management consideration.

Recreation on federally administered lands that use the extensive network of double-track and single-track routes have an impact on sagebrush and GRSG. Ecological impacts of roads and motorized trails are mortality due to collisions; behavior modifications due to noise, activity, and habitat loss; alteration of physical environment; nutrient leaching; erosion; invasive plants spread; increased use; and alteration by humans due to accessibility (Knick et al. 2011, p. 219). Recreation activities can degrade GRSG habitat through direct impacts on vegetation and soils, introduction or spread of invasive species, and habitat fragmentation. This occurs in areas of concentrated use, trailheads, staging areas, and routes and trails.

Motorized activities, including OHV use, are expected to have a larger footprint on the landscape. They are anticipated to have the greatest level of impact due to noise levels, compared to nonmotorized uses, such as hiking or equestrian use. Cross-country motorized travel, which is permitted in designated areas on BLM-administered lands but not National Forest lands, would increase the potential for soil compaction, perennial grasses and forbs loss, and reduce sagebrush canopy cover. Losses in sagebrush canopy could be the result of repeated, high frequency, cross-country OHV use over long periods. In addition, the chances of wildfire are increased during the summer, when fire dangers are high and recreation is at its highest.

Dispersed uses expand the human footprint. Closing areas to recreation and reclaiming unused, minimally used, or redundant roads in and around sagebrush habitats during seasonal use by GRSG may reduce the footprint and presumably impacts on wildlife. Restricting access to important habitat areas during seasonal use (lekking, nesting, brood-rearing, and wintering) may decrease the impacts associated with humans. However, access restriction will not eliminate other impacts, such as invasive plant spread, predator movements, cover loss, and erosion (Manier et al. 2013, p. 108).

Conditions in the Sub-region and in MZ IV. Human populations have increased and expanded, primarily over the past century and in the western portion of the sagebrush distribution (Knick et al. 2011, p. 212). With these expanding populations come greater human impacts (Leu et al. 2008).

The COT report objectives for recreation are to maintain healthy native sagebrush communities, based on local ecological conditions, and to manage direct and indirect human disturbance (including noise) to avoid interruption of normal GRSG behavior (USFWS 2013, p. 49). Limits on road use under the action alternatives and limits on OHVs would help meet these objectives.

In the Idaho and southwestern Montana sub-region, travel management planning is underway to determine specific routes available for closure.

Impact Analysis. **Table 5-12** shows Acres of Travel Management Designations in GRSG Habitat in MZ IV.

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA within travel management designations of open, limited and closed in MZ IV; it also displays the percentage of those acres that are found within the planning area.

As shown in **Table 5-12**, there are slight variations among alternatives in acres closed and limited to motorized vehicles in both PHMA and GHMA. However, the action alternatives would reduce acres open in PHMA, particularly Alternatives C and the Proposed Plan, under which no acres would be open to motorized vehicles. There would be a similar reduction in GHMA except under Alternative E where more acres would be open compared to current management. As a result of travel management planning, impacts on GRSG from recreational motorized vehicle use would be greatest under Alternatives A and E; impacts would be reduced most under Alternative C and the Proposed Plan.

For recreation, Alternatives B, D, and the Proposed Plan would aim to reduce impacts on GRSG with issuance of SRPs and SUPs. Alternative F would take a similar approach, but with the addition of seasonal restrictions within 4 miles of active leks. Alternatives A, C, and E would not manage recreation to reduce impacts on GRSG.

Implementation of the recreation-related action alternatives described above, in concert with travel management planning on BLM-administered lands within MZ IV, limitations on National Forest System lands the disturbance caps applied

under state plans, and other past, present, and reasonably foreseeable future actions, would help reduce the threats from recreation and travel on GRSG habitats and would provide a net conservation gain to GRSG populations in MZ IV.

**5.1.7 Existing Conditions in WAFWA MZs II/VII**

This section summarizes existing conditions and past and present actions for the Idaho and southwestern Montana sub-region (provided in more detail in **Chapter 3**) and for MZs II/VII as a whole.

*GRSG Habitat and Populations*

MZs II/VII consist of eleven GRSG populations: Eagle-South Routt, Middle Park, Laramie, Jackson Hole, Wyoming Basin, Rich-Morgan-Summit, Uintah, North Park, Northwest Colorado, Parachute-Piceance-Roan Basin, and Meeker-White River (Garton et al. 2011). The sub-region includes the Wyoming Basin population. Leks in the northern portion of MZs II/VII are the most highly connected in the range (Knick and Hanser 2011); populations in southern portions of MZ II/VII (the Colorado Plateau) are less robust, with low lek connectivity and a 96 percent chance of populations declining below 200 males by 2037 (Garton et al. 2011; Knick and Hanser 2011). MZs II/VII include GRSG populations in Idaho, Montana, Wyoming, Utah, and Colorado.

In MZs II/VII, BLM-administered, National Forest System and other federal lands account for over 20 million acres of GRSG habitat (approximately 58 percent of habitat), with state and private lands accounting for approximately 16 million acres of GRSG habitat (approximately 44 percent of habitat) (Manier et al. 2013, p. 118). This indicates the importance of conservation and restoration on both private and public lands.

**Table 5-13** provides a breakdown of landownership and acres of GRSG habitat in MZs II/VII. As the table shows, approximately 52 percent of PPHMAPPH and 47 percent of PGHMAPGH is on BLM-administered lands. Less than one percent of PPHMAPPH and 2 percent of PGHMAPGH is on National Forest System lands. The remaining 18,028,000 million acres (49 percent) of GRSG habitat in the MZs comprise private, local state, and other federal and tribal lands. Acres in these and other tables are rounded to the nearest 1,000 acres. Values of less than 1,000 acres are presented as 0 acres.

**Table 5-13**  
**Management Jurisdiction in MZs II/VII by Acres of Priority and General Habitats**  
**(PPHMAPPH and PGHMAPGH)**

Total Surface Area (Acres)	PPHMAPPH (Acres)	PGHMAPGH (Acres)	Non-habitat (Acres)
----------------------------	------------------	------------------	---------------------

**Table 5-13**

Source: Manier et al. 2013, p. 118

A very small percentage—approximately one tenth of one percent—of PHMA and GHMA in MZs II/VII are located on BLM-administered and National Forest System lands in the Idaho and southwest Montana sub-region. As a result, BLM and Forest Service management in this sub-region would have very little influence on GRSG across the broader MZs II/VII. BLM and Forest Service management in this sub-region would be most effective at conserving a portion of the Wyoming Basin population; it would have little or no effect on other populations in the MZs. Because past, present, and reasonably foreseeable future actions do not vary by alternative, the incremental effect of implanting any of the Idaho and southwest Montana LUPA alternatives on GRSG in MZs II/VII would vary little across the range of alternatives.

*Population Trends in Management Zones II/VII*

The Wyoming Basin population within MZs II/VII is the largest population in the GRSG range with over 20,000 males attending leks annually. Although recent data suggests a population increase, long-term monitoring is trending downward and population modeling suggests this trend will continue (Garton et al. 2011).

Wyoming data suggest a cyclic pattern with population lows in 1995, 2002 and 2013 and peaks in 2000 and 2006. Actual trends are difficult to discern due to the lower survey effort prior to 2007, meaning the number and proportion of

active/inactive leks is unknown. Since 2007, the number of active leks has remained stable (approximately 1,100 active leks), but the number of males/active lek has declined by more than half (from 42 to 17 males/lek). In northeast Wyoming, the decreasing number of active leks since 2007 suggests a population decline in that area, greater than that indicated by the average lek size. Similar population trends are suggested at both state and local scales (Christiansen 2013).

**Commented [JMM30]:** It is inappropriate to compare the NE Wyoming population to any outside of MZ I. Delete.

The isolation of many other populations on the fringes of MZs II/VII makes them particularly vulnerable to habitat loss and fragmentation. The Wyoming Basin population within Wyoming and extending into the sub-region is at risk due to renewable and non-renewable energy development, long-term drought, and brush eradication programs (USFWS 2013, p. 68).

#### **5.1.8 Regional Efforts to Manage Threats to GRSG in MZs II/VII**

There are several regional efforts to manage threats to GRSG in MZs II/VII. These efforts may have a strong influence in alleviating threats to GRSG than BLM and Forest Service actions alone. This is because state and private lands account for approximately 16 million acres (approximately 44 percent) of GRSG habitat in MZs II/VII (Manier et al. 2013, p. 118).

##### *Idaho Statewide Efforts*

Idaho statewide efforts are as described in **Section 5.1.4**.

##### *Montana Statewide Efforts*

Montana statewide efforts are as described in **Section 5.1.4**.

##### *Natural Resource Conservation Service Sage Grouse Initiative*

The NRCS SGI is as described in **Section 5.1.4**. As of 2014, the most recent year for which data are available, SGI has secured conservation easements on 243,403 acres within MZs II/VII (NRCS 2015).

##### *Wyoming Statewide Efforts*

Wyoming has established Core Population Areas to help delineate landscape planning units by distinguishing areas of high biological value. These areas are based on the locations of breeding areas and are intended to help balance GRSG habitat requirements with demand for energy development (Doherty et al. 2011).

In 2000, the Wyoming Sage-Grouse Working Group (WSGWG) was formed to develop a statewide strategy for GRSG conservation. This group prepared the Wyoming GRSG Conservation Plan (WSGWG 2003) to provide coordinated management and direction across the state. In 2004, local GRSG working groups were formed to develop and implement local conservation plans. Eight local working groups around Wyoming have completed conservation plans, many of which prioritize addressing past, present, and reasonably foreseeable threats at state and local levels, and prescribe management actions for private

landowners to improve GRSG conservation at the local scale, consistent with the overall Wyoming Core [Area Strategy](#).

Wyoming Executive Order. Wyoming Governor Matt Mead issued an executive order on June 2, 2011, that complemented and replaced several executive orders issued by his predecessor. The 2011 Wyoming ~~eExecutive Order~~ articulates Wyoming's Core Population Area Strategy (Core Area Strategy) as an approach to balancing GRSG conservation and development. It also provides an approach to mitigating human disturbances to GRSG. The USFWS believes that Wyoming's Core Area Strategy, if extended to all landowners via regulatory mechanisms, would provide adequate protection for GRSG and its habitat (USFWS 2010); however, universal implementation remains uncertain due to the variety in landownership and management (Manier et al. 2013).

The Wyoming ~~eExecutive Order~~ applies to state trust lands starting in 2008. These trust lands cover almost 23 percent of GRSG habitat and benefit approximately 80 percent of the estimated breeding population in the state (USFWS 2010). All proposed activities are evaluated through a density/disturbance calculation tool to determine if the project would exceed recommended density/disturbance thresholds. Additionally, the order has stipulations to be included in permits, with varying restrictions depending on whether the proposed development activity occurs within or outside delineated Core Population Areas (Wyoming Executive Order, June 2, 2011).

In Core Areas, there is a 0.6-mile no surface occupancy (NSO) buffer around occupied leks, [density restrictions of one location per 640 acres, a disturbance cap of 5%](#), and restrictions on activities in breeding and winter concentration habitat. ~~Wyoming's Industrial Siting Council, which permits large development projects on all lands in the state, is subject to the terms of the executive order.~~ This buffer provides protection for males during lekking season and acts in coordination with the density disturbance cap. The combination of protections could offer GRSG considerable regulatory protection when [large wind energy](#) and other development projects are being considered in Wyoming (USFWS 2010; Manier et al. 2013).

Statewide modeling of trends under the Core Area Strategy suggests that with effective enforcement statewide, the strategy could reduce population losses by 9 to 15 percent across Wyoming. Moreover, the number of Core Areas predicted to maintain 75 percent of their current populations could increase from 20 to 25 under long-term scenarios (Copeland et al. 2013). Combining the Core Area Strategy with \$250 million in target conservation easements (provided willing landowners and funding are available) could reduce population declines by another 9 to 11 percent (Copeland et al. 2013).

**Commented [JMM31]:** At present, the WY EO does not allow wind energy development inside Core Areas unless they can prove no adverse effects to sage-grouse. I think that is more important of a distinction here than the remainder of the limitations outlined in the WY EO.

*Colorado Statewide Efforts*

In 2008, the Colorado Division of Wildlife (now Colorado Parks and Wildlife) developed a state conservation plan, which prioritized threats and identified key issues facing conservation. The plan included issues, objectives, and strategies in detail. The strategies for conservation discussed responsible parties, lead agency, timeline, and cost associated with implementation of the strategy.

**Commented [JMM32]:** Before moving on to other State's efforts, please add additional efforts to Wyoming's write up equivalent to what is being included for the other states: Wyoming Habitat Exchange (also under development, Sweetwater River Conservancy's Greater Sage-grouse Habitat Bank, Wyoming Landscape Conservation Initiative, Powder River Restoration Initiative, etc.

In 2012, a state conservation plan revision process began, and in consultation with stakeholders, a matrix summarizing implementation and effectiveness of the strategies was developed (Colorado Package), along with a subsequent Synthesis Report. The Colorado Package identified a number of conservation efforts within Colorado which have resulted in positive impacts to GRSG including acquisition of conservation easements and habitat improvement projects (Colorado Department of Natural Resources 2013). The Synthesis Report provided additional information on the effectiveness of conservation efforts such as county zoning ordinances which support protection of GRSG habitat, and measures from the Colorado State Board of Land Commissioners which will support adaptive management techniques to improve GRSG habitat (Colorado Department of Natural Resources 2014). Additional statewide conservation measures as described in the Synthesis Report include the Colorado Habitat Exchange (under development), which creates incentives for landowners to reduce impact, as well as conserve, enhance, and restore critical habitat.

**Commented [JMM33]:** This should be deleted or equal discussion should be given to the same effort in Wyoming with the Wyoming Habitat Exchange (also under development)

*Utah Statewide Efforts*

The Conservation Plan for Greater Sage-grouse in Utah (2013) was designed to protect, enhance, and restore GRSG habitat, in an effort to reduce the threats to the species. The plan identifies 11 GRSG management areas throughout the state (including lands within MZs II/VII), which represent areas of high habitat value. The plan calls for state and local efforts to obtain incentive-based negotiated covenants, easements, leases or other legal tools in order to protect habitat. Additionally, the plan identifies a five percent disturbance limitation of habitat on state or federally managed lands, intended to limit the effects of large scale disturbances.

*Other Regional Efforts*

Other regional efforts are as described in **Section 5.1.4**.

**5.1.9 Relevant Cumulative Actions**

This cumulative effects analysis considers past, present, and reasonably foreseeable future actions on other federal, state, tribal, local, and private lands in MZs II/VII. Where these actions interface with GRSG habitat, they would cumulatively add to the impacts of BLM- and Forest Service-authorized activities.

The following list includes past, present, and future actions in MZs II/VII that could cumulatively affect GRSG (more detail is included in the table in Appendix A):

- Pinedale Anticline Project, Wyoming
- Hiawatha Regional Energy Development Project, Wyoming, Colorado
- Oil Shale and Tar Sands Programmatic EIS, Wyoming, Colorado, Utah
- Gateway South Transmission Project, Wyoming, Colorado, Utah
- TransWest Express Transmission Line Project, Wyoming, Colorado, Utah, Nevada
- Gateway West Transmission Line Project, Wyoming, Idaho
- Riley Ridge to Natrona Pipeline Project, Wyoming
- Invasive Plant Management EIS, Wyoming, Colorado

#### 5.1.10 Threats to GRSG in Management Zones II/VII

In its COT report, the USFWS identifies energy development, infrastructure, grazing/free-roaming equids, conversion to agriculture, fire, spread of weeds, recreation, and conifers as the present and widespread threats facing GRSG in MZs II/VII (USFWS 2013, pp. 17-19, 27-28). Each threat is discussed below.

##### ***Energy Development and Mining***

The COT report states that energy development should be designed to ensure that it will not impinge on stable or increasing GRSG population trends. For mining, the objective is to maintain stable to increasing GRSG populations and no net loss of GRSG habitats in areas affected by mining (USFWS 2013, p. 49).

There are approximately 1,144,800 acres of GRSG habitat in MZs II/VII where energy and mineral development is presently occurring. There are over 30 million acres indirectly influenced by energy development (including oil and gas, coal leasing, mineral materials, and renewables) (Manier et al. 2013, pp. 52-71). No geothermal energy development is presently occurring in MZs II/VII. Indirect influences are overwhelmingly due to oil and gas leases. Of the 80 percent of GRSG habitat in MZ II/VII indirectly influenced by oil and gas development, approximately 50 percent occurs on BLM-administered land, with most of the remainder on private lands (Manier et al. 2013, p. 52). Only 1 percent of oil and gas development affects National Forest System lands. Approximately 7 percent of federal lands are closed to oil and gas leasing, but the majority of leased lands are presently undeveloped. BLM and Forest Service regulatory actions would primarily influence unleased areas by way of attaching stipulations, conditions of approval, and other conservation measures on future leases.

##### ***Oil and Gas***

Nature and Type of Effects. The impacts of oil and gas development on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. Forty-four percent of the 39-million acre federal mineral estate in MZs I and II is leased and authorized for

**Commented [JMM34]:** The list in the MZ II/VII document is this:

- Hiawatha Regional Energy Development EIS
- LaBarge Platform Exploration & Development Project
- Continental Divide-Creston Natural Gas Project
- Moneta Divide Natural Gas and Oil Development Project
- Pinedale Anticline Project
- Black Fork Project (Formerly Moxa Arch Area Infill)
- Oil Shale and Tar Sands Programmatic EIS
- Atlantic Rim Natural Gas Field Development Project
- Chokecherry Sierra Madre Wind Farm
- Gateway South Transmission Line Project
- TransWest Express Transmission Line Project
- Gateway West Transmission Line Project
- Riley Ridge o Natrona Pipeline Project
- Invasive Plan Management EIS for the Medicine Bow – Routt National Forests, and Thunder Basin National Grassland

Compare and edit to be consistent.

exploration and development (Naugle et al. 2011). The Greater Green River Basin, Uintah-Piceance Basin, and North Park Basin are all important oil and gas reserves in MZs II/VII. In Wyoming, which contains the bulk of the mineral estate, 52 percent is authorized for development (Naugle et al. 2011). There are two leases on the Bear Lake Plateau within the sub-region but there has been no oil and gas development.

Approximately 15 percent of GRSG habitat in MZs II/VII is within 1.8 miles of oil and gas wells (Knick et al. 2011, p. 240). Oil and natural gas development-related wells indirectly influence over 50 percent of PPHMAPPH and PGHMAPGH on BLM-administered lands across MZs II/VII, occurring to a distance of 12 miles from the development. There are virtually no indirect impacts on National Forest System lands. Private surface lands account for 33 percent of the indirect impact in PPHMAPPH and 37 percent in PGHMAPGH in MZs II/VII (Manier et al. 2013, p. 52). Thus, actions on BLM-administered land are likely to have a greater potential to ameliorate the effects of oil and gas development than any other single land management entity.

Though the BLM and Forest Service may restrict future leasing for oil and gas on BLM-administered and National Forest System lands within GRSG habitat, existing leases remain valid with potential for development based on locations of geologic fields for traditional oil and gas distributed extensively across eastern portions of GRSG range (Manier et al. 2013, p. 51). Oil and gas reserves are extensive across the Powder River Basin of northeastern Wyoming and southeastern Montana; the Wyoming Thrust Belt of extreme southwestern Wyoming, and the Southwest Wyoming Basin including portions of southwestern and central Wyoming. The Southwestern Wyoming and the Uinta-Piceance geological basins are both located partly in MZs II/VII, and coincide with high-density areas of GRSG, large numbers of leks, and the highest male attendance at leks compared with any areas in the eastern part of the range (USFWS 2010).

According to the RFD scenario (Appendix X), permanent disturbance associated with oil and gas development is projected to occur on 156 acres within the sub-region over the next 10 years. The potential for impacts would be reduced where areas are closed to fluid mineral leasing and where NSO and CSU/TL stipulations are applied. Given the small acreage and implementation of RFDs and BMPs (Appendix B), the likelihood for impacts on GRSG habitat on BLM-administered and National Forest System lands in the planning area is anticipated to be small and localized under all alternatives.

Impact Analysis. **Tables 5-14** and **5-15** provide a quantitative summary of fluid mineral leasing conditions on BLM-administered and National Forest System lands across MZs II/VII, followed by an analysis of the Idaho and southwestern Montana sub-regional alternatives.

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA with NSO Stipulations and CSU/TL Stipulations in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

Acres open, closed, and with stipulations for fluid mineral leasing do not vary substantially across alternatives, as the acres in **Tables 5-14 and 5-15** represent the Proposed Plans from other BLM and Forest Service sub-regions and planning areas in MZs II/VII combined with the management in the MZs II/VII portion of the Idaho and southwestern Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII, alternatives in this sub-region would have a relatively small influence on total acres open, closed, or with stipulations. As shown in **Tables 5-14 and 5-15**, any action alternative for fluid mineral leasing in the Idaho and southwestern Montana LUPA would affect 6 percent or less of GRSG habitat within MZs II/VII.

Implementing any alternative under the Idaho and southwestern Montana LUPA/EIS would not affect pending or future oil and gas development projects outside of the sub-region. For example, numerous oil and gas development projects are proposed in Wyoming (Appendix A). However, the NSO buffer and the disturbance cap under the Wyoming Executive Order would reduce the threat to GRSG from oil and gas development on non-federal lands in MZs II/VII.

All BLM and Forest Service Proposed Plans within MZs II/VII include BMPs and RDFs to minimize impacts on GRSG from oil and gas development on federal lands. Examples include: locating new compressor stations outside of PHMA to reduce noise disturbance; clustering operations and facilities as closely as possible; placing infrastructure in already disturbed locations where the habitat has not been fully restored; and restoring disturbed areas at final reclamation to the pre-disturbance landforms and desired plant communities. State plans contain similar measures to reduce impacts. Together, these measures would help protect unfragmented habitats, minimize habitat loss and fragmentation, and maintain conditions that meet GRSG life history needs. Recent research indicates that restored habitats lack many of the features sought by GRSG in their habitat areas, and may not support GRSG for long periods following restoration activities. In order to conserve GRSG populations on the landscape, protection of existing habitat through minimizing development, would provide the best hope for GRSG persistence (Arkle et al. 2014).

Overall, the Montana and Wyoming state actions, such as the disturbance cap, planned restoration activities, other BLM and Forest Service Proposed Plans within MZs II/VII, and other past, present, and reasonably foreseeable future actions will provide a net conservation gain to GRSG habitats and populations in MZs II/VII from fluid minerals management regardless of management within the Idaho and southwestern Montana sub-region.

#### *Coal*

While coal is the major mining activity in GRSG habitat (Braun 1998), there is no potential for coal within the sub-region. Coal mines are widespread in southern portions of MZs II/VII, and federal leases developed through surface extraction directly influence approximately 52,100 acres of these MZs. There is the potential for additional coal mining in large portions of PPHMAAPP and PGHMAPGH in MZs I, II, and VII. Indirect effects of surface coal mines suggest influence over approximately 8 percent of PPHMAAPP across the range of the species and approximately 5 percent of PPHMAAPP in MZs II/VII. Approximately 36 percent of PPHMAAPP that is indirectly influenced by coal mines across the species' range are managed by BLM. Although coal companies have demonstrated that disturbed lands can be restored to a point that supports a diversity of vegetative species, including big sagebrush, there is little evidence that GRSG populations have reoccupied habitat disturbed by coal mining, at least in terms of lek establishment (Manier et al. 2013, pp. 70-71, 74).

Coal development is also managed at the state level. For example, coal development that requires state agency review or approval would be subject to the permitting process and stipulations for development in GRSG Core areas under the Wyoming ~~eExecutive eOrder, executive order~~. Additionally, new coal leases applications on federal lands would be subject to 43 CFR, Part 3461.5, Criterion 15. This states that a lease may be issued if, after consultation with the state, the surface management agency determines that all or certain stipulated methods of coal mining would not have a significant long-term impact on the GRSG. Special conditions could be required, as identified during the leasing process, to protect GRSG habitat. The requirements of 43 CFR, Part 3461.5, Criterion 15, in combination with BLM and Forest Service planning efforts and state plans, would help reduce the threat from coal extraction and would provide a net conservation gain to GRSG habitats and populations in MZs II/VII.

*Mineral Materials*

Nature and Type of Effects. The impacts of mineral material development on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. There are 846,600 acres of mining and mineral materials disposal sites (not including minerals mined as energy sources) on BLM-administered surface land on **PPHMAPPH** and **PGHMPPGH** in MZs II/VII. There are 1,027,500 acres across all landownership types, making BLM-administered land the largest contributor to direct effects from this threat. National Forest System lands contribute to direct effects on 3,100 acres of **PPHMAPPH** and **PGHMPPGH** (Manier et al. 2013, p. 77).

Indirect effects are estimated to 1.5 miles out from the direct effects area. In total, 65 percent of **PPHMAPPH** and 60 percent of **PGHMPPGH** influenced by the indirect impact of mining and mineral materials disposal sites are on BLM-administered land. This does not include minerals mined as energy sources. Mining and mineral materials disposal sites on private land, by comparison, indirectly affect 26 percent of **PPHMAPPH** and 32 percent of **PGHMPPGH**. National Forest System lands have virtually no indirectly effects on **PPHMAPPH** and **PGHMPPGH** (Manier et al. 2013, p. 77). As a result, management of mining and material disposal sites on BLM-administered land would have the greatest impact on GRSG habitat conditions.

Impact Analysis. Acres open and closed to mineral material disposal do not vary substantially across alternatives, as the acres in **Table 5-16** represent the Proposed Plans from other BLM and Forest Service sub-regions and planning areas in MZs II/VII combined with the management in the MZs II/VII portion of the Idaho and southwestern Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII, alternatives in this sub-region would have a relatively small influence on total acres open or closed. As shown in **Table 5-16**, any alternative for mineral

materials management in the Idaho and southwestern Montana LUPA would affect 2 percent or less of GRSG habitat within MZs II/VII.

<sup>2</sup> Open with standard stipulations. This table displays the acres of PHMA and GHMA open and closed to mineral material disposal in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

Reasonably foreseeable future mineral material disposals in MZs II/VII could affect GRSG through habitat disturbance, fragmentation, or behavior disruptions, depending on the location and extent of the project; however, implementation of BLM and Forest Service Proposed Plans in other areas of MZs II/VII would restrict development, thereby reducing the risk of removing or fragmenting habitat elsewhere in MZs II/VII, particularly on federal lands. There would be a net conservation gain to GRSG habitats and populations in MZs II/VII, but it would be concentrated in areas outside the Idaho and southwestern Montana sub-region.

Under the Wyoming and Montana Executive Orders, authorizations of new mineral material disposal sites that require state agency review or approval would be subject to the GRSG permitting process. They also would be subject to stipulations for development in GRSG Core areas. These stipulations would be of particular benefit on privately owned surface and subsurface lands, where BLM and Forest Service protective regulatory mechanisms do not apply.

Overall, the Montana and Wyoming state actions, such as the disturbance cap, planned restoration activities, other BLM and Forest Service Proposed Plans within MZs II/VII, and other past, present, and reasonably foreseeable future actions will provide a net conservation gain to GRSG habitats and populations in MZs II/VII from mineral materials management regardless of management within the Idaho and southwestern Montana sub-region.

*Locatable Minerals*

Nature and Type of Effects. The impacts of locatable mineral development on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZ II/VII. The magnitude of existing conditions in the sub-region is largely unknown, but mining of locatable federal mineral resources currently affects approximately 2.2 percent of GRSG habitat in MZs II/VII (Manier et al. 2013, p. 74).

Impact Analysis. Under all alternatives, BMPs and RDFs in all BLM and Forest Service Proposed Plans would help minimize the impacts on GRSG from locatable mineral development on federal land. Examples include: locating new compressor stations outside of PHMA to reduce noise disturbance; clustering operations and facilities as closely as possible; placing infrastructure in already disturbed locations where the habitat has not been fully restored; and restoring disturbed areas at final reclamation to the pre-disturbance landforms and desired plant communities.

Acres open and recommended for withdrawal from locatable mineral entry do not vary substantially across alternatives, as the acres in **Table 5-17** represent the Proposed Plans from other BLM and Forest Service sub-regions and planning areas in MZs II/VII combined with the management in the MZs II/VII portion of

the Idaho and southwestern Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII, alternatives in this sub-region would have a relatively small influence on total acres open or recommended for withdrawal. As shown in **Table 5-17**, any alternative for locatable minerals management in the Idaho and southwestern Montana LUPA would affect 7 percent or less of GRSG habitat within MZs II/VII. The greatest impacts would result under Alternatives B, C, and F, where PHMA in the Idaho and southwestern Montana sub-region would be recommended for withdrawal.

<sup>2</sup> Open with standard stipulations. Open with standard stipulations. This table displays the acres of PHMA and GHMA open to mineral entry and recommended for withdrawal from locatable mineral entry in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

Under the Proposed Plans, all SFAs would be recommended for withdrawal. SFAs represent areas having the highest densities of GRSG and other criteria important for the persistence of the species. As such, if these areas are withdrawn, the Proposed Plan would provide a greater net conservation gain to GRSG populations by reducing disturbance to birds from mining. However due to the sub-region containing such a small percentage of GRSG habitat within the larger MZs, the impact of the sub-region would be limited. Together, the Montana and Wyoming state actions, planned restoration activities, other BLM and Forest Service Proposed Plans within MZs II/VII, and other past, present, and reasonably foreseeable future actions will provide a net conservation gain to GRSG habitats and populations in MZs II/VII from locatable materials management regardless of management within the Idaho and southwestern Montana sub-region.

*Nonenergy Leasable Minerals*

Nature and Type of Effects. The impacts of nonenergy leasable mineral development on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. Existing prospecting permits for nonenergy leasable minerals directly affect 935,500 acres (2.5 percent) of GRSG habitats in MZs II/VII, which is the largest proportion of GRSG habitat compared with the other MZs (Manier et al. 2013, p. 79). Phosphate development is prevalent in southeastern Idaho, though acres disturbed are not known (**Section 3.12**).

Impact Analysis. Acres open and closed to nonenergy leasable mineral leasing do not vary substantially across alternatives, as the acres in **Table 5-18** represent the Proposed Plans from other BLM and Forest Service sub-regions and planning areas in MZs II/VII combined with the management in the MZs II/VII portion of the Idaho and southwestern Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII, alternatives in this sub-region would have a relatively small influence on total acres open or closed. As shown in **Table 5-18**, any alternative for nonenergy leasable minerals management in the Idaho and southwestern Montana LUPA would affect 2 percent or less of GRSG habitat within MZs II/VII.

<sup>2</sup> Open with standard stipulations. This table displays the acres of PHMA and GHMA open and closed to nonenergy leasing in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

Overall, the Montana and Wyoming state actions, such as the disturbance cap, planned restoration activities, other BLM and Forest Service Proposed Plans within MZs II/VII, and other past, present, and reasonably foreseeable future actions will provide a net conservation gain to GRSG habitats and populations in MZs II/VII from nonenergy leasable minerals management regardless of management within the Idaho and southwestern Montana sub-region.

**Infrastructure**

*Rights-of-Way*

Nature and Type of Effects. The impacts of ROWs on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. Infrastructure, such as ROWs and associated facilities and urbanization, is widespread throughout MZs II/VII. In some locations, infrastructure development has affected GRSG habitat. Development of roads, fences, and utility corridors has also contributed to habitat loss and fragmentation in portions of MZs II/VII. The best available estimates suggest about 25 percent of the MZs II/VII are within approximately 4 miles of urban development (Knick et al. 2011, p. 214). Impacts of infrastructure development in MZ IV are primarily related to highways, roads, power lines, and communication towers, with 90 percent of MZs II/VII within 4 miles of a road, 25 percent within 4 miles of a power line, and 5 percent within 4 miles of a communication tower (Knick et al. 2011, pp. 215-216).

Although not representative of all infrastructure ROWs, transmission lines greater than 115 kilovolts indirectly influence 60 percent of PPHMA and 63 percent of PGHMA across MZs II/VII. Indirect effects are assumed to occur

to a radius of 4 miles (Manier et al. 2013, p. 41). Approximately 50 percent of transmission lines in PHMAPPH and 45 percent in PGHMAPGH are on BLM-administered lands across GRSG habitats in MZs II/VII (Manier et al. 2013, p. 41). There is also a substantial contribution from private lands, where 42 percent of transmission lines in PHMAPPH and 47 percent in PGHMAPGH are located. In contrast, National Forest System lands contain 1 percent of transmission lines in PHMAPPH and 1 percent in PGHMAPGH. Therefore, actions on BLM-administered and private lands are likely to have the greatest potential to affect transmission line ROWs in GRSG habitat than other land management entities. Designating ROW exclusion and avoidance areas in PHMA and GHMA on BLM-administered and National Forest System lands could reduce the threat on these lands. However, in areas with scattered federal landownership, infrastructure may be routed around federal lands, often increasing its length and impact. ROW avoidance and exclusion areas on BLM-administered and National Forest System lands could increase this tendency.

Impact Analysis. Acres managed as open, exclusion, and avoidance for ROWs do not vary substantially across alternatives, as the acres in **Table 5-19** represent the Proposed Plans from other BLM and Forest Service sub-regions and planning areas in MZs II/VII combined with the management in the MZs II/VII portion of the Idaho and southwestern Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII, alternatives in this sub-region would have a relatively small influence on total acres managed as open, exclusion, or avoidance. As shown in **Table 5-19**, any action alternative for ROW management in the Idaho and southwestern Montana LUPA would affect 8 percent or less of GRSG habitat within MZs II/VII. The greatest impacts would result under Alternatives B, C, and F, where PHMA in the Idaho and southwestern Montana sub-region would be managed as ROW exclusion.

Source: BLM GIS 2015

<sup>1</sup> Includes IHMA

<sup>2</sup> Open with standard stipulations

This table displays the acres of PHMA and GHMA within rights-of-way designations in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

The numbers of ROW authorizations are anticipated to grow in the sub-region. Increasing populations, continued energy development, and new communication sites drive the need for new ROWs on both federal and non-federal lands.

New ROW authorizations that require state agency review or approval would be subject to the permitting process and stipulations for development in GRSG Core areas under the Wyoming and Montana ~~eExecutive eOrders executive orders~~. These stipulations would benefit the GRSG in Core ~~aAreasareas~~ by encouraging ROW development outside of core habitat areas, restricting surface occupancy within 0.6 mile of occupied leks, prohibiting power lines greater than 115 kV outside of designated corridors, and locating new roads used to transport products or waste over 1.9 miles from occupied leks.

Presidential Priority transmission projects which are proposed in MZs II/VII (i.e., Transwest Express and Gateway West), would not be subject to GRSG conservation requirements in BLM and Forest Service LUPAs, but would be subject to requirements in applicable state plans as well as other state and federal laws and regulations. They would also develop their own suite of protective measures analyzed in project-specific NEPA documents. Whether or not these project-specific measures would adequately protect GRSG is unknown at this point in time because the measures have not been finalized. Regardless, impacts would likely be greater in Colorado where the proposed route would impact approximately 26 miles in PACs and 57 miles in PHMA in the Little Snake and White River BLM Field Offices. This impact would be especially harmful to fringe GRSG populations in Colorado, as some are less robust than those in Wyoming and southern Montana. In Wyoming, the routes avoid Core ~~aAreasareas~~ due to that state plan's requirements; this would reduce impacts in Wyoming. Overall, the Montana and Wyoming state actions, other BLM and Forest Service Proposed Plans within MZs II/VII, and other past, present, and reasonably foreseeable future actions will provide a net conservation gain to GRSG habitats and populations in MZs II/VII from ROW management regardless of management within the Idaho and southwestern Montana sub-region.

#### *Renewable Energy*

Nature and Type of Effects. The impacts of renewable energy development on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. While most federal lands are not currently leased or developed for wind or solar energy, the areas of potential development coincide closely with GRSG habitats, especially in MZs II/VII (Manier et al. 2013, p. 60).

Although not representative of all renewable energy development, wind turbines on BLM-administered land indirectly influence less than 1 percent of

PPHMAPPH and PGHMAPGH combined across MZs II/VII. Private lands account for 70 percent of wind turbines affecting GRSG in PPHMAPPH (and 73 percent in PGHMAPGH) within MZs II/VII (Manier et al. 2013, p. 61). Therefore, actions on private land are likely to have a greater potential to ameliorate the effects of wind energy development than any other single land management entity.

Impact Analysis Table 5-20 displays acres open to wind energy ROW and wind energy exclusion and avoidance areas by alternative.

<sup>1</sup> Includes IHMA

<sup>2</sup> Open with standard stipulations. This table displays the acres of PHMA and GHMA within wind energy management designations in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

Acres managed as open, avoidance, and exclusion for wind energy development do not vary substantially across alternatives, as the acres in **Table 5-20** represent the Proposed Plans from other BLM and Forest Service sub-regions and planning areas in MZs II/VII combined with the management in the MZs II/VII portion of the Idaho and southwestern Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII, alternatives in this sub-region would have a relatively small influence on total acres managed as open, avoidance, or exclusion. As shown in **Table 5-20**, any action alternative for wind energy management in the Idaho and southwestern Montana LUPA would affect 1 percent or less of GRSG habitat within MZs II/VII.

All Proposed Plans within Wyoming in MZs II/VII rely on wind ROW avoidance designations to protect GRSG habitat rather than wind ROW exclusion. Similar to other ROWs, this approach preserves management flexibility in situations where landownership is mixed. Without this flexibility, rerouting ROWs across nonfederal land may result in a longer route, increasing disturbance of GRSG leks, nests, and brood-rearing and wintering areas more than direct routing across federal land. Other Proposed Plans in MZs II/VII would manage PHMA as

ROW exclusion, thereby providing the greatest protection on federal lands, but potentially increasing impacts on nonfederal lands.

Reasonably foreseeable future projects within MZs II/VII include renewable energy developments, such as the Chokecherry/Sierra Madre Wind Farm in southern Wyoming. Projects which require state agency review or approval would be subject to the Wyoming Executive Order permitting process for development in core areas, which would encourage ROW development outside of ~~Core~~ ~~habitat~~ ~~Areas~~ and restrict surface occupancy within 0.6 miles of occupied leks. Overall, the Montana and Wyoming state actions, other BLM and Forest Service Proposed Plans within MZs II/VII, and other past, present, and reasonably foreseeable future actions will provide a net conservation gain to GRSG habitats and populations in MZs II/VII from wind energy management regardless of management within the Idaho and southwestern Montana sub-region.

**Grazing/Free-Roaming Equids**

Nature and Type of Effects. The impacts of livestock grazing and free-roaming equids on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. Livestock grazing is present and widespread on many land types, such as federal and private, across MZs II/VII. Rangeland health assessments have found that nearly 4 percent of BLM-administered grazing allotments in GRSG habitat in MZs II/VII are not meeting wildlife standards with grazing as a causal factor. Additionally, nearly 5 million acres of GRSG habitat within MZs II/VII, largely in the central portion of the area, is federally managed wild horse and burro range (Manier et al. 2013, p. 131).

Impact Analysis. **Table 5-21** lists the acres of PHMA and GHMA available and unavailable for grazing by alternative.

**Commented [JMM35]:** This was written as 19 percent on page 28. Review and edit accordingly.

Source: BLM GIS 2015

This table displays the acres of PHMA and GHMA available and unavailable to livestock grazing in MZ I; it also displays the percentage of those acres that are found within the planning area.

Acres available and unavailable to livestock grazing generally do not vary substantially across alternatives, as the acres in **Table 5-21** represent the Proposed Plans from other BLM and Forest Service sub-regions and planning areas in MZs II/VII combined with the management in the MZs II/VII portion of the Idaho and southwestern Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII, alternatives in this sub-region would have a relatively small influence on total acres available or unavailable. As shown in **Table 5-21**, most alternatives for livestock grazing management in the Idaho and southwestern Montana LUPA would affect 1 percent or less of GRSG habitat within MZs II/VII. The exception would be under Alternative C, where grazing would be removed from PHMA in the Idaho and southwestern Montana sub-region. This represents 64 percent of the total acres unavailable to grazing in MZs II/VII under this alternative. Impacts from removal of grazing under Alternative C would be as described in **Section 5.1.6**.

Since 2010, SGI has enhanced rangeland health through rotational grazing systems, re-vegetating former rangeland with sagebrush and perennial grasses and control of invasive weeds. On privately-owned lands, SGI has developed a prescribed grazing approach that balances forage availability with livestock demand. This system allows for adjustments to timing, frequency, and duration of grazing, ensuring rangelands are managed sustainably to provide continued ecological function of sagebrush-steppe. A primary focus of the prescribed grazing approach is maintenance of key plant species, such as deep-rooted perennial grasses that have been shown to be essential for ecological resistance to invasive annual grasses (Reisner et al. 2013, pp. 1047-1048). These actions help to alleviate the adverse impacts associated with improper grazing practices outlined above under Nature and Type of Effects. Within MZs II/VII, SGI has implemented 543,511 acres of prescribed grazing systems. This program is likely the largest and most impactful program on private lands within MZs II/VII. Because of its focus on priority areas for conservation, which often overlap PHMA, the SGI's past, present, and reasonably foreseeable work has had and likely will continue to have a cumulative beneficial impact on GRSG when considered alongside protective BLM management actions in PHMA.

NRCS actions under the Sage-Grouse Initiative, including fence marking and conservation easements, state efforts to maintain ranchland, other BLM and Forest Service Proposed Plans within MZs II/VII, and other past, present, and reasonably foreseeable future actions will provide a net conservation gain to GRSG habitats and populations in MZs II/VII from livestock grazing management regardless of management within the Idaho and southwestern Montana sub-region.

#### ***Spread of Weeds***

Nature and Type of Effects. The impacts of weed spread on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. Cheatgrass is distributed throughout these MZs, though generally not with the same abundance observed in other areas, such as the Great Basin. Localized areas, such as southern Wyoming, are more invaded than cooler parts of the region (Manier et al. 2013, p. 131).

The BLM currently manages weed infestations through integrated weed management: biological, chemical, mechanical, manual, and educational methods. It is guided by the 1991 and 2007 RODs for Vegetation Treatment on BLM Lands in Thirteen Western States (BLM 1991) and by the 2007 Programmatic Environmental Report (BLM 2007). Weeds are managed in cooperation with county governments and represents a landscape-level approach across management jurisdictions.

Impact Analysis. Given the small acreage of the Idaho and southwestern Montana sub-region within MZs II/VII, it is unlikely that the alternatives in the Idaho and southwestern Montana LUPA would have a measurable contribution to cumulative effects from invasive weed management within MZs II/VII.

Invasive species on BLM-administered and National Forest System lands would be controlled under all alternatives and may be more successful given the lower extent of invasion within the MZs. This would provide a net conservation gain to GRSG by restoring degraded sagebrush habitat.

Relevant cumulative actions that result in surface-disturbing activities would increase the potential for the spread of invasive weeds on both federal and non-federal lands. Projects subject to the general stipulations outlined in the Montana and Wyoming ~~eExecutive eOrder~~ executive orders are required to control noxious and invasive weed species and to use native seed mixes during reclamation processes. These stipulations would benefit GRSG core habitat areas. They would accomplish this by limiting the spread or establishment of invasive species, particularly on lands that lack BLM and Forest Service protective regulatory mechanisms. Further, the *Greater Sage-Grouse Habitat Conservation Strategy for NRCS in Idaho* has identified GRSG conservation measures related to invasive weeds, such as reducing the risk and rate of fire spread, restoration and rehabilitation, and weed control. A number of projects are ongoing or in the planning phase to treat nonnative, invasive species (Appendix A).

These stipulations, in combination with other state and county noxious weed regulations, other BLM and Forest Service Proposed Plans in MZs II/VII, and other past, present, and reasonably foreseeable future actions, would provide a net conservation gain to GRSG habitats and populations in MZs II/VII under all the project alternatives, regardless of management within the Idaho and southwestern Montana sub-region.

#### **Conversion to Agriculture**

Nature and Type of Effects. The impacts of conversion to agriculture on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. Regional assessments estimate that while only 1 percent of PPHMAPPH and PGHMAPGH in MZs II/VII are directly influenced by agricultural development, over 80 percent of these habitats are within approximately 4 miles of agricultural land (Manier et al. 2013, p. 27).

Impact Analysis. The BLM and Forest Service do not convert public lands to agriculture. As such, the only direct authority these agencies have over conversion to agriculture is by retaining or disposing of lands in the realty program. Lands retained under BLM and Forest Service management will not be converted to agriculture and disposing of lands could increase the likelihood

they will be converted to agriculture, depending on their location and the policies of the new management authority.

Acres identified for retention and disposal generally do not vary substantially across alternatives, as the acres in **Table 5-22** represent the Proposed Plans from other BLM and Forest Service sub-regions and planning areas in MZs II/VII combined with the management in the MZs II/VII portion of the Idaho and southwestern Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII, alternatives in this sub-region would have a relatively small influence on total acres identified for retention or disposal. As shown in **Table 5-22**, most alternatives for land tenure adjustments in the Idaho and southwestern Montana LUPA would affect 4 percent or less of GRSG habitat within MZs II/VII. The exception would be under Alternatives A and E, which would identify some PHMA in the Idaho and southwestern Montana sub-region for disposal. This represents 65 and 63 percent of the total acres identified for disposal in MZs II/VII under Alternatives A and E, respectively.

**Table 5-22**

Source: BLM GIS 2015

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA identified for retention and disposal in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

Cumulative impacts vary relatively little across alternatives, and BLM and Forest Service management may have little impact on alleviating this threat. Restrictions on grazing on federal land could increase agriculture pressure on adjacent private lands. If the loss of federal grazing rights makes ranching economically unviable, the potential conversion of private grazing lands to agriculture would increase. However, the Proposed Plan does not substantially increase acreage unavailable to grazing.

The COT report objectives for converting land to agriculture are to avoid further loss of sagebrush habitat for agricultural activities (both plant and animal production) and to prioritize restoration. In areas where taking agricultural lands out of production has benefited GRSG, the programs supporting these actions should be targeted and continued (USFWS 2013, p. 48). In accordance with this objective, the NRCS's SGI program focuses on maintaining rangeland that provides habitat for GRSG.

This voluntary program provides private landowners with monetary incentives to protect GRSG habitat, often through conservation easements. As a result, private land containing GRSG habitat is protected from conversion to agriculture or other development for the life of the conservation agreement. The conservation easements and other conservation incentives, such as restoration of water features and fence marking, can enhance the ability of

private rangelands to support GRSG. As of 2014, SGI has secured conservation easements on 243,403 acres within MZs II/VII and marked or removed 23 miles of fence (NRCS 2015). This has preserved habitat and reduced the risk of direct mortality on these lands. As a result, these efforts, in conjunction with BLM and Forest Service management, would provide a net conservation gain to GRSG habitats and populations in MZs II/VII, regardless of management within the Idaho and southwestern Montana sub-region.

#### **Fire**

Nature and Type of Effects. The impacts of fire on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. Fire risk is generally low across MZs II/VII, though areas in the northern and southern portions of the MZs have a higher fire risk (Manier et al. 2013, p. 131). Within the MZs, 10 percent of PHMAPPH and GHMAPGH have a high risk for fire (Manier et al. 2013, p. 85).

Impact Analysis. Given the small acreage of the Idaho and southwestern Montana sub-region within MZs II/VII, it is unlikely that the alternatives in the Idaho and southwestern Montana LUPA would have a measurable contribution to cumulative effects from fire management within MZs II/VII.

Recognition of the importance of sagebrush habitat during interagency wildfire response would benefit GRSG in the event of an unplanned fire. The Montana ~~Executive Order~~ emphasizes fire suppression in ~~Core Population Areas~~, while recognizing other suppression priorities may take precedent. This would benefit GRSG during wildfire planning and response, particularly on lands not administered by the BLM or Forest Service.

The Interagency Standards for Fire and Fire Aviation Operations “Red Book” includes a BMP for GRSG habitat conservation for wildlife and fuels management (BLM 2013b). This document is a supplemental policy or guidance for the BLM, the Forest Service, and the USFWS. This BMP would benefit the GRSG during interagency wildland fire operations. It would do this by using spatial habitat data and predictive services to prioritize and preposition firefighting resources in critical habitat areas. The coordination of federal, state, and local fire prevention actions and changes in fire management would provide a net conservation gain to GRSG habitats and populations in MZs II/VII, regardless of management within the Idaho and southwestern Montana sub-region.

#### **Recreation**

Nature and Type of Effects. The impacts of recreation on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. Human populations have increased and expanded, primarily over the past century and in the western portion of the sagebrush distribution. Within MZs II/VII, population densities have increased 31 percent on the Colorado Plateau and 19 percent in the Wyoming Basin (Knick et al. 2011, p. 212). With these expanding populations come greater human impacts (Leu et al. 2008).

The COT report objectives for recreation are to maintain healthy native sagebrush communities, based on local ecological conditions, and to manage direct and indirect human disturbance (including noise) to avoid interruption of normal GRSG behavior (USFWS 2013, p. 49). Limits on road use under the action alternatives and limits on OHVs would help meet these objectives.

In the Idaho and southwestern Montana sub-region, travel management planning is underway to determine specific routes available for closure.

Impact Analysis. **Table 5-23** shows Acres of Travel Management Designations in GRSG Habitat in MZs II/VII.

**Table 5-23**

Source: BLM GIS 2015

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA within travel management designations of open, limited and closed in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

Acres open, closed, and limited to motorized vehicles do not vary substantially across alternatives, as the acres in **Table 5-23** represent the Proposed Plans from other BLM and Forest Service sub-regions and planning areas in MZs II/VII combined with the management in the MZs II/VII portion of the Idaho and

southwestern Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII, alternatives in this sub-region would have a relatively small influence on total acres open, closed or limited. As shown in **Table 5-23**, any alternative for travel management in the Idaho and southwestern Montana LUPA would affect 1 percent or less of GRSG habitat within MZs II/VII.

Implementation of the other BLM and Forest Service Proposed Plans, in concert with limitations on National Forest System lands and the disturbance caps applied under state plans, would help reduce the threats from recreation and travel on GRSG habitats and would provide a net conservation gain to GRSG populations in MZs II/VII, regardless of management within the Idaho and southwestern Montana sub-region.

#### **Conifers**

**Nature and Type of Effects.** Conifer woodlands, especially juniper (*Juniperus* spp.) and in some regions pinyon pine (*Pinus edulis*), may expand into sagebrush habitat and reduce availability of habitat for GRSG. Conifer expansion may be encouraged by human activities, including fire suppression and grazing (Miller et al. 2011). If woodland development is sufficient to restrict shrub and herbaceous understory growth, habitat quality for GRSG will be reduced (Connelly et al. 2004). Mature trees offer perch sites for raptors; thus, woodland expansion may also increase the threat of predation, as with powerlines (Manier et al. 2013). Locations within approximately 1,000 yards of current pinyon-juniper woodlands are at highest risk of expansion (Bradley 2010). The greatest risks from conifer encroachment are thought to be in the Great Basin, with smaller risks (6 to 7 percent of PH and GH) in the Wyoming Basin (Connelly et al. 2004; Manier et al. 2013). Studies have shown that GRSG incur population-level impacts at very low levels of conifer encroachment (Baruch-Mordo et al. 2013).

**Conditions in MZs II/VII.** Approximately 46 percent of conifer encroachment risk in PPHMAPPH (and 43 percent in PGHMAPGH) occur on BLM-administered lands within MZs II/VII (Manier et al. 2013). Therefore, BLM actions are likely to have a greater potential to ameliorate the effects of conifer encroachment on GRSG than any other single land management entity.

**Impact Analysis.** Specific required design features common to all BLM and Forest Service plans in MZs II/VII include removal of standing and encroaching trees within 100 meters of occupied leks and other habitats (e.g., nesting, wintering, and brood rearing). Additionally, reintroduction of appropriate fire regimes would limit conifer encroachment into the sagebrush plant communities. These actions would benefit GRSG by improving the quality of habitat throughout the MZ.

Additionally, under all action alternatives and the Proposed Plan, conifer removal treatments would be prioritized closest to occupied GRSG habitats and

near occupied leks, and where juniper encroachment is phase I or phase 2. This action would benefit GRSG by improving the quality of habitat and functionality.

Recommendations within the Wyoming State Plan call for removal of juniper and other conifers where they have invaded sagebrush sites important to GRSG, which could help ameliorate the threat on non-federal lands. In Colorado, the Colorado Parks and Wildlife has conducted conifer treatments totaling 2,600 acres (Colorado Department of Natural Resources 2013).

**Commented [JMM36]:** Executive Order? Core Area Strategy? We don't have anything with the label "Wyoming State Plan"

SGI has helped reduce the threat of early succession conifer encroachment through mechanical removal on 10,500 acres of private lands within MZs II/VII. The majority of these efforts were located inside PACs (NRCS 2015), helping to preserve historic fire return intervals and important GRSG habitat. While the threat of conifer encroachment is likely to continue under all alternatives and the Proposed Plan, implementing mechanical treatments and reintroduction of appropriate fire regimes would result in a net conservation gain for GRSG.

#### 5.1.11 Conclusions

In addition to BLM and Forest Service management in the Idaho and southwestern Montana sub-region and other planning areas in MZs IV and II/VII, GRSG in these MZs will also be impacted by management and conservation at state, regional, tribal and local levels. This analysis takes into account each alternative in the Idaho and southwestern Montana LUPA in conjunction with state and private initiatives, as well as past, present, and reasonably foreseeable future actions at the federal, state, and local levels. The analysis assumes that the Proposed Plans would be implemented in the other BLM and Forest Service LUPA planning areas in MZs IV and II/VII.

Some of the most important past and present actions benefitting GRSG populations on private land in MZ IV and II/VII are the conservation easements coordinated by the NRCS SGI with private ranchers. SGI has also worked with landowners to increase fence marking, seeding of native vegetation, and conifer removal to improve GRSG habitat quality. Future coordination of private landowners with SGI is expected to provide further benefits to GRSG habitat.

**Commented [JMM37]:** SGI is not the sole source of conservation easements. I would add the other sources (BLM, USFS, State of Wyoming, etc)

This coordination with private landowners enhances conservation in addition to what BLM and Forest Service management can accomplish on federal lands. Ranchers in Wyoming and Montana are also using Candidate Conservation Agreement with Assurances with the USFWS. Under these instruments, the ranchers voluntarily agree to manage lands to reduce threats to GRSG in exchange for a guarantee that they will not be subject to additional regulations should the species become listed. While ranchers have used these agreements across the GRSG range, thus far the agreements have been applied to only a small number of ranches in Wyoming and Montana.

As discussed in **Sections 5.1.4 and 5.1.8**, both Wyoming and Montana have adopted statewide plans to promote GRSG conservation. Both plans implement

a Core Population Area Strategy with well density limitations, timing restrictions, and a uniform 5 percent disturbance cap across all landownership types. These measures would improve GRSG population levels if effectively enforced (Copeland et al. 2013) and would primarily affect MZs II/VII. The limitations on timing and density of energy development along with the disturbance cap, and BLM and Forest Service management on lands with federal mineral estate, would act in concert to promote GRSG conservation and reduce the impacts from energy development on leks, breeding habitat, and wintering habitat.

However, a majority of MZ IV, including the states of Idaho, Oregon, Nevada, and Utah, do not have similar executive orders in place. These states do have GRSG conservation plans, but these plans generally include voluntary guidelines, not regulatory mechanisms. This could allow for more impacts on the 31 percent of GRSG habitat within the MZ that is state or privately owned. Since most GRSG habitat in MZ IV (68 percent) is under federal management, BLM and Forest Service regulatory mechanisms will have a substantial contribution to cumulative effects.

BLM and Forest Service restrictions on ROWs/SJAs, renewable energy, and energy development in GRSG habitat would help reduce loss and disturbance of GRSG populations. The Proposed Plan includes numerous measures to allow development while reducing the likelihood for impacts on GRSG, such as requirements for anthropogenic disturbance criteria, a 3 percent disturbance cap, buffers, mitigation, and RDFs and BMPs.

The more challenging threats to manage in MZ IV are fire, the spread of weeds, and conifer encroachment. Fire regimes are complex and vary tremendously across the sagebrush region and through time; furthermore, the ecological role of fire has changed dramatically since the European settlement era (circa 1850) due to changing fuel and habitat patterns (Manier et al. 2013, p. 79). Fire is exacerbated by invasive weeds, particularly in Wyoming big sagebrush types, where the invasion by exotic annuals has resulted in dramatic increases in number and frequency of fires with widespread, detrimental effects on habitat conditions (Manier et al. 2013, p. 88). Expansion of conifer woodlands, especially juniper (*Juniperus* spp.) do not provide suitable habitat for GRSG, and mature trees displace shrubs, grasses and forbs through direct competition (Manier et al. 2013, p. 91). These threats are at the landscape scale and are extensive throughout MZ IV; the Proposed Plans within MZ IV include a comprehensive strategy to address these threats.

*Alternative A: Current Management*

Under Alternative A, current management would continue on BLM-administered and National Forest System lands in the Idaho and southwestern Montana sub-region. Several protective measures would not be implemented; for example, the BLM and Forest Service would not designate PHMA or GHMA

and would not manage any additional ROW/SUA avoidance or exclusion areas. Alternative A does not include any consistent management prescriptions to protect GRSG across the sub-region, though several individual BLM district offices and National Forests have some protections in place. Appropriate and allowable uses and restrictions with regard to such activities as mineral leasing and development, recreation, utility corridors, and livestock grazing would also remain unchanged.

Under current management, widespread wildfire and subsequent spread of nonnative, invasive species have destroyed and degraded PHMA and PGMA, particularly in MZ IV. This is likely to continue and reinforce the cycle of fire and weed spread. Further, the expansion of conifers, particularly juniper, will continue to reduce the suitability of sagebrush habitats for GRSG.

In the rest of MZs IV and II/VII, other BLM and Forest Service LUPA planning efforts would implement their Proposed Plans to improve protection of GRSG and their habitat. In addition, GRSG conservation strategies would be implemented on state and private lands. As a result, the lack of protections under the Idaho and southwestern Montana LUPA Alternative A would be offset to an extent by more protective management elsewhere in the MZs, particularly within MZs II/VII. In the Idaho and southwestern Montana sub-region, though, continuation of current management would do little to reduce the major threats to GRSG in the sub-region: wildfire, invasive weeds, and conifer encroachment. Current management provides a limited number and extent of regulatory mechanisms to avoid continued degradation of GRSG habitat in MZs IV and II/VII, but it would not meet the COT report objectives for conservation of GRSG.

#### *Alternative B*

Under Alternative B, the BLM and Forest Service would manage lands to conserve, enhance, and restore sagebrush ecosystems. In conjunction with NRCS and state initiatives on private land, several aspects of BLM and Forest Service management under Alternative B would benefit GRSG conservation at a landscape level. These include implementation of a 3 percent disturbance cap, retention of GRSG habitat, restrictions on resource uses such as managing PHMA as ROW exclusion and closed to mineral development, and prioritizing restoration in GRSG habitat. Implementing these protective measures on BLM-administered and National Forest System lands within the Idaho and southwestern Montana sub-region would help reduce damage to GRSG habitat, minimize loss of connectivity and could also minimize the spread of invasive species by limiting human activities that disturb soil or introduce seeds. However, such restrictions could also risk pushing development onto adjacent, nonfederal lands with less restrictive management. This is particularly a concern where nonfederal lands have fewer protections (e.g., most of MZ IV). In parts of MZ IV and MZs II/VII, some nonfederal lands have similarly restrictive measures such as in Core [Areas](#) in Wyoming and Montana (though Core areas do

not cover all existing GRSG populations), which would reduce the likelihood for impacts.

In combination with other past, present, and reasonably foreseeable future actions, Alternative B would likely meet the objectives laid out in the COT report for infrastructure, grazing/free-roaming equids, conversion to agriculture, energy development, and recreation. Without a comprehensive strategy to address fire, invasive weeds, and conifer encroachment, it may not meet the COT objectives for these threats.

*Alternative C*

Under Alternative C, the BLM and Forest Service would manage lands to conserve, enhance, and restore sagebrush ecosystems and would apply management to all occupied GRSG habitats, making it the most restrictive alternative for development in GRSG habitat. In conjunction with NRCS and state initiatives on private land, several aspects of BLM and Forest Service management under Alternative C would benefit GRSG conservation at a landscape level. These include implementation of a 3 percent disturbance cap, removal of livestock grazing from BLM-administered and National Forest System lands, and closure to leasable mineral development. Impacts would be similar to those described for Alternative B, but could be greater due to the larger area over which restrictions would be applied.

Together with other past, present, and reasonably foreseeable future actions, Alternative C would likely meet the objectives laid out in the COT report for infrastructure, conversion to agriculture, energy development, and recreation. Without a comprehensive strategy to address fire, invasive weeds, and conifer encroachment, it may not meet the COT objectives for these threats. Further, it is unknown whether removal of grazing would meet the COT objectives for range management, as analyzed above and in greater detail in **Section 4.2**.

*Alternative D*

Under Alternative D, the BLM and Forest Service would manage lands to conserve, enhance, and restore sagebrush ecosystems. Management and impacts would be similar to Alternative B, though Alternative D would incorporate more flexibility and adaptive management applied to resource uses to account for sub-regional conditions. The BLM and Forest Service would require a no net unmitigated loss of PHMA and ~~HMA~~HMA and would implement numerous conservation measures to reduce impacts from human activities in PHMA, such as management of GRSG habitat as ROW avoidance areas and closure to some mineral development. Alternative D also includes additional measures and planning for wildfire management.

Under Alternative D, the BLM would increase GRSG habitat protection over current management, but with less restrictive actions than under Alternatives B or C. In conjunction with state and regional planning efforts, implementation of state disturbance caps in GRSG core areas, conservation easements on private

**Commented [JMM38]:** Typo or undefined Idaho HMA?

lands, implementation of other BLM and Forest Service LUPAs in MZ IV and MZs II/VII, and other past, present, and reasonably foreseeable future actions, Alternative D would likely meet the objectives laid out in the COT report for fire, infrastructure, grazing/free-roaming equids, conversion to agriculture, energy development, and recreation. Without a comprehensive strategy to address invasive weeds and conifer encroachment, it may not meet the COT objectives for these threats.

*Alternative E*

Under Alternative E, the BLM and Forest Service would manage to maintain, conserve, enhance, and restore sagebrush ecosystems. In PHMA and IHMA, the BLM and Forest Service would incorporate management flexibility to permit high value infrastructure with appropriate mitigation and best management practices tailored for the sub-region. Management and impacts are similar to Alternative D, though Alternative E would require less stringent use restrictions and would designate the least amount of PHMA compared to the other alternatives' management area designations. Alternative E also includes additional measures and planning for wildfire management.

Under Alternative E, the BLM would increase GRSG habitat protection over current management, but with less restrictive actions than under Alternatives B, C, or D. In conjunction with state and regional planning efforts, implementation of state disturbance caps in GRSG core areas, conservation easements on private lands, implementation of other BLM and Forest Service LUPAs in MZ IV and MZs II/VII, and other past, present, and reasonably foreseeable future actions, Alternative E would likely meet the objectives laid out in the COT report for fire, infrastructure, grazing/free-roaming equids, and recreation. Alternative E imposes fewer restrictions on mining and energy development and does not provide guidance for land tenure decisions, so the alternative may not meet the COT objectives for mining, energy development, and conversion to agriculture. Without a comprehensive strategy to address invasive weeds and conifer encroachment, it also may not meet the COT objectives for these threats.

*Alternative F*

Management under Alternative F would be largely similar to that described for Alternative B, though with more stringent guidance and restrictive management in sagebrush ecosystems. Alternative F would implement a 3 percent disturbance cap but all surface disturbances (including human disturbance and fire) would count toward this cap. In addition, grazing would be reduced by 25 percent.

In combination with other past, present, and reasonably foreseeable future actions, Alternative F would likely meet the objectives laid out in the COT report for infrastructure, grazing/free-roaming equids, conversion to agriculture, energy development, and recreation. Without a comprehensive strategy to

address fire, invasive weeds, and conifer encroachment, it may not meet the COT objectives for these threats.

*Proposed Plan*

Under the Proposed Plan, the BLM and Forest Service would manage lands to conserve, enhance and restore GRSG habitat and the sagebrush ecosystem upon which GRSG populations depend. Management and impacts would be similar to Alternatives D and E, though the Proposed Plan would incorporate robust strategies and approaches to GRSG management, including wildfire and invasive species management, conifer removal, adaptive management, mitigation, a 3 percent disturbance cap, anthropogenic disturbance criteria, buffers, habitat objectives and monitoring. In addition to habitat management areas, SFAs would also be managed to protect recognized the most important areas for the species.

The Proposed Plan would provide a higher level of GRSG habitat protection compared to current management, while allowing flexibility for resource uses when there would be no impacts to GRSG.

In the rest of MZs II/VII, other BLM and Forest Service LUPAs would implement their Proposed Plans to improve protection of GRSG and their habitat. In addition, other regional GRSG conservation strategies as discussed in **Section 5.1.8**, would be implemented on non-federal lands. Reasonably foreseeable future actions in MZs II/VII such as proposed oil and gas developments, interstate transmission lines, and other land disturbance projects would be subject to the requirements set forth in the BLM and Forest Service Proposed Plans which encompass MZs II/VII, where those projects occur on federal decision area lands. For non-federal lands, reasonably foreseeable future projects may be subject to disturbance caps, buffer restrictions, and other requirements of GRSG state plans, as well as site specific mitigation measures.

In conjunction with state and regional planning efforts, implementation of state disturbance caps in GRSG core areas, conservation easements on private lands, implementation of other BLM and Forest Service LUPAs in MZ IV and MZs II/VII, and other past, present, and reasonably foreseeable future actions, the Proposed Plan would likely meet the objectives laid out in the COT report for fire, infrastructure, grazing/free-roaming equids, mining, energy development, conversion to agriculture, invasive weeds, conifer encroachment, and recreation.

*Summary*

Overall, GRSG populations across MZ IV and MZs II/VII face the greatest pressures from wildfire, invasive weeds, energy development, and infrastructure. BLM and Forest Service actions within the Idaho and southwestern Montana sub-region would have a limited influence on GRSG populations and habitats within MZs II/VII, but would substantially contribute to cumulative effects on populations and habitats within MZ IV.

Infrastructure and energy development are of particular concern in MZs II/VII because they affect the greatest amount of land. Numerous multi-state transmission lines are proposed through GRSG habitat, as are large-scale oil and gas field developments in excess of 100,000 acres. Implementation of the BLM and Forest Service Proposed Plans in MZs II/VII is unlikely to preclude such projects from proceeding, especially Presidential Priority transmission line projects that are not subject to GRSG protective measures in the BLM/USFS planning efforts. The cumulative effect of reasonably foreseeable future infrastructure and energy development projects over the next 10 years, when combined with unplanned events such as wildfires, drought, or West Nile virus outbreaks, could increase the likelihood of population extirpation, particularly for the less robust populations which are considered at-risk. However, restrictions on land use in combination with project-specific BMPs and required design features, and other regional efforts will help mitigate the effects.

Of particular concern is that threat reduction for fire is difficult and costly. Given the intensity and widespread distribution of the threat, it may never be fully eliminated (USFWS 2013, p. 40), but the comprehensive strategies under Alternatives D, E, and the Proposed Plan, may be able to reduce the threat considerably.

The Idaho and southwestern Montana sub-region in MZ IV contains one of the GRSG strongholds with the largest area of habitat rangewide with low similarity to extirpated portions of the range (USFWS 2013, p. 70). Both MZ IV and MZs II/VII support the two largest populations of GRSG rangewide (USFWS 2013, p. 75). As such, management within the sub-region and MZs is critical to preserving the species. All action alternatives considered in the Idaho and southwestern Montana LUPA would reduce threats to some degree and via different strategies.

Although small fringe populations may extirpated in the next ten years, implementing Alternatives B, E, F, or the Proposed Plan in combination with other regional efforts (such as the Proposed Plans for other BLM and Forest Service planning areas; conservation strategies in state plans; increased land protections via NRCS SGI, and local habitat restoration efforts) would effectively conserve the region-wide population of GRSG in MZs IV and II/VII.

**GRSG 36: Greater Sage-grouse Monitoring Framework DD: March 15, 2015**  
*A Path Forward*

This Greater Sage-grouse Monitoring Framework will guide the BLM/FS approach to monitor sage-grouse habitats by collecting data that can be analyzed at multiple geographic scales and to monitor implementation decisions. The goal of monitoring is to demonstrate certainty in the implementation and effectiveness of our regulatory mechanisms and initiate adaptive management when/where needed.

**Monitoring Priorities:**

Monitoring for Sage-grouse				
	Implementation	Habitat		Population(States)
<i>Geographic Scales</i>	Decisions	Disturbance	Vegetation	Demographics
<i>Coarse scale:</i> Example management question: What is the status, trend, pattern, abundance and/or connectivity of sagebrush habitats?				
From the range of sage-grouse to WAFWA Management Zones (MZ)	LUP/LMP objectives and management actions	Priority and General habitat delineation (occupied habitat)	Existing national level vegetation monitoring and mapping efforts (remote sensing)	WAFWA MZ population level and population trends
<i>Mid-scale:</i> Example management question: What is the status, trend and/or condition of sagebrush habitats?				
From MZ level down to population level	LUP/LMP decisions, vegetation/ mid scale decisions	Percent of sagebrush, anthropogenic footprint, density of energy development	National data augmented with locally collected-data using core indicators and statistical study design	Subpopulation levels, dispersal and lek complex trends

**Who Does What:**

What: Region, WAFWA zone and mid-scale sage brush status and trend reporting

Who: Data collection funded at the WO 200 level, data analysis and reporting are led by the NOC

What: Region, WAFWA zone, and mid-sage brush patch size, pattern, and connectivity mapping and reporting

Who: Data collection funded by WO 200, analysis and reporting is completed by the NOC, data interpretation validated by FO botanists (off-season work months)

What: Disturbance mapping and reporting

Who: FO supplied geospatial footprint of new permitted disturbances, NOC analysis and reporting

What: Effectiveness of management actions reports

Who: FO supplied data, NOC assistance as requested for analysis and reporting

What: Implementation of management actions reports

Who: FO responsibility

What: Site level reporting

Who: Data collection and reporting based on local needs, FO responsibility

**Decision:**

- The Disturbance and Monitoring sub-group will move forward with developing language for the draft EISs that will establish a consistent monitoring framework – this language will be brought back to the land manager groups for review.
- Monitoring plans will be developed between draft and final that recognizes capacity, effectiveness, and temporal concerns.
- Monitoring data will be scalable.
  - The Disturbance and Monitoring sub-group will develop template language to be inserted into the Drafts. A draft will be sent to WO/Ed by March 29, 2013, to the Land Manager group by April 5, 2013, and will be discussed and hopefully approved on the Land Manager Call on April 12, 2013.

## Idaho/Montana Sage-Grouse Meeting

### Buffer Discussion

December 9, 2014 1:30 p.m. MST

Attendees: Jon Beck; Paul Makela; Ethan Ellsworth; Jason Pyron; Katie Powell; Kelly Bockting; Chris Colt

#### Handouts

- Buffers table.

#### Meeting Minutes

##### *Meeting Purpose*

- Review how ID/MT responded to Washington Office questions on buffers.
- Review potential changes to buffers based on USGS report.
- Compare buffer table and RDF table to ensure consistency.

##### *Response to WO Questions*

- Did you use buffers to designate PPH/PGH? Yes, 6.4 km buffer.
- What are the buffers for each resource use? Created summary table.
- Are the buffers allocations? No. They are another layer of protection on implementation level.
- Created a map of buffers.

##### *Buffers Table*

- USGS report recommends 3-5 mile buffer from surface disturbance. ID/MT interpreted this as including mineral development. Currently have 0.8-mile buffer for noise.
- Biologists want to incorporate decibel level as an indicator of disturbance. Consider incorporation of BMPs that accounts for impacts at 10 decibels at the edge of the lek for disturbing activities. **Ethan will work with Paul and Jason to develop a BMP/recommendation.**
- Pipelines and roads are classified as “linear features”. No changes to buffers are suggested.
- Unleased fluid minerals – ID/MT has NSO in Priority/Important and a 2-mile buffer for well pads. USGS report recommended 3.1 to 5 miles. **Team may consider increasing the buffer in GHMA.**
- Transmission lines: Currently have a 600 m buffer around leks and application of the anthropogenic disturbance criteria. USGS report recommends 3 to 5 miles. Larger buffer may impeded the flexibility of the disturbance criteria and preclude all development. **Team does not want to revise this buffer, but may consider including a 2-mile buffer as a BMP.**
- Distribution lines: No changes suggested.
- Solar Energy: Within USGS report recommendations.
- Wind Energy: PHMA as exclusion, IHMA as avoidance, GHMA as open. Need to include buffer clearly in the table.

- Communication towers, fences, and miscellaneous: No changes suggested.

#### *Potential Changes to BMPs/RDFs*

- New roads and upgrades: “High volume gravel roads” - might want to say which maintenance level this is. (e.g., just below a maintained paved road). **Consider removing lek buffer because it is captured by nesting habitat buffer of 0.8 mile. Nesting buffer will be BMP.**
- Fence collision: move/modify/mark fences to reduce collision risk. No buffer tied to it. This is an RDF in PHMA/IHMA and BMP in GHMA. There is also RDF #104 – no new fences within 2 km of occupied leks. Applies to all habitat types. **Add a BMP to cover marking existing fences.**
- Avoiding use of heavy equipment or targeted grazing in nesting habitat. No spatial buffer tied to it. **Make this an RDF where appropriate.**
- If it was a BMP in buffer table, make it an “RDF as appropriate”.

#### *Other*

- USFWS concerns about changing buffers and direction now after having length discussions with partners in the past and having come to agreement on these issues.
- Concerns about applying the same management to Priority/Important/General – if there will be the same management in all three management areas, it is not worth having three management areas.
- When discussing buffers, need to take other restrictions into account as well. For example, the exception criteria are intended to push projects into GHMA, and this is where buffers become important.
- Inflexible rules may not be the best for the bird in some instances. For example, making BLM lands exclusion could push development onto private lands.

**US Department of the Interior  
Bureau of Land Management**

**Greater Sage-Grouse Resource Management Plan  
Amendments and Environmental Impact  
Statements**

**Western Region**

---

**CURRENT MANAGEMENT  
[OWYHEE FIELD OFFICE]**

**FEBRUARY 16, 2012**

**FOR INTERNAL BLM AND FOREST SERVICE USE ONLY – NOT FOR  
DISTRIBUTION**

## To Western Sage-grouse RMPA/EIS ID Teams:

This document is intended for internal use by the BLM and Forest Service Field Offices for the Greater Sage-Grouse RMPAs/EISs. Current management (No Action alternative) provides a useful baseline for comparison of environmental effects (including cumulative effects) and demonstrates the consequences of not meeting the need for the action. Development of the Greater Sage-Grouse RMPAs/EISs current management will include reviewing and analyzing relevant goals, objectives, and management actions and allocations (descriptions of goals, objectives, and management actions and allocations is provided below) related to sage-grouse/habitat protection in existing BLM and Forest Service land use plans. This process will include documenting those goals, objectives, and management actions and allocations to aid in developing the No Action alternative in the RMPAs/EISs.

**Current Management Matrix** (provided at the end of these instructions). Field Office IDT members should use the current management matrix to capture current management relevant to sage-grouse/habitat protection. The intent is not to repeat the entire ROD for a land use plan, but rather document only the relevant goals, objectives, and management actions and allocations related to sage-grouse/habitat. The matrix includes an exhaustive list of resource and resource use topics that could possibly apply to a planning area/land use plan. However, not all resources/resource uses in the matrix may apply to all existing land use plans. Field Offices need to only provide information for those resources/resource uses that apply to 1) the land use plan under consideration, and 2) the resource/resource use **directly** or **indirectly** related to sage-grouse/habitat management.

## Steps in Documenting Current Management

1. **Column 1 – Current Management: Capture goals, objectives, and management actions and allocations relevant to sage-grouse/habitat protection.** The land use plan decisions establish goals and objectives (desired outcomes) for resources and resource uses and the allowable uses and management actions needed to achieve those goals and objectives. More specifically, **desired future conditions or desired outcomes are stated as goals and objectives**. Goals are broad statements of desired outcomes (plan-wide and resource or resource-use specific) and generally are not quantifiable or measurable. Objectives are more specifically desired conditions or outcomes to meet the resource/resource use goal.

Management actions and allowable uses are designed to achieve the objectives. Management actions include management measures that will guide future and day-to-day activities. Allowable uses indicate which uses are allowed, restricted, or prohibited, and may include stipulations. Allowable uses also identify lands where specific uses are excluded to protect resource values, or where certain lands are open or closed in response to legislative, regulatory, or policy requirements.

2. **Column 2 – Source Data: Document the source data related to the management action/allocation.** Include the GIS and other data that goal, objective, and management action and allocation is based on.
3. **Column 3 – Preliminary Assessment: Perform preliminary assessment of management action/allocation.** Include results of preliminary analysis (i.e., overlays) to determine status of sage-grouse/habitat protections (Example – FO excludes ROWs of X% of priority habitat).
4. **Column 4 – Management Adequacy: Assess whether goals, objectives, and management actions and allocations are adequate related to sage-grouse/habitat protection.** A “Not Adequate” determination will require an amendment to the land use plan.

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
<b>Resources</b>					
<b>Air</b>					
<b>Objective: AIRQ I</b> Meet or exceed the National Ambient Air Quality Standards and the Prevention of Significant Deterioration regulations with all authorized actions.					
Action: Limit prescribed burning in juniper/sagebrush/grassland areas to a maximum of 15,000 acres per year (or the equivalent of 100,000 tons of fuels) and average 7,500 acres of prescribed burns per year over the life of the plan. Projected emissions from individual burns will be calculated to assure	<b>All RMP spatial data is available at the ISO in a geodatabase.</b>	Limits acreage of sagebrush habitat loss across the 1,320,000 acre planning area to no more than 1.1% per year.	Y to meet the objective, N for GSG protection–needs to be limited to minimize net loss of sagebrush cover sufficient to provide habitat for sage-grouse (see Tech Ref. 417, 2005). This can be framed by recovery	S	Rx Fire, Conifer Encroachment, and Sagebrush Control

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
compliance with National Ambient Air Quality Standards and Prevention of Significant Deterioration regulations.			timelines expected for xeric/mesic sagebrush habitats...or refined to target juniper encroachment and conifer areas		
<b>Soil &amp; Water</b>					
<b>Objective: SOIL I</b> Improve unsatisfactory and maintain satisfactory watershed health/condition on all acres.					
Action: Implement grazing practices that during and at the end of the grazing season provide adequate amounts of ground cover (determined on an ecological site basis) to support proper infiltration, maintain soil moisture, stabilize soils, and maintain site productivity.		Provides protection across the planning area when implemented through Idaho Standards of Rangeland Health and Guidelines for Livestock Grazing Mgmt.	Y - cover amounts to provide protection from erosion may be less than what is needed to provide adequate/desired cover for nesting and early brood rearing.	S	Livestock Impacts
Action: Implement grazing practices that improve or maintain native rangeland species to attain composition, density, aerial cover and vigor appropriate to site potential.		Provides protection across the planning area when implemented through Idaho Standards of Rangeland Health and Guidelines for Livestock Grazing Mgmt.	Y	T	Livestock Impacts
Action: Limit OHMV use in high erosion hazard		Would potentially limit disturbance on	Y/N – Is dependent upon completion of travel	T	Human Disturbance

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
watersheds, watersheds at-risk or in unsatisfactory condition.		specified soil types within the planning area that may provide protections to habitat and grouse.	mgmt. planning efforts (not complete, but legislated by P.L. 111-11, 2009).		
Action: Grazing systems and other activities will be designed to minimize soil erosion caused by surface disturbing activities through proper timing with regard to soil moisture content and range readiness.		Since soil moisture is highest in the late winter/spring, this would provide protection to breeding and nesting habitats.	Y – range readiness criteria are used to delay authorizations until conditions are consistent with this RMP action.	S	Livestock impacts and human disturbance
Action: Provide a minimum of two growing seasons of rest from livestock grazing and other watershed disturbing activities following fires.		Protects grouse displaced by fire events and ensures forb/grass cover availability as habitats recover from fire.	Y	S	Annual Grasslands, Livestock Impacts and Seeded perennial grasslands
Action: Implement a juniper abatement plan for appropriate sites on which juniper is invading.		Protects sagebrush sites from conversion to woodlands avoided by grouse.	Y	P	Conifer Encroachment
<b>Objective: SOIL 2</b> Achieve stabilization of current, and prevent the potential for future, localized accelerated soil erosion problems (particularly on streambanks, roads, and trails). Localized accelerated soil erosion is where humans, by their actions, are responsible for the site					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
specific erosive process.					
Action: Improve or maintain streambank and channel stability as appropriate for the site by managing grazing to limit annual trampling impacts to 10% or less of the linear bank length.		This action limits grazing effects on riparian meadows that are important for late brood-rearing.	Y	T	Livestock Impacts
Action: Limit surface disturbing activities on soils sensitive to compaction or that have a high soil erosion potential rating, or that are exhibiting existing accelerated erosion problems.		Protects degraded/sensitive sites from further degradation.	Y	T	Livestock impacts, Infrastructure
<b>Objective: WATR I</b> Meet or exceed State of Idaho water quality standards on all Federally administered waters within the Owyhee Resource Area					
Action: In pastures containing riparian areas categorized as unsatisfactory, non-functioning, or functional-at-risk, or stream segments listed as water quality limited in the current Idaho Division of Environmental Quality 303(d) list, implement grazing practices that make progress towards achieving proper functioning condition and satisfactory riparian condition. These grazing practices will, at a minimum, comply with the Idaho Standards for Rangeland		This action limits grazing effects on riparian meadows that are important for late brood-rearing.	Y	T	Livestock Impacts

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
Health and Guidelines for Livestock Grazing Management, and BMPs and component practices approved in the Idaho Agricultural Pollution Abatement Plan or subsequent plans. See Table RIPN-I and Map RIPN-I for affected areas. Future inventory or monitoring may indicate additional pastures to which this management action will apply.					
Action: Improve or maintain herbaceous vegetation species to attain composition, density, canopy and ground cover, and vigor appropriate for the site. Adequate residual stubble height in an amount appropriate for the site will be present throughout the grazing treatment and overwinter. This pertains to key sedge and rush species which are excellent streambank stabilizers.		This action limits grazing effects on riparian meadows that are important for late brood-rearing.	Y	S	Livestock Impacts
Action: Implement management practices addressing non-grazing impacts to riparian areas where needed and appropriate.		This action limits other authorized uses effects on riparian meadows that are important for late brood-rearing.	N – could be more specific to preclude loss of riparian habitats to actions like mineral materials sites etc.	T	Infrastructure
<b>Vegetation – General</b>					
<b>Objective: VEGE I</b> Improve unsatisfactory and maintain satisfactory vegetation health/condition on all areas.					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage- grouse Relation (P, S, T)	Threat
Action: Implement grazing practices that during and at the end of the grazing season provide adequate amounts of ground cover (determined on an ecological site basis) to support proper infiltration, maintain soil moisture, stabilize soils, and maintain site productivity.		Provides protection across the planning area when implemented through Idaho Standards of Rangeland Health and Guidelines for Livestock Grazing Mgmt.	Y - cover amounts to provide protection of infiltration, soil moisture, and site productivity may be less than what is needed to provide adequate/desired cover for nesting and early brood rearing.	T	Livestock Impacts
Action: Implement grazing practices that improve or maintain native rangeland species to attain composition, density, foliar cover and vigor appropriate to site potential.		Provides protection across the planning area when implemented through Idaho Standards of Rangeland Health and Guidelines for Livestock Grazing Mgmt.	Y	T	Livestock Impacts
Action: Implement prescribed burning practices in areas where it is determined that burning would improve rangeland health and increase plant biodiversity in western juniper and big sagebrush vegetation types. Mechanical and chemical methods may also be used.		Provides for protection of sagebrush sites invaded by western junipers.	N – allowing for burning of sagebrush sites without a framework resulting in no net loss across the planning area (cumulative agency actions and wildfire) or allowable temporary loss may put habitats/populations at risk.	T	Conifer Encroachment
Action: Apply approved noxious weed control		Protects sagebrush habitats from noxious	N – expand to include invasive species rather	T	Weeds

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
methods [Includes burning, mechanical, manual, biological, and chemical control methods as identified in the Vegetation Management EIS (USDI, BLM, 1991)].		weed invasion, but not invasive species invasion.	than just “noxious.” This will allow for treatments to minimize fire recurrence and habitat loss to fire/annual species conversion.		
Action: Implement grazing practices designed to meet Idaho Standards for Rangeland Health and conform to the Guidelines for Livestock Grazing Management (see Appendix LVST-1).		Provides protection across the planning area when implemented through Idaho Standards of Rangeland Health and Guidelines for Livestock Grazing Mgmt.	Y	T	Livestock Impacts
<b>Vegetation – Forest &amp; Woodlands</b>					
<b>Objective: FORS 2</b> Use juniper harvesting to help achieve a desired plant community.					
Action: Manage harvest of western juniper woodlands in accordance with layout and cutting standards in the Owyhee Juniper Woodland Harvest Management Plan (USDI, BLM, October 1987). See Map FORS-1.		Allows for protection of encroached sagebrush habitats from woodland conversion.	Y	S	Conifer Encroachment
<b>Wildlife</b>					
<b>Objective: WDLF 1</b> Maintain or enhance the condition, abundance, structural stage, and distribution of plant communities and					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
special habitat features required to support a high diversity and desired populations of wildlife.					
Action: Ensure that all activity plans include objectives for maintaining or enhancing habitat for those wildlife species known or likely to occur within the planning area.		Some activity plans (ex. Murphy Sub-region Travel Mgmt. Plan) have included specific objectives to maintain/enhance habitat for sage-grouse. Most activities are designed or have mitigations to address wildlife rather than objectives.	N – need specific and consistent sage-grouse objectives that can be incorporated into activity plans.	T	General
Action: Limit the adverse impacts of various land use activities, management actions and land tenure adjustments to wildlife populations and habitats through implementation of management actions identified in objectives FORS 2, WHRS I, LVST I, FIRE I-4, LAND I-6, LOCM I, FLUM I, MMAT I, RECT I, and HAZM I.		Provides protection as identified above and below.	Y	T	General
Action: Protect and enhance habitat for a diversity of wildlife through implementation of management actions identified in objectives SOIL I and 2, WATR I and 2, VEGE I, RIPN I, FORS		Provides protection as identified above and below.	Y	T	General

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
I and 2, FISH I and 2, RECT 3, WNES I and 2, HAZM I, and ACEC I.					
<p>Action: Adjust overall grazing management practices to ensure that adequate upland forage and cover remains to accommodate the needs of wildlife. Specifically:</p> <ul style="list-style-type: none"> <li>• Limit utilization of key browse species, as measured in the fall, to a maximum of 30% within all deer winter habitat and 50% within all other habitats.</li> <li>• Limit utilization of key upland herbaceous forage species to a maximum of 50% at the time of livestock removal from a pasture.</li> </ul> <p>More restrictive utilization standards may be imposed where necessary to accomplish specific wildlife or other resource objectives.</p>		Sets maximum utilization levels across the planning area.	N – specify seasonal values for sage-grouse habitat/cover objectives. Season of use is important to grouse (spring utilization to 50% will result in temporary lack of cover needed for nest/brood concealment in many years) and regrowth not timely to reduce the effect.	T	Livestock Impacts
<p>Action: Design and implement vegetation treatments to improve habitat where juniper or shrub density is contributing to unsatisfactory habitat conditions. All treatments will be designed to protect scarce, unique and highly productive wildlife habitat types, retain large interconnected blocks of more common</p>		Protects habitat across the planning area.	N for GSG protection– needs to be limited to minimize net loss of sagebrush cover sufficient to provide habitat for sage-grouse (see Tech Ref. 417, 2005). This can be framed by recovery timelines expected for	S	Livestock Impacts, annual grassland, seeded perennial, sagebrush control, prescribed

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
<p>habitat types and accommodate specific wildlife habitat requirements including migration corridors for big game. Reseed burns with a variety of shrubs, forbs and grasses. Rest all burns and seedings from livestock grazing for a minimum of two growing seasons following treatment.</p>			<p>xeric/mesic sagebrush habitats...spatial and temporal scales are important before authorizing an activity that may cumulatively limit habitat effectiveness over a given spatial extent or span of time.</p>		<p>fire.</p>
<p>Action: Ensure water availability for wildlife by providing unrestricted access to all livestock waters, requiring that where necessary, waters are left on following removal of livestock and constructing additional water developments where water is determined to be limiting. Ensure that water is available at intervals of no more than three miles apart in big game habitat.</p>		<p>Provides access to water.</p>	<p>N – Effects of West Nile Virus were not factored into this. Constructing new water developments in GSG habitat may amplify adverse effects of the virus and habitat modification in areas previously subjected to little disturbance.</p>	<p>T</p>	<p>West Nile Virus</p>
<p>Action: Retain all public land within crucial and other high quality wildlife habitats unless exchanging for land of equal or higher value and acquire additional high quality habitat through purchase or exchange with willing landowners. These include but are not limited to wetland/riparian habitats, crucial big game winter habitat and isolated tracts and shrublands adjacent to agricultural areas that</p>		<p>Promotes “block mgmt.” and retention of land that supports habitat important to GSG.</p>	<p>Y</p>	<p>T</p>	<p>Urban/Exurban Development, agricultural expansion.</p>

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
provide important cover for upland game. Isolated tracts will be grazed only if needed to maintain or improve wildlife habitat.					
Action: Protect and enhance habitat for wildlife at all developed springs and selected undeveloped springs, wet meadows, reservoirs, and stream riparian reaches by fencing to exclude livestock. Close all exclosures to livestock grazing for the life of this plan except where it is determined that controlled grazing is necessary to achieve a specific resource objective.		Protects late brood rearing habitats. Implemented in grazing permit renewal efforts/Idaho Standards of RLH/Guidelines for Livestock grazing management.	Y	S	Livestock Impacts
<b>Special Status Species – Wildlife</b>					
<b>Sage-grouse</b>					
<b>Objective: SPSS I</b> Manage special status species and habitats to increase or maintain populations at levels where their existence is no longer threatened and there is no need for listing under the Endangered Species Act of 1973, as amended. See Tables SPSS-I and SPSS-2.					
Action: 9 Identify, protect, and enhance key sage grouse habitats and populations. Guidance for enhancement and protection is addressed in the		This action provides direction, but does not necessarily address allocations made through specific	N – Needs to specifically address conservation measures from state plan, across land use programs.	P	General

WHRS-I for details.					
<b>Wildland Fire Management</b>					
<p><b>Objective: FIRE 1</b>                      Suppress wildfires by taking appropriate management response utilizing the range of acceptable acreage limits listed for each fire management zone (FMZ) within the resource area. The current Fire Management Plan (FMP) is reviewed periodically and may be revised in conformance with RMP. See Map FIRE-I.</p>					
<p><b>Action:</b>                      Provide appropriate management response, considering resource values, fire-fighter safety, costs, allowing natural fire to burn to meet resource objectives, in closely monitored opportunities, on all natural and human caused fires to meet suppression standards established. When prescriptive criteria are developed, fires may be managed to meet resource objectives.</p>		Protects habitat across the planning area.	N – needs to be limited to minimize net loss of sagebrush cover sufficient to provide habitat for sage-grouse (see Tech Ref. 417, 2005). This can be framed by recovery timelines expected for xeric/mesic sagebrush habitats...spatial and temporal scales are important before natural fires are allowed to burn. This may cumulatively limit habitat effectiveness over a given spatial extent or span of time.	T	Wildfire, annual grasslands
<p><b>Objective: FIRE 2</b>                      Decrease soil erosion and sediment</p>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
yield, restore forage values, and restore upland habitat values and riparian values using fire rehabilitation procedures following a wildfire.					
Action: 1 Waterbar and seed all firelines constructed on slopes of 25% or more to prevent erosion.		Protects habitat across the planning area.	Y – may include use of shrub, grass, and forbs.	T	annual grasslands, seeded perennial
Action: 2 Backfill and reseed all firelines constructed by heavy equipment.		Protects habitat across the planning area.	Y – may include use of shrub, grass, and forbs.	T	annual grasslands, seeded perennial
Action: 3 Apply rehabilitation seed mixtures to meet watershed, wildlife, and riparian objectives.		Protects habitat across the planning area.	Y – may include use of shrub, grass, and forbs.	T	annual grasslands, seeded perennial
<b>Objective: FIRE 3</b> Restore natural disturbance regime to improve rangeland health and the biodiversity of native plant communities, using the example for a Prescribed Fire Activity Plan and the example for a Wilderness Fire Activity Plan.					
Action: Use natural and prescribed fire in big sagebrush and western juniper dominated vegetation communities to burn approximately 105,000 acres. No more than 15,000 acres would be prescribed burned in any given year. The target or goal would be 7,500 acres		Protects habitat across the planning area.	N – remove big-sagebrush from acre allowance unless a framework to address spatial and temporal recovery concerns are incorporated.	S	Conifer encroachment, wildfire, sagebrush control

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
per year.					
<b>Objective: FIRE 5</b> Modify standard suppression techniques to protect sensitive resource values.					
Action: 2 Use any and all available fire suppression techniques to protect the Silver City area, cultural ACECs, and unique wildlife habitat areas.		Protects habitat across the planning area.	N – emphasize important breeding/nesting/winter habitat areas.	T	Wildfire
<b>Resource Uses</b>					
<b>Livestock Grazing</b>					
<b>Objective: LVST I</b> Provide for a sustained level of livestock use compatible with meeting other resource objectives. Resolve issues associated with livestock grazing identified in the allotment management summary. See Appendix LVST-I in the Proposed Owyhee Resource Management Plan and Final Environmental Impact Statement (July 1999).					
Action: 6 Use a minimal level of rangeland developments (e.g., fences, water facilities) to adjust livestock grazing practices to achieve multiple use resource objectives and meet standards for rangeland health.		Protects habitat across the planning area.	Y	T	Livestock Impacts
Action: 8 Exclude livestock grazing from 22,227		Protects habitat across the planning	Y	T	Livestock Impacts

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
acres. Areas excluded from grazing are shown on Map LVST-2.		area.			
<b>Recreation and Visitor Services</b>					
<b>Objective: RECT I</b> Provide for off-highway motor vehicle (OHMV) use on public lands while protecting sensitive resource values.					
<p>Action: I Manage OHMV recreational use and mechanized vehicle recreational use on public lands in accordance with the following designations: See Maps RECT-1, RECT-2, and RECT-4.</p> <p>Open: Off-highway motorized vehicle use is allowed on all public lands without special restrictions, except as otherwise posted: 192 acres.</p> <p>Limited: Off-highway motorized vehicle use is limited to existing roads and trails year-round, except as otherwise posted: 519,442 acres. Off-highway motorized vehicle use is limited to designated roads and trails except as otherwise posted: 698,363 acres. Within the limited use area, competitive use may be permitted on designated routes on 224,265 acres. On 13,959 of these acres competitive use may be permitted on designated routes only from July 1 through November 14.</p> <p>Closed: All lands are closed to off-</p>		<p>Protects habitat across the planning area.</p> <p>This is superseded by Public Law 111-11, 2009, which limits OHMV use to existing roads and trails within Owyhee County until a comprehensive travel management plan is completed for the county (excepting areas where limited to designated routes in the Wilson Creek, Murphy Subregion, and Hemmingway Butte travel mgmt. areas).</p>	Y/N – could be updated to reflect P.L. 111-11.	T	Human Disturbance

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
highway motorized vehicle use year-round: 101,994.					
<p>Action: 2                      Manage over-snow- vehicle (OSV) recreational use on public lands in accordance with the following designations: See Map RECT-3.                      Open: Over snow vehicle use is allowed on all public lands without special restrictions, except as otherwise posted: 864,729 acres.                      Limited: Over snow vehicle use is limited to designated areas, except as otherwise posted: 24,211 acres. Over snow vehicle use is restricted from 12/15 through 3/31, except as otherwise posted: 90,749 acres.                      Closed: All lands are closed to over snow vehicle use: 259,036.                      Closed-IMP: All lands are closed to over snow vehicle use; if released from wilderness consideration, lands are then managed as limited to designated areas: 81,266 acres.</p>		<p>Protects habitat across the planning area.</p> <p>This is superseded by Public Law 111-11, 2009, which limits OMHV use to existing roads and trails within Owyhee County until a comprehensive travel management plan is completed for the county (excepting areas where limited to designated routes in the Wilson Creek, Murphy Subregion, and Hemmingway Butte travel mgmt. areas).</p>	Y/N – could be updated to reflect P.L. 111-11.	T	Human Disturbance
<b>Lands and Realty</b>					
<p><b>Objective: LAND I</b>                      Acquire through exchange, purchase, easement or donation and maintain those lands which have high resource values and to improve the management and administration of the public lands.</p>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
Lands with high resource values will be retained in federal ownership which provides for efficient and effective management and administration.					
Action: 1 Acquire through purchase, exchange, easement or donation, lands that will benefit the management of resource programs including but not limited to wild horses, wildlife, WSA's, ACEC's, riparian, cultural, recreation, etc.		This allows for the acquisition of important properties. Areas within Designated Wilderness have current priority for acquisition.	Y – could be refined to assign priority to GSG habitats within wilderness areas.	T	Urban/Exurban Development, agricultural expansion.
Action: 2 Manage newly acquired lands for the highest potential purpose for which they were acquired. Manage acquired lands with unique or fragile resources to protect those resources. Manage acquired lands without special values or management goals in the same manner as comparable or adjacent public lands.		Allows for protection of acquired lands.	Y	T	Urban/Exurban Development, agricultural expansion.
<b>Special Designations</b>					
<b>ACECs (Administrative Designations)</b>					
<b>Objective: ACEC I</b> Retain existing and designate new areas of critical environmental concern (ACECs) where relevance and importance criteria are met and where special management is needed to protect the values identified.					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse Relation (P, S, T)	Threat
<p>Action: I Designate the following areas of critical environmental concern (ACECs): See Map ACEC-I</p> <ul style="list-style-type: none"> <li>• Guffey Butte/Black Butte Archaeological District (7,750 acres)</li> <li>• Owyhee River Bighorn Sheep Habitat Area (141,796 acres)</li> <li>• Boulder Creek Outstanding Natural Area (6,978 acres)</li> <li>• North Fork Juniper Woodland Outstanding Natural Area (4,204 acres)</li> <li>• Cinnabar Mountain Research Natural Area (277 acres)</li> <li>• Coal Mine Basin Research Natural Area (1,604 acres)</li> <li>• Jump Creek Canyon (612 acres)</li> <li>• McBride Creek Research Natural Area (261 acres)</li> <li>• Pleasant Valley Table Research Natural Area (1,467 acres)</li> <li>• Sommercamp Butte Research Natural Area (440 acres)</li> <li>• Squaw Creek Research Natural Area (150 acres)</li> <li>• The Badlands Research Natural Area (1,833 acres).</li> </ul> <p>The total acreage of the 12 designated</p>		<p>Protects areas designated for the relevant and important values identified.</p>	<p>Y – ensure areas within priority habitat have GSG habitat identified as a relevant and important value.</p>	<p>T</p>	<p>General</p>

**CURRENT MANAGEMENT  
UPPER SNAKE FIELD OFFICE**

**JANUARY 4, 2012**

**FOR INTERNAL BLM AND FOREST SERVICE USE ONLY – NOT FOR  
DISTRIBUTION**

## To Western Sage-grouse RMPA/EIS ID Teams:

This document is intended for internal use by the BLM and Forest Service Field Offices for the Greater Sage-Grouse RMPAs/EISs. Current management (No Action alternative) provides a useful baseline for comparison of environmental effects (including cumulative effects) and demonstrates the consequences of not meeting the need for the action. Development of the Greater Sage-Grouse RMPAs/EISs current management will include reviewing and analyzing relevant goals, objectives, and management actions and allocations (descriptions of goals, objectives, and management actions and allocations is provided below) related to sage-grouse/habitat protection in existing BLM and Forest Service land use plans. This process will include documenting those goals, objectives, and management actions and allocations to aid in developing the No Action alternative in the RMPAs/EISs.

**Current Management Matrix** (provided at the end of these instructions). Field Office IDT members should use the current management matrix to capture current management relevant to sage-grouse/habitat protection. The intent is not to repeat the entire ROD for a land use plan, but rather document only the relevant goals, objectives, and management actions and allocations related to sage-grouse/habitat. The matrix includes an exhaustive list of resource and resource use topics that could possibly apply to a planning area/land use plan. However, not all resources/resource uses in the matrix may apply to all existing land use plans. Field Offices need to only provide information for those resources/resource uses that apply to 1) the land use plan under consideration, and 2) the resource/resource use **directly** or **indirectly** related to sage-grouse/habitat management.

## Steps in Documenting Current Management

1. **Column 1 – Current Management: Capture goals, objectives, and management actions and allocations relevant to sage-grouse/habitat protection.** The land use plan decisions establish goals and objectives (desired outcomes) for resources and resource uses and the allowable uses and management actions needed to achieve those goals and objectives. More specifically, desired future conditions or desired outcomes are stated as goals and objectives. Goals are broad statements of desired outcomes (plan-wide and resource or resource-use specific) and generally are not quantifiable or measurable. Objectives are more specifically desired conditions or outcomes to meet the resource/resource use goal.

Management actions and allowable uses are designed to achieve the objectives. Management actions include management measures that will guide future and day-to-day activities. Allowable uses indicate which uses are allowed, restricted, or prohibited, and may include stipulations. Allowable uses also identify lands where specific uses are excluded to protect resource values, or where certain lands are open or closed in response to legislative, regulatory, or policy requirements.

2. **Column 2 – Source Data: Document the source data related to the management action/allocation.** Include the GIS and other data that goal, objective, and management action and allocation is based on.
3. **Column 3 – Preliminary Assessment: Perform preliminary assessment of management action/allocation.** Include results of preliminary analysis (i.e., overlays) to determine status of sage-grouse/habitat protections (Example – FO excludes ROWs of X% of priority habitat).
4. **Column 4 – Management Adequacy: Assess whether goals, objectives, and management actions and allocations are adequate related to sage-grouse/habitat protection.** A “Not Adequate” determination will require an amendment to the land use plan.

<b>Wildland Fire Management</b>					
<b>GOAL:</b> Ensure that public lands are managed to protect public health and firefighter safety, resources and private lands, restore fire adapted ecosystems and promote community assistance and education.	N/A	Adequate		Tertiary	wildfire
Objective: Observe National Fire Policy wildland fire	N/A	Adequate		Secondary	wildfire

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
suppression priorities, including striving to reduce average wildland fire size and number of human-caused fire starts within the wildland-urban interface.					
<p>Action: When multiple wildland fire ignitions occur, apply the following criteria for establishing suppression priorities for resource protection, after fire fighter and public safety and WUI concerns are addressed:</p> <ul style="list-style-type: none"> <li>• Minimize risks to Greater sage-grouse source, Key, and Restoration habitats.</li> <li>• Minimize risks to resources where changes in fuel accumulation and fire occurrence have occurred (e.g., fire regime condition class [FRCC] 2 and FRCC 3 areas).</li> </ul>	N/A (Assuming you have statewide coverage of Key and Restoration habitat)	Adequate		Secondary	Wildfire
<p>Objective: Plan, design, and monitor WUI and landscape-level projects to reduce the combined risk to human life/property and resources.</p>	N/A	Adequate		Tertiary	Wildfire
<p>Action: Design fuels and vegetation projects (e.g., thinning, fuel breaks, reducing juniper encroachment) at the appropriate landscape scale to prevent wildland fire from moving toward or from WUI areas or other resources at risk (e.g., Greater sage-grouse</p>	N/A	Adequate		Secondary	Wildfire

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
habitat, big game ranges, developed recreation sites) using applicable fuels and vegetation treatment methods (e.g., chemical, biological [including livestock], mechanical, seeding, prescribed fire).					
Action: In designing vegetation treatments in Low- and Mid-elevation Shrub and Mountain Shrub that could potentially affect Greater Sage-grouse, conservation measures would be implemented.	Use statewide veg coverage, or USFO can provide one upon request	Inadequate. Need to state the specific conservation measures required.		Secondary	Wildfire
Objective: Maintain, protect, and expand Greater sage-grouse stronghold/source habitats.	N/A	Adequate		Primary	Wildfire
Action: Conduct vegetation treatments in areas that pose a wildland fire risk to Greater sage-grouse Key habitat.	N/A	Adequate		Primary	Wildfire
Objective: Maintain or improve FRCC so that wildland fire occurs within the historical (natural) range of fire frequency-severity while supporting the DPC.	N/A	Adequate		Tertiary	Wildfire
Action: Strategically place treatments on a landscape scale to prevent wildland fire from spreading into intact sagebrush steppe habitat (e.g., leks, breeding or brood rearing area) or WUI.	N/A	Adequate		Primary	Wildfire

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
Objective: Rehabilitate and stabilize areas to help stabilize soils, promote natural recovery, and establish fire-tolerant vegetation communities.	N/A	Adequate		Secondary	Wildfire
Action: WFU may be allowed in historically frequent fire regimes to restore fire's natural role and in Greater sage-grouse habitat for the benefit of the habitat only after site-specific project-level coordination with the Idaho Department of Fish and Game.	N/A	Adequate		Secondary	Wildfire
Action: Suppress wildland fires in stronghold/source habitats, except where WFU would benefit habitat.	N/A	Adequate		Primary	Wildfire
<b>Goal:</b> Protect and enhance sage grouse source habitats as well as enhance key ecological components in plant and animal communities.	N/A	Adequate		Secondary	Wildfire
Objective: Make progress towards DFC in the low-elevation shrub, perennial grass, invasive annual grass, mid-elevation shrub, mountain shrub, and juniper vegetation types.	N/A	Adequate		Secondary	Wildfire
Action: In perennial grass, invasive grass, and juniper invaded cover types, restore sagebrush steppe with an aggressive sagebrush seeding	N/A	Adequate		Primary	Wildfire

<b>Current Management</b>	<b>Source Data (GIS data requirements/ source related to management action)</b>	<b>Preliminary Assessment</b>	<b>Management Adequacy Y/N (N=need amendment)</b>	<b>Sage-grouse relation</b>	<b>Threat</b>
effort, using the appropriate sagebrush subspecies for the treatment area.					
Objective: Maintain, protect, and expand sage grouse source habitats.	N/A	Adequate		Primary	Wildfire
Action: Allow WFU in sage grouse habitats for the benefit of the habitat only after site-specific project level coordination with IDFG.	N/A	Adequate		Secondary	Wildfire
Action: Treat areas with source habitats that have low resiliency (i.e., areas characterized by low species diversity, undesirable composition, and dead or decadent sagebrush)	N/A	Adequate		Secondary	Wildfire
Action: Following wildland fire, WFU and prescribed fire treatments, use chemical, mechanical, and seeding treatments with appropriate plant materials to attempt to stabilize sites and prevent dominance of invasive, annual vegetation, and noxious weeds.	N/A	Adequate		Secondary	Invasive species
Objective: Treat sage grouse key and restoration habitats to expand source habitats. Improve and maintain sage grouse Restoration (RI-3) and key habitats.	N/A (assuming you have statewide coverage of Restoration habitat)	Adequate		Primary	Wildfire
Action: Use AMR to wildland fire in all sage grouse	N/A	Adequate		Primary	Wildfire

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
restoration and key habitats and healthy wildlife habitats.					
Action: WFU may be allowed in historically frequent fire regimes to restore fire's natural role and in sage grouse restoration and key habitats for the benefit of the habitat only after site-specific project level consultation/collaboration with IDFG.	N/A	Adequate		Secondary	Wildfire
Action: Conduct vegetation treatments in restoration and key habitats to reduce risk of wildland fire and reconnect restoration and key habitats.	N/A	Adequate		Primary	Wildfire
Action: Treat areas of restoration and key habitats that have low resiliency characterized by low species diversity.	N/A	Adequate		Secondary	Wildfire
Objective: Apply Greater sage-grouse conservation measures and management restrictions for fire suppression and fire and non-fire vegetation treatments.	N/A	Adequate		Secondary	Wildfire
Action: Implement the following suppression restrictions: <b><u>Fire Management</u></b> <ul style="list-style-type: none"> <li>In the event a wildland fire escapes initial attack, a BLM resource advisor will be</li> </ul>	N/A	Adequate, together with other fire suppression actions		Secondary	wildfire

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>assigned to ensure that resource management concerns are adequately addressed and that necessary mitigation occurs. If one of the following is being threatened or has the potential to be threatened, the appropriate manager will be notified with the following information and a resource advisor will be dispatched: 1) Public health and safety, 2) WUI, 3) Sage grouse habitat and, 4) Any ACEC, Resource Natural Area (RNA), congressionally delegated watershed or any other area of significant concern.</p> <p><b><u>Noxious Weeds</u></b></p> <ul style="list-style-type: none"> <li>To minimize spread of noxious weeds, equipment used for extended attack or Type I/II incidents should be cleaned before arriving on-site and prior to leaving the incident. Staging areas and fire camps should avoid sites with noxious weed infestations.</li> </ul> <p><b><u>Special Designations (WSAs, ACECs)</u></b></p> <ul style="list-style-type: none"> <li>Fire camps and staging areas should be placed outside of special management areas.</li> <li>Use of natural firebreaks and existing roads and trails to contain a wildland fire would be encouraged.</li> <li>The resource values, hazards present, and management prescriptions within specific areas would be evaluated when</li> </ul>

<p>applying guidelines to ACECs.</p> <p><b><u>Vegetation</u></b></p> <ul style="list-style-type: none"> <li>Blading should occur on existing roads where possible. Blading through undisturbed areas, especially those supporting native cover types, should be avoided unless necessary to protect life, property, or resource values.</li> </ul> <p><b><u>Wildlife</u></b></p> <ul style="list-style-type: none"> <li>When conducting fire suppression actions, species with recovery plans, conservation agreements, Partners in Flight species, and Birds of Conservation Concern will be protected as specified in their respective plans and or agreements.</li> <li>Establishment of control lines, base camps, and support facilities in known SSS habitat will be avoided unless life and property are threatened.</li> </ul> <p><b><u>Threatened, Endangered, and Candidate Species</u></b></p> <p>The following restrictions apply to Proposed, Threatened, Endangered and Candidate species and to “designated” critical habitat.</p> <ul style="list-style-type: none"> <li>The BLM will coordinate annually with the USFWS to update species status in the planning area.</li> <li>Field Managers will ensure resource staff initiates emergency consultation with the USFWS whenever suppression activities</li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>may impact listed species habitat and, more specifically, during emergency suppression actions to protect life and property.</p> <ul style="list-style-type: none"> <li>• Minimum Impact Suppression Techniques (MIST) guidelines will be followed in occupied T&amp;E and Candidate species habitat where appropriate (Appendix T in Interagency Standards for Fire and Aviation Operations, 2005). MIST guidelines direct suppression techniques, procedures, tools, and equipment that least impact the environment. Wet-lining (using water to soak/saturate fuels) is the preferred fireline construction tactic.</li> <li>• Field Managers will assign a Resource Advisor or other designated representative as per the current Red Book guidance. <ul style="list-style-type: none"> <li>○ BLM will notify USFWS when appropriate to discuss T&amp;E species mitigation within the suppression area to assure conservation practices are being followed to avoid adverse effects.</li> <li>○ When Incident Management Teams (IMTs) are required, the Resource Advisor will brief the IC about conservation measures needed to avoid adverse effects.</li> </ul> </li> <li>• To minimize spread of noxious weeds,</li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>equipment used for extended attack or Type I/II incidents should be cleaned before arriving on-site and prior to leaving the incident. Staging areas and fire camps will avoid sites with noxious weed infestations.</p>					
<p>Action: Implement the following fire and non-fire vegetation restrictions: <b><u>Vegetation Management</u></b></p> <ul style="list-style-type: none"> <li>No chemical treatment would conflict with existing or future national vegetative treatment guidance. To reduce potential resource impacts from chemical treatments, herbicide use would conform to application criteria described in the 1991 document, Environmental Impact Statement for Vegetation Treatment on BLM Lands in Thirteen Western States or in subsequent revisions and/or replacements of this document. Use would conform to instructions from BLM Manual 9011 Chemical Pest Control, as well as label restrictions and current policies and state statutes. In addition, the prescription for herbicide application (desired, optimum environmental conditions) would evaluate off-site migration and non-target species by assessing wind speed and direction,</li> </ul>	N/A	Adequate, along with other veg treatment actions		Secondary	wildfire

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>temperature, precipitation forecast, soil infiltration potential, constraints on overland water transport due to precipitation or flooding, establishment of riparian buffer strips, and risk to special status species. Fishery and/or wildlife biologists would assist project planners in selecting appropriate herbicides for use among or near terrestrial and aquatic flora and fauna sensitive to herbicides.</p> <ul style="list-style-type: none"> <li>Fuels treatments would be utilized to reduce the overall threat of the establishment and spread of noxious/invasive plant species.</li> </ul> <p><b><u>Livestock Grazing</u></b></p> <ul style="list-style-type: none"> <li>All treatment areas would be rested from livestock grazing until project-specific monitoring identified in site-specific project plans and/or NEPA documents show that resource objectives have been met. Resumption of grazing would be determined on a case-by-case basis.</li> </ul> <p><b><u>Placeholder Species</u></b></p> <ul style="list-style-type: none"> <li>Plant materials used in re-vegetation actions would be native when appropriate and practical. However, desirable non-native species may be used in re-vegetation actions on harsh or degraded sites, when native seed is not</li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>available, or where they would structurally mimic the natural plant community and prevent soil loss and invasion by exotic annual grasses and noxious weeds. The species used would be those that have the highest probability of establishment on these sites. These "placeholders" would maintain the area for potential future native restoration. Native seed would be used more frequently and at larger scales as species adapted to local areas become more available.</p> <p><b>Wildlife</b></p> <ul style="list-style-type: none"> <li>Species with recovery plans, conservation agreements, Partners in Flight species, and Birds of Conservation Concern will be protected as specified in their respective plans/agreements.</li> <li>Habitat Conservation Assessment and Conservation Strategies have been prepared and are currently being implemented for the following BLM sensitive species: Townsend's big-eared bat, wolverine, spotted bat, white headed woodpecker, trumpeter swan, northern goshawk, Columbian sharp-tailed grouse, greater sage grouse (Idaho plan pending), mountain quail, Idaho dunes tiger beetle, Bonneville cutthroat trout, bull trout, Yellowstone cutthroat trout, red band</li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>trout and leather sided chub.</p> <ul style="list-style-type: none"> <li>Vegetation treatments proposed in areas supporting sage grouse and sharp-tailed grouse would be coordinated with IDFG and would be implemented under LUP guidance or restrictions.</li> </ul> <p><b><u>Threatened, Endangered, and Candidate Species</u></b></p> <p>The following restrictions apply to proposed habitats occupied by T&amp;E and Candidate species and designated critical habitat.</p> <ul style="list-style-type: none"> <li>Treatment activities may occur near or adjacent to T&amp;E and Candidate species habitat and will be designed to minimize or mitigate impacts to habitat occupied by T&amp;E and Candidate species and designated critical habitat so that the species or their habitats will not be adversely affected. All related fire and non-fire vegetation treatment activities in areas that may affect T&amp;E and Candidate species would be conducted in consultation with USFWS. Further, all such activities would be designed and implemented in such a manner that potential impacts to T&amp;E and Candidate species from disturbance or habitat modification would be extremely unlikely to occur or would be so small as to not be meaningfully measured, detected, or analyzed.</li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<ul style="list-style-type: none"> <li>T&amp;E and Candidate species with recovery plans, conservation agreements, and conservation strategies will be protected as specified in their respective plans/agreements/strategies. These protections include such measures as adequate habitat and range for a given species, including mitigation measures for multiple land use activities authorized by the BLM.</li> <li>Herbicide applicators will obtain a weather forecast for the area prior to initiating a spraying project to ensure no extreme precipitation or wind events could occur during or immediately after spraying. Aerial application of herbicides will not occur during periods of inversion. Spraying will follow label instructions.</li> </ul>					
<p>Action: Implement the following Greater sage-grouse conservation measures: <b>Prescribed Fire</b></p> <ul style="list-style-type: none"> <li>Prior to planning prescribed burns or other vegetation management treatments in sagebrush communities, ensure that sage-grouse seasonal habitats have been mapped (see 5.3.2 for additional discussion of mapping).</li> <li>Once seasonal habitats have been</li> </ul>	N/A	Adequate		secondary	Prescribed Fire

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>mapped, ensure that proposed project areas have been evaluated on the ground in the context of the appropriate seasonal habitat characteristics (see 5.3.2).</p> <ul style="list-style-type: none"> <li>• Avoid the use of prescribed fire and other sagebrush-reduction projects in areas where sagebrush is limiting on the landscape or in habitats that currently meet, or are trending toward meeting, breeding or winter habitat characteristics.</li> <li>• If the analysis shows that a vegetation treatment may still be advisable, design habitat-manipulation projects to achieve the desired objectives, considering the following:               <ul style="list-style-type: none"> <li>○ Where prescribed burning, or other treatments, in sage-grouse habitats may be warranted (e.g., sagebrush cover exceeds desired breeding or winter habitat characteristics; understory does not meet seasonal habitat characteristics and restoration is desired; there is a need to restore ecological processes; or a proposed treatment site is in an exotic seeding being managed for overall sage-grouse benefits on the surrounding landscape).</li> <li>○ Project design should be done with</li> </ul> </li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>interdisciplinary input and in cooperation with IDFG.</p> <ul style="list-style-type: none"> <li>○ Ensure that any proposed sagebrush treatment acreage is conservative in the context of surrounding seasonal habitats and landscape.</li> <li>○ Where appropriate, ensure that treatments are configured in a manner that promotes use by sage-grouse (see Connelly 2000 for additional discussion).</li> <li>○ Leave adequate untreated sagebrush areas for loafing/hiding cover near leks for sage-grouse.</li> </ul> <ul style="list-style-type: none"> <li>● Evaluate and monitor prescribed burns, and other treatments, as soon as possible after treatment and periodically thereafter to determine whether the project was successful and is meeting or trending toward desired objectives.</li> <li>● Avoid the use of prescribed fire or other sagebrush treatments in habitats prone to the expansion or invasion of cheatgrass or other invasive species unless adequate measures are taken to control the invasive species and ensure subsequent dominance by desirable perennial species. In many—if not most—cases, this will likely require chemical treatments and reseeded.</li> <li>● Plan, execute, and monitor prescribed</li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>fires in a manner that provides for adequate control and provision for contingency resources.</p> <ul style="list-style-type: none"> <li>• Ensure that burn plans address the importance of preventing escaped fires when prescription fires are planned in the vicinity of stronghold and key habitat.</li> </ul> <p><b>Annual Grasslands</b></p> <ul style="list-style-type: none"> <li>• Local working groups (LWG), land management agencies, IDFG, and other partners should work closely together to identify and prioritize annual grassland areas for restoration. Work cooperatively to identify options, schedules, and funding opportunities for specific projects.</li> <li>• In general, the priority for implementation of specific sage-grouse habitat restoration projects in annual grasslands should be given first to: <ul style="list-style-type: none"> <li>○ Sites adjacent to or surrounded by sage-grouse stronghold habitats, then</li> <li>○ Sites outside stronghold habitats but adjacent to or within approximately two miles of key habitat, and</li> <li>○ Sites beyond two miles of key habitat. The intent here is to focus restoration outward from existing, intact habitat.</li> </ul> </li> <li>• All seeding project designs should include measures for noxious weed control and</li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>monitoring for at least 3 years following implementation.</p> <ul style="list-style-type: none"> <li>Seed used in sage-grouse habitat restoration seedings, burned area rehabilitation projects, and hazardous fuels/wildland urban interface projects will be tested and certified as weed-free, based on prevailing agency policy and protocol. Private landowners are encouraged to use only certified seed, as well.</li> <li>In designing rehabilitation and restoration projects, use the best available science relative to seeding technology and plant materials. Use of NRCS's "VegSpec" website may be helpful. VegSpec is a web-based decision support system that assists land managers in the planning and design of vegetation establishment practices. VegSpec uses soil, plant, and climate data to select plant species that are site-specifically adapted, suitable for the selected practice, and appropriate for the purposes and objectives for which the planting is intended. (See <a href="http://plants.usda.gov">http://plants.usda.gov</a>).</li> <li>Design vegetation treatments in areas of high fire frequency to facilitate firefighter safety; reduce the risk of extreme fire behavior; reduce the risk and rate of fire</li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>spread to stronghold, key, and restoration habitats; reduce fire frequencies; and shorten the fire season.</p> <ul style="list-style-type: none"> <li>• Where rangelands are dominated by annuals (such as cheatgrass) or where they border farmlands or railroad right-of-ways, convert cheatgrass areas to perennials, or establish buffers of perennial species to reduce the risk of fire spread from railroad or agriculture-related activities (e.g., sparks from trains, field burns, burn barrels), where appropriate and feasible.</li> <li>• To discourage the spread of invasive annuals and noxious weed seed, require the washing of fire vehicles (including undercarriage) prior to deployments and prior to demobilization from wildfire incidents.</li> <li>• Human activities such as fence and pipeline maintenance or construction, facility maintenance, utility maintenance, or any project or related work at or within 1 km (0.6 miles) of occupied leks that results in or will likely result in disturbance to lekking birds should be avoided from approximately 6:00 PM to 9:00 AM. In general, this guideline should be applied from March 15 through May 1 in lower elevation habitats and March 25 through May 15 in higher elevation</li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>habitats.</p> <p><b>Perennial Grasslands</b></p> <ul style="list-style-type: none"> <li>• LWGs, land management agencies, IDFG, and other partners should work closely together to identify and prioritize perennial grasslands (exotic versus native) where plant species diversity or sagebrush is limiting on the landscape. Further, they should work cooperatively to identify options, schedules, and funding opportunities for reestablishing sagebrush in higher priority areas.</li> <li>• When seeding sagebrush, source-identified, tested seed adapted to local conditions should be used.</li> <li>• One or more of the following approaches for restoring sagebrush should be considered to improve likelihood of success (see Dalzell 2004 and Monsen et al. 2004):</li> <li>• Use of the "Oyer" compact row seeder, which compacts soil and presses seed into the surface.</li> <li>• Use of the Brillion cultipacker seeder, where seed is broadcast over the surface followed by cultipacking.</li> <li>• Transplant bare-root or containerized stock in small critical areas to establish a seed source.</li> <li>• Use the "mother plant" technique, and</li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>transplant bare-root or containerized stock in select locations throughout the area to establish a seed source.</p> <ul style="list-style-type: none"> <li>• For large areas (e.g., large wildland fires), aerial seed onto a rough seedbed (Monsen et al. 2004) coupled with one or more of the above options.</li> <li>• In established stands of introduced perennial grasses, transplant sagebrush into strategic patches or strips in critical sites or throughout the area. Scalp spots or strips to reduce grass competition prior to planting. Or, as an alternative to scalps, consider the use of herbicides (see Monsen et al. 2004, Volume 3).</li> <li>• Where the diversification of crested wheatgrass or similar seedings with native species of grasses, forbs, and/or shrubs is desired, Pellant and Lysne (2005) recommend a three-step process:</li> <li>• Reduce competition of crested wheatgrass to facilitate the establishment and persistence of the desired species. Possibilities include use of livestock, capitalizing on drought episodes that reduce grass vigor, herbicides such as glyphosate, and mechanical treatments. <ul style="list-style-type: none"> <li>○ Introduce desired, site-adapted species through drill seeding; aerial seeding followed by harrow, cultipacker or chaining;</li> </ul> </li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>livestock trampling; or transplanting container stock, bareroot stock, or individual plants from native sources ("wildings"). Lambert (2005) provides descriptions, recommended seeding rates, and other useful information for nearly 250 species of native and non-native grasses, forbs, and shrubs.</p> <ul style="list-style-type: none"> <li>○ As part of post-treatment management, ensure that livestock grazing and rest intervals are matched with the phenology and life history characteristics of the desired/seeded/transplanted species. Implement monitoring to clearly document how, what, when, and where treatments were implemented. Follow up with suitable effectiveness monitoring to document success of the treatments relative to project objectives.</li> </ul> <p><b>Conifer Encroachment</b></p> <ul style="list-style-type: none"> <li>• LWGs, land management agencies, IDFG, and other partners should work closely together to identify and prioritize conifer encroachment areas for further management action. Work cooperatively to identify options, schedules, and funding opportunities for specific projects. For western juniper, Miller et al. (2005) provide <i>Guidelines for Selecting the</i></li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p><i>Most Appropriate Management Actions</i>, pages 54–57.</p> <ul style="list-style-type: none"> <li>• IDFG, land management agencies, LWGs, and other partners should work closely together to identify leks where conifer encroachment may be affecting lek attendance or nearby habitat quality.</li> <li>• Remove Douglas fir or other conifers where they are encroaching on wet meadows, riparian areas, or sagebrush stands that provide potential sage-grouse habitat.</li> <li>• Remove juniper, Douglas fir, pinyon pine, or other trees within at least 100 m (330 ft) or an 8-acre area of occupied sage-grouse leks. The purpose of this procedure is to reduce perching opportunity for raptors or other avian predators within view of leks. Techniques could include chainsaw, chipper, or other suitable mechanical means. Ensure cutting and slash disposal is completed between approximately July 15 and January 30 to minimize disturbance to grouse that may be in the vicinity (e.g., males at leks, nesting females, and young broods). This practice serves to reduce raptor predation on sage-grouse by eliminating potential perches, thereby improving survival, recruitment, and productivity. It may be particularly valuable where avian</li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<p>predation may be of greater concern such as in areas with fragmented habitat, nearby infrastructure features, and/or in the case of small, isolated sage-grouse populations.</p> <ul style="list-style-type: none"> <li>Where juniper or other conifer species have encroached upon sagebrush communities at larger scales, employ prescribed fire, chemical, mechanical (e.g., chaining, chipper, chainsaw, or commercial sale), or other suitable methods to reduce or eliminate juniper. Priority should be given to areas where there is a strong likelihood for recovery of perennial herbaceous vegetation or where preparatory and follow-up actions (e.g., control of invasive species and seeding) are likely to be successful. Whenever possible, but especially if sagebrush habitat is limited locally, use juniper-control techniques that are least disruptive to the affected stand of sagebrush. For example, if junipers are only scattered, and the associated sagebrush community is otherwise relatively healthy, cutting junipers with chainsaws will remove the encroachment threat while allowing for immediate use of the sagebrush by sage-grouse. In all cases, control efforts should be planned using interdisciplinary expertise.</li> </ul>					

Current Management	Source Data (GIS data requirements/ source related to management action)	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)	Sage-grouse relation	Threat
<ul style="list-style-type: none"> <li>Where juniper control around leks is planned, monitor leks for at least three consecutive years post-treatment to document effects on lek attendance. Ideally, two to three years of pre-treatment monitoring is also recommended, but this may not always be feasible.</li> </ul>

Preliminary: GSG Conservation Guidance/MT-DAKs Conformance Review

**Instructions:** please review the NTT column and identify for your RMP how you approached that issue/topic area in your current pre-draft RMP (how this is covered in the range of alternatives, where it is found in the document, how it is analyzed, etc.) – and in the last column comments about rationale (perhaps why it wasn’t identified as an issue to be addressed) or other comments. For issues that you feel are not RMP planning level considerations (mitigation guidelines or BMPs) please discuss if these are addressed in an appendix, where they could be appropriately added, and rationale for why they are not RMP level actions for your planning area.

Topic Area	GSG National Technical Team Report	Consistency Review	Comment/Concern
<p><b>Travel and Transportation</b></p>	<p><b>Priority Habitat</b></p> <ul style="list-style-type: none"> <li>Limit motorized travel to designated roads, primitive roads, and trails at a minimum</li> </ul>	<p><b>Appendix X pg. 214</b>  <b>DFO ROD/RMP pg. 60</b>  <u>Wheeled Motorized Use/Non-Motorized Use</u>                      Manage no areas as “open” under the regulations at 43 CFR Part 8340-8342.                      Manage 826,876 acres as “limited” to designated routes for OHV use under the regulations at 43 CFR Part 8340-8342.</p> <ul style="list-style-type: none"> <li>Designate approximately 1,342 miles of road on BLM lands as open to public travel as shown on Maps 26 and 27 (oversized).</li> <li>Make 159 miles of the 1, 342 miles of road subject to seasonal restrictions</li> </ul>	<p>No Concern</p> <p>All motorized travel in DFO is limited to designated routes.</p> <p>All of these actions listed under travel require an EA to be completed if we make any changes to the TMP.</p>
	<ul style="list-style-type: none"> <li>Travel management should evaluate the need for permanent or seasonal road or area closures.</li> </ul>	<p><b>See above↑</b>  <b>Also Appendix X pg. 214</b>  <b>Roads and Motorized Vehicles</b>  <i>Issue: Roads may increase sage grouse mortality through collisions with vehicles, displacement because of human disturbance, or other factors.</i></p> <ol style="list-style-type: none"> <li>Identify, map, quantify, and evaluate impacts of existing roads, including 2-tracks, in relation to known lek locations and sage grouse winter ranges.</li> <li>Consider impacts to sage grouse when designing new roads and modifying existing roads.</li> </ol>	<p>No Concern</p>

Topic Area	GSG National Technical Team Report	Consistency Review	Comment/Concern
		<p>3. Consider seasonal use restrictions or signing to avoid disturbance of critical times, such as winter and nesting periods.</p>	
	<ul style="list-style-type: none"> <li>Complete activity level plans within five years of the record of decision. During activity level planning, where appropriate, designate routes with current administrative/agency purpose or need to administrative access only.</li> </ul>	<p><b>Pg 62 Action 11b</b>                      11 Allow motorized cross-country or route travel to occur without prior permission in areas closed to motorized travel for the following activities:                      b. BLM personnel, or agency contractors, performing official administrative business (e.g., prescribed fire, noxious weed control, re-vegetation, surveying, etc.). Where possible, personnel will place a sign or notice in the area they are working in to identify for the public the function they are authorized to perform.</p>	<p>No Concern</p>
	<ul style="list-style-type: none"> <li>Limit route construction to realignments of existing designated routes if that realignment has a minimal impact on sage-grouse habitat, eliminates the need to construct a new road, or is necessary for motorist safety</li> </ul>	<p><b>Pg. 61 Action 9</b>                      9. Evaluate "new roads" on a case-by-case basis through an environmental assessment process to determine whether they will be open to public travel. "New roads" means roads that do not presently exist but are necessary for access to timber sales, mining activities, to provide general access, or to facilitate other authorized uses of public lands. Designate routes determined to enhance public access opportunities that do not conflict with management of other resources as open and add them to the travel management map through routine plan maintenance.</p>	<p>No Concern                       Would require an EA anyway</p>
	<ul style="list-style-type: none"> <li>Use existing roads, or realignments as described above to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary, and add the surface disturbance to the total disturbance in the priority area. If that disturbance exceeds 3 % for that area, then make</li> </ul>	<p><b>Pg. 59 Action 1</b>  <b>TRANSPORTATION AND FACILITIES MAINTENANCE</b>  <b>Goal 1</b>                      Manage facilities, including roads and trails, to provide for public access or administrative needs, while maintaining or protecting resource values and in</p>	<p>No Concern</p>

Topic Area	GSG National Technical Team Report	Consistency Review	Comment/Concern
	<p>additional, effective mitigation necessary to offset the resulting loss of sage-grouse habitat (see Objectives).</p>	<p>coordination with other federal agencies, state and local governments, and private landowners.</p> <p><b>Actions</b></p> <p>1 Inventory and maintain transportation system roads and trails under BLM jurisdiction in accordance with assigned maintenance levels as outlined in Appendix O to meet public health and safety requirements, but also in consideration of resource issues including but not limited to proliferation of weeds and disturbance of cultural resources.</p> <p><b>Appendix O pg. 171</b></p> <p>Transportation system roads and trails are classified by maintenance levels specified in BLM Manual Handbook H-9113- 2. Any changes or updates to maintenance levels will be incorporated into this planning guidance.</p>	<p>Appendix O Identifies the minimum maintenance standards to be applied</p>
	<ul style="list-style-type: none"> <li>Allow no upgrading of existing routes that would change route category (road, primitive road, or trail) or capacity unless the upgrading would have minimal impact on sage-grouse habitat, is necessary for motorist safety, or eliminates the need to construct a new road.</li> </ul>	<p>See above ↑ and Appendix O</p>	<p>No Concern</p>
	<ul style="list-style-type: none"> <li>Conduct restoration of roads, primitive roads and trails not designated in travel management plans. This also includes primitive route/roads that were not designated in Wilderness Study Areas and within lands with wilderness characteristics that have been selected for protection.</li> </ul>	<p><i>Issue: Roads and their associated disturbances and cumulative effects contribute to the loss of habitat and declining sage grouse populations.</i></p> <ol style="list-style-type: none"> <li>Develop a transportation management plan across ownership boundaries in critical sage grouse habitats.</li> <li>Participate in travel planning efforts and educate the general public about the impacts of roads on sage grouse and critical habitat.</li> <li>Consider buffers, removal, realignment, or seasonal closures where appropriate to avoid degradation of habitat.</li> <li>Re-vegetate closed roads with plant species beneficial to sage grouse.</li> </ol>	<p>Ongoing as identified in our watershed assessments</p>

	<p>Objectives).</p> <ul style="list-style-type: none"> <li>▪ When necessary, conduct additional, effective mitigation in 1) priority sage-grouse habitat areas or – less preferably – 2) general sage-grouse habitat (dependent upon the area-specific ability to increase sage-grouse populations).</li> <li>▪ Conduct additional, effective mitigation first within the same population area where the impact is realized, and if not possible then conduct mitigation within the same Management Zone as the impact, per 2006 WAFWA Strategy – pg 2-17.</li> </ul> <ul style="list-style-type: none"> <li>• Require unitization when deemed necessary for proper development and operation of an area (with strong oversight and monitoring) to minimize adverse impacts to sage-grouse according to the Federal Lease Form, 3100-11, Sections 4 and 6.</li> <li>• Identify areas where acquisitions (including subsurface mineral rights) or conservation easements, would benefit sage-grouse habitat.</li> <li>• Require a full reclamation bond specific to the site. Insure bonds are sufficient for costs relative to reclamation (Connelly et al. 2000, Hagen et al. 2007) that would result in full restoration. Base the reclamation costs on the assumption that contractors for the BLM will perform the work.</li> <li>• Make applicable Best Management Practices (BMPs, see Appendix D) mandatory as Conditions of Approval within priority sage-grouse habitat.</li> </ul>	<p><b>SUMMARY OF THE REASONABLE FORESEEABLE DEVELOPMENT SCENARIO FOR OIL AND GAS</b></p> <p>Based on our analysis, we estimate that six wildcat wells could be drilled in the area in the next 10 to 15 years. (A “wildcat well” is an exploratory well drilled in an area with no existing production.) Of these six wells, we estimate that four would be dry holes. (If no economically producible oil or gas is discovered, a well is called a “dry hole” or “noncommercial discovery.”) Dry holes would be plugged and abandoned with surface reclamation occurring shortly afterward. For analysis purposes, we believe that two of the wells could likely have gas discoveries (however there is also a lower chance of oil production). One producer would be on either BLM minerals or lands administered by the Forest Service. The other would be on privately owned minerals. Each of those wells would probably prompt additional step-out wells. (A “step-out well” is a well drilled adjacent to or near a proven well to establish the limits of the oil or gas reservoir.) For analysis purposes, we estimate that a total of four step-out wells would be drilled, two for each discovery.</p> <p><b>DFO Proposed RMP/Final EIS Appendix H - table at bottom of pg. 88</b> Total disturbed acres for development would be less than 580 Acres</p>	<p>←←</p> <p>See scenario analyzed in RMP for full field development. max of ten wells could be drilled over the life of the RMP</p> <p>RMP plan amendment would be needed to exceed this over the life of the plan.</p>

(Kramer and Havens 2009).</p>	<p>be excluded by using fencing, closing specific pastures, or closing en-tire allotments.</p> <ul style="list-style-type: none"> <li>• Only native species will be seeded in WSAs.</li> <li>• Monitoring will determine the effectiveness of seeding and to indicate when grazing will resume.</li> <li>• Use only certified weed-free sources and collect seed samples for an All States Noxious Weed Test. Seed nonnatives only in areas of the burn where high erosion or unacceptable vegetation is expected to occur. This may include, but not be limited to, roads, gullies, noxious weed areas, or cheatgrass sites. This will allow refugia for native species where they can reestablish without competition from nonnative species.</li> <li>• If nonnative species are used, a preference should be given to species that are not invasive and can be replaced naturally by native shrubs and grasses. If this is inappropriate or is ineffective, a commitment should be made for long-term secondary restoration of a site following planting of nonnatives.</li> </ul> <p><b>DFO ROD/RMP pg. 29 Monitoring</b>  <i>Goal 2</i>                      Pre-fire condition and post-fire effects will be determined by monitoring vegetative response to treatments and progress towards meeting objectives. Monitoring methods may include fuels and vegetation transects, photo points, density, cover and frequency plots, and ocular estimates. As available, applicable remote sensing data will also be incorporated into ecological condition monitoring. The number of acres in Condition Class 1, 2, and 3 will be re-evaluated during the watershed assessment</p>	

Topic Area	GSG National Technical Team Report	Consistency Review	Comment/Concern
		<p>process, and tracked and reported in the Annual Program Summary and Planning Update.</p> <p><i>Goal 3</i> Wildfire rehabilitation effectiveness monitoring studies will be encouraged to determine whether emergency rehabilitation objectives are met. Monitoring requirements and methods will be project specific.</p> <p><b>Appendix X pg.208</b> <i>Issue: Rehabilitation and restoration of sagebrush grass-lands.</i></p> <ol style="list-style-type: none"> <li>1. Assure that long-term wildfire rehabilitation objectives are consistent with the desired natural plant community.</li> <li>2. Re-vegetate burned sites in sage grouse habitat within one year unless natural recovery of the native plant community is expected. Areas disturbed by heavy equipment will be given priority consideration.</li> <li>3. Emphasize native plant species adapted to the site that are readily available and economically and biologically feasible.</li> <li>4. Monitor the site and treat for noxious weeds.</li> <li>5. Allow a minimum of two growing seasons of rest from grazing by domestic livestock unless there are specific restoration objectives using livestock.</li> </ol>	
<p><b>Habitat Restoration</b></p>	<ul style="list-style-type: none"> <li>• Prioritize implementation of restoration projects based on environmental variables that improve chances for project success in areas most likely to benefit sage-grouse (Meinke et al. 2009). <ul style="list-style-type: none"> <li>○ Prioritize restoration in seasonal habitats that are thought to be limiting sage-grouse distribution and/or abundance.</li> </ul> </li> </ul>	<p>WAFWA guidelines are incorporated in Appendix X and include restoration guidelines</p> <p><b>Rangeland Veg pg. 51 Action 14</b> 14. Improve existing seedings that are not meeting range-land health standards for plant vigor and density by implementing grazing management systems or re-seeding with appropriate species of natives or cultivars. Focus restoration of any existing</p>	<p>No seasonal habitats in DFO have been identified as limiting sage grouse distribution. Most if not all habitat that has been tilled or sprayed and seeded on BLM lands in the past has re-established the sagebrush canopy cover .</p>

Topic Area	GSG National Technical Team Report	Consistency Review	Comment/Concern
		seedings on areas containing high resource values and/or priority habitats and species. Allow the use of all available tools.	
	<ul style="list-style-type: none"> <li>• Include sage-grouse habitat parameters as defined by Connelly et al. (2000), Hagen et al. (2007) or if available, State Sage-Grouse Conservation plans and appropriate local information in habitat restoration objectives. Make meeting these objectives within priority sage-grouse habitat areas the highest restoration priority.</li> </ul>	WAFWA guidelines are incorporated in Appendix X Management Plan and Conservation strategies for sage grouse in MT is also used for sage grouse habitat management	No Concern  This is identified and prioritized during Watershed assessment process
	<ul style="list-style-type: none"> <li>• Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success (Richards et al. 1998). Where probability of success or adapted seed availability is low, non-native seeds may be used as long as they support sage-grouse habitat objectives (Pyke 2011).</li> </ul>	This is all addressed in responses above under the other resources and conservation measures in Appendix X <b>DFO ROD/RMP</b> <b>Noxious Weeds pg. 49 Action 10</b> 10. Use native species for rehabilitation and reclamation unless site specific evaluations indicate that nonnative species are needed to ensure success or rapid vegetative reestablishment.	No Concern
	<ul style="list-style-type: none"> <li>• Design post restoration management to ensure long term persistence. This could include changes in livestock grazing management, wild horse and burro management and travel management, etc., to achieve and maintain the desired condition of the restoration effort that benefits sage-grouse (Eiswerth and Shonkwiler 2006).</li> </ul>	This is all addressed in responses above under the other resources and conservation measures in Appendix X	No Concern
	<ul style="list-style-type: none"> <li>• Consider potential changes in climate (Miller et al. 2011) when proposing restoration seedings when using native plants. Consider collection from the warmer component of the species current range when selecting native species (Kramer and Havens 2009).</li> </ul>		Climate change not addressed in RMP
	<ul style="list-style-type: none"> <li>• Restore native (or desirable) plants and create landscape patterns which most benefit sage-grouse.</li> </ul>	This is all addressed in responses above	No Concern

Topic Area	GSG National Technical Team Report	Consistency Review	Comment/Concern
	<ul style="list-style-type: none"> <li>Make re-establishment of sagebrush cover and desirable understory plants (relative to ecological site potential) the highest priority for restoration efforts.</li> </ul>	<p>This is all addressed in responses above under the other resources and conservation measures in Appendix X</p>	<p>No Concern</p>
	<ul style="list-style-type: none"> <li>In fire prone areas where sagebrush seed is required for sage-grouse habitat restoration, consider establishing seed harvest areas that are managed for seed production (Armstrong 2007) and are a priority for protection from outside disturbances.</li> </ul>	<p><b>Appendix E pg. 118</b>  <b>NATURAL REVEGETATION</b>                      In many cases, successful reestablishment of native species occurs if the perennial plant species are not killed as a result of the fire, or if viable and desirable seed or root mass is present. Generally, in these areas it would be necessary to rest the burned area from livestock grazing for at least two growing seasons. In some situations, the area may be closed to vehicles by issuing a temporary emergency closure. The only rehabilitation that may be necessary is repairing dam-aged fencing and/or construction of temporary fencing around the burned area until the native vegetation is successfully re-established.</p> <p>Seeding guidelines:</p> <ul style="list-style-type: none"> <li>Native species will be utilized over nonnative species as appropriate and based on seed availability.</li> <li>A project inspector will monitor all phases of implementation.</li> <li>The area to be seeded will be rested from grazing for at least two growing seasons or until vegetation is successfully established. Livestock will be excluded by using fencing, closing specific pastures, or closing en-tire allotments.</li> <li>Only native species will be seeded in WSAs.</li> <li>Monitoring will determine the effectiveness of seeding and to indicate when grazing will resume.</li> <li>Use only certified weed-free sources and collect seed samples for an All States Noxious Weed Test. Seed</li> </ul>	<p>No Concern</p>

**DONE!!**

**US Department of the Interior  
Bureau of Land Management**

**Greater Sage-Grouse Resource Management Plan  
Amendments and Environmental Impact  
Statements**

**Western Region**

---

**CURRENT MANAGEMENT  
JARBIDGE RESOURCE MANAGEMENT PLAN  
(1987)**

**FEBRUARY 2012**

**FOR INTERNAL BLM AND FOREST SERVICE USE ONLY – NOT FOR  
DISTRIBUTION**

## To Western Sage-grouse RMPA/EIS ID Teams:

This document is intended for internal use by the BLM and Forest Service Field Offices for the Greater Sage-Grouse RMPAs/EISs. Current management (No Action alternative) provides a useful baseline for comparison of environmental effects (including cumulative effects) and demonstrates the consequences of not meeting the need for the action. Development of the Greater Sage-Grouse RMPAs/EISs current management will include reviewing and analyzing relevant goals, objectives, and management actions and allocations (descriptions of goals, objectives, and management actions and allocations is provided below) related to sage-grouse/habitat protection in existing BLM and Forest Service land use plans. This process will include documenting those goals, objectives, and management actions and allocations to aid in developing the No Action alternative in the RMPAs/EISs.

**Current Management Matrix** (provided at the end of these instructions). Field Office IDT members should use the current management matrix to capture current management relevant to sage-grouse/habitat protection. The intent is not to repeat the entire ROD for a land use plan, but rather document only the relevant goals, objectives, and management actions and allocations related to sage-grouse/habitat. The matrix includes an exhaustive list of resource and resource use topics that could possibly apply to a planning area/land use plan. However, not all resources/resource uses in the matrix may apply to all existing land use plans. Field Offices need to only provide information for those resources/resource uses that apply to 1) the land use plan under consideration, and 2) the resource/resource use **directly** or **indirectly** related to sage-grouse/habitat management.

## Steps in Documenting Current Management

1. **Column 1 – Current Management: Capture goals, objectives, and management actions and allocations relevant to sage-grouse/habitat protection.** The land use plan decisions establish goals and objectives (desired outcomes) for resources and resource uses and the allowable uses and management actions needed to achieve those goals and objectives. More specifically, desired future conditions or desired outcomes are stated as goals and objectives. Goals are broad statements of desired outcomes (plan-wide and resource or resource-use specific) and generally are not quantifiable or measurable. Objectives are more specifically desired conditions or outcomes to meet the resource/resource use goal.  
  
Management actions and allowable uses are designed to achieve the objectives. Management actions include management measures that will guide future and day-to-day activities. Allowable uses indicate which uses are allowed, restricted, or prohibited, and may include stipulations. Allowable uses also identify lands where specific uses are excluded to protect resource values, or where certain lands are open or closed in response to legislative, regulatory, or policy requirements.
2. **Column 2 – Source Data: Document the source data related to the management action/allocation.** Include the GIS and other data that goal, objective, and management action and allocation is based on.
3. **Column 3 – Preliminary Assessment: Perform preliminary assessment of management action/allocation.** Include results of preliminary analysis (i.e., overlays) to determine status of sage-grouse/habitat protections (Example – FO excludes ROWs of X% of priority habitat).
4. **Column 4 – Management Adequacy: Assess whether goals, objectives, and management actions and allocations are adequate related to sage-grouse/habitat protection.** A “Not Adequate” determination will require an amendment to the land use plan.

<b>Current Management</b>	<b>Source Data (GIS data requirements/ source related to management action)</b>	<b>Sage-Grouse Relation</b>	<b>Threats</b>	<b>Preli minar y Assess ment</b>	<b>Management Adequacy Y/N (N=need amendment)</b>
<b>Resources</b>					
<b>Air</b>					
N/A - Did not find any info related to sage-grouse.					
<b>Soil &amp; Water</b>					
<b>GOAL:</b> Soils will be managed to maintain productivity and to minimize erosion.		Tertiary	Livestock Impacts		
Objective: Project level planning will consider the level of sensitivity of soil, water and air resources in the affected area on a site specific basis.		Tertiary	Infrastructure		
Action: All construction of management facilities and land treatments will be designed to minimize adverse impacts to the soil, water, and air resources.		Tertiary	Infrastructure		
Action: All areas disturbed during project construction will be reseeded with a mixture of grasses, forbs, and shrubs.		Tertiary	Infrastructure		
Objective: Maintain soil erosion by maintaining good, perennial vegetation cover on all sites.		Tertiary	Livestock Impacts		

Current Management	Source Data (GIS data requirements/ source related to management action)	Sage-Grouse Relation	Threats	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)
Objective: Manage native perennial range to attain good ecological condition.		Secondary	Livestock Impacts		
Objective: Rehabilitated or manipulated sites are considered to be in good condition from a watershed standpoint when at least 75% (by weight) of the sites potential for production is composed of perennial vegetation.		Secondary	Livestock Impacts		
Action: [Insert allowable use #1]					
<b>Vegetation – General</b>					
Listed under Vegetation-Rangeland					
<b>Vegetation – Forest &amp; Woodlands</b>					
N/A - Did not find any info related to sage-grouse.					
<b>Vegetation – Rangeland</b>					
<b>GOAL:</b> The overall objective of the range program is to maintain or improve the soil, vegetation, and watershed conditions within the resource area and to provide forage for livestock, wildlife and wild horses.		Secondary	Livestock Impacts		
Objective: Wildlife habitat will be managed to maintain or increase wildlife numbers over the long term, and the total acres of unsatisfactory crucial habitat will be reduced over the long term.	<i>No maps or GIS data exist to describe wildlife habitat in this plan.</i>	Secondary	Annual Grasslands		
Action: Interseeding and reseeding projects in MUA with objectives to improve ecological condition to benefit wildlife or livestock will use shrub, forb, and grass seed mixture that are normally found in that type of ecological zone/type.		Secondary	Perennial Seeded		
Action: Specific habitat improvement projects will be	Map 11	Tertiary	Annual		

Current Management	Source Data (GIS data requirements/ source related to management action)	Sage-Grouse Relation	Threats	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)
implemented on 18,200 acres.			Grassland		
Action: No chemical control of sagebrush will be allowed.		Secondary	Contaminants – Pesticide Use		
Action: Priority areas for vegetative treatment include: areas where excessive annual vegetation is causing management problems or economic burdens; areas where unacceptable wildlife habitat condition exists (appropriate seed mixtures for wildlife will be used); areas for overall multiple use improvement using seed mixtures for both wildlife and livestock.		Secondary	Annual Grassland		
Action: [Insert allowable use #1]					
<b>GOAL:</b> Manage all ecological sites on mule deer, pronghorn, elk, bighorn sheep and sage grouse habitat currently in fair or poor ecological condition, for good ecological condition.	<i>No maps or GIS data exist to describe wildlife habitat or ecological condition in this plan.</i>	Primary	Livestock Impacts		
Objective: [Insert objective #1]					
Action: [Insert management action #1]					
<b>Vegetation – Riparian</b>					
<b>GOAL:</b> Riparian and wetland habitat will have a high priority for protection and improvement in accordance with national policy.		Secondary	Livestock Impacts		
Objective: Management activities in riparian zones will be designed to maintain or improve riparian habitat condition.		Secondary	Livestock Impacts		
Action: Roads and utility corridors will avoid riparian zones to the extent practicable.		Secondary	Infrastructure		
Action: Design all new spring developments and modify selected existing spring developments to protect wetted areas.		Secondary	Water Development		

Current Management	Source Data (GIS data requirements/ source related to management action)	Sage-Grouse Relation	Threats	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)
Action: Where possible, and if the need exists for wildlife, fence reservoirs and provide water for livestock away from the reservoirs.	Map 8	Secondary	Livestock Impact		
Objective: Avoid construction activities which remove or destroy riparian vegetation and instream fish cover.		Secondary	Infrastructure		
Action: Provide a riparian buffer zone of sufficient width (100 to 300 feet minimum) to protect riparian vegetation....as determined by an interdisciplinary team of resource specialists, which includes fisheries and wildlife specialists. Buffer zones would generally be used to exclude the following activities: <ul style="list-style-type: none"> <li>• Limit new road construction that parallels streams</li> <li>• Maintain full suppression on wildfires</li> <li>• Spraying of herbicides and pesticides</li> </ul>		Secondary	Infrastructure		
Action: Utilize a 1000 foot (500 feet each side) buffer zone for the total exclusion of the following activities: <ul style="list-style-type: none"> <li>• Oil and gas occupancy and/or surface disturbance</li> <li>• Introduction of chemical toxicants as a result of construction, mining, or agriculture.</li> </ul>		Tertiary	Oil and Gas		
Action: In all cases, allow no proposals that include dewatering of the streambed.		Secondary	Water Development		
Action: All habitat improvement projects in riparian-stream systems will be coordinated and/or reviewed by the Idaho Department of Fish and Game.		Tertiary	Human Disturbance		
<b>Vegetation – Weeds</b>					
<b>GOAL:</b> BLM will control the spread of noxious weeds on public lands where possible, where economically feasible, and to the extent that funds		Secondary	Invasive Plants		

Current Management	Source Data (GIS data requirements/ source related to management action)	Sage-Grouse Relation	Threats	Preli minar y Assess ment	Management Adequacy Y/N (N=need amendment)
are prioritized for that purpose.					
Objective: [Insert objective #1]					
Action: [Insert management action #1]					
<b>Fisheries &amp; Aquatic Wildlife</b>					
N/A - Did not find any info related to sage-grouse.					
<b>Wildlife</b>					
Listed under general wildlife section.					
<b>Special Status Species – Wildlife</b>					
<b>Sage-grouse</b>					
<b>GOAL:</b> Protect and enhance endangered, threatened, and sensitive species habitats in order to maintain or enhance existing and potential populations within the planning area.		Secondary	Sagebrush Control		
Objective: Where applicable, “Guidelines for Habitat Protection in Sage Grouse Range” and “Sage Grouse Management Practices” (Technical Bulletin No. 1) – Western States Sage Grouse Committee, June 1974, and 1982 respectively, will be followed.		Primary	Sagebrush Control		
Action: No control work would be allowed where live sagebrush cover is less than 20%.	<i>No maps or GIS data exist to describe 20% sagebrush cover in this plan.</i>	Primary	Sagebrush Control		
Action: Treatment measures should be applied in irregular patterns using topography and other ecological considerations to minimize adverse effects to the sage grouse resource.		Primary	Sagebrush Control		
Action: Where fire is used as a habitat management tool, it should be used in such manner as to result in a mosaic pattern of shrubs in open areas, with openings, optimally from 1 to 10 acres in size.		Secondary	Prescribed Fire		
Action: Maintain the density of sagebrush canopy	<i>No maps or GIS data exist</i>	Primary	Sagebrush		

Current Management	Source Data (GIS data requirements/ source related to management action)	Sage-Grouse Relation	Threats	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)
coverage at 20-30% within nesting habitats and at least 20% in wintering habitats.	<i>to describe sagebrush cover, nesting or wintering habitats in this plan.</i>		Control		
Action: No control of sagebrush would be considered in any area known to have supported important wintering populations of sage grouse in the past 10 years.	<i>No maps or GIS data exist to describe wintering sage-grouse populations/areas in this plan.</i>	Primary	Sagebrush Control		
Action: Seed mixtures for range improvement projects and fire rehabilitation projects will include a mixture of grasses, forbs, and shrubs that benefit sage grouse.		Primary	Seeded Perennial Grassland		
Action: Improve sage grouse brood rearing habitat where sagebrush canopy cover is greater than 20% by removing sagebrush in small irregular areas and then reseeding.	<i>No maps or GIS data exist to describe sagebrush cover or brood rearing habitats in this plan.</i>	Primary	Sagebrush Control		
Action: Wildlife Habitat Occupancy Restrictions: No occupancy in sage grouse winter range (entire habitat area) from December 1 through February 15.	<i>No maps or GIS data exist to describe sagebrush wintering habitats in this plan.</i>	Primary	Human Disturbance		
Action: Wildlife Habitat Occupancy Restrictions: No occupancy in sage grouse breeding grounds (entire habitat) from February 15 through June 30.	<i>No maps or GIS data exist to describe sage-grouse breeding grounds in this plan.</i>	Primary	Human Disturbance		
Action Wildlife Habitat Occupancy Restrictions: No occupancy in sage grouse nesting/brood rearing habitat within 2 miles radius from a lek from April 15 through June 30.	<i>No maps or GIS data exist to describe sage-grouse nesting/brood rearing habitat or leks in this plan. IDFG has historic lek data.</i>	Primary	Human Disturbance		

Current Management	Source Data (GIS data requirements/ source related to management action)	Sage-Grouse Relation	Threats	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)
<b>GOAL:</b> Priority for habitat management will be given to habitat for listed and candidate threatened or endangered species and sensitive species.		Secondary	Several: Infrastructure, Livestock Impacts, Human Disturbance, Sagebrush Control, Prescribed Fire		
Objective: [Insert objective #1]					
Action: If any listed or candidate threatened or endangered species may be affected by BLM actions, the Fish and Wildlife Service will be consulted as prescribed by the Endangered Species Act.		Secondary	Several: Infrastructure, Livestock Impacts, Human Disturbance, Sagebrush Control, Prescribed Fire		
Action: [Insert management action #2]					
<b>General Wildlife</b>					
<b>GOAL:</b> Wildlife habitat will be managed to maintain or increase wildlife numbers over the long term, and the total acres of unsatisfactory crucial habitat will be reduced over the long term.	<i>No maps or GIS data exist to describe crucial habitat in this plan.</i>	Secondary	Annual Grassland		
Objective: Localized adverse impacts will be avoided or reduced through interdisciplinary project planning and wildlife input into the development of AMPs and other specific resource plans.		Tertiary	Livestock Impacts		
Action: Existing fences will be modified where specific wildlife needs are not being met. All new fences will be built for wildlife passage.		Secondary	Infrastructure		

Current Management	Source Data (GIS data requirements/ source related to management action)	Sage-Grouse Relation	Threats	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)
Objective: Wildlife needs will be considered in all vegetation treatment projects. Seed mixtures will contain appropriate mixtures of grasses, forbes, and shrubs to benefit wildlife.		Secondary	Seeded Perennial Grassland		
Action: Forage/cover requirements will be incorporated into allotment management plans and will be specific to areas of primary wildlife use.		Secondary	Livestock Impacts		
Action: Areas disturbed during project construction will be reseeded with a mixture of grasses, forbs and shrubs to meet site specific needs or habitat requirements.		Secondary	Infrastructure		
Action: The Idaho Department of Fish and Game will be consulted one year in advance on all vegetative manipulation projects.		Tertiary	Sagebrush Control		
Objective: Range improvements will be designed to achieve watershed, wildlife, and range objectives.		Secondary	Sagebrush Control		
Action: Wildlife escape devices will be installed on all troughs and tanks.		Tertiary	Water Development		
Action: In crucial wildlife habitats (winter ranges, strutting grounds, etc.) major construction and maintenance work will be scheduled to avoid or minimize disturbance to wildlife.	<i>No maps or GIS data exist to describe wildlife habitat in this plan.</i>	Secondary	Human Disturbance		
Action: Water will be provided in allotments (including rested pastures) during seasonal periods of need for wildlife.		Secondary	Water Development		
<b>GOAL:</b> Limited use class areas' purpose is to delineate public lands where strict environmental controls are required to protect sensitive and significant resources.		Tertiary	Infrastructure		
Objective: First priority for managing a limited use class is to protect and enhance key wildlife habitat, wild horse habitat, scenic values, wilderness, cultural	Map 4	Tertiary	Infrastructure		

Current Management	Source Data (GIS data requirements/ source related to management action)	Sage-Grouse Relation	Threats	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)
resources, watershed, and other sensitive and significant resources.					
Action: [Insert management action #1]

<b>Forestry</b>					
N/A - Did not find any info related to sage-grouse.					
<b>Livestock Grazing</b>					
<b>GOAL:</b> The overall objective of the range program is to maintain or improve the soil, watersheds and vegetation conditions within the resource area and to provide forage for livestock, wildlife, and wild horses.		Tertiary	Livestock Impacts		
Objective: Sufficient vegetation is reserved for purposes of maintaining plant vigor, stabilizing soil, providing cover for wildlife, and other non-consumptive uses.		Secondary	Livestock Impacts		
Action: Establish livestock grazing systems and		Tertiary	Livestock		

Current Management	Source Data (GIS data requirements/ source related to management action)	Sage-Grouse Relation	Threats	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)
practices that recognize the physiological requirements of forbs and shrubs.			Impacts		
Objective: Proposed stocking rates are designed to provide adequate forage for watershed protection, plant requirements, wildlife, livestock, and other resource uses.		Secondary	Livestock Impacts		
Action: The proposed use of 176,976 AUMs is a target level that will be reached over a period of several years and may be adjusted based on monitoring and evaluation studies.		Tertiary	Livestock Impacts		
Objective: Priority will be given to evaluating the season-of-use on multiple use areas (MUA) 10, 15, and 16. These MUA contain large areas of crucial wildlife habitat. Season of use will be adjusted if necessary to resolve forage conflicts. Priority will be given to crucial habitat areas that are in poor ecological condition.	<i>No maps or GIS data exist to describe crucial wildlife habitat in this plan.</i>	Secondary	Livestock Impacts		
Action: [Insert allowable use #1]					
Objective: Improve lands in poor ecological condition.	<i>No maps or GIS data exist to describe ecological condition in this plan.</i>	Secondary	Livestock Impacts		
Objective: Maintain existing lands that are in good and excellent ecological condition.	<i>No maps or GIS data exist to describe ecological condition in this plan.</i>	Secondary	Livestock Impacts		
Objective: Maintain present levels of upland game bird nesting and cover habitat.	<i>No maps or GIS data exist to describe bird nesting and cover habitat in this plan.</i>	Secondary	Sagebrush Control		
Action: Activity plans will be implemented on an allotment basis and will be designed to achieve		Tertiary	Livestock Impacts		

Current Management	Source Data (GIS data requirements/ source related to management action)	Sage-Grouse Relation	Threats	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)
the resource objectives identified in each MUA.					
Objective: Maintain current condition of riparian habitat.		Tertiary	Livestock Impacts		
Objective: Improve 40.4 miles of riparian habitat.	Map 8?	Secondary	Livestock Impacts		
Action: Specific management actions to improve riparian habitat will include grazing schedules designed to meet riparian vegetative needs and fencing of riparian pastures to provide maximum control over livestock use.		Secondary	Livestock Impacts		
Action: Fencing of riparian habitat to exclude livestock will occur where other management opportunities do not exist or where other management actions have been implemented and are not successful in achieving the riparian management objective.	Map 8 Riparian/Aquatic Proposed Fencing	Secondary	Livestock Impacts		
<b>Recreation and Visitor Services</b>					
<b>GOAL:</b> BLM will manage recreation on the public lands.		Tertiary	Human Disturbance		
Objective: The Boise District will provide and maintain recreation opportunities and facilities on public lands.		Tertiary	Human Disturbance		
Action: Some areas may be subject to special restrictions to protect resources or eliminate or reduce conflicts among uses.		Secondary	Human Disturbance		
<b>Comprehensive Trails and Travel Management</b>					
<b>GOAL:</b> [Insert goal #1]					
Objective: [Insert objective #1]					
Action: Avoid constructing any roads within or	<i>No maps or GIS data exist</i>	Secondary	Infrastructure		

Current Management	Source Data (GIS data requirements/ source related to management action)	Sage-Grouse Relation	Threats	Preliminary Assessment	Management Adequacy Y/N (N=need amendment)
closely adjacent to crucial wildlife habitat.	<i>to describe crucial wildlife habitat in this plan.</i>				
<b>Lands and Realty</b>					
<b>GOAL:</b> The RMP identifies 90,366 acres of public land for transfer out of federal ownership.		Tertiary	Urban/Exurban Development, Agricultural Expansion		
Objective: Detailed analysis will be conducted on a case by case basis before decisions are made to transfer these lands through sale, exchange, or through appropriate agricultural entry laws.		Tertiary	Urban/Exurban Development/ Agricultural Expansion		
Action: Land exchanges would not be considered where crucial wildlife habitat would be disposed of unless better crucial wildlife habitat is to be received.	<i>No maps or GIS data exist to describe crucial wildlife habitat in this plan.</i>	Secondary	Urban/Exurban Development, Agricultural Expansion		
Action: Exchanges will not be considered that would dispose of Sikes Act designated wildlife tracts.	<i>No maps or GIS data exist to describe wildlife tracts in this plan.</i>	Tertiary	Agricultural Expansion		
Objective: Exchanges will be weighed against enhancing the Jarbidge Forks Recreation Management Area and wildlife values.	<i>No maps or GIS data exist to describe the Jarbidge Forks RMA in this plan.</i>	Tertiary	Urban/Exurban Development, Agricultural Expansion		
Action: The Idaho Department of Fish and Game will be consulted one year in advance on all proposed land transfers.		Tertiary	Urban/Exurban Development, Agricultural Expansion		
Action: Any public lands where rare, endangered, threatened, or sensitive species of plant or animal are known to live (or nest) would be found unsuitable for disposal, unless mitigation is possible.		Secondary	Urban/Exurban Development, Agricultural Expansion		
Action: Certain tracts of land identified as valuable for wildlife habitat would be found unsuitable for	<i>No maps or GIS data exist to describe wildlife habitat</i>	Tertiary	Agricultural Expansion

### Approaches/Considerations - Brainstorming/Discussion

- 1) Current Functioning/Non-functioning Habitat in PPH Habitats
  - a. Use vernacular in the Framework report: suitable, marginal, unsuitable
  - b. PPH habitats - management actions for restoration – Current map includes stratification for perennial grassland and conifer encroachment
  - c. Potential for wildfire relative to habitat loss, contribution to sage-grouse habitat requisites, site resiliency, etc.
- 2) Habitat Categories/intensity of management
  - a. Footprint/population
- 3) Habitat Categories/Seasons of Use – Data Availability
  - a. Brood-rearing – some data available
  - b. Lekking – yes
  - c. Winter – generally known - yes
  - d. Connectivity – yes
  - e. Priority habitats broken into 3 categories: functioning, perennial grass, conifer encroachment
  - f. Connectivity with BBD map – could map seasonal habitats as individual layers
  - g. Habitat Quality – Measures of habitat are one component, but needs to include restoration/management of habitats
    - i. Degrees of departure
  - h. Management Zones
    - i. Goals and objectives vary depending on habitat suitability and vegetation condition
    - ii. Functional vs non-functional habitats – suite of management actions depending on category
    - iii. Difficulty in mapping functional and non-functional habitats – scale inferences?
- 4) Precipitation Zones – Lump with #
  - a. Inferences for productivity, management goals and objectives, etc.
- 5) Sage-Grouse Population/sub-populations
  - a. 2006 assessment, management areas within administrative boundaries
- 6) Management Areas – Administration of Management Boundaries
- 7) Local Working Group Boundaries
  - a. Use LWG boundaries as areas relative to management priorities
- 8) Protection vs. Restoration Stratification (cf. #1)
  - a. Stratification of habitats relative to management direction
- 9) WAFWA Management Zones
  - a. Most of ID is MZ 3 with a small portion in MZ 4
  - b. Need to be addressed separately
- 10) Soil/Vegetation
  - a. Restoration/management opportunities, site resiliency, etc.
- 11) Ecoregional/Assessments Delineation
- 12) Key/R1/R2/R3 – Stratification of sagebrush/sage-grouse habitats
  - a. Key habitats – intact for sage-grouse in most seasons
  - b. Restoration areas – perennial grasslands
  - c. R2 – annual grassland
  - d. R3 – conifer

**Idaho Sage-Grouse Meeting**  
**June 25, 2012**  
**Pocatello, ID**

Participants: from sign-up sheet

**Goals and Objectives**

- Goals for Meeting
  - o Develop stratification for sage-grouse habitats with group consensus
  - o Criteria for which stratifications are derived
  - o Recommendation of in a final map and approach
  - o Used as a basis for future discussion by teams in July/August
  - o Submit to Contractor for use in EIS
- Internal ID/MT Alternatives – Range of Alternatives
  - o Stratify sage-grouse PPH map
  - o Management goals, objectives and actions
- Alternatives to Date
  - o No Action - Schroeder map
  - o National Planning Strategy – Guidance in NTT report to PPH
    - Map displays PPH and PGH = occupied habitat
    - Management direction and guidance from NTT – focus on PPH
  - o Alt. B – Conservation Group Alternative
    - Derived from scoping document – Wild Earth Guardians
    - Recommended all PPH described – energy development areas → Nominate as ACEC
    - Map = PPH and PGH combined as priority areas – managed separately
  - o Governor’s Task Force Draft
    - PPH/PGH as base to redefine subsets of habitat/management direction
      - Core habitats – existing development, no new development
      - Important Areas – allow for some new development → focus on existing development areas/corridors
      - PGH – rest of sage-grouse habitats
      - Combination of Core/Important Areas covers 95% BBD map (100%)
    - Totals PPH/PGH habitat among the 3 subsets

**Available Data**

- Information from v. 2 map for PPH/PGH for Idaho and Montana
- Persistence information with currently occupied habitat
  - o 1 km grids cf. Aldredge – 25-65% considered low probability; 65% + persistence – index of landscape (sagebrush)
- Analysis comprised of 3 data layers: lek connectivity, persistence map, BBD (100%) maps to sum up contribution of landscaped
- Assessed relationship to other data sets: recent lek data (2011), known winter and breeding habitats, human footprint analysis, geographic risk map (abiotic map), fire history, roads, etc.
- Cf. Framework document (*A Framework to Identify Greater Sage-grouse Preliminary Priority Habitat and Preliminary General Habitat for Idaho*)

## Approaches – Step Down

- 1) Populations – primary stratification (incorporates MZs)
  - Populations in Sub-region
    - SW MT – telemetry indicates high connectivity – essentially one core population
      - Potential to group with Idaho populations? Management guidance may be similar across state boundaries
    - Weiser
    - East Central ID
    - Snake -Salmon-Beaverhead
    - Northern Great Basin
    - Sawtooth (lump with Snake/Salmon River Population)
    - Bear River (part of WY Basin population) – MZ III
  - USFWS - roll up for populations; contribution of populations to range-wide distribution
- 2) Local Working Groups - second stratification (within population)
  - Provides specific goals and objectives
  - Geographically identifiable
  - Some applicability to sub-population boundaries
  - Means of aggregating information for analysis purposes and management guidance
  - Provides for further stratification of PPH/PGH and importance to population
- 3) PPH/PGH – third stratification (spatial)
  - a. Seasonal and (cf. Habitat Assessment Framework) – described in the document (non-spatial)
  - b. Connectivity Habitats as described in Idaho Framework
- 4) Internal ACEC nominations – fourth stratification

Ed's questions regarding ID-BLM Response to NPT 6/4/14

In preparation for our discussion later today, I wanted to provide you with some of the concerns we would like to go over with you and your team regarding the info memo you sent us on 5/29/14. Hopefully you can provide us with some clarification/rationale on a few inconsistencies with the NPT allocation recommendations.

**For Priority Habitat (Core/Important):**

- 1 What is your rationale for managing medial (important) habitat as a ROW avoidance area, instead of managing it as a ROW exclusion area for wind/solar?
- 2 Idaho is only closing areas to fluid mineral development that are low potential. What is the biological rationale for opening moderate and high potential areas for development? Are you applying NSO to any core (priority) areas?
- 3 Are core and important areas closed to non-energy leasables?
- 4 For mineral materials, what is the rationale for leaving medial (important) areas open? For existing sites, are they subject to the 3% disturbance cap and no net unmitigated loss?

**For General Habitat**

- 5 What is your rationale for not managing general habitat as a ROW avoidance area for solar/wind?
- 6 What is your rationale for not managing general habitat as a ROW avoidance area for high-voltage transmission ROWs?

### **Adaptive Management**

- 7 Is BLM Idaho's adaptive management strategy consistent with the AM sideboards? How does the AM strategy apply to other allocation categories other than ROWs?

### **Disturbance**

- 8 What do you mean when you say that BLM Idaho is “inconsistent with specific biological units.” The NPT guidance allowed the sub-regions to provide for their own unit, as long as information could be aggregated up to the PAC level. Also – you state that the cap is only subject to “seasonal habitats of highest concern” – does this mean that you are not applying the cap to all general and priority (core, important, and general)? Who makes the determination of what is of a “highest concern?”
- 9 Will the no net unmitigated loss be applied to core, important, and general habitat?
- 10 How much medial (important) habitat lies within the PAC boundaries?

### **Cross-Jurisdictional Coordination**

- 11 Are there any inconsistencies with how the Forest Service plans to manage their priority and general habitat areas?
- 12 Have you resolved all of the FWS stop-light matrix concerns (shifting reds to yellows or greens)?

I look forward to our discussion. After we discuss these questions and reconcile these issues, we can confirm that the data you sent to the NOC is ready for the roll-up or you can send any changes in data on to the NOC.

**Roberson, Edwin** <eroberso@blm.gov>

Wed, Jun 4, 2014 at 6:42 AM

To: Timothy Murphy <tmurphy@blm.gov>, Jeffery Foss <jfoss@blm.gov>, Brent Ralston <bralston@blm.gov>

Tim, I had a misstatement in the last line of my email to you all this morning. It should have said: After we discuss these questions and reconcile these issues, we can confirm that the data is ready to send to the NOC for the roll up.,

On Wed, Jun 4, 2014 at 8:35 AM, Roberson, Edwin <eroberso@blm.gov> wrote:

Tim,

In preparation for our discussion later today, I wanted to provide you with some of the concerns we would like to go over with you and your team regarding the info memo you sent us on 5/29/14. Hopefully you can provide us with some clarification/rationale on a few inconsistencies with the NPT allocation recommendations.

### For Priority Habitat (Core/Important):

What is your rationale for managing medial (important) habitat as a ROW avoidance area, instead of managing it as a ROW exclusion area for wind/solar?

Idaho is only closing areas to fluid mineral development that are low potential. What is the biological rationale for opening moderate and high potential areas for development? Are you applying NSO to any core (priority) areas?

Are core and important areas closed to non-energy leasables?

For mineral materials, what is the rationale for leaving medial (important) areas open? For existing sites, are they subject to the 3% disturbance cap and no net unmitigated loss?

### For General Habitat

What is your rationale for not managing general habitat as a ROW avoidance area for solar/wind?

What is your rationale for not managing general habitat as a ROW avoidance area for high-voltage transmission ROWs?

### Adaptive Management

Is BLM Idaho's adaptive management strategy consistent with the AM sideboards? How does the AM strategy apply to other allocation categories other than ROWs?

### Disturbance

What do you mean when you say that BLM Idaho is "inconsistent with specific biological units." The NPT guidance allowed the sub-regions to provide for their own unit, as long as information could be aggregated up to the PAC level. Also – you state that the cap is only subject to "seasonal habitats of highest concern" – does this mean that you are not applying the cap to all general and priority (core, important, and general)? Who makes the determination of what is of a "highest concern?"

Will the no net unmitigated loss be applied to core, important, and general habitat?

How much medial (important) habitat lies within the PAC boundaries?

Cross-Jurisdictional Coordination

Are there any inconsistencies with how the Forest Service plans to manage their priority and general habitat areas?

Have you resolved all of the FWS stop-light matrix concerns (shifting reds to yellows or greens)?

I look forward to our discussion. After we discuss these questions and reconcile these issues, we can confirm that the data you sent to the NOC is ready for the roll-up or you can send any changes in data on to the NOC.  
Thank you. Ed

1 Avoidance Wind & Solar

**Why does Idaho have three GRS management zones?**

The three-tiered management zone approach, created in partnership with the state of Idaho, is designed to specifically support an adaptive management strategy and to substantively address wildfire, the primary threat to the species within the Idaho and Montana sub-region.

The Idaho and SW Montana sub-regional plan delineates three sage-grouse management zones – Core, Important and General, to retain and protect sagebrush cover and sage-grouse habitat through appropriate habitat prioritization and protective measures within the most critical habitat zones.

**Core Management Zones:**

- Protect large, continuous sagebrush habitat from anthropogenic disturbance
- Focus on wildfire reduction within these areas
- Two key metapopulations; 65% of the occupied leks and associated seasonal habitats necessary to support 73% of the breeding males
- Compose 66% of the USFWS priority areas for conservation (PAC)
- Extremely limited to further anthropogenic disturbance
- Go beyond the NPT direction by including closures to fluid mineral leasing,
- If an adaptive regulatory hard trigger is engaged in these zones, no further development is permitted
- Soft triggers in these zones can be related to grazing management

**Important Management Zones:**

- Provide protection for habitats adjacent to CMZs
- Encompass 30% of the occupied leks
- Support approximately 22% of the breeding males
- Compose remaining PACs (33%)
- Include additional 750,000 acres that support 4% of the breeding males outside of PACs
- Also include areas beyond those PAC boundaries that would receive threat amelioration management to help foster connectivity and retention of habitat within CMZ and PAC areas.
- Any proposed development in these zones must comply with Anthropogenic Disturbance Development Criteria and would require lek buffers, required design features, and appropriate seasonal or timing restrictions

**General Management Zones:**

- Contain less than 5% of the occupied leks and population
- Represent least intact/least productive habitat

The management zone development restrictions are consistent with the USFWS COT report and its identified PAC areas; they serve to discourage further development in GRS habitat.

**ROW**

Avoidance criteria applies more to ROW areas because BLM Idaho wants to ensure that, if these projects are instituted, sage-grouse habitat is not compromised. All disturbance and associated effects is evaluated with regard to GRS impacts with the same rule set. This eliminates the potential occurrence

where an activity may be approved/not approved while the ROW associated with or supporting the activity would be conversely not approved.

The General Management Zone is not an avoidance area for ROW developments, however, proposals within this zone would still need to conform to the required design features, lek buffers and seasonal restrictions. This maintains a high standard of limiting effects to GRSG and directs potential use away from CMZ and IMZ areas.

### **Other Disturbances**

In the Idaho and Southwestern Montana sub-region, we have expanded ROW avoidance criteria to other large-scale disturbances as well. This ensures that all potential disturbances and their associated effects are evaluated with regard to GRSG impacts using the same rule set and evaluation tools, which avoids inconsistencies in project applications too.

### **Wildland Fire Threats**

BLM Idaho has supported the state of Idaho in the creation of Rangeland Fire Protection Associations (RFPA), which are comprised of ranchers and private land owners in remote, rural areas. RFPA members have been trained to respond to wildfires and to coordinate with federal firefighters, which help keep wildfires in sage-grouse habitat small across both private and public land ownership.

### **Working with Partners**

BLM Idaho's Sage-Grouse planning effort Interdisciplinary Team is comprised of scientists and partners from the Idaho Governor's Office, Idaho Department of Fish and Game, USDA, USDS, and the USFWS. We have shown that, through the need to conserve a species, we can work together across agency and political divides.

We have institutionalized how we monitor rangeland health and sage-grouse habitat across agencies and land ownership; everyone is working on learning how to provide healthy sage-grouse habitat.

BLM has worked with Idaho's numerous sage-grouse working groups throughout the state over the last 10-15 years. For example, the Twin Falls District Fire and Fuels program has partnered with the Natural Resources Conservation Service, Pheasants Forever, Idaho Department of Fish and Game and permittee allotment holders to treat portions of the Burley Field Office encroached by Utah juniper that is affecting sage-grouse habitat

The Idaho and Southwestern Montana Sub-region's key habitat map does not recognize land ownership; it addresses sage-grouse habitat conservation as an intact landscape.

### **Disturbance Threshold**

Our sub-regional plan will limit anthropogenic disturbance to 3% as calculated within the biologically significant unit, (the nesting and wintering habitat within Core and Important Management Zones). This includes all land ownerships for the purpose of evaluation and excludes wildfire disturbance.

New anthropogenic disturbances will not be permitted within Core or Important management zones if the disturbance threshold is already exceeded from any source. A proposed development would not be permitted until enough habitat has been restored to maintain the area under the 3% threshold.

### **Adaptive Management**

There are two different triggers that can be tripped in order to flag the BLM and FS that adjustments must be made within a certain management zone; hard triggers and soft triggers.

Adaptive Regulatory Criteria for soft habitat triggers involves a 10% loss of nesting and/or wintering habitat within a CA/CMZ or IMZ.

Adaptive Regulatory Criteria for hard habitat triggers involves a 20% decline in the maximum number of males counted and a finite rate of change within a CA/CMZ or IMZ.

**Soft Triggers:** Once one of these triggers is activated, Adaptive Regulatory Criteria is initiated, allowing land managers to adjust administration techniques in order to best conserve sagebrush habitat.

**Habitat Triggers:** When a 20% combined loss of nesting and/or wintering habitat occurs within a Conservation Area's CMZ, land managers must adjust their management techniques.

National Greater Sage-Grouse  
Idaho & Southwestern Montana Sub Region  
Federal Family Meeting  
August 2014

**1. Why does Idaho need to have three GRSG management zones?**

The Idaho delineates three GRSG management zones – Core, Important and General, to retain and protect sagebrush cover and GRSG habitat (consistent with Wisdom et al. 2011, Aldridge et al. 2008, and Knick et al. 2000) through appropriate prioritization and protective measures within the most critical habitats and across broader habitat areas. Each of these management zones has associated management restrictions and protections for greater sage-grouse (GRSG) and are foundational to the adaptive management strategy.

**Core Management Zones (CMZ)** are delineated to protect large unfragmented, contiguous landscapes from anthropogenic disturbance and to focus wildfire reduction (suppression activities and fuels treatments) associated with the two key metapopulations within the subregion (Garton et al. 2011). These areas encompass 68% of the occupied leks and associated seasonal habitats necessary to support 77% of the breeding males (and by association the entire population) in Idaho. CMZ compose 66% of the USFWS priority areas for conservation (PACs). They have the highest priority for wildfire suppression and minimization activities (fuel breaks and reduction treatments) and have the most restrictive management direction for anthropogenic development which is consistent with the national policy team direction or goes beyond that direction in its protection of GRSG.

**Important Management Zones (IMZ)** are delineated to provide protection to habitats adjacent to the CMZs and encompass 26% of the occupied leks and support approximately 22% of the breeding males (and by association the entire population) in Idaho. IMZ compose the remaining areas of PACs (33%) and in addition include over 750K additional acres supporting 4% of the breeding males outside of PAC areas. The two management zones encompass the FWS identified priority areas for conservation (PAC) and include areas beyond those PAC boundaries that would receive threat amelioration management to help foster connectivity and retention of habitat within CMZ and PAC areas. The IMZ areas provide a management buffer between more intact CMZ areas and General Management Zones with a higher likelihood of wildfire occurrence. The IMZ also has protective and restrictive management supporting the retention and recovery of GRSG habitats in IMZ and CMZ with management direction for anthropogenic development disturbance that is largely consistent with the national policy team direction with several exceptions – solar, wind, non-energy leasable (phosphate) and mineral material developments.

**General Management Zones (GMZ)** contain less than 5% of the occupied leks and population and represent the least intact and least productive habitats for GRSG.

The three management zone approach, unique to Idaho's Plan, was specifically designed in coordination with the State of Idaho to support an adaptive management strategy that substantively addresses the primary threat to the species in Idaho and which could be supported and applicable to non-federal lands within the management zone in coordination with Rural Fire Protection Associations, the development and support of which has garnered Gubernatorial and Congressional support in the State of Idaho.

**2. Why is Solar development not excluded in Important and General Management Zones?**

3. *Why is Wind development not excluded in Important and General Management Zones?*
4. *Why is non-energy leasable development not excluded in Important Management Zones?*
5. *Why is mineral materials development not excluded in Important Management Zones?*

- a. See - *Why does Idaho need to have three GRSG management zones?*
- b. The management zone development restrictions serve to discourage further development in GRSG habitat. The management for the identified uses is consistent with the objectives described in the USFWS COT Report and consistent with the identified PAC areas. The CMZ areas are extremely limited to further anthropogenic disturbance and go beyond the direction provided by the National Policy Team (e.g. closures to fluid mineral leasing and a cessation of further development in the event an adaptive regulatory hard trigger is engaged).
- c. Any proposed development in Important Zones must comply with the Anthropogenic Disturbance Development Criteria (avoidance criteria); if development were to proceed then lek buffers, required design features and appropriate seasonal or timing restrictions would also be applied to limit impacts to GRSG or habitat. In addition mitigation of residual impacts would be required.

AD-4: Core and Important Management Zone: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:

- a. The project cannot reasonably be achieved, technically or economically, outside of this management zone; and
- b. The project is co-located within the footprint for existing infrastructure, to the extent practicable. In the event co-location is not practicable, the siting should best reduce cumulative impacts and/or impacts on other high value natural, cultural, or societal resources; and
- c. The project does not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA; and
- d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
- e. The project complies with the applicable RDFs and BMPs as described in Appendix A.
- f. The project would not exceed the disturbance threshold (AD-1).

6. *Why are high voltage transmission and major pipeline ROW developments not avoided in General Management Zones?*

The GMZ is not identified as an avoidance area for ROW developments; however, proposals within this zone would still need to conform to the required design features, lek buffers and seasonal restrictions which would serve to direct actions away from GRSG habitat (leks specifically) and times that could impact bird behavior. This maintains a high standard of limiting effects to GRSG even within GMZ. This serves to direct potential use away from CMZ and IMZ areas while still minimizing and eliminating impacts to GRSG.

7. *Why is no net unmitigated loss not applied to General Management Zones?*

This has been further refined during the development of the Proposed Plan to include no net unmitigated loss within GMZs as well.

8. *Why does avoidance criteria apply to more than ROWs?*

While many activities or proposals for development are carried out within the purview of ROW permits, others are not, and in some cases proposals involve both actions permitted under a ROW and those permitted under other authorities. In Idaho the ROW avoidance criteria has been expanded to include all large scale anthropogenic disturbance proposals. This effectively accomplishes several objectives:

1. All disturbance and associated effects is evaluated with regard to GRSG impacts with the same rule set (individual proposals may have very different potential impacts – a transmission line versus and oil and gas well – which would be considered in the evaluation of the projects conformance to the criteria.
2. This eliminates the potential occurrence where an activity may be approved/not approved while the ROW associated with or supporting that activity would be conversely not approves/approved, leading to inconsistencies in application.

**9. Lek Buffers**

The plan contains direction to minimize impacts from various impacts and causes. These include minimization measures, buffers around leks and seasonal timing restrictions. The following table delineates specific uses and associated lek buffers.

Program/Use	Buffer
Fluid Minerals Development	2 miles
Solar Development	2 miles
Misc. Anthropogenic Structures	2 miles
Roads	0.8 miles
Industrial Pipelines	0.6 miles
Salable Minerals Developments	0.8 miles
Communication Towers	3 miles
Transmission Lines	600 meters
Organized Recreational Events	2 miles

**10. Disturbance Threshold**

Limit anthropogenic disturbance to 3 percent. This is measured within the nesting and wintering habitat within Core and Important management zones, separately, by Conservation Area. This area is inclusive of all ownerships for evaluation. Anthropogenic disturbance excludes habitat disturbance from wildfire and includes specific activities defined in the Monitoring Strategy. For Idaho this disturbance is measured by direct footprint or by ROW width for linear features (powerlines, pipelines and roads).

If or when the 3% threshold were hit within the nesting and wintering areas of either Core or Important management zones then new anthropogenic disturbances within that Core or Important management zone would not be not be allowed (subject to valid existing rights).

Core and Important Management Zone: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:

f. The project would not exceed the disturbance threshold (AD-1).

### ***11. 3 percent disturbance in biologically significant unit for nesting and winter habitat only?***

Nesting and wintering habitats were delineated in Idaho within each of the Conservation Areas to monitor and adaptively manage threats at a biologically meaningful scale. Measuring habitat loss and disturbance within nesting and wintering habitats, as opposed to across the entire Conservation Area or PAC, has several advantages:

- It more accurately reflects methodologies applied in relevant scientific literature (e.g. Knick et al. 2013, Wisdom et al. 2011, Aldridge et al. 2008);
- Provides greater sensitivity for threat response within the large meta-populations;
- Provides a disincentive for development in more critical habitats, while at the same time providing an incentive for proactive maintenance and restoration of those same habitats.

### ***12. Adaptive Management***

The Idaho portion of the plan contains both soft and hard triggers for adaptive management. The triggers are a loss of 10% (soft) or 20% (hard) of either population or habitat when compared to 2001 baseline values.

When any of the Adaptive Regulatory Criteria for Soft Triggers have been met the Implementation Team would evaluate causal factors and recommend additional potential implementation level activities.

When any of the Adaptive Regulatory Criteria for Hard Triggers have been met then CMZ management actions would be applied to the IMZ within that CA.

If an adaptive regulatory trigger is tripped and livestock grazing is identified as a probable limiting factor then adjustments would follow the Adaptive Grazing Management Response.

Remove any adaptive management response when the habitat or population information shows a return to or an exceedance of baseline values within the associated CA.

### ***13. Resource Potentials***

Solar: Extremely low to the point of not addressed in Solar PEIS

Wind: Low with a few areas with higher potential/interest – Cotterell, China Mountain

Oil and Gas: Low in most of Idaho; moderate to high in Bear Lake (se Idaho) and sw Montana

Geothermal: Low in western, northern and eastern part of Idaho and sw Montana; moderate to high in central part of Idaho

Phosphate: high in Known Phosphate Leasing Areas in eastern part of Idaho

### ***14. Protection of PACs***

Core and Important Management Zones encompass all of the PAC areas. Protective management is included for both management zones which meets the COT objectives and affects over 95% of the population in Idaho.

### ***15. State Monitoring Strategy***

The subregional monitoring strategy includes measures and processes to support the evaluation of the adaptive regulatory triggers and anthropogenic disturbance cap. The State of Idaho monitors and tracks population indices and the BLM and Forest Service monitor and track habitat indices.

Implementation of the Habitat Assessment Framework and the broad scale Monitoring Framework are also included as part of the local monitoring strategy.

### ***16. Issues with MT/ID as there are great differences?***

Montana BLM continues to work forward in the development of adaptive management and anthropogenic disturbance approaches applicable to Montana that are also consistent with the yet to be final State of Montana Plan. These will be incorporated into the proposed plan when final.

### ***17. Designated corridors in SE Idaho?***

No final answer on these corridors, their validity and designation is being investigated.

### ***18. Mitigation***

The plan calls for mitigation for any impacts to GRSG and their habitat to a net conservation benefit standard and in addition any key habitat impacted through discretionary actions would be mitigated to a no net loss standard.

### ***19. Map Adjustment***

Between Draft and Final EIS the BLM, Forest Service, US Fish and Wildlife Service and State of Idaho took some time to refine the maps to more accurately reflect on the ground conditions. At the larger scale the original management zone mapping in the preferred alternatives in the Draft identified approximately 11.3 million acres of BLM and Forest Service greater sage-grouse habitat. Based on the refinement there were adjustments between Core, Important and General management zones and removal of non-habitat areas. These non-habitat areas comprised approximately 250k acres leaving approximately 11 million acres designated by BLM or Forest Service as greater sage-grouse habitat.

## Why does Idaho have three GRSG management zones?

The three-tiered management zone approach, created in partnership with the state of Idaho, based on sage-grouse populations and habitat conditions to protect the two key meta-populations in the subregion, is designed to specifically support an adaptive management strategy and to substantively address wildfire, the primary threat to the species within the Idaho and Montana sub-region.

The Idaho and SW Montana sub-regional plan delineates three sage-grouse management zones – Core, Important and General, to retain and protect sagebrush cover and sage-grouse habitat through appropriate habitat prioritization and protective measures within the most critical habitat zones.

### Core Management Zones:

- Protect large, continuous sagebrush habitat from anthropogenic disturbance
- Focus on wildfire reduction within these areas
- Two key metapopulations; 68% of the occupied leks and associated seasonal habitats necessary to support 77% of the breeding males
- Compose 66% of the USFWS priority areas for conservation (PAC)
- Extremely limited to further anthropogenic disturbance
- Go beyond the NPT direction by including closures to fluid mineral leasing,
- If an adaptive regulatory hard trigger is engaged in these zones, no further development is permitted
- Soft triggers in these zones can be related to grazing management

### Important Management Zones:

- Provide protection for habitats adjacent to CMZs
- Encompass 26% of the occupied leks
- Support approximately 20% of the breeding males
- Compose remaining PACs (33%)
- Include additional 750,000 acres that support 4% of the breeding males outside of PACs
- Also include areas beyond those PAC boundaries that would receive threat amelioration management to help foster connectivity and retention of habitat within CMZ and PAC areas.
- Any proposed development in these zones must comply with Anthropogenic Disturbance Development Criteria and would require lek buffers, required design features, and appropriate seasonal or timing restrictions

### General Management Zones:

- Contain less than 5% of the occupied leks and population
- Represent least intact and least productive habitat and the lowest priority for conservation or restoration efforts

The management zone development restrictions are consistent with the USFWS COT report and its identified PAC areas; they serve to discourage further development in GRSG habitat.

## ROW

Avoidance criteria applies more to ROW areas because BLM Idaho wants to ensure that, if these projects

are instituted, sage-grouse habitat is not compromised. All disturbance and associated effects is evaluated with regard to GRSG impacts with the same rule set. This eliminates the potential occurrence where an activity may be approved/not approved while the ROW associated with or supporting the activity would be conversely not approved.

The General Management Zone is not an avoidance area for ROW developments, however, proposals within this zone would still need to conform to the required design features, lek buffers and seasonal restrictions. This maintains a high standard of limiting effects to GRSG and directs potential use away from CMZ and IMZ areas.

### **Other Disturbances**

In the Idaho and Southwestern Montana sub-region, we have expanded ROW avoidance criteria to other large-scale disturbances as well. This ensures that all potential disturbances and their associated effects are evaluated with regard to GRSG impacts using the same rule set and evaluation tools, which avoids inconsistencies in project applications too.

### **Wildland Fire Threats**

BLM Idaho has supported the state of Idaho in the creation of Rangeland Fire Protection Associations (RFPA), which are comprised of ranchers and private land owners in remote, rural areas. RFPA members have been trained to respond to wildfires and to coordinate with federal firefighters, which help keep wildfires in sage-grouse habitat small across both private and public land ownership.

### **Working with Partners**

BLM Idaho's Sage-Grouse planning effort Interdisciplinary Team is comprised of scientists and partners from the Idaho Governor's Office, Idaho Department of Fish and Game, USDA, USDS, and the USFWS. We have shown that, through the need to conserve a species, we can work together across agency and political divides.

We have institutionalized how we monitor rangeland health and sage-grouse habitat across agencies and land ownership; everyone is working on learning how to provide healthy sage-grouse habitat.

BLM has worked with Idaho's numerous sage-grouse working groups throughout the state over the last 10-15 years. For example, the Twin Falls District Fire and Fuels program has partnered with the Natural Resources Conservation Service, Pheasants Forever, Idaho Department of Fish and Game and permittee allotment holders to treat portions of the Burley Field Office encroached by Utah juniper that is affecting sage-grouse habitat

The Idaho and Southwestern Montana Sub-region's key habitat map does not recognize land ownership; it addresses sage-grouse habitat conservation as an intact landscape.

### **Disturbance Threshold**

Our sub-regional plan will limit anthropogenic disturbance to 3% as calculated within the biologically significant unit, (the nesting and wintering habitat within Core and Important Management Zones). This includes all land ownerships for the purpose of evaluation and excludes wildfire disturbance.

New anthropogenic disturbances will not be permitted within Core or Important management zones if the disturbance threshold is already exceeded from any source. A proposed development would not be permitted until enough habitat has been restored to maintain the area under the 3% threshold.

### **Adaptive Management**

There are two different triggers that can be tripped in order to flag the BLM and FS that adjustments must be made within a certain management zone; hard triggers and soft triggers.

Adaptive Regulatory Criteria for soft habitat triggers involves a 10% loss of nesting and/or wintering habitat within a CA/CMZ or IMZ.

Adaptive Regulatory Criteria for hard habitat triggers involves a 20% decline in the maximum number of males counted and a finite rate of change within a CA/CMZ or IMZ.

**Soft Triggers:** Once one of these triggers is activated, Adaptive Regulatory Criteria is initiated, allowing land managers to adjust administration techniques in order to best conserve sagebrush habitat.

**Habitat Triggers:** When a 20% combined loss of nesting and/or wintering habitat occurs within a Conservation Area's CMZ, land managers must adjust their management techniques.

The Idaho and Southwestern Montana Subregional plan encompasses 18.5 million BLM & Forest Service acres of which 11 million acres provide habitat for Greater Sage-Grouse.

These 11 million acres represent 12 percent of the habitat range-wide and provides habitat for 15 percent of Greater Sage-Grouse range-wide.

The greatest threat to Greater Sage-grouse in the subregion by far is wildfire and invasive species (cheatgrass). All other threats are either insignificant or very site specific in extent.

Anthropogenic disturbance is well below 3% in all sage-grouse areas and potential for solar, wind and oil and gas development is low in most or all of the subregion. Eastern Idaho contains a high potential phosphate resource with designated known phosphate leasing areas.

The Subregional plan designates five (5) Conservation Areas based on relative threats, sage-grouse populations and similar habitat conditions.

The Plan also designates three management zones in Idaho and two in SW Montana, based on sage-grouse populations and habitat conditions to protect the two key meta-populations in the subregion.

These zones are Core, Important and General in Idaho, and Core and General in SW Montana and have been designated to protect sagebrush cover and sage-grouse habitat through habitat prioritization and protective measures within the most critical habitat.

The Conservation Areas and Management Zones have been designated to support the adaptive management strategy and the 3% anthropogenic disturbance threshold.

The Management Zones, adaptive management strategy, disturbance threshold and all other significant components of the plan have been developed in full cooperation and coordination with the State of Idaho, US Fish and Wildlife Service and Forest Service.

The Core and Important Management Zones provide protective management that meets the US Fish and Wildlife Service Conservation Objectives for all priority areas for conservation within the subregion and protects over 95% of the Greater Sage-Grouse population in Idaho.

Core Management Zones encompass 5.2 million acres of BLM and Forest Service sage-grouse habitat and 66% of the priority areas for conservation and protect 68% of the leks and 77% of the population.

Important Management Zones provide protection to an additional 3.1 million acres of BLM and Forest Service sage-grouse habitat, the remaining areas within PACs, including an additional 750 thousand acres outside of PACs and protect 26% of the leks and 20% of the population.

Combined Core and Important Management Zones encompass over 64% of the sage-grouse habitat in the subregion, contains all of the priority areas for conservation and contains over 94% of the leks and 97% of the population in Idaho.

The Adaptive Management Strategy is designed to specifically address the threat of wildfire in the subregion. Core Management Zones are the highest priority for suppression resources during times of multiple starts when resources are not available to address all new fires, and for protection from fuel breaks and other fuels management activities.

The Important Management Zone is the next highest priority for suppression and fuels management activities. In the event that significant portions of populations or habitat are lost (primarily due to fire although other factors could also play a role) the Important Management Zone would then receive the same high priority as Core along with more restrictive measures to address disturbance.

The Adaptive Management Strategy use a soft and a hard trigger to determine management changes based on a 10% (soft trigger) or 20% (hard trigger) change in either populations or habitat.

Engagement of a soft trigger would result in causal factor analysis and an evaluation of implementation level activities with potential adjustments to those activities to reduce or eliminate impacts to sage-grouse.

Engagement of the hard trigger results in a planning scale change in management direction within the Important Management Zone which includes additional priority for wildfire suppression, pre-suppression fuels treatments and limitations on anthropogenic disturbance activities.

Application of the Adaptive Management Strategy is a coordinated effort among BLM, Forest Service, US Fish and Wildlife Service and the States of Idaho and Montana for their respective states.

In Idaho the population component of the Adaptive Management Strategy is monitored and tracked by the state Fish and Game agency, BLM and Forest Service in coordination with the State Fish and Game and Local Sage-Grouse Working Groups track the habitat component. The Office of Species Conservation in the Governor's Office also supports this effort with oversight to be provided to the Idaho Implementation Task Force when it is convened.

The adaptive management strategy is designed to address the largest threat to sage-grouse in the subregion and to sustain viable populations of sage-grouse.

The 3% anthropogenic disturbance threshold is designed to limit development within critical habitats (nesting and wintering habitats). While current disturbance is significantly below 3% and future development is not expected to ever hit this threshold, it is included as a backstop to prevent disturbance beyond this level within Core and Important Management Zones.

The plan also identifies the need to mitigate all impacts to Greater Sage-grouse and that a no net mitigated loss requirement would apply within all management zones.

The Idaho portion of the plan has been coordinated with the Governor of Idaho, the Office of Species Conservation, the Department of Fish and Game, the US Fish and Wildlife Service, and the Forest Service.

The implementation and appropriate functioning of the management direction is reliant on a strong partnership with and continued involvement of the partners involved.

The plan for BLM and Forest Service lands lays a strong foundation for future inclusion of state and potentially private lands through continued efforts of the State of Idaho and Montana.

This coalition of support, management that addresses the primary threats in the subregion, protection provided to over 95% of the sage-grouse population in Idaho and consistency with the US Fish and Wildlife Service Conservation Objective and protection of all the priority areas for conservation, provides a strong foundation to maintain resilient populations in the subregion.

So one more question. Designated corridors only right? The numbers that are in the table that you sent, are those for BLM-wide? So we add two other columns, one for Idaho and one for Montana?

Hi Brent,

Is there a ROW component to this as well? I only see mineral stuff. Want to make sure I am not missing anything.

Ted Koch asked that I send you this table. It is a projections of existing or potential development based existing rights.

**ESTIMATES OF AMOUNT OF GRSG HABITAT CURRENT UNDER EXISTING RIGHTS**

<b>FLUID LEASING</b>	OIL & GAS: There are apx. 1,900 oil & gas leases statewide (not all developed yet – leases only). BLM estimates that about 20% of these are in GRSG habitat. Based on Manier et al., (and the BLM Monitoring Framework) which assumes a 5-acre footprint per well, there are about <b>1,900</b> acres of existing rights oil and gas development (0.01% of 17,700 acres total).
<b>GEOHERMAL:</b>	There are 515 geothermal leases statewide (not all developed yet – leases only). BLM estimates 1/3 of these are in GRSG habitat, or about 155 leases. Based on Manier et al. (and the BLM Monitoring Framework) which assumes a 3 acre footprint per site, there are about <b>465</b> acres of existing rights geothermal development (0.003% of 17,700 acres total)
<b>SALABLE MINERALS:</b>	There are 108 pending cases for salable mineral leases. MMS Disposal Sites data 170 sites total <b>23,081</b> acres (0.013% of 17,700 acres Alt G Habitat)
<b>CORRIDORS:</b>	BLM estimates that of the 17.7 million acres, corridors make up 1.22% of GRSG habitat, or approx. <b>216,834</b> acres
<b>LOCATABLES:</b>	The mining claim acres as of 6/16/14 was <b>36,475</b>

REVISED ESTIMATE (07-15-14): 1,900 + 465 + 23,081 + 216,834 + 36,475 = **278,755 acres (or 1.57% of GRSG habitat)**

Brent-

I've got minerals numbers for you for all except mining claims, which Diane is working on providing me. It may take her some time to overlay the claims with habitat to arrive at an acreage, so in the meantime, I'm sending you what I've got so far, since you wanted this several hours ago. The data I've got is for the entire planning area-

Sarah, Neil, Steve-

We will be sharing the following information (AG's Office memo concerning state regulation of locatable minerals; DEQ gold permit with reference to GSG) as well as other relevant data with the FWS locally as they work with their regional and national offices concerning locatable minerals and GSG in Wyoming. I wanted to ensure that you have this information as we do that outreach this evening and tomorrow. We are also working on the management actions and maps associated with locatable minerals in the stronghold areas in Wyoming. BLM Wyoming is currently working on that issue with their contractor and solicitors. More to come on both fronts. If you would like to discuss any of this please do not hesitate to contact me.

My best.
